### Appearance Category Properties

The following table contains a list of properties in the Appearance property category used by the:

- Elements.
- Canvas.
- Element groups.
- Embedded graphics.

It shows their purpose, where they are used and where to find more information on how to use them.

Asterisk (\*) marks properties that are specific to only one type of element or the canvas, a group or an embedded graphic.

Property	Purpose, category, usage and further information
<b>AbsoluteAnchor*</b>	<p>Purpose: Defines the absolute anchor point of the source graphic. By default, this is the center point of all elements on the canvas but can be changed.</p> <p>Category: Appearance</p> <p>Used by: Canvas</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Size Propagation and Anchor Points</a></p>
<b>AnchorFixedTo</b>	<p>Purpose: Determines if the anchor point is fixed to the canvas when you resize, delete, or add elements (Absolute), or if the anchor point is recalculated relative to the element sizes and positions (Relative).</p> <p>Category: Appearance</p> <p>Used by: Embedded Symbol, Canvas</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Size Propagation and Anchor Points</a></p>

<b>AbsoluteOrigin</b>	<p>Purpose: Defines an X, Y location relative to the top, left (0, 0) origin of the graphic or window.</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Embedded Symbol, Group, Path, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box.</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Changing Points of Origin in the Properties Editor</a></p>
<b>AnchorPoint*</b>	<p>Purpose: Defines the anchor X, Y location of the embedded graphic.</p> <p>Category: Appearance</p> <p>Used by: Embedded Symbol</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Size Propagation and Anchor Points</a></p>
<b>Angle</b>	<p>Purpose: Defines the current angle of rotation of the element. 0 is always the top of the element relative to the canvas. Angle is always determined relative to the top of the element and rotates in a clockwise direction.</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Group, Embedded Symbol</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Rotating Elements by Changing the Angle Property</a></p>
<b>AutoScale</b>	<p>Purpose: If this property is set to True then the text is stretched horizontally and vertically (larger or smaller) to fit the bounding rectangle.</p>

	<p>Category: Appearance</p> <p>Used by: Button, Text Box</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting Auto Scaling and Word Wrapping for a Text Box</a></p>
<b>ButtonStyle*</b>	<p>Purpose: Determines if the button appears as a standard button or as an image.</p> <p>Category: Appearance</p> <p>Used by: Button</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Configuring Buttons with Images</a></p>
<b>CalendarColumns*</b>	<p>Purpose: Defines the number of columns the calendar object has.</p> <p>Category: Appearance</p> <p>Used by: Calendar</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Number of Calendar Month Sheets</a></p>
<b>CalendarRows*</b>	<p>Purpose: Defines the number of rows the calendar object has.</p> <p>Category: Appearance</p> <p>Used by: Calendar</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Number of Calendar Month Sheets</a></p>
<b>Checked*</b>	<p>Purpose: Sets or gets the value of check box. This is the initial value of the check box when the control is not connected to a reference and is overridden at run time with value of reference.</p> <p>Category: Appearance</p> <p>Used by: Check Box</p> <p>Can be read by script at run time: Yes</p>

	<a href="#">Info: Setting the Default State of a Check Box Control</a>
<b>ControlStyle</b>	<p>Purpose: Defines the control style as Flat or 3D.</p> <p>Category: Appearance</p> <p>Used by: Radio Button Group, Check Box</p> <p>Can be read by script at run time: No</p> <p><a href="#">Info:Setting the Layout of the Radio Button Group Options</a> and <a href="#">Setting the 3D appearance of a Check Box Control</a></p>
<b>CustomFormat*</b>	<p>Purpose: Defines the format to be used in the DateTime Picker control for input of a date or time.</p> <p>Category: Appearance</p> <p>Used by: DateTime Picker</p> <p>Can be read by script at run time: No</p> <p><a href="#">Info: Configuring DateTime Picker Controls</a></p>
<b>DefaultValue</b>	<p>Purpose: The default time value to use for the control.</p> <p>Category: Appearance</p> <p>Used by: Calendar, DateTime Picker</p> <p>Can be read by script at run time: No</p> <p><a href="#">Info: Setting the Default Value of the Calendar Control</a> and <a href="#">Configuring DateTime Picker Controls</a></p>
<b>DownImage*</b>	<p>Purpose: Defines the image that is rendered in the button element when it is clicked or held down.</p> <p>Category: Appearance</p> <p>Used by: Button</p> <p>Can be read by script at run time: No</p> <p><a href="#">Info: Configuring Buttons with Images</a></p>
<b>DropDownType*</b>	<p>Purpose: Defines the type of combo box: simple, drop-down or drop-down list.</p> <p>Category: Appearance</p>

	<p>Used by: Combo Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Type of Combo Box Control</a></p>
<b>DropDownWidth*</b>	<p>Purpose: Defines the width of the drop-down list.</p> <p>Category: Appearance</p> <p>Used by: Combo Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Width of the Drop-Down List</a></p>
<b>DynamicSizeChange*</b>	<p>Purpose: Determines if the embedded graphic propagates the size changes from the source graphic.</p> <p>Category: Appearance</p> <p>Used by: Embedded Symbol</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Enabling or Disabling Dynamic Size Change of Embedded Graphics</a></p>
<b>End</b>	<p>Purpose: Defines the end of a line or H/V line as X, Y location.</p> <p>Category: Appearance</p> <p>Used by: Line, H/V Line</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Start or End Points of a Line</a></p>
<b>FirstDayOfWeek*</b>	<p>Purpose: Defines the first day of the week used for the display of the columns in the calendar.</p> <p>Category: Appearance</p> <p>Used by: Calendar</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the First Day of the Week</a></p>
<b>Format*</b>	<p>Purpose: Defines the format of the reference values. This is only available for array mode.</p>

	<p>Category: Appearance</p> <p>Used by: DateTime Picker</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Configuring DateTime Picker Controls</a></p>
<b>HasTransparentColor*</b>	<p>Purpose: Indicates whether or not the image applies a transparent color. If True the image is rendered transparent wherever a color in the image matches the TransparentColor property.</p> <p>Category: Appearance</p> <p>Used by: Image</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting the Image Color Transparency</a></p>
<b>Height</b>	<p>Purpose: Defines the height of the element.</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Resizing Elements by Changing Size Properties</a></p>
<b>HorizontalScrollbar</b>	<p>Purpose: Determines if a horizontal scroll bar appears on a list box control to allow the user to scroll the list box items horizontally.</p> <p>Category: Appearance</p> <p>Used by: List Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Using a Horizontal Scroll Bar in a List Box Control</a></p>
<b>Image*</b>	<p>Purpose: Defines the image that is rendered in the element. Any image format supported by the application can be used.</p>

	<p>Category: Appearance</p> <p>Used by: Image</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Selecting a Different Image</a></p>
<b>ImageAlignment*</b>	<p>Purpose: Controls the location of the image relative to the bounding rectangle of the graphic. This property is only applicable when the ImageStyle is set to Normal.</p> <p>Category: Appearance</p> <p>Used by: Image</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Image Alignment</a></p>
<b>ImageStyle</b>	<p>Purpose: Defines how the image is rendered relative to its bounding rectangle.</p> <p>Category: Appearance</p> <p>Used by: Button, Image</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Image Display Mode</a></p>
<b>IntegralHeight</b>	<p>Purpose: Determines if the List Box size is an integral multiple of the Font Size so that a finite number of items fit in it without being clipped.</p> <p>Category: Appearance</p> <p>Used by: Combo Box, List Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Avoiding Clipping of Items in the Simple Combo Box Control</a></p>
<b>Layout*</b>	<p>Purpose: Defines the way the radio buttons are arranged in the group (Horizontal or Vertical).</p> <p>Category: Appearance</p> <p>Used by: Radio Button Group</p> <p>Can be read by script at run time: No</p>

	<p>Info: <a href="#">Setting the Layout of the Radio Button Group Options</a></p>
<b>Locked</b>	<p>Purpose: Locks or unlocks the element's size, position, orientation and origin. Other properties that can have an affect on element size, position, orientation and origin are also locked. These are element-specific.</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Locking and Unlocking Elements</a></p>
<b>MaxDropDownItems*</b>	<p>Purpose: Defines the maximum number of items the drop-down list shows.</p> <p>Category: Appearance</p> <p>Used by: Combo Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Maximum Number of Items to Appear in the Combo Box Drop-Down List</a></p>
<b>Multiline*</b>	<p>Purpose: Determines if the control shows several lines of text that automatically wrap up when reaching the right border of the control.</p> <p>Category: Appearance</p> <p>Used by: Edit Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Configuring the Text to Wrap in an Edit Box Control</a></p>
<b>Radius*</b>	<p>Purpose: Defines the radius of the corners of the Rounded Rectangle.</p> <p>Category: Appearance</p>

	<p>Used by: Rounded Rectangle</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting the Radius of Rounded Rectangles</a></p>
<b>ReadOnly*</b>	<p>Purpose: Determines if the user can type data into the edit box.</p> <p>Category: Appearance</p> <p>Used by: Edit Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Configuring the Text to be Read-Only in an Edit Box Control</a></p>
<b>RelativeAnchor*</b>	<p>Purpose: Relative anchor point of the source graphic. By default, this is 0,0.</p> <p>Category: Appearance</p> <p>Used by: Canvas</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Size Propagation and Anchor Points</a></p>
<b>RelativeOrigin</b>	<p>Purpose: Defines the relative origin as X, Y location. The location is relative to the center point of the element (0, 0).</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Changing Points of Origin in the Properties Editor</a></p>
<b>ShowToday*</b>	<p>Purpose: Determines if today's date is shown on the calendar control.</p> <p>Category: Appearance</p> <p>Used by: Calendar</p>

	<p>Can be read by script at run time: No</p> <p>Info: <a href="#">Showing or Hiding Today's Date on a Calendar Control</a></p>
<b>Smoothing*</b>	<p>Purpose: When False the graphics are rendered normally, when True graphics are rendered with anti-aliasing which produces a smoother appearing graphic.</p> <p>Category: Appearance</p> <p>Used by: Canvas</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Radius of Rounded Rectangles</a></p>
<b>Start</b>	<p>Purpose: Defines the start of a line or H/V line as X, Y location.</p> <p>Category: Appearance</p> <p>Used by: Line, H/V Line</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Start or End Points of a Line</a></p>
<b>StartAngle</b>	<p>Purpose: Defines the starting angle of an Arc, Pie or Chord. 0 is always the top of the graphic relative to its orientation. A positive number is clockwise from 0 and a negative number is counter clockwise from 0. If a negative number is used to set the property it is automatically converted to a positive value.</p> <p>Category: Appearance</p> <p>Used by: 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, 2 Point Arc, 3 Point Arc</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Changing Angles of Arcs, Pies and Chords</a></p>
<b>SweepAngle</b>	<p>Purpose: Defines the ending angle of the Arc, Pie or Chord. This angle is always measured from the start angle.</p> <p>Category: Appearance</p> <p>Used by: 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point</p>

	<p>Chord, 2 Point Arc, 3 Point Arc</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Changing Angles of Arcs, Pies and Chords</a></p>
<b>Tension</b>	<p>Purpose: Specifies how tightly the curve bends through the control points of the curve.</p> <p>Category: Appearance</p> <p>Used by: Closed Curve, Curve</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Changing the Tension of Curves and Closed Curves</a></p>
<b>Text</b>	<p>Purpose: Defines the unicode text that is shown by the element.</p> <p>Category: Appearance</p> <p>Used by: Button, Text, Text Box, Edit Box</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting the Displayed Text</a></p>
<b>TextFormat</b>	<p>Purpose: Defines the formatting string that is applied to the text when it is shown.</p> <p>Category: Appearance</p> <p>Used by: Button, Text, Text Box</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting the Text Display Format</a></p>
<b>Transparency</b>	<p>Purpose: Defines the transparency. A value of 0 means fully opaque and a value of 100 means fully transparent.</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Group, Path, Embedded Symbol</p>

	<p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting the Transparency Level of an Element</a></p>
<b>TransparentColor*</b>	<p>Purpose: Defines the RGB color value that is used as the transparent color.</p> <p>Category: Appearance</p> <p>Used by: Image</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Image Color Transparency</a></p>
<b>UpImage*</b>	<p>Purpose: Defines the image that is used in the button element when it is un-clicked or released.</p> <p>Category: Appearance</p> <p>Used by: Button</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Configuring Buttons with Images</a></p>
<b>Width</b>	<p>Purpose: Defines the width of the element.</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Resizing Elements by Changing Size Properties</a></p>
<b>WordWrap</b>	<p>Purpose: When set to True, the text in the button or text box is formatted to fit as much text on a single line within the horizontal bounding area of the element and then continued to the next line. This continues as long as there is vertical space.</p> <p>Category: Appearance</p> <p>Used by: Button, Text Box</p>

	Can be read by script at run time: Yes
	Info: <a href="#">Wrapping Text in Buttons</a>
X	<p>Purpose: Defines the left position of the element.</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p>
	Can be read by script at run time: Yes
	Info: <a href="#">Moving Elements</a>
Y	<p>Purpose: Defines the top position of the element.</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p>
	Can be read by script at run time: Yes
	Info: <a href="#">Moving Elements</a>

### Fill Style Group Properties

The following table contains a list of properties in the Fill Style property category used by the:

- Elements.
- Canvas.
- Element groups.
- Embedded graphics.

It describes their purpose, where they are used and where to find more information on how to use them.

An asterisk (\*) identifies properties that apply to only one type of element or the canvas, a group or an embedded graphic.

Property	Purpose, category, usage and further information
<b>FillBehavior</b>	<p>Purpose: Determines how the Fill (Horizontal, Vertical or Both) should be applied to the element.</p> <p>Category: Fill Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Fill Behavior</a></p>
<b>FillColor</b>	<p>Purpose: Defines the fill style used for the filled portion of the element.</p> <p>Category: Fill Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, List Box, Path</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Fill Style and Changing Background Color and Text Color of Windows Common Controls</a></p>
<b>FillOrientation</b>	<p>Purpose: Determines the orientation of the fill when the element orientation is any value other than 0.</p> <p>Category: Fill Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Fill Orientation</a></p>
<b>HorizontalDirection</b>	<p>Purpose: Determines the horizontal direction of the fill for the element. Can be "Right" or "Left".</p> <p>Category: Fill Style</p>

	<p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Horizontal Fill Direction and Percentage</a></p>
<b>HorizontalPercentFill</b>	<p>Purpose: Determines the percentage of horizontal fill for the element.</p> <p>Category: Fill Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting Horizontal Fill Direction and Percentage</a></p>
<b>TitleFillColor*</b>	<p>Purpose: Determines the background solid color in the title bar of the calendar control.</p> <p>Category: Fill Style</p> <p>Used by: Calendar</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Title Fill Color and Text Color on a Calendar Control</a></p>
<b>UnFilledColor</b>	<p>Purpose: Determines the element's unfilled area appearance.</p> <p>Category: Fill Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Unfilled Style</a></p>
<b>VerticalDirection</b>	<p>Purpose: Defines the vertical direction of the fill. Can be "Top" or "Bottom".</p> <p>Category: Fill Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse,</p>

	Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path
	Can be read by script at run time: No
	Info: <a href="#">Setting Vertical Fill Direction and Percentage</a>
<b>VerticalPercentFill</b>	Purpose: Determines the percentage of vertical fill for the element.
	Category: Fill Style
	Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path
	Can be read by script at run time: Yes
	Info: <a href="#">Setting Vertical Fill Direction and Percentage</a>

### Line Style Group Properties

The following table contains a list of properties in the Line Style property category used by the:

- Elements.
- Canvas.
- Element groups.
- Embedded graphics.

It shows their purpose, where they are used and where to find more information on how to use them.

Asterisk (\*) marks properties that are specific to only one type of element or the canvas, a group or an embedded graphic.

Property	Purpose, category, usage and further information
<b>EndCap</b>	<p>Purpose: Defines the cap used at the end of the line of an open element.</p> <p>Category: Line Style</p> <p>Used by: Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Line End Shape and Size</a></p>
<b>LineColor</b>	<p>Purpose: Defines the color and affects of the line or border.</p> <p>Category: Line Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Text Box, Path</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Line Style</a></p>
<b>LinePattern</b>	<p>Purpose: Defines the pattern of the line or border.</p> <p>Category: Line Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Text Box, Path</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Line Pattern</a></p>
<b>LineWeight</b>	<p>Purpose: Determines the weight of the element's line or border. A value of 0 means that there is no line or border.</p> <p>Category: Line Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Text Box, Path</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting the Line Weight</a></p>
<b>StartCap</b>	<p>Purpose: Defines the cap used at the start of the line of an open graphic.</p> <p>Category: Line Style</p> <p>Used by: Line, H/V Line, Polyline, Curve, 2 Point Arc, 3</p>

Property	Purpose, category, usage and further information
	<p>Point Arc</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Line End Shape and Size</a></p>

### Runtime Behavior Group Properties

The following table contains a list of properties in the Runtime Behavior property category used by the:

- Elements.
- Canvas.
- Element groups.
- Embedded graphics.

The table shows the purpose of Runtime Behavior properties, where they are used, and where to find more information on how to use them.

Asterisk (\*) marks properties that are specific to only one type of element or the canvas, a group or an embedded graphic.

Property	Purpose, category, usage and further information
Enabled	<p>Purpose: When set to True enables the element at run time and allows the user to interact with it. If the property is set to False the user cannot use the mouse or keyboard to interact with the element. Data changes as a result of an animation or script still execute.</p> <p>Category: Runtime Behavior</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Enabling and Disabling Elements for Run-Time Interaction</a></p>
Language	<p>Purpose: Defines the current language of the graphic.</p> <p>Category: Runtime Behavior</p> <p>Used by: Embedded Symbol</p> <p>Can be read by script at run time: Yes</p>

	<p>Info: <a href="#">Selecting a Language for a Graphic</a>.</p>
LanguageID	<p>Purpose: Defines the current language ID of the graphic.</p> <p>Category: Runtime Behavior</p> <p>Used by: Embedded Symbol</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Selecting a Language for a Graphic</a>.</p>
MultiplePopupsAllowed*	<p>Purpose: If False, ShowSymbol animations only show within a single dialog window no matter how many animations are invoked and regardless of how the animations are configured. If True, ShowSymbol animations show in separate dialog windows.</p> <p>Category: Runtime Behavior</p> <p>Used by: Canvas</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Radius of Rounded Rectangles</a></p>
OwningObject*	<p>Purpose: Used as the object reference to replace all "Me." references in expressions and scripts. Everywhere there is a "Me." reference this object reference is used instead. The object name can be set either using a tag or equipment reference.</p> <p>Category: Runtime Behavior</p> <p>Used by: Embedded Symbol</p> <p>Can be read by script at run time: Yes</p>
Scripts*	<p>Purpose: Defines a collection of scripts configured for the graphic.</p> <p>Category: Runtime Behavior</p> <p>Used by: Canvas</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Adding and Maintaining Graphic Scripts</a></p>
SymbolReference*	<p>Purpose: Contains the exact location that the Embedded Symbol is linked to. This can help the user</p>

	<p>in locating the original definition for editing purposes.</p>
	<p>This property is always disabled.</p>
	<p>Category: Runtime Behavior</p>
	<p>Used by: Embedded Symbol</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Detecting the Source Graphic of an Embedded Graphic</a></p>
TabOrder	<p>Purpose: Defines the tab order for the element. The tab order is only used when navigating by the keyboard. This property is valid only when the TabStop property is set to true.</p> <p>Category: Runtime Behavior</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Editing the Tab Order of an Element</a></p>
TabStop	<p>Purpose: Determines if the element can be navigated to and can receive focus at run time.</p> <p>Category: Runtime Behavior</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Editing the Tab Order of an Element</a></p>
TreatAsIcon	<p>Purpose: If this property is set to False, the animations defined on the graphics within the group or</p>

	embedded graphic take precedence over an animation defined on the group or embedded graphic. If there are no animations or the user clicked on an area of the group or embedded graphic that does not have an animation, then the group or embedded graphic animation executes.
	If the property is set to True, only the animation on the group or embedded graphic is executed. The interactive animations within the group or embedded graphic never execute.
	Category: Runtime Behavior
	Used by: Group, Embedded Symbol
	Can be read by script at run time: Yes
	Info: <a href="#">Editing the Embedded Graphic</a>
Visible	Purpose: Determines the visibility of the element. This property is configured at design time and used only at runtime. At design time all elements are visible irrespective of this setting.  Category: Runtime Behavior  Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol  Can be read by script at run time: Yes  Info: <a href="#">Changing the Visibility of Elements</a>

## Switching Languages for Graphic Elements

This section describes how to switch the language shown for Industrial Graphics, the effects of different language settings on an individual industrial graphic, and language switching behaviors for certain features, such as embedded graphics, custom properties, and string substitution.

The language settings configured in Plant SCADA Studio control which languages are available to graphics (see [Configure Languages for Industrial Graphics Applications](#)). You cannot add a language at the graphic level.

Using the Industrial Graphic Editor, you select which of the configured languages you want to show for your graphic. By default, text for the graphic is shown in the default language and font specified in Plant SCADA Studio.

## In This Chapter

- [Selecting a Language for a Graphic](#)
- [Removing a Language from a Graphic](#)
- [Creating Elements When Multiple Languages are Defined](#)
- [How Fonts are Applied at Design Time](#)
- [Language Switching for Embedded Graphics](#)
- [String Substitutions and Language Switching](#)
- [Translating String Custom Properties](#)
- [Support for Empty Strings](#)
- [Language Switching Example](#)
- [Overriding Translated Strings for Industrial Graphics](#)
- [Language Switching at Run Time](#)

### Selecting a Language for a Graphic

When you select a language for a graphic, all graphic elements show the translated text associated with the selected language, if it is available. You can switch languages even if you open the graphic in read-only mode.

You can only select languages that are currently configured in Plant SCADA Studio.

---

**Note:** The current Element Style assigned to a text font does not change when you switch to a different language.

---

#### To select the language for a graphic

1. Open the graphic in the Industrial Graphic Editor.
2. In the **Languages** panel, select the language from the list.

### Related Topics

[Switching Languages for Graphic Elements](#)

### Removing a Language from a Graphic

If you remove a language from Plant SCADA Studio, the language is still available for a graphic until you specifically remove it.

You cannot remove a language from a graphic if the language is configured at the HMI/SCADA product level.

#### To remove the language for a graphic

1. Open the graphic in the Industrial Graphic Editor.
2. On the **Special** menu, point to **Configure** and then click **Locales**. The **Configure Languages** dialog box appears.
3. Select the language to remove and click **Remove**.
4. Click **OK**.

## Related Topics

[Switching Languages for Graphic Elements](#)

### Creating Elements When Multiple Languages are Defined

You must select the default language for your HMI/SCADA product before you create a new graphic element. You cannot create an element if you have a secondary language selected in the Industrial Graphic Editor. This includes:

- Duplicating an element
- Pasting an element
- Embedding a graphic
- Grouping or ungrouping elements
- Combining paths
- Breaking paths
- Convert a graphic to a group

## Related Topics

[Switching Languages for Graphic Elements](#)

### How Fonts are Applied at Design Time

When you create a graphic element that supports visible text, it is created in the default language of your HMI/SCADA product. The font used is the last font persisted in the editor. However, if you provide a specific translation for an element in a secondary language, the configured font for the language is applied to the element.

For example:

1. You configure three languages: English (Default, Font = Arial), French (Font = Courier New) and German (Font = Times New Roman).
2. You open a graphic S1 in the English language. The editor default is Arial. You create a textbox in English. It is created with the Arial font.
3. You switch to German and translate the text. The font changes to Times New Roman, which is the font configured for German. The original font size and style remains the same.
4. You switch to French. The font is Arial because the text in French is not translated yet.

## Related Topics

[Switching Languages for Graphic Elements](#)

## Language Switching for Embedded Graphics

When you embed a graphic into another graphic, any translations are also loaded for the embedded graphic. Switching the language for a graphic also switches the language for all embedded graphics.

For example, a graphic G1 contains a text graphic with the text "English String." English is the default language. The text is set to "French String" for the French language. The following steps describe language switching for the embedded graphic:

1. You embed the graphic G1 into the graphic G2.  
You see the text showing the "English String."
2. You switch the language to French in the editor of G2.  
The text in the embedded graphic G1 switches to "French String."

If you convert an embedded graphic to a group, any translations defined for the embedded graphic are migrated to the new elements created in the graphic. If the embedded graphic supports languages that are not defined in the base graphic, those translations are removed during the conversion.

If you open a graphic containing one or more embedded graphics and the current language of the Industrial Graphic Editor is not available in the embedded graphics, then the embedded graphic uses the configured default language, if available. If the configured default language configured in your application, is not available, then the embedded graphics use the last saved default language of that graphic.

For example:

1. You create graphic S1 with French and German languages. The default language for your HMI/SCADA application is German.
2. You embed G1 inside G2 and then save and close G2.
3. You change the default application language to French.
4. You add English as another language.

If you open the graphic G2 in the English language, then the graphic G1 is shown using the French text. This is because French is the default language configured in the application.

Embedded graphics support translations for custom properties. For more information on translating custom properties, see [Translating String Custom Properties](#).

Embedded graphics also support translations for string substitutions. For more information on translation and string substitutions, see [String Substitutions and Language Switching](#).

## Related Topics

[Switching Languages for Graphic Elements](#)

## String Substitutions and Language Switching

You can substitute strings for textual elements within a graphic. For general information about string substitution, see [Substituting Strings](#).

If you perform a first-time string substitution on an embedded graphic in the primary language, that substitution is shown in the secondary languages. You can then perform a substitution in the secondary language to create a

string substitution specific to the secondary language.

If you perform a first-time string substitution on an embedded graphic in a secondary language, the substitution is also applied to the primary language, because the translated string that previously existed for the primary language is no longer valid. Because the primary language value is changed in the graphic, this string applies to all secondary languages configured. You can then perform a second substitution in the primary language, which will apply to all secondary languages except the ones that have had a specific substitution set.

If you perform a string substitution in a secondary language with an existing string substitution in the primary language, the new substitution is applied to the secondary language only.

The following design time and run-time rules are applied during a language switch to properly update an embedded graphic with the current substitutions for the language:

- Apply the string substitutions from the default language.
- Apply the string substitutions from the secondary language, if switching to a secondary language.

For example, an embedded graphic contains a text graphic with the text "English String." English is the default language. The following steps describe how changing the language affects string substitution for the embedded graphic:

1. While editing in the default language, you select an embedded graphic and open the string substitution dialog box.
2. You can see the old column with a value of "English String."
3. You replace the "English String" with "New English String."
4. You close the string substitution dialog box.
5. You switch to the French language.
6. You open the string substitution dialog box and see the string "New English String" in the old column.
7. You now replace the "New English String" with "New French String."
8. You close the string substitution dialog box.
9. You switch to the German language.
10. You open the string substitution dialog box and see the string "New English String" in the old column.
11. You now replace the "New English String" with "New German String."
12. You close the string substitution dialog box.
13. You switch to the French language.
14. You open the string substitution dialog box and see the string "New French String" in the old column.

If you select an alternate graphic, the string substitutions made on the initial graphic are reapplied to the new graphic across all languages.

## Related Topics

[Switching Languages for Graphic Elements](#)

## Translating String Custom Properties

You can translate custom properties that are defined as static strings.

If the custom property is configured with a reference, then that reference applies across all languages in the graphic. If you change that reference in any language to a static string, that string is set for all languages, and you can provide specific translations in the other languages.

For example, you create a custom property CP1 of type string with a default value of "Hello." You can now translate this custom property. You switch to another language in the editor and modify the default value of CP1 to UD1.str1 (changed from string to reference). Now CP1 cannot be translated. If you go back and change CP1 from a reference to a string, you can translate it again. The value you place in the default value is the value shown for all other languages if you do not specify a different string in that language.

When the custom property dialog box opens, it shows the appropriate translated values for the constant string custom properties, as determined by the translation precedence rules. For more information on these rules, see Precedence Rules for Showing the Language and Font.

## Related Topics

[Switching Languages for Graphic Elements](#)

## Support for Empty Strings

You cannot substitute an empty string in the primary locale. Use space characters. When you set an empty string for a primary locale, the empty string is propagated to all other locales that do not have translations.

Performing a first time substitution of an empty string in a secondary locale puts a space character in the primary and the current locale. The remaining locales will match the primary value if they do not already have a specific value.

If a primary locale contains an empty string, it will be exported for translation.

If you substitute an empty string for a secondary locale, the element shows as empty. However, if you switch to the primary locale and then back to the secondary locale, the element shows the primary string substitution again.

## Language Switching Example

The following table describes the effects of language switching on the various parts of the system. In this example:

- The application is configured with two languages: English and French.
- The default language is English.
- There are several graphics, some of which contain partial or mismatched language configurations compared to your HMI/SCADA product's configured languages.

Action	Effect on the Languages Configured for the Graphic	Effect on Elements that contain English Translations	Effect on Elements that contain French Translations
You open a new graphic.	English language is added to the graphic.	None	None
You open an existing graphic that only has English defined.	None	None	None
You open an existing graphic that only has the French language defined.	English language is added to the graphic.	French strings are transferred into the English language.	French strings are marked as specific translations for French.
You open an existing graphic that only has the German language defined.	English language is added to the graphic.	German strings are transferred into the English language. German strings are marked as specific translations for German.	None
You change a text string in the English language.	None	New string is set for the English language.	None
You switch to the French language for the first time in a graphic that only had the English language.	French language is added to the graphic.	None	The default language strings are shown unless a specific French translation exists.
You change a string while viewing the French language.	None	None	The new string is set as the specific translation for the French language and used for display.
You create a new text element in a graphic that has English only while viewing the English language.	None	The new element's string value is saved for translation.	None
You delete an element with translations in English and French.	None	English translations are removed.	French translations are removed.
You copy animations from an element.	None	English animation translation strings are put into the clipboard.	French animation translation strings are put into the clipboard.
You paste animations to	None	English animation	French animation

an element.		translation strings are put into the destination animations.	translation strings are put into the destination animations.
You clear animations for an element.	None	English animation strings are removed.	French animation strings are removed.
You copy and paste elements from a German-only graphic into a graphic containing English and French.	None	German strings are placed in the English language.	None
You copy and paste elements from an English and German graphic into a symbol containing English and French.	None	English strings from the source graphic are copied during the paste. The German strings are dropped.	None
You export the French language, having never switched to the French language.	The French language is added to the graphic for the purposes of the export. The language is not saved back to the graphic during the export.	English strings are exported in the "Phrase" XML attribute field.	If specific strings exist for French, they are exported in the "Translation" XML field.
You import the French language.	The French language is added.	None	Any translations provided in the import are marked as specific translations for the French language. If the translation is empty, the default language value is shown.
You convert a graphic to a group.	Same logic as copy/paste.	Same logic as copy/paste.	Same logic as copy/paste.
You delete the German language.	German is removed.	None	None

## Windows Common Control List Methods

You can use the methods of the Windows common controls to manipulate the controls at run time by using them in scripting.

The following table contains a list of methods you can use in scripting to:

- Load and save the contents of the Edit Box control from and to a file.
- Manipulate items in the lists of the List Box control and Combo Box control.
- Manipulate items in the lists of the List Box control and Combo Box control.

Method	Purpose, syntax and information
AddItem	<b>Purpose:</b> Add an item (coerced to String) to the list. If the list is sorted, then the new item is inserted at the right position and selected. If the list is unsorted, the item is added to the bottom of the list. <b>Used by:</b> Combo Box, List Box <b>Note:</b> This function does not work when using an Enum or Array to populate the List Box. <b>Syntax:</b> ControlName.AddItem(CaptionString); <b>Info:</b> <a href="#">Adding and Inserting Items into a List</a>
Clear	<b>Purpose:</b> Removes all items from the List. If the list is bound, it clears the bound reference (array or enum). <b>Note:</b> This function does not work when using an Enum or Array to populate the List Box. <b>Used by:</b> Combo Box, List Box

Method	Purpose, syntax and information
	<p><b>Syntax:</b> ControlName.Clear();</p> <p><b>Info:</b> <a href="#">Deleting Items from a List</a></p>
DeleteItem	<p><b>Purpose:</b> Accepts an index as a parameter and removes that item from the list. The first item in the list has an index of 0.</p> <p><b>Used by:</b> Combo Box, List Box</p> <p><b>Syntax:</b> ControlName.DeleteItem(Index);</p> <p><b>Info:</b> <a href="#">Deleting Items from a List</a></p>
DeleteSelection	<p><b>Purpose:</b> Delete the currently selected item from the list.</p> <p><b>Used by:</b> Combo Box, List Box</p> <p><b>Syntax:</b> ControlName.DeleteSelection();</p> <p><b>Info:</b> <a href="#">Deleting Items from a List</a></p>
FindItem	<p><b>Purpose:</b> Accepts a string as a parameter and returns the index of the first item that matches the string. The first item in the list has an index of 0.</p> <p><b>Used by:</b> Combo Box, List Box</p> <p><b>Syntax:</b> ControlName.FindItem(SearchString);</p> <p><b>Info:</b> <a href="#">Finding an Item in a List</a></p>
GetItem	<p><b>Purpose:</b> Returns the item associated with an index supplied as a parameter to this function. The first item in the list has an index of 0.</p> <p><b>Used by:</b> Combo Box, List Box</p> <p><b>Syntax:</b> ItemCaption = ControlName.GetItem(Index);</p> <p><b>Info:</b> <a href="#">Reading the Caption of a Selected Item in a List</a></p>
InsertItem	<p><b>Purpose:</b> Inserts the supplied string after the current selection in the List. Does not work if list is sorted.</p> <p><b>Used by:</b> Combo Box, List Box</p> <p><b>Syntax:</b> ControlName.InsertItem(String);</p> <p><b>Info:</b> <a href="#">Adding and Inserting Items into a List</a></p>
SetItemData	<p><b>Purpose:</b> Associates a value with an item in the list which index is provided to the function. The first item in the list has an index of 0.</p> <p><b>Note:</b> This function only works when UseValuesAsItems is set to false. It does not work when using an Enum or Array to populate the List Box control.</p>

Method	Purpose, syntax and information
	<p><b>Used by:</b> Combo Box, List Box</p> <p><b>Syntax:</b> ControlName.SetItemData(Index,Value);</p> <p><b>Info:</b> <a href="#">Associating Items with Values in a List</a></p>
GetItemData	<p><b>Purpose:</b> Returns the value associated with the item in the list which index is supplied to the function. The first item in the list has an index of 0.</p> <p><b>Note:</b> This function only works when UseValuesAsItems is set to false. It does not work when using an Enum or Array to populate the List Box control.</p> <p><b>Used by:</b> Combo Box, List Box</p> <p><b>Syntax:</b> Value = ControlName.GetItemData(Index);</p> <p><b>Info:</b> <a href="#">Associating Items with Values in a List</a></p>
LoadList	<p><b>Purpose:</b> Loads a list of strings from a file which name is passed as parameter to the function. The default location for files is the users folder, for example: c:\documents and settings\username.</p> <p><b>Note:</b> The LoadList method does not work when using an Enum or Array to populate the List Box control.</p> <p><b>Used by:</b> Combo Box, List Box</p> <p><b>Syntax:</b> ControlName.LoadList(FileName);</p> <p><b>Info:</b> <a href="#">Loading and Saving Item Lists</a></p>
LoadText	<p><b>Purpose:</b> Loads a text from a file into the Edit Box control. The default location for files is the users folder, for example: c:\documents and settings\username.</p> <p><b>Used by:</b> Edit Box</p> <p><b>Syntax:</b> ControlName.LoadText(FileName);</p> <p><b>Info:</b> <a href="#">Configuring Edit Box Methods</a></p>
SaveList	<p><b>Purpose:</b> Save a list to a file which name is passed as parameter to the function. The default location for files is the users folder, for example: c:\documents and settings\username.</p> <p><b>Used by:</b> Combo Box, List Box</p> <p><b>Syntax:</b> ControlName.SaveList(FileName);</p> <p><b>Info:</b> <a href="#">Loading and Saving Item Lists</a></p>
SaveText	<p><b>Purpose:</b> Saves the current text in the Edit Box control to a file. The default location for files is the users</p>

Method	Purpose, syntax and information
	folder, for example: c:\documents and settings\username. <b>Used by:</b> Edit Box <b>Syntax:</b> ControlName.SaveText(FileName); <b>Info:</b> <a href="#">Configuring Edit Box Methods</a>

[GetCPQuality\(\)](#)

[GetCPTimeStamp\(\)](#)

[HideSelf\(\)](#)

# GetCPQuality()

Returns the Quality value of a custom property. This function is available within any Industrial Graphics client script, but may not be supported by your HMI. For more information, consult your HMI documentation.

## Syntax

```
Int GetCPQuality(String name)
```

Where *String name* is the name of the custom property whose quality is to be retrieved.

This script function takes the name of a custom property on the symbol. This argument is of type string and it can be a reference or a constant.

If the custom property is type constant, GOOD is the quality always returned.

---

**Note:** For use with custom properties only. It does not apply to HMI tags.

---

## Return Value

The GetCPQuality() script function returns a value 0-255 of type Integer, as per the OPC quality standard. 192 is GOOD.

Example

```
cp2 = GetCPQuality("cp1");
```

Where cp1 and cp2 are custom properties and the data type of cp2 is Integer.

## Related Topics

[Graphic Client Functions](#)

# GetCPTimeStamp()

Returns the time stamp of a custom property. This function is available within any Industrial Graphics client

script.

## Syntax

```
DateTime GetCPTimeStamp(String name)
```

Where *String name* is the name of the custom property whose time stamp is to be retrieved.

This script function takes the name of a custom property on the symbol. This argument is of type string and it can be a reference or a constant.

**Note:** For use with custom properties only. It does not apply to HMI tags.

## Return Value

The GetCPTimeStamp() script function returns the time stamp of the custom property's current value of type DateTime. If the custom property value is a constant, then the return value is the time the value was created.

Example

```
cp2 = GetCPTimeStamp("cp1");
```

Where cp1 and cp2 are custom properties and the data type of cp2 is DateTime.

# HideSelf()

Closes the displayed graphic or layout for which this script is configured. This script function is available within any Industrial Graphics client script.

## Category

Graphic Client

## Syntax

```
HideSelf();
```

## Remarks

For an Industrial Graphics script, call the script function within the symbol to hide the popup.

## Example

```
HideSelf();
```

## Related Topics

### Math Functions

Use math functions to return the answer to the specified mathematical expression.

In QuickScript, all mathematical operations are calculated internally as double, regardless of the operand data type. Following standard mathematical rules, the result is always rounded in division operations to maintain accuracy. Rounding only occurs on the end result, not intermediate values, and the quotient will match the target data type. This is the standard methodology for SCADA and DCS systems, and provides the data integrity, precision retention, time stamps, and overall data quality propagation and aggregation needed for these systems.

If you want to round at each step instead of only at the final result, you can leverage the support built into QuickScript for .NET libraries and utilize the System.Math.Floor and System.Math.Round methods to explicitly round the intermediate steps. As an example, consider the following script:

```
dim dividend as integer;
dim divisor as integer;
dim quotient as integer;
dim remainder as integer;
dividend = 8;
divisor = 3;
LogMessage("Value of dividend = " + dividend);
LogMessage("Value of divisor = " + divisor);
    quotient = dividend/divisor;
LogMessage("Value of quotient = " + quotient);
remainder = dividend mod divisor;
LogMessage ("Value of remainder = " + remainder);
dividend = divisor*quotient +remainder;
LogMessage ("Value of dividend = " + dividend);
```

The result is: 8 / 3 = 3

If, instead, you want to drop the remainder (not rounding the final result to the nearest integer), you could add a call to the Math.Floor method and use the following:

```
dim dividend as integer;
dim divisor as integer;
dim quotient as integer;
dim remainder as integer;
dividend = 8;
divisor = 3;
LogMessage("Value of dividend = " + dividend);
LogMessage("Value of divisor = " + divisor);
// *** Add call to Math.Floor. This drops the remainder rather than rounding the internal
Double result to integer
    quotient = System.Math.Floor(dividend/divisor);
LogMessage("Value of quotient = " + quotient);
remainder = dividend mod divisor;
LogMessage ("Value of remainder = " + remainder);
dividend = divisor*quotient +remainder;
LogMessage ("Value of dividend = " + dividend);
```

The result is: 8 / 3 = 2 (remainder 2)

# Abs()

Returns the absolute value (unsigned equivalent) of a specified number.

## Category

Math

## Syntax

```
Result = Abs( Number );
```

## Parameter

*Number*

Any number or numeric equipment.item.

## Examples

```
Abs(14); ' returns 14
```

```
Abs(-7.5); ' returns 7.5
```

## Related Topics

[Math Functions](#)

# ArcCos()

Returns an angle between 0 and 180 degrees whose cosine is equal to the number specified.

## Category

Math

## Syntax

```
Result = ArcCos( Number );
```

## Parameter

*Number*

Any number or numeric equipment.item with a value between -1 and 1 (inclusive).

## Examples

```
ArcCos(1); ' returns 0
ArcCos(-1); ' returns 180
```

# ArcSin()

Returns an angle between -90 and 90 degrees whose sine is equal to the number specified.

## Category

Math

## Syntax

```
Result = ArcSin( Number );
```

## Parameter

*Number*

Any number or numeric equipment.item with a value between -1 and 1 (inclusive).

## Examples

```
ArcSin(1); ' returns 90  
ArcSin(-1); ' returns -90
```

# ArcTan()

Returns an angle between -90 and 90 degrees whose tangent is equal to the number specified.

## Category

Math

## Syntax

```
Result = ArcTan( Number );
```

## Parameter

*Number*

Any number or numeric equipment.item.

## Examples

```
ArcTan(1); ' returns 45  
ArcTan(0); ' returns 0
```

## See Also

[Cos\(\)](#), [Sin\(\)](#), [Tan\(\)](#), [ArcCos\(\)](#), [ArcSin\(\)](#)

# Cos()

Returns the cosine of an angle in degrees.

## Category

Math

## Syntax

```
Result = Cos( Number );
```

## Parameter

*Number*

Any number or numeric equipment.item.

## Examples

```
Cos(90); ' returns 0  
Cos(0); ' returns 1
```

This example shows how to use the function in a math equation:

```
Wave = 50 * Cos(6 * Now().Second);
```

# Exp()

Returns the result of the exponent  $e$  raised to a power.

## Category

Math

## Syntax

```
Result = Exp( Number );
```

## Parameter

*Number*

Any number or numeric equipment.item.

## Example

```
Exp(1); ' returns 2.718...
```

## Related Topics

[Math Functions](#)

# Int()

Returns the next integer less than or equal to a specified number.

## Category

Math

## Syntax

```
IntegerResult = Int( Number );
```

## Parameter

*Number*

Any number or numeric equipment.item.

## Remarks

When handling negative real (float) numbers, this function returns the integer farthest from zero.

## Examples

```
Int(4.7); ' returns 4
Int(-4.7); ' returns -5
```

## Related Topics

[Math Functions](#)

# Log()

Returns the natural log (base e) of a number.

## Category

Math

## Syntax

```
RealResult = Log( Number );
```

## Parameter

*Number*

Any number or numeric equipment.item.

## Remarks

Natural log of 0 is undefined.

## Examples

```
Log(100); ' returns 4.605...
Log(1); ' returns 0
```

[Math Functions](#)

# LogN()

Returns the values of the logarithm of x to base n.

## Category

Math

## Syntax

```
Result = LogN( Number, Base );
```

## Parameters

### Number

Any number or numeric equipment.item.

### Base

Integer to set log base. You could also specify an integer equipment.item.

## Remarks

Base 1 is undefined.

## Examples

```
LogN(8, 3); ' returns 1.89279  
LogN(3, 7); ' returns 0.564
```

## See Also

## Syntax

```
RealResult = Pi();
```

## Example

```
Pi(); ' returns 3.1415926
```

## Related Topics

[Math Functions](#)

# Round()

Rounds a real number to a specified precision and returns the result.

## Category

Math

## Syntax

```
RealResult = Round( Number, Precision );
```

## Parameters

*Number*

Any number or numeric equipment.item.

*Precision*

Sets the precision to which the number is rounded. This value can be any number or a numeric equipment.item.

## Examples

```
Round(4.3, 1); ' returns 4
Round(4.3, .01); ' returns 4.30
Round(4.5, 1); ' returns 5
Round(-4.5, 1); ' returns -4
Round(106, 5); ' returns 105
Round(43.7, .5); ' returns 43.5
```

## See Also

[Trunc\(\)](#)

[Math Functions](#)

# Sgn()

Determines the sign of a value (whether it is positive, zero, or negative) and returns the result.

## Category

Math

## Syntax

```
IntegerResult = Sgn( Number );
```

## Parameter

*Number*

Any number or numeric equipment.item.

## Return Value

If the input number is positive, the result is 1. Negative numbers return a -1, and 0 returns a 0.

## Examples

```
Sgn(425); ' returns 1;  
Sgn(0); ' returns 0;  
Sgn(-37.3); ' returns -1;
```

## Related Topics

[Math Functions](#)

# Sin()

Returns the sine of an angle in degrees.

## Category

Math

## Syntax

```
Result = Sin( Number );
```

## Parameter

*Number*

Angle in degrees. Any number or numeric equipment.item.

## Examples

```
Sin(90); ' returns 1;  
Sin(0); ' returns 0;
```

This example shows how to use the function in a math expression:

```
wave = 100 * Sin (6 * Now().Second);
```

## See Also

[Math Functions](#)

# Sqrt()

Returns the square root of a number.

## Category

Math

## Syntax

```
RealResult = Sqrt( Number );
```

## Parameter

*Number*

Any number or numeric equipment.item.

## Example

This example takes the value of me.PV and returns the square root as the value of x:

```
x=Sqrt(me.PV);
```

## Related Topics

[Math Functions](#)

# Tan()

Returns the tangent of an angle given in degrees.

## Category

Math

## Syntax

```
Result = Tan( Number );
```

## Parameter

*Number*

The angle in degrees. Any number or numeric equipment.item.

## Examples

```
Tan(45); ' returns 1;  
Tan(0); ' returns 0;
```

This example shows how to use the function in a math expression:

```
Wave = 10 + 50 * Tan(6 * Now().Second);
```

## Related Topics

[Math Functions](#)

# Trunc()

Truncates a real (floating point) number by simply eliminating the portion to the right of the decimal point, including the decimal point, and returns the result.

## Category

Math

## Syntax

```
NumericResult = Trunc( Number );
```

## Parameter

*Number*

Any number or numeric equipment.item.

## Remarks

This function accomplishes the same result as placing the contents of a float type equipment.item into an integer type equipment.item.

## Examples

```
Trunc(4.3); ' returns 4;  
Trunc(-4.3); ' returns -4;
```

## See Also

## DateTimeGMT()

Returns a number representing the number of days and fractions of days since January 1, 1970, in Coordinated Universal Time (UTC), regardless of the local time zone.

### Category

Miscellaneous

### Syntax

```
Result=DateTimeGMT();
```

### Parameters

None

### Example

```
MessageTag = StringFromTime(DateTimeGMT() * 86400.0, 3);
```

### Related Topics

[Miscellaneous Functions](#)

## IsBad()

Returns a Boolean value indicating if the quality of the specified equipment.item is Bad.

### Category

Miscellaneous

### Syntax

```
BooleanResult = IsBad( equipmentitem1, equipmentitem2, ... );
```

### Parameter(s)

*equipment.item1, equipment.item2, ...equipment.itemN*

Names of one or more equipment.items for which you want to determine Bad quality. You can include a variable-length list of equipment.items.

## Return Value

If any of the specified equipment.items has Bad quality, then true is returned. Otherwise, false is returned.

## Examples

```
IsBad(TIC101.PV);  
IsBad(TIC101.PV, PIC102.PV);
```

# IsGood()

Returns a Boolean value indicating if the quality of the specified equipment.item is Good.

## Category

Miscellaneous

## Syntax

```
BooleanResult = IsGood( equipment.item1, equipment.item2, ... );
```

## Parameter(s)

*equipment.item1, equipment.item2, and so on*

Name of the equipment.item(s) for which you want to determine Good quality. You can include a variable-length list of equipment.items.

## Return Value

If all of the specified equipment.items have Good quality, then true is returned. Otherwise, false is returned.

## Examples

```
IsGood(TIC101.PV);  
IsGood(TIC101.PV, PIC102.PV);
```

## See Also

[IsBad\(\)](#), [IsInitializing\(\)](#), [IsUsable\(\)](#)

## Related Topics

[Miscellaneous Functions](#)

# IsInitializing()

Returns a Boolean value indicating if the quality of the specified equipment.item is Initializing.

## Category

Miscellaneous

## Syntax

```
BooleanResult = IsInitializing( equipment.item1, equipment.item2, ... );
```

## Parameter(s)

*equipment.item1, equipment.item2, and so on*

Name of the equipment.item(s) for which to determine Initializing quality. You can include a variable-length list of equipment.items.

## Return Value

If any of the specified equipment.items has Initializing quality, then true is returned. Otherwise, false is returned.

## Examples

```
IsInitializing(TIC101.PV);  
IsInitializing(TIC101.PV, PIC102.PV);
```

## See Also

## Related Topics

[Miscellaneous Functions](#)

# IsUncertain()

Returns a Boolean value indicating if the quality of the specified equipment.item is Uncertain.

## Category

Miscellaneous

## Syntax

```
BooleanResult = IsUncertain( equipment.item1, equipment.item2, ... );
```

## Parameter(s)

*equipment.item1, equipment.item2, and so on*

Name of the equipment.item(s) to determine Uncertain quality. You can include a variable-length list of equipment.items.

## Return Value

If all of the specified equipment.items have Uncertain quality, then true is returned. Otherwise, false is returned.

## Examples

```
IsUncertain(TIC101.PV);  
IsUncertain(TIC101.PV, PIC102.PV);
```

## See Also

[IsBad\(\)](#), [IsGood\(\)](#), [IsInitializing\(\)](#), [IsUsable\(\)](#)

## Related Topics

[Miscellaneous Functions](#)

# IsUsable()

Returns a Boolean value indicating if the specified equipment.item is usable for calculations.

## Category

Miscellaneous

## Syntax

```
BooleanResult = IsUsable( equipment.item1, equipment.item2, ... );
```

## Parameter(s)

*equipment.item1, equipment.item2, ...equipment.itemN*

Name of one or more equipment.items for which you want to determine unusable quality. You can include a variable-length list of equipment.items.

## Return Value

If all of the specified equipment.items have either Good or Uncertain quality, then true is returned. Otherwise, false is returned.

## Remarks

The attributes having Good or Uncertain quality qualifies as usable. In addition, each float or double equipment.item cannot be a NaN (not a number).

## Examples

```
IsUsable(TIC101.PV);  
IsUsable(TIC101.PV, PIC102.PV);
```

## See Also

[IsBad\(\)](#), [IsGood\(\)](#), [IsInitializing\(\)](#), [IsUncertain\(\)](#)

## Related Topics

[Miscellaneous Functions](#)

# LogCustom()

Writes a user-defined custom flag message in the [Log Viewer](#).

## Category

Miscellaneous

## Syntax

```
LogCustom( CustomFlag, msg );
```

## Parameter

*CustomFlag*

Creates a new log flag based on the first parameter string. The first call creates the custom flag.

*msg*

The message to write to the Log Viewer. Actual string or a string equipment.item.

## Remarks

The log flag is disabled by default.

The message is always logged under the component "ObjectName.ScriptName". For example, "WinPlatform\_001.script1: msg", which identifies what object and what script within the object logged the error.

LogCustom() is similar to LogMessage(), but displays the message in the custom log flag when Log Custom is enabled.

The parameter help tooltip and Function Browser sample parameter list will show "LogCustom( CustomFlag, msg )" rather than "LogCustom( CustomFlag, Message )". "Message" is a reserved keyword.

## Example

```
LogCustom(EditBox1.text, "User-defined message.");
```

This statement writes to the Log Viewer as follows:

```
10/24/2005 12:49:14 PM ScriptRuntime
<ObjectName.ScriptName>: <LogFlag EditBox1> User-defined message.
```

## Related Topics

[Miscellaneous Functions](#)

# LogDataChangeEvent()

Logs an application change event to the application Historian.

---

**Note:** The LogDataChangeEvent() function works only in object scripts, not in symbol scripts.

---

## Category

Miscellaneous

## Syntax

```
LogDataChangeEvent(EquipmentitemName, Description, OldValue, NewValue, TimeStamp);
```

## Parameters

*EquipmentitemName*

Equipment.item name as a tag name.

*Description*

Description of the object.

*OldValue*

Old value of the equipment.item.

*NewValue*

New value of the equipment.item.

*TimeStamp*

The time stamp associated with the logged event. The timestamp can be UTC or local time. The TimeStamp parameter is optional. The timestamp of the logged event defaults to Now() if a TimeStamp parameter is not included.

## Remarks

A symbol script still compiles if the LogDataChangeEvent() function is included. However, a warning message is written to the log at run time that the function is inoperable.

## Example

This example logs an event when a pump starts or stops with a timestamp of the current time when the event occurred.

```
LogDataChangeEvent(TC104.pumpstate, "Pump04", OldState, NewState);
```

## Related Topics

[Miscellaneous Functions](#)

# .LogError()

Writes a user-defined error message in the [Log Viewer](#) with a red error log flag.

## Category

Miscellaneous

## Syntax

```
.LogError( msg );
```

## Parameter

*msg*

The message to write to the Log Viewer. Actual string or a string equipment.item.

## Remarks

The log flag is enabled by default.

The message is always logged under the component "ObjectName.ScriptName". For example, "WinPlatform\_001.script1: msg", which identifies what object and what script within the object logged the error.

`.LogError()` is similar to `LogMessage()`, but displays the message in red.

The parameter help tooltip and Function Browser sample parameter list will show "LogError( msg )" rather than "LogError( Message )". "Message" is a reserved keyword.

## Example

```
.LogError("User-defined error message.");
```

This statement writes to the Log Viewer as follows:

```
10/24/2005 12:49:14 PM ScriptRuntime  
<ObjectName.ScriptName>: User-defined error message.
```

## Related Topics

[Miscellaneous Functions](#)

# LogMessage()

Writes a user-defined message to the [Log Viewer](#).

## Category

Miscellaneous

## Syntax

```
LogMessage( msg );
```

## Parameter

*msg*

The message to write to the Log Viewer. Actual string or a string equipment.item.

## Remarks

This is a very powerful function for troubleshooting scripting. By strategically placing LogMessage() functions in your scripts, you can determine the order of script execution, performance of scripts, and identify the value of equipment.items both before they are changed and after they are affected by the script.

Each message posted to the Log Viewer is stamped with the exact date and time. The message always begins with the component "Tagname.ScriptName" so you can tell what object and what script within the object posted the message to the log.

## Examples

```
LogMessage("Report Script is Running");
```

The above statement writes the following to the Log Viewer:

```
10/24/2005 12:49:14 PM ScriptRuntime <Tagname.ScriptName>:Report Script is Running.  
MyTag=MyTag + 10;  
LogMessage("The Value of MyTag is " + Text(MyTag, "#"));
```

## Related Topics

[Miscellaneous Functions](#)

# LogTrace()

Writes a user-defined trace message in the [Log Viewer](#).

## Category

Miscellaneous

## Syntax

```
LogTrace( msg );
```

## Parameter

*msg*

The message to write to the Log Viewer. Actual string or a string equipment.item.

## Remarks

The log flag is disabled by default.

The message is always logged under the component "ObjectName.ScriptName". For example, "WinPlatform\_001.script1: msg", which identifies what object and what script within the object logged the error.

LogTrace() is similar to LogMessage(), but displays the message as Trace when Log Trace is enabled.

The parameter help tooltip and Function Browser sample parameter list will show "LogTrace( msg )" rather than "LogTrace( Message )". "Message" is a reserved keyword.

## Example

```
LogTrace("User-defined trace message.");
```

This statement writes to the Log Viewer as follows:

```
10/24/2005 12:49:14 PM ScriptRuntime
<ObjectName.ScriptName>: User-defined trace message.
```

## Related Topics

[Miscellaneous Functions](#)

# LogWarning()

Writes a user-defined error message in the [Log Viewer](#) with a yellow warning log flag.

## Category

Miscellaneous

## Syntax

```
LogWarning( msg );
```

## Parameter

*msg*

The message to write to the Log Viewer. Actual string or a string equipment.item.

## Remarks

The log flag is disabled by default.

The message is always logged under the component "ObjectName.ScriptName". For example, "WinPlatform\_001.script1: msg", which identifies what object and what script within the object logged the error.

LogWarning() is similar to LogMessage(), but displays the message as a yellow warning message.

The parameter help tooltip and Function Browser sample parameter list will show "LogWarning( msg )" rather than "LogWarning( Message )". "Message" is a reserved keyword.

## Example

```
LogWarning("User-defined warning message.")
```

This statement writes to the Log Viewer as follows:

```
10/24/2005 12:49:14 PM ScriptRuntime
<ObjectName.ScriptName>: User-defined warning message.
```

[StringUpper\(\)](#)  
[Text\(\)](#)

## DText()

Returns one of two possible strings, depending on the value of the *Discrete* parameter.

### Category

String

### Syntax

```
StringResult = DText( Discrete, OnMsg, OffMsg );
```

### Parameters

*Discrete*

A Boolean value or Boolean equipment.item.

*OnMsg*

The message that is shown when the value of *Discrete* equals true.

*OffMsg*

The message shown when *Discrete* equals false.

### Example

```
StringResult = DText(me.temp > 150, "Too hot", "Just right");
```

### Related Topics

[String Functions](#)

## StringASCII()

Returns the ASCII value of the first character in a specified string.

### Category

String

## Syntax

```
IntegerResult = StringASCII( Char );
```

## Parameter

*Char*

Alphanumeric character or string or string equipment.item.

## Remarks

When this function is processed, only the single character is tested or affected. If the string provided to StringASCII contains more than one character, only the first character of the string is tested.

## Examples

```
StringASCII("A"); ' returns 65;  
StringASCII("A Mixer is Running"); ' returns 65;  
StringASCII("a mixer is running"); ' returns 97;
```

## See Also

[StringLower\(\)](#), [StringMid\(\)](#), [StringReplace\(\)](#), [StringSpace\(\)](#), [StringTest\(\)](#), [StringToIntg\(\)](#), [StringToReal\(\)](#), [StringTrim\(\)](#),  
[StringUpper\(\)](#), [Text\(\)](#)

## Related Topics

[String Functions](#)

# StringChar()

Returns the character corresponding to a specified ASCII code.

## Category

String

## Syntax

```
StringResult = StringChar( ASCII );
```

## Parameter

*ASCII*

ASCII code or an integer equipment.item.

## Remarks

Use the StringChar function to add ASCII characters not normally represented on the keyboard to a string equipment.item.

This function is also useful for SQL commands. The where expression sometimes requires double quotation marks around string values, so use StringChar(34).

## Example

In this example, a [Carriage Return (13)] and [Line Feed (10)] are added to the end of StringAttribute and passed to ControlString. Inserting characters out of the normal 32-126 range of displayable ASCII characters can be very useful for creating control codes for external devices such as printers or modems.

```
ControlString = StringAttribute+StringChar(13)+StringChar(10);
```

## Related Topics

[String Functions](#)

# StringCompare()

Compares a string value with another string.

## Category

String

## Syntax

```
StringCompare( Text1, Text2 );
```

## Parameters

*Text1*

First string in the comparison.

*Text2*

Second string in the comparison.

## Return Value

The return value is zero if the strings are identical, -1 if Text1's value is less than Text2, or 1 if Text1's value is greater than Text2.

## Example

```
Result = StringCompare ("Text1","Text2"); (or)
Result = StringCompare (MText1,MText2);
Where Result is an Integer or Real tag and MText1 and MText2 are Memory Message tags.
```

[String Functions](#)

# StringCompareNoCase()

C.compares a string value with another string and ignores the case.

## Category

String

## Syntax

```
SStringCompareNoCase( Text1, Text2 );
```

## Parameters

*Text1*

First string in the comparison.

*Text2*

Second string in the comparison.

## Return Value

The return value is zero if the strings are identical (ignoring case), -1 if Text1's value is less than Text2 (ignoring case), or 1 if Text1's value is greater than Text2 (ignoring case).

## Example

```
Result = StringCompareNoCase ("Text1","TEXT1"); (or)
Result = StringCompareNoCase (MText1,MText2);
Where Result is an Integer or Real tag and MText1 and MText2 are Memory Message tags.
```

## Related Topics

[String Functions](#)

# StringFromGMTTimeToLocal()

Converts a time value (in seconds since Jan-01-1970) to a particular string representation. This is the same as [StringFromTime\(\)\(\)](#).

## Category

String

## Syntax

```
MessageResult=StringFromGMTTimeToLocal(SecsSince1-1-70,StringType);
```

## Parameters

*SecsSince1-1-70*

Is converted to the *StringType* specified and the result is stored in *MessageResult*.

*StringType*

Determines the display method:

1 = Displays the date in the same format set from the windows control Panel. (Similar to that displayed for \$DateString.)

2 = Displays the time in the same format set from the Windows control Panel. (Similar to that displayed for \$TimeString.)

3 = Displays a 24-character string indicating both the date and time: "Wed Jan 02 02:03:55 1993"

4 = Displays the short form for the day of the week: "Wed"

5 = Displays the long form for the day of the week: "Wednesday"

## Remarks

Any adjustments necessary due to Daylight Savings Time are automatically applied to the return result. Therefore, it is not necessary to make any manual adjustments to the input value to convert to DST.

## Example

This example assumes that the time zone on the local node is Pacific Standard Time (UTC-0800). The UTC time passed to the function is 12:00:00 AM on Friday, 1/2/1970. Since PST is 8 hours behind UTC, the function will return the following results:

```
StringFromGMTTimeToLocal(86400, 1); ' returns "1/1/1970"  
StringFromGMTTimeToLocal(86400, 2); ' returns "04:00:00 PM"  
StringFromGMTTimeToLocal(86400, 3); ' returns "Thu Jan 01 16:00:00 1970"  
StringFromGMTTimeToLocal(86400, 4); ' returns "Thu"  
StringFromGMTTimeToLocal(86400, 5); ' returns "Thursday"
```

[String Functions](#)

# StringFromIntg()

Converts an integer value into its string representation in another base and returns the result.

## Category

String

## Syntax

```
SringResult = StringFromIntg( Number, numberBase );
```

## Parameters

*Number*

Number to convert. Any number or an integer equipment.item.

*numberBase*

Base to use in conversion. Any number or an integer equipment.item.

## Examples

```
StringFromIntg(26, 2); ' returns "11010"  
StringFromIntg(26, 8); ' returns "32"  
StringFromIntg(26, 16); ' returns "1A"
```

## Related Topics

[String Functions](#)

# StringFromReal()

Converts a real value into its string representation, either as a floating-point number or in exponential notation, and returns the result.

## Category

String

## Syntax

```
StringResult = StringFromReal( Number, Precision, Type );
```

## Parameters

*Number*

Converted to the Precision and Type specified. Any number or a float equipment.item.

*Precision*

Specifies how many decimal places is shown. Any number or an integer equipment.item.

*Type*

A string value that determines the display method. Possible values are:

f = Display in floating-point notation.

e = Display in exponential notation with a lowercase "e."

E = Display in exponential notation with an uppercase "E" followed by a plus sign and at least three exponential digits.

## Examples

```
StringFromReal(263.355, 2,"f"); ' returns "263.36";
StringFromReal(263.355, 2,"e"); ' returns "2.63e2";
StringFromReal(263.355, 2,"E"); ' returns "2.63 E+002";
```

## See Also

[StringUpper\(\)](#), [Text\(\)](#)

## Related Topics

[String Functions](#)

# StringFromTime()

Converts a time value (in seconds since January 1, 1970) into a particular string representation and returns the result.

## Category

String

## Syntax

```
StringResult = StringFromTime( SecsSince1-1-70, StringType );
```

## Parameters

*SecsSince1-1-70*

Converted to the *StringType* specified.

*StringType*

Determines the display method. Possible values are:

1 = Shows the date in the same format set from the Windows Control Panel.

2 = Shows the time in the same format set from the Windows Control Panel.

3 = Shows a 24-character string indicating both the date and time: "Wed Jan 02 02:03:55 1993"

4 = Shows the short form for a day of the week: "Wed"

5 = Shows the long form for a day of the week: "Wednesday"

## Remarks

The time value is UTC equivalent: number of elapsed seconds since January 1, 1970 GMT. The value returned reflects the local time.

## Examples

```
StringFromTime(86400, 1); ' returns "1/2/1970"  
StringFromTime(86400, 2); ' returns "12:00:00 AM"  
StringFromTime(86400, 3); ' returns "Fri Jan 02 00:00:00 1970"  
StringFromTime(86400, 4); ' returns "Fri"  
StringFromTime(86400, 5); ' returns "Friday"
```

# StringFromTimeLocal()

Converts a time value (in seconds since Jan-01-1970) into a particular string representation. The value returned also represents local time.

## Category

String

## Syntax

```
MessageResult=StringFromTimeLocal(SecsSince1-1-70, StringType);
```

## Parameters

*SecsSince1-1-70*

Is converted to the *StringType* specified and the result is stored in *MessageResult*.

*StringType*

Determines the display method:

1 = Displays the date in the same format set from the windows control Panel. (Similar to that displayed for \$DateString.)

2 = Displays the time in the same format set from the Windows control Panel. (Similar to that displayed for \$TimeString.)

3 = Displays a 24-character string indicating both the date and time: "Wed Jan 02 02:03:55 1993"

4 = Displays the short form for the day of the week: "Wed"

5 = Displays the long form for the day of the week: "Wednesday"

## Remarks

Any adjustments necessary due to Daylight Savings Time will automatically be applied to the return result. Therefore, it is not necessary to make any manual adjustments for DST to the input value.

## Example

```
StringFromTimeLocal (86400, 1); ' returns "1/2/1970"  
StringFromTimeLocal (86400, 2); ' returns "12:00:00 AM"  
StringFromTimeLocal (86400, 3); ' returns "Fri Jan 02 00:00:00 1970"  
StringFromTimeLocal (86400, 4); ' returns "Fri"  
StringFromTimeLocal (86400, 5); ' returns "Friday"
```

[String Functions](#)

# StringInString()

Returns the position in a string of text where a specified string first occurs.

## Category

String

## Syntax

*IntegerResult* = StringInString( *Text*, *SearchFor*, *StartPos*, *CaseSens* );

## Parameters

*Text*

The string that is searched. Actual string or a string equipment.item.

#### *SearchFor*

The string to be searched for. Actual string or a string equipment.item.

#### *StartPos*

Determines the position in the text where the search begins. Any number or an integer equipment.item.

#### *CaseSens*

Determines whether the search is case-sensitive.

0 = Not case-sensitive

1 = Case-sensitive

Any number or an integer equipment.item.

## Remarks

If multiple occurrences of *SearchFor* are found, the location of the first is returned.

## Examples

```
StringInString("The mixer is running", "mix", 1, 0) ' returns 5;
StringInString("Today is Thursday", "day", 1, 0) ' returns 3;
StringInString("Today is Thursday", "day", 10, 0) ' returns 15;
StringInString("Today is Veteran's Day", "Day", 1, 1) ' returns 20;
StringInString("Today is Veteran's Day", "Night", 1, 1) ' returns 0;
```

[String Functions](#)

# StringLeft()

Returns a specified number of characters in a string value, starting with the leftmost string character.

## Category

String

## Syntax

*StringResult* = StringLeft( *Text*, *Chars* );

## Parameters

*Text*

Actual string or a string equipment.item.

*Chars*

Number of characters to return or an integer equipment.item.

## Remarks

If *Chars* is set to 0, the entire string is returned.

## Examples

```
StringLeft("The Control Pump is On", 3) ' returns "The";
StringLeft("Pump 01 is On", 4) ' returns "Pump";
StringLeft("Pump 01 is On", 96) ' returns "Pump 01 is On";
StringLeft("The Control Pump is On", 0) ' returns "The Control Pump is On";
```

[StringLower\(\)](#), [StringMid\(\)](#), [StringReplace\(\)](#), [StringRight\(\)](#), [StringSpace\(\)](#), [StringTest\(\)](#), [StringToIntg\(\)](#),  
[StringToReal\(\)](#), [StringTrim\(\)](#), [StringUpper\(\)](#), [Text\(\)](#)

## Related Topics

[String Functions](#)

# StringLen()

Returns the number of characters in a string.

## Category

String

## Syntax

*IntegerResult* = StringLen( *Text* );

## Parameter

*Text*

Actual string or a string equipment.item.

## Remarks

All the characters in the string equipment.item are counted, including blank spaces and those not normally shown on the screen.

## Examples

```
StringLen("Twelve percent") ' returns 14;  
StringLen("12%") ' returns 3;  
StringLen("The end." + StringChar(13)) ' returns 9;
```

The carriage return character is ASCII 13.

## Related Topics

[String Functions](#)

# StringLower()

Converts all uppercase characters in text string to lowercase and returns the result.

## Category

String

## Syntax

```
StringResult = StringLower( Text );
```

## Parameter

*Text*

String to be converted to lowercase. Actual string or a string equipment.item.

## Remarks

Lowercase characters, symbols, numbers, and other special characters are not affected.

## Examples

```
StringLower("TURBINE") ' returns "turbine";
StringLower("22.2 Is The Value") ' returns "22.2 is the value";
```

## See Also

[StringASCII\(\)](#), [StringChar\(\)](#), [StringFromIntg\(\)](#), [StringFromReal\(\)](#), [StringFromTime\(\)](#), [StringInString\(\)](#), [StringLeft\(\)](#), [StringLen\(\)](#), [StringMid\(\)](#), [StringReplace\(\)](#), [StringRight\(\)](#), [StringTest\(\)](#), [StringToIntg\(\)](#), [StringToReal\(\)](#), [StringTrim\(\)](#), [StringUpper\(\)](#), [Text\(\)](#)

## Related Topics

[String Functions](#)

# StringMid()

Extracts a specific number of characters from a starting point within a string and returns the extracted character string as the result.

## Category

String

## Syntax

```
StringResult = StringMid( Text, StartChar, Chars );
```

## Parameters

*Text*

Actual string or a string equipment.item to extract a range of characters.

*StartChar*

The position of the first character within the string to extract. Any number or an integer equipment.item.

*Chars*

The number of characters within the string to return. Any number or an integer equipment.item.

## Remarks

This function is slightly different than the [StringLeft\(\)](#) function and [StringRight\(\)](#) function in that it allows you to specify both the start and end of the string that is to be extracted.

## Examples

```
StringMid("The Furnace is Overheating",5,7); ' returns "Furnace";
StringMid("The Furnace is Overheating",13,3); ' returns "is ";
StringMid("The Furnace is Overheating",16,50); ' returns "Overheating"
```

## See Also

[StringLower\(\)](#), [StringReplace\(\)](#), [StringSpace\(\)](#), [StringTest\(\)](#), [StringToIntg\(\)](#), [StringToReal\(\)](#), [StringTrim\(\)](#),  
[StringUpper\(\)](#), [Text\(\)](#)

## Related Topics

[String Functions](#)

# StringReplace()

Replaces or changes specific parts of a provided string and returns the result.

## Category

String

## Syntax

```
StringResult = StringReplace( Text, SearchFor, ReplaceWith, CaseSens, NumToReplace, MatchWholeWords );
```

## Parameters

### *Text*

The string in which characters, words, or phrases will be replaced. Actual string or a string equipment.item.

### *SearchFor*

The string to search for and replace. Actual string or a string equipment.item.

### *ReplaceWith*

The replacement string. Actual string or a string equipment.item.

### *CaseSens*

Determines whether the search is case-sensitive. (0=no and 1=yes) Any number or an integer equipment.item.

#### *NumToReplace*

Determines the number of occurrences to replace. Any number or an integer equipment.item. To indicate all occurrences, set this value to -1.

#### *MatchWholeWords*

Determines whether the function limits its replacement to whole words. (0=no and 1=yes) Any number or an integer equipment.item. If MatchWholeWords is turned on (set to 1) and the SearchFor is set to "and", the "and" in "handle" are not replaced. If the MatchWholeWords is turned off (set to 0), it is replaced.

## Remarks

Use this function to replace characters, words, or phrases within a string.

The StringReplace() function does not recognize special characters, such as @ # \$ % & \* ( ). It reads them as delimiters. For example, if the function StringReplace() (abc#,abc#,1234,0,1,1) is processed, there is no replacement. The # sign is read as a delimiter instead of a character.

## Examples

```
StringReplace("In From Within","In","Out",0,1,0) ' returns "Out From Within" (replaces only  
the first one);  
StringReplace("In From Within","In","Out",0,-1,0) ' returns "Out From without" (replaces  
all occurrences);  
StringReplace("In From Within","In","Out",1,-1,0) ' returns "Out From Within" (replaces all  
that match case);  
StringReplace("In From Within","In","Out",0,-1,1) ' returns "Out From Within" (replaces all  
that are whole words);
```

## Related Topics

[String Functions](#)

# StringRight()

Returns the specified number of characters starting at the right-most character of text.

## Category

String

## Syntax

```
StringResult = StringRight( Text, Chars );
```

## Parameters

*Text*

Actual string or a string equipment.item.

*Chars*

The number of characters to return or an integer equipment.item.

## Remarks

If *Chars* is set to 0, the entire string is returned.

## Examples

```
StringRight("The Pump is On", 2) ' returns "On";
StringRight("The Pump is On", 5) ' returns "is On";
StringRight("The Pump is On", 87) ' returns "The Pump is On";
StringRight("The Pump is On", 0) ' returns "The Pump is On";
```

[String Functions](#)

# StringSpace()

Generates a string of spaces either within a string equipment.item or within an expression and returns the result.

## Category

String

## Syntax

```
StringResult = StringSpace( NumSpaces );
```

## Parameter

### *NumSpaces*

Number of spaces to return. Any number or an integer equipment.item.

## Examples

```
All spaces are represented by the "x" character:  
StringSpace(4) ' returns "xxxx";  
"Pump" + StringSpace(1) + "Station" ' returns "PumpxStation";
```

## See Also

[StringASCII\(\)](#), [StringChar\(\)](#), [StringFromIntg\(\)](#), [StringFromReal\(\)](#), [StringFromTime\(\)](#), [StringInString\(\)](#), [StringLeft\(\)](#), [StringLen\(\)](#), [StringLower\(\)](#), [StringMid\(\)](#), [StringReplace\(\)](#), [StringTest\(\)](#), [StringToIntg\(\)](#), [StringToReal\(\)](#), [StringTrim\(\)](#), [StringUpper\(\)](#), [Text\(\)](#)

## Related Topics

[String Functions](#)

# StringTest()

Tests the first character of text to determine whether it is of a certain type and returns the result.

## Category

String

## Syntax

```
DiscreteResult = StringTest( Text, TestType );
```

## Parameters

### *Text*

String that function acts on. Actual string or a string equipment.item.

### *TestType*

Determines the type of test. Possible values are:

- 1 = Alphanumeric character ('A-Z', 'a-z' and '0-9')
- 2 = Numeric character ('0- 9')
- 3 = Alphabetic character ('A-Z' and 'a-z')
- 4 = Uppercase character ('A-Z')

- 5 = Lowercase character ('a'-'z')
- 6 = Punctuation character (0x21-0x2F)
- 7 = ASCII characters (0x00 - 0x7F)
- 8 = Hexadecimal characters ('A-F' or 'a-f' or '0-9')
- 9 = Printable character (0x20-0x7E)
- 10 = Control character (0x00-0x1F or 0x7F)
- 11 = White Space characters (0x09-0x0D or 0x20)

## Remarks

`StringTest()` function returns true to `DiscreteResult` if the first character in `Text` is of the type specified by `TestType`. Otherwise, false is returned. If the `StringTest()` function contains more than one character, only the first character of the `equipment.item` is tested.

## Examples

```
StringTest("ACB123",1)  ' returns 1;  
StringTest("ABC123",5)  ' returns 0;
```

## See Also

[StringASCII\(\)](#), [StringChar\(\)](#), [StringFromIntg\(\)](#), [StringFromReal\(\)](#), [StringFromTime\(\)](#), [StringInString\(\)](#), [StringLeft\(\)](#), [StringLen\(\)](#), [StringLower\(\)](#), [StringMid\(\)](#), [StringReplace\(\)](#), [StringSpace\(\)](#), [StringToIntg\(\)](#), [StringToReal\(\)](#), [StringTrim\(\)](#), [StringUpper\(\)](#), [Text\(\)](#)

## Related Topics

[String Functions](#)

# StringToIntg()

Converts the numeric value of a string to an integer value and returns the result.

## Category

String

## Syntax

```
IntegerResult = StringToIntg( Text );
```

## Parameter

*Text*

String that function acts on. Actual string or a string equipment.item.

## Remarks

When this statement is evaluated, the system reads the first character of the string for a numeric value. If the first character is other than a number, the string's value is equated to zero (0). Blank spaces are ignored. If the first character is a number, the system continues to read the subsequent characters until a non-numeric value is detected.

## Examples

```
StringToIntg("ABCD"); ' returns 0;
StringToIntg("22.2 is the Value"); ' returns 22 (since integers are whole numbers);
StringToIntg("The Value is 22"); ' returns 0;
```

## Related Topics

[String Functions](#)

# StringToReal()

Converts the numeric value of a string to a real (floating point) value and returns the result.

## Category

String

## Syntax

```
RealResult = StringToReal( Text );
```

## Parameter

*Text*

String that function acts on. Actual string or a string equipment.item.

## Remarks

When this statement is evaluated, the system reads the first character of the string for a numeric value. If the first character is other than a number (blank spaces are ignored), the string's value is equated to zero (0). If the first character is found to be a number, the system continues to read the subsequent characters until a non-numeric value is encountered.

## Examples

```
StringToReal("ABCD"); ' returns 0;
StringToReal("22.261 is the value"); ' returns 22.261;
StringToReal("The Value is 2"); ' returns 0;
```

[String Functions](#)

# StringTrim()

Removes unwanted spaces from text and returns the result.

## Category

String

## Syntax

```
StringResult = StringTrim( Text, TrimType );
```

## Parameter

*Text*

String that is trimmed of spaces. Actual string or a string equipment.item.

*TrimType*

Determines how the string is trimmed. Possible values are:

1 = Remove leading spaces to the left of the first non-space character

2 = Remove trailing spaces to the right of the last non-space character

3 = Remove all spaces except for single spaces between words

## Remarks

The text is searched for white-spaces (ASCII 0x09-0x0D or 0x20) that are to be removed. TrimType determines the method used by the function:

## Examples

All spaces are represented by the "x" character.

```
StringTrim("xxxxxThisxisxxxxtestxxxx", 1) ' returns "Thisxisxxxxtestxxxx";  
StringTrim("xxxxxThisxisxxxxtestxxxx", 2) ' returns "xxxxxThisxisxxxxtest";  
StringTrim("xxxxxThisxisxxxxtestxxxx", 3) ' returns "Thisxisxxxxtest";
```

The [StringReplace\(\)](#) function can remove ALL spaces from a specified a string equipment.item. Simply replace all the space characters with a "null."

# StringUpper()

Converts all lowercase text characters to uppercase and returns the result.

## Category

String

## Syntax

```
StringResult = StringUpper( Text );
```

## Parameter

*Text*

String to be converted to uppercase. Actual string or a string equipment.item.

## Remarks

Uppercase characters, symbols, numbers, and other special characters are not affected.

## Examples

```
StringUpper("abcd"); ' returns "ABCD";
StringUpper("22.2 is the value"); ' returns "22.2 IS THE VALUE";
```

[String Functions](#)

# Text()

Converts a number to text based on a specified format.

## Category

String

## Syntax

```
StringResult = Text( Number, Format );
```

## Parameters

*Number*

Any number or numeric equipment.item.

*Format*

Format to use in conversion. Actual string or a string equipment.item.

## Examples

```
Text(66,"#.00"); ' returns 66.00;
Text(22.269,"#.00"); ' returns 22.27;
Text(9.999,"#.00"); ' returns 10.00;
```

The following example shows how to use this function within another function:

```
LogMessage("The current value of FreezerRoomTemp is:" + Text (FreezerRoomTemp, "#.#"));  
In the following example, MessageTag is set to "One=1 Two=2".  
MessageTag = "One + " + Text(1,"#") + StringChar(32) + "Two +" + Text(2,"#");
```

## QuickScript .NET Variables

QuickScript .NET variables must be declared before they can be used in QuickScript .NET scripts. Variables can be used on both the left and right side of statements and expressions.

Local variables or equipment.items can be used together in the same script. Variables declared within the script body lose their value after the script is executed. Those declared in the script body cannot be accessed by other scripts.

Variables declared in the **Declarations** area maintain their values throughout the lifetime of the object that the script is associated with.

Declare each variable in the script by a separate DIM statement followed by a semicolon. Enter DIM statements in the **Declarations** area of the **Script** tab page. The DIM statement syntax is as follows:

```
DIM <variable_name> [ ( <upper_bound>
[, <upper_bound>[, <upper_bound>]] ) ]
[ AS <data_type> ];
```

Where:

DIM	Required keyword.
<variable_name>	Name that begins with a letter (A-Z or a-z) and whose remaining characters can be any combination of

	letters (A-Z or a-z), digits (0-9) and underscores (_). The variable name is limited to 255 Unicode characters.
<upper_bound>	Reference to the upper bound (a number between 1 and 2,147,483,647, inclusive) of an array dimension. Three dimensions are supported in a DIM statement, each being nested in the syntax structure. After the upper bound is specified, it is fixed after the declaration. A statement similar to Visual Basic's ReDim is not supported.  The lower bound of each array dimension is always 1.
AS	Optional keyword for declaring the variable's datatype.
<data_type>	Any one of the following 11 datatypes: Boolean, Discrete, Integer, ElapsedTime, Float, Real, Double, String, Message, Time or Object.  Data_type can also be a .Net data_type like System.Xml.XmlDocument or a type defined in an imported script library.  If you omit the AS clause from the DIM statement, the variable, by default, is declared as an Integer datatype. For example:  DIM LocVar1;  is equivalent to:  DIM LocVar1 AS Integer;

In contrast to equipment.item names, variable names must not contain dots. Variable names and the data type identifiers are not case sensitive. If there is a naming conflict between a declared variable and another named entity in the script (for example, equipment.item name, alias or name of an object leveraged by the script), the variable name takes precedence over the other named entities. If the variable name is the same as an alias name, a warning message appears when the script is validated to indicate that the alias is ignored.

The syntax for specifying the entire array is "[ ]" for both local array variables and for equipment.item references. For example, to assign an equipment.item array to a local array, the syntax is:

locarr[] = tag.attr[];

DIM statements can be located anywhere in the script body, but they must precede the first referencing script statement or expression. If a local variable is referenced before the DIM statement, script validation done when you save the object containing the script prompts you to define it.

---

**Caution:** The validation mentioned above occurs only when you save the object containing the script. This is not the script syntax validation done when you click the **Validate Script** button.

Do not cascade DIM statements. For example, the following examples are invalid:

DIM LocVar1 AS Integer, LocVar2 AS Real;

```
DIM LocVar3, LocVar4, LocVar5, AS Message;
```

To declare multiple variables, you must enter separate DIM statements for each variable.

When used on the right side of an equation, declared local variables always cause expressions on the left side to have Good quality. For example :

```
dim x as integer;
dim y as integer;
x = 5;
y = 5;
me.attr = 5;
me.attr = x;
me.attr = x+y;
```

In each case of me.attr, quality is Good.

When you use a variable in an expression to the right of the operator, its Quality is treated as Good for the purpose of data quality propagation.

You can use null to indicate that there is no object currently assigned to a variable. Using null has the same meaning as the keyword "null" in C# or "nothing" in Visual Basic. Assigning null to a variable makes the variable eligible for garbage collection. You may not use a variable whose value is null. If you do, the script terminates and an error message appears in the logger. You may, however, test a variable for null. For example:

```
IF myvar == null THEN ...
```

It is not possible to pass equipment.items as parameters for system objects. To work around this issue, use a local variable as an intermediary or explicitly convert the equipment.item to a string using an appropriate function call when calling the system object.

## Related Topics

[QuickScript References](#)

[Numbers and Strings](#)

### Numbers and Strings

Allowed format for integer constants in decimal format is as follows:

```
IntegerConst = 0 or [sign] <non-zero_digit> <digit>*;
```

Where:

- sign ::= + | -
- non-zero\_digit ::= 1-9
- digit ::= 0-9

For example, an integer constant is a zero or consists of an optional sign followed by one or more digits. Leading zeros are not allowed. Integer constants outside the range -2147483648 to 2147483647 cause an overflow error.

Prepending either 0x or 0X causes a literal integer constant to be interpreted as hexadecimal notation. The +/- sign is supported.

The acceptable float for integers in hexadecimal is as follows:

```
IntegerHexConst = [<sign>] <0><x (or X)> <hexdigit>*
```

Where:

- sign ::= + or -
- hexdigit ::= 0-9, A-F, a-f (only eight hexdigits [32-bits] are allowed)

Allowed format for floats is as follows:

FloatConst ::= [<sign>] <digit>\* .<digit>+ [<exponent>;]

or

[<sign>] <digit>+ [.<digit>\* [<exponent>]];

Where:

- sign ::= + or -
- digit ::= 0-9 (can be one or more decimal digits)
- exponent = e (or E) followed by a sign and then digit(s)

Float constants are applicable as values for variables of type float, real, or double. For example, float constants do not take the number of bytes into account. Script validation detects an overflow when a float, real, or double variable has been assigned a float constant that exceeds the maximum value.

If no digits appear before the period (.), at least one has to appear after it. If neither an exponent part nor the period appears, a period is assumed to follow the last digit in the string.

If an equipment.item reference exists that has a format similar to a float constant with an exponent (such as "5E3"), then use the equipment.item qualifier, as follows:

equipment.item("5E3")

Strings have to be surrounded by double quotation marks. They are referred to as quoted strings. The double-double quote indicates a single double-quote in the string. For example, the string:

Joe said, "Look at that."

can be represented in QuickScript .NET as:

"Joe said, ""Look at that."""

[QuickScript .NET Variables](#)

## QuickScript .NET Control Structures

QuickScript .NET provides five primary control structures in the scripting environment:

- [IF ...THEN ... ELSEIF ... ELSE ... ENDIF](#)
- [FOR ... TO ... STEP... NEXT Loop](#)
- [FOR EACH ... IN ... NEXT](#)
- [TRY ... CATCH](#)
- [WHILE Loop](#)

## Related Topics

[QuickScript References](#)  
[IF ...THEN ... ELSEIF ... ELSE ... ENDIF](#)  
[IF... THEN ... ELSEIF ... ELSE ... ENDIF and Equipment.item Quality](#)  
[FOR ... TO ... STEP... NEXT Loop](#)  
[FOR EACH ... IN ... NEXT](#)  
[TRY ... CATCH](#)  
[WHILE Loop](#)

### IF ...THEN ... ELSEIF ... ELSE ... ENDIF

IF-THEN-ELSE-ENDIF conditionally executes various instructions based on the state of an expression. The syntax is as follows:

```
IF <Boolean_expression> THEN
[statements];
[ { ELSEIF
    [statements] } ];
[ ELSE
    [statements] ];
ENDIF;
```

Where Boolean\_expression is an expression that can be evaluated as a Boolean.

Depending on the data type returned by the expression, the expression is evaluated to constitute a True or False state according to the following table:

Data Type	Mapping
Boolean, Discrete	Directly used (no mapping needed).
Integer	Value = 0 evaluated as False. Value != 0 evaluated as True.
Float, Real	Value = 0 evaluated as False. Value != 0 evaluated as True.
Double	Value = 0 evaluated as False. Value != 0 evaluated as True.
String, Message	Cannot be mapped. Using an expression that results in a string type as the Boolean_expression results in a script validation error.
Time	Cannot be mapped. Using an expression that results in a time type as the Boolean_expression results in a script validation error.

Data Type	Mapping
ElapsedTime	Cannot be mapped. Using an expression that results in an elapsed time type as the Boolean_expression results in a script validation error.
Object	Using an expression that results in an object type. Validates, but at run time, the object is converted to a Boolean. If the type cannot be converted to a Boolean, a run-time exception is raised.

The first block of statements is executed if Boolean\_expression evaluates to True. Optionally, a second block of statements can be defined after the keyword ELSE. This block is executed if the Boolean\_expression evaluates to False.

To help decide between multiple alternatives, an optional ELSEIF clause can be used as often as needed. The ELSEIF clause mimics switch statements offered by other programming languages. For example:

```
IF value == 0 Then
    Message = "Value is zero";
ELSEIF value > 0 Then
    Message = "Value is positive";ELSEIF value < 0 Then
    Message = "Value is negative";
ELSE
    {Default. Should never occur in this example};
ENDIF;
```

The following approach nests a second IF compound statement within a previous one and requires an additional ENDIF:

```
IF (X1 == 1) THEN
    X1 = 5;
{ ELSEIF <X1 == 2> THEN
    X1 = 10;
ELSEIF X1 == 3 THEN
    X1 = 20 ;
ELSEIF X1 == 4 THEN
    X1 = 30 };
    IF X1 == 99 THEN
        X1 = 0;
    ENDIF;
ENDIF;
```

See Sample Scripts for more ideas about using this type of control structure.

## Related Topics

[QuickScript .NET Control Structures](#)

### IF... THEN ... ELSEIF ... ELSE ... ENDIF and Equipment.item Quality

When an equipment.item value is copied to another equipment.item of the same type, the equipment.item's quality is also copied. This can be especially relevant when working with I/O equipment.items. For example, the following two statements copy both value and quality:

```
me.Attr2 = me.Attr1;
me.Attr2.value = me.Attr1.value;
```

If only the value needs to be copied and the equipment.item has the quality BAD, you can use a temporary variable to hold the value. For example:

```
Dim temp as Integer;
temp = me.Attr1;
me.Attr2 = temp;
```

If there is a comparison such as Attr1 <> Attr2 and one of the equipment.items has the quality BAD, then the statements within the IF control block are not executed. For example, assuming Attr1 has the quality BAD:

```
if me.Attr1<> me.Attr2 then
    me.Attr2 = me.Attr1;
endif;
```

In this script, the statement me.Attr2 = me.Attr1 is not executed because Attr1 has the quality BAD and comparing a BAD quality value with a good quality value is not defined/not possible.

The recommended approach is to first verify the quality of Attr1, as shown in the following example:

```
if(IsBad(me.Attr1)) then
LogMessage("Attr1 quality is bad, its value is not copied to Attr2");
else
if me.Attr1<> me.Attr2 then
me.AttrA2 = me.Attr1;
endif;
endif;
```

An alternative method of verifying quality is to use the "==" operator:

```
if Me.Attr1 == TRUE then
```

Or, you can add the "value" property to the simplified IF THEN statement:

```
if Me.Attr1.value then
```

Using any of the above methods to verify data quality will ensure that your scripts execute correctly.

[QuickScript .NET Control Structures](#)

### FOR ... TO ... STEP... NEXT Loop

FOR-NEXT performs a function (or set of functions) within a script several times during a single execution of a script. The general format of the FOR-NEXT loop is as follows:

```
FOR <analog_var> = <start_expression> TO <end_expression> [STEP <change_expression>];
[statements];
[EXIT FOR];
[statements];
NEXT;
```

Where:

- `analog_var` is a variable of type Integer, Float, Real, or Double.
- `start_expression` is a valid expression to initialize `analog_var` to a value for execution of the loop.
- `end_expression` is a valid expression. If `analog_var` is greater than `end_expression`, execution of the script jumps to the statement immediately following the `NEXT` statement.

This holds true if loop is incrementing up, otherwise, if loop is decrementing, loop termination occurs if analog\_var is less than end\_expression.

- change\_expression is an expression that defines the increment or decrement value of analog\_var after execution of the NEXT statement. The change\_expression can be either positive or negative.
  - If change\_expression is positive, start\_expression must be less than or equal to end\_expression or the statements in the loop do not execute.
  - If change\_expression is negative, start\_expression must be greater than or equal to end\_expression for the body of the loop to be executed.
- If STEP is not set, then change\_expression defaults to 1 for increasing increments, and defaults to -1 for decreasing increments.

Exit the loop from within the body of the loop with the EXIT FOR statement.

The FOR loop is executed as follows:

1. analog\_var is set equal to start\_expression.
2. If change\_expression is positive, the system tests to see if analog\_var is greater than end\_expression. If so, the loop exits. If change\_expression is negative, the system tests to see if analog\_var is less than end\_expression. If so, program execution exits the loop.
3. The statements in the body of the loop are executed. The loop can potentially be exited via the EXIT FOR statement.
4. analog\_var is incremented by 1,-1, or by change\_expression if it is specified.
5. Steps 2 through 4 are repeated.

FOR-NEXT loops can be nested. The number of levels of nesting possible depends on memory and resource availability.

## Related Topics

[QuickScript .NET Control Structures](#)

### FOR EACH ... IN ... NEXT

FOR EACH loops can be used only with collections exposed by OLE Automation servers. A FOR-EACH loop performs a function (or set of functions) within a script several times during a single execution of a script. The general format of the FOR-EACH loop is as follows:

```
FOR EACH <object_variable> IN <collection_object >
    [statements];
    [EXIT FOR;];
    [statements];
NEXT;
```

Where:

- object\_variable is a dimmed variable.
- collection\_object is a variable holding a collection object.

As in the case of the FOR ... TO loop, it is possible to exit the execution of the loop through the statement EXIT

FOR from within the loop.

## Related Topics

[QuickScript .NET Control Structures](#)

### TRY ... CATCH

TRY ... CATCH provides a way to handle some or all possible errors that may occur in a given block of code, while still running rather than terminating the program. The TRY part of the code is known as the try block. Deal with any exceptions in the CATCH part of the code, known as the catch block.

The general format for TRY ... CATCH is as follows:

```
TRY
  [try statements] 'guarded section
CATCH
  [catch statements]
ENDTRY
```

Where:

*tryStatements*

Statement(s) where an error can occur. Can be a compound statement. The tryStatement is a guarded section.

*catchStatements*

Statement(s) to handle errors occurring in the associated Try block. Can be a compound statement.

Statements inside the Catch block may reference the reserved ERROR variable, which is a .NET System.Exception thrown from the Try block. The statements in the Catch block run only if an exception is thrown from the Try block.

TRY ... CATCH is executed as follows:

1. Run-time error handling starts with TRY. Put code that might result in an error in the try block.
2. If no run-time error occurs, the script will run as usual. Catch block statements will be ignored.
3. If a run-time error occurs, the rest of the try block does not execute.
4. When a run-time error occurs, the program immediately jumps to the CATCH statement and executes the catch block.

The simplest kind of exception handling is to stop the program, write out the exception message, and continue the program.

The error variable is not a string, but a .NET object of System.Exception. This means you can determine the type of exception, even with a simple CATCH statement. Call the GetType() method to determine the exception type, and then perform the operation you want, similar to executing multiple catch blocks.

## Example:

```
dim command = new System.Data.SqlClient.SqlCommand;
dim reader as System.Data.SqlClient.SqlDataReader;
command.Connection = new System.Data.SqlClient.SqlConnection;
try
  command.Connection.ConnectionString = "Integrated Security=SSPI";
```

```
command.CommandText="select * from sys.databases";
command.Connection.Open();
reader = command.ExecuteReader();

while reader.Read()
    me.name = reader.GetString(0);
    LogMessage(me.name);
endWhile;
catch
    LogMessage(error);
endtry;
if reader <> null and not reader.IsClosed then
    reader.Close();
endif;
if command.Connection.State == System.Data.ConnectionState.Open then
    command.Connection.Close();
endif;
```

## Related Topics

[QuickScript .NET Control Structures](#)

### WHILE Loop

WHILE loop performs a function or set of functions within a script several times during a single execution of a script while a condition is true. The general format of the WHILE loop is as follows:

```
WHILE <Boolean_expression>
[statements]
[EXIT WHILE;]
[statements]
ENDWHILE;
```

Where: Boolean\_expression is an expression that can be evaluated as a Boolean as defined in the description of IF...THEN statements.

It is possible to exit the loop from the body of the loop through the EXIT WHILE statement.

The WHILE loop is executed as follows:

1. The script evaluates whether the Boolean\_expression is true or not. If not, program execution exits the loop and continues after the ENDWHILE statement.
2. The statements in the body of the loop are executed. The loop can be exited through the EXIT WHILE statement.
3. Steps 1 through 2 are repeated.

WHILE loops can be nested. The number of levels of nesting possible depends on memory and resource availability.

## QuickScript .NET Operators

The following QuickScript .NET operators require a single operand:

Operator	Short Description
~	Complement
-	Negation
NOT	Logical NOT

The following QuickScript .NET operators require two operands:

Operator	Short Description
+	Addition and concatenation
-	Subtraction
&	Bitwise AND
*	Multiplication
**	Power
/	Division
^	Exclusive OR
	Inclusive OR
<	Less than
<=	Less than or equal to
<>	Not equal to
=	Assignment
==	Equivalency (is equivalent to); not supported for entire array compares. Arrays must be compared one element at a time using ==.
>	Greater than
>=	Greater than or equal to
AND	Logical AND
MOD	Modulo
OR	Logical OR

Operator	Short Description
SHL	Left shift
SHR	Right shift

The following table shows the precedence of QuickScript .NET operators:

Precedence	Operator
1 (highest)	( )
2	- (negation), NOT, ~
3	**
4	* , /, MOD
5	+ , - (subtraction)
6	SHL, SHR
7	<, >, <=, >=
8	==, <>
9	&
10	^
11	
12	=
13	AND
14 (lowest)	OR

The arguments of the listed operators can be numbers or equipment.item values. Putting parentheses around an argument is optional. Operator names are not case-sensitive.

## Related Topics

- [Negation \( - \)](#)
- [Complement \( ~ \)](#)
- [Power \( \\*\\* \)](#)
- [Multiplication \( \\* \), Division \( / \), Addition \( + \), Subtraction \( - \)](#)
- [Modulo \(MOD\)](#)

Shift Left (SHL), Shift Right (SHR)

Assignment ( = )

Comparisons ( <, >, <=, >=, ==, <> )

## Parentheses ( )

Parentheses specify the correct order of evaluation for the operator(s). They can also make a complex expression easier to read. Operator(s) in parentheses are evaluated first, preempting the other rules of precedence that apply in the absence of parentheses. If the precedence is in question or needs to be overridden, use parentheses.

In the example below, parentheses add B and C together before multiplying by D:

( B + C ) \* D;

## Related Topics

### Negation ( - )

Negation is an operator that acts on a single component. It converts a positive integer or real number into a negative number.

## Related Topics

[QuickScript .NET Operators](#)

### Complement ( ~ )

This operator yields the one's complement of a 32-bit integer. It converts each zero-bit to a one-bit and each one-bit to a zero-bit. The one's complement operator is an operator that acts on a single component, and it accepts an integer operand.

## Related Topics

[QuickScript .NET Operators](#)

### Power ( \*\* )

The Power operator returns the result of a number (the base) raised to the power of a second number (the power). The base and the power can be any real or integer numbers, subject to the following restrictions:

- A zero base and a negative power are invalid.  
Example: "0 \*\* -2" and "0 \*\* -2.5"
- A negative base and a fractional power are invalid.  
Example: "-2 \*\* 2.5" and "-2 \*\* -2.5"
- Invalid operands yield a zero result.

The result of the operation should not be so large or so small that it cannot be represented as a real number.

Example:

```
1 ** 1 = 1.0
3 ** 2 = 9.0
10 ** 5 = 100,000.0
```

## Related Topics

[QuickScript .NET Operators](#)

### Multiplication ( \* ), Division ( / ), Addition ( + ),Subtraction ( - )

These binary operators perform basic mathematical operations. The plus (+) can also concatenate String datatypes.

For example, in the data change script below, each time the value of "Number" changes, "Setpoint" changes as well:

```
Number=1;
Setpoint.Name = "Setpoint" + Text(Number, "#");
```

Where: The result is "Setpoint1."

## Related Topics

[QuickScript .NET Operators](#)

### Modulo (MOD)

MOD is a binary operator that divides an integer quantity to its left by an integer quantity to its right. The remainder of the quotient is the result of the MOD operation. Example:

```
97 MOD 8 yields 1
63 MOD 5 yields 3
```

## Related Topics

[QuickScript .NET Operators](#)

### Shift Left (SHL), Shift Right (SHR)

SHL and SHR are binary operators that use only integer operands. The binary content of the 32-bit word referenced by the quantity to the left of the operator is shifted (right or left) by the number of bit positions specified in the quantity to the right of the operator.

Bits shifted out of the word are lost. Bit positions vacated by the shift are zero-filled. The shift is an unsigned shift.

## Related Topics

[QuickScript .NET Operators](#)

### Bitwise AND ( & )

A bitwise binary operator compares 32-bit integer words with each other, bit for bit. Typically, this operator masks a set of bits. The operation in this example "masks out" (sets to zero) the upper 24 bits of the 32-bit word. For example:

```
result = name & 0xff;
```

## Related Topics

[QuickScript .NET Operators](#)

### Exclusive OR (^) and Inclusive OR ( | )

The ORs are bitwise logical operators compare 32-bit integer words to each other, bit for bit. The Exclusive OR compare the status of bits in corresponding locations. If the corresponding bits are the same, a zero is the result. If the corresponding bits differ, a one is the result. Example:

```
0 ^ 0 yields 0
0 ^ 1 yields 1
1 ^ 0 yields 1
1 ^ 1 yields 0
```

The Inclusive OR examines the corresponding bits for a one condition. If either bit is a one, the result is a one. Only when both corresponding bits are zeros is the result a zero. For example:

```
0 | 0 yields 0
0 | 1 yields 1
1 | 0 yields 1
1 | 1 yields 1
```

## Related Topics

[QuickScript .NET Operators](#)

### Assignment ( = )

Assignment is a binary operator which accepts integer, real, or any type of operand. Each statement can contain only one assignment operator. Only one name can be on the left side of the assignment operator.

Read the equal sign (=) of the assignment operator as "is assigned to" or "is set to."

---

**Note:** Do not confuse the equal sign with the equivalency sign (==) used in comparisons.

---

## Related Topics

[QuickScript .NET Operators](#)

## Comparisons ( <, >, <=, >=, ==, <> )

Comparisons in IF-THEN-ELSE statements execute various instructions based on the state of an expression.

### Related Topics

[QuickScript .NET Operators](#)

### AND, OR, and NOT

These operators work only on discrete equipment.items. If these operators are used on integers or real numbers, they are converted as follows:

- Real to Discrete: If real is 0.0, discrete is 0, otherwise discrete is 1.
- Integer to Discrete: If integer is 0, discrete is 0, otherwise discrete is 1.

If the statement is: "Disc1 = Real1 AND Real2;" and Real1 is 23.7 and Real2 is 0.0, Disc1 has 0 assigned to it, since Real1 is converted to 1 and Real2 is converted to 0.

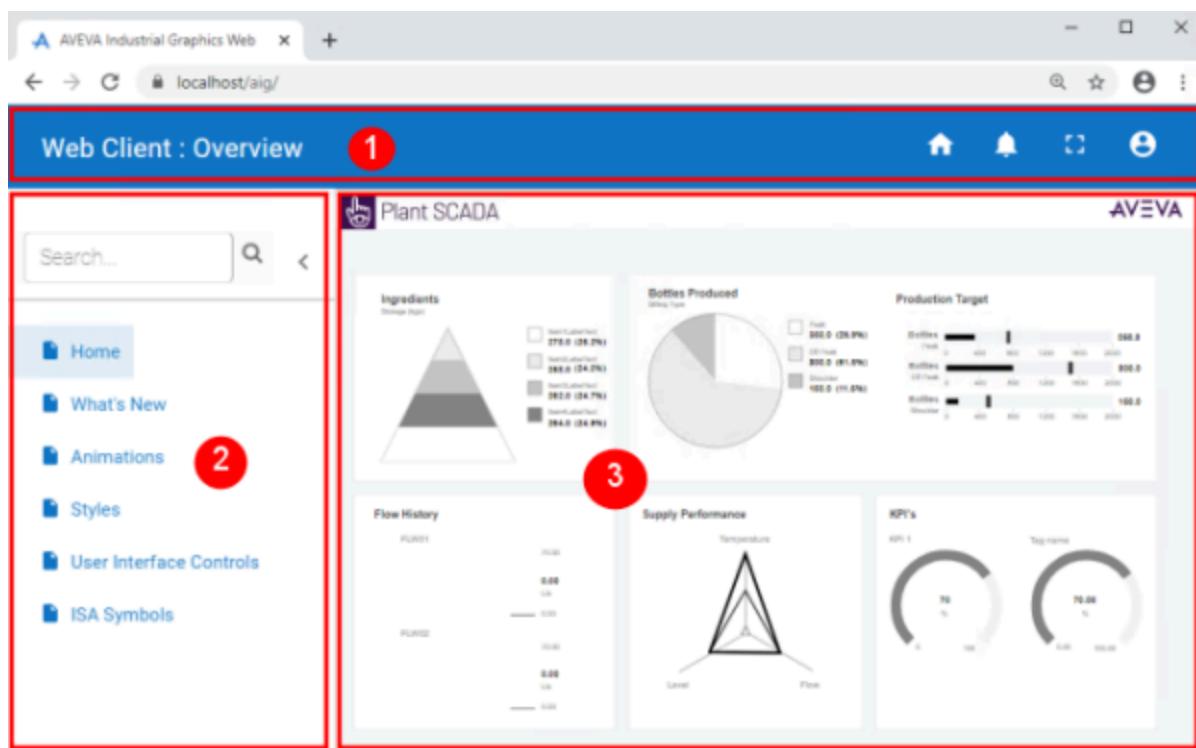

When assigning the floating-point result of a mathematical operation to an integer, the value is rounded to the nearest integer instead of truncating it. This means that an operation like IntAttr = 32/60 results in IntAttr having a value of 1, not 0. If truncation is needed, use the Trunc() function.

## Use the Industrial Graphics Web Client

The Industrial Graphics Web Client allows you to view selected Industrial Graphics used within a Plant SCADA project on any supported HTML5 web browser. The following diagram describes its layout.

Element	Description	
1	The <b>Title Bar</b> displays the Industrial Graphics application name, page name, home icon, notifications icon, full screen icon and profile icon.	
	Application Name: Symbol Name	The Title Bar will display the application and page name.  For example, <i>Web Client: Overview</i> . Where: <i>Web Client</i> = the application name. <i>Overview</i> = the page name.
		Click to view the page set as the web client home page.
		Click the Notifications icon messages related to License status change and other status change messages. The number of notifications will be overlayed on the icon.
		Click to maximize the canvas area and display the web page in full screen mode. You can also use the F11 key. The title bar and navigation overlay will not be

		<p>visible.</p> <p><b>To view the title bar:</b></p> <ul style="list-style-type: none"><li>• Move your cursor to the top of the page, the title bar will slide down.</li><li>• Click  to pin the title bar on the page.</li><li>• Click  to hide the title bar.</li></ul>
		Click to minimize the canvas area and exit the full screen mode.
		The profile icon displays the user logged in.
	 <b>Sign Out</b>	Click the profile icon and then select the <b>Sign Out</b> icon. The Sign Out will only be available if System Management Server option is configured. For more information, see <a href="#">Log On to the Industrial Graphics Web Client</a> .
		From the Title Bar click  , and then click the <b>Language</b> icon. Select the language. The tooltip, translated static text and custom properties will display in the selected language. <b>Note:</b> When the user changes the language, a new session will be created causing the data in custom properties to be reset.
2		<p>Click the following icon to view the <b>menu navigation</b> overlay.</p> <p>All folders and symbols under the selected Web Client root folder are displayed.</p> <p>You can use the search box at the top of the overlay to search for pages. The search box is enabled with the autocomplete feature, where page names matching the input search term will be listed as you are typing. Select the page name to view the page in the canvas area.</p>

3	<p>The <b>canvas area</b> displays the page selected from the navigation overlay. The page will be scaled to fit the browser viewport size, while maintaining the aspect ratio. The navigation and notifications overlays do not consume any space on the canvas.</p>
	<p> Click the warning icon to view the list of animations or properties not supported by the Industrial Graphics Web Client. This icon is available only during application development and when the browser points to the exact URL of <a href="http://localhost/aig">http://localhost/aig</a>.</p>

[Pan and Zoom Support](#)

[Customize the Web Client](#)

## View Application Graphics in a Web Browser

After you configure an Industrial Graphics application you can view the graphics in a web browser. For a list of tested and supported browsers, see [Browser and Mobile Support](#).

1. Launch an HTML5 supported browser, enter the URL: <http://<hostname>/aig> or <http://<IPAddress>/aig>. If your credentials are authenticated and a valid Industrial Graphics Web Server license is acquired, the Industrial Graphics Web Client page will display. The home page will be displayed by default. You can also access the web client using the URL: <https://<hostname>/aig> or <https://<IPAddress>/aig>. The Web Client will automatically use the HTTPS protocol when the System Management Server is configured with a certificate (local or remote server) for encrypted communication between the server and client. If the Web Client page is not displayed, refer to [Troubleshooting the Industrial Graphics Web Client](#).
2. Click the  icon. The overlay on the left displays the hierarchical structure of the pages under the selected Web Client Root folder within the running application.
3. Click a folder name. The pages within the folder are displayed.
4. Click a page. The selected graphic is displayed in the Web Client.

The user account accessing the graphics must be Authenticated and Authorized, for more information see

## Licensing for Industrial Graphics Applications in a Web Browser.

Plant SCADA Runtime must be running on the host machine for symbols displayed in the Web Client to receive live data from Plant SCADA tags. You can also run Plant SCADA as a service.

## See Also

[Customize the Web Client](#)

## Application Graphics and Browser Resizing

The Industrial Graphics Web Client page can be viewed in different screen sizes. As the browser is adjusted, the graphics resize to fit the new browser viewport dimensions. The graphic will also resize when the mobile device is rotated between portrait and landscape orientation.

For very small screens, the icons on the right collapse into a vertical bar. The icons will be hidden to save screen space. You can view Industrial Graphics on any mobile device, and use the pan and zoom gestures to view larger graphics.

## See Also

[Pan and Zoom Support](#)

## Pan and Zoom Support

The Industrial Graphics Web Client supports the Pan and Zoom gestures for all supported browsers and devices. When a graphic in the web browser is zoomed in from a non-mobile device, the zoom percentage is displayed in the lower left corner of the horizontal scroll bar. The zoom percentage is limited up to 500%.

### Pan and Zoom using Touch

You can zoom-in and zoom-out on a focused display by using two fingers.

- To zoom-in, place two fingers on the screen and expand. To zoom-out, pinch the display with two fingers.
- Double-tap to restore the display to 100% zoom.

To pan the display, press one finger on the display and move your finger.

### Pan and Zoom using Mouse

You can zoom-in and zoom-out on a focused display by using the mouse's scroll wheel.

- Hold the **Ctrl** key and scroll the wheel up or down to zoom-in or zoom-out. If the mouse pointer is outside of a pane, then zooming will not be allowed.
- Double-click the left mouse button to restore the display to 100% zoom.

To pan a display, keep the center wheel pressed, move the mouse to the area and then release the center wheel.

### Zoom using Keyboard

You can zoom-in and zoom-out on a focused display by using keyboard.

To zoom-in, use the **Ctrl** and + keys together. To zoom-out, use **Ctrl** and - keys together.

### Zoom by Location

You can also zoom in the graphic from the location you click on.

Pan and Zoom toolbars are not supported. Pan and Zoom gestures are not supported for graphics displayed using the ShowSymbol animation, Button Click and Slider.

## See Also

[Use the Industrial Graphics Web Client](#)

## Customize the Web Client

Users can customize the Web Client settings using Configurator on the computer that hosts the Industrial Graphics Server.

1. Open Configurator and navigate to **Industrial Graphics Server | Client Settings** tab.
2. In the **Graphic Refresh Rate (ms)** specify the refresh rate in milliseconds.
3. Click **Apply**. This will restart the Industrial Graphics Server.

---

**Note:** Alarm Refresh Rate is not supported by Industrial Graphics applications in this version of Plant SCADA.

[Use the Industrial Graphics Web Client](#)

## Manage the Industrial Graphics Web Client

### In This Chapter

[Secure the Industrial Graphics Web Client](#)

[Licensing for Industrial Graphics Applications in a Web Browser](#)

## Secure the Industrial Graphics Web Client

A System Management Server (SMS) allows an Industrial Graphics Web Client to be used securely with the HTTPS protocol. You will need to connect an Industrial Graphics Server to an SMS to secure client access.

As an administrator, there are two configuration options available for user authentication and security. The option you chose will depend on whether or not you need to expose the Industrial Graphic Server to clients that exist outside your SCADA system network.

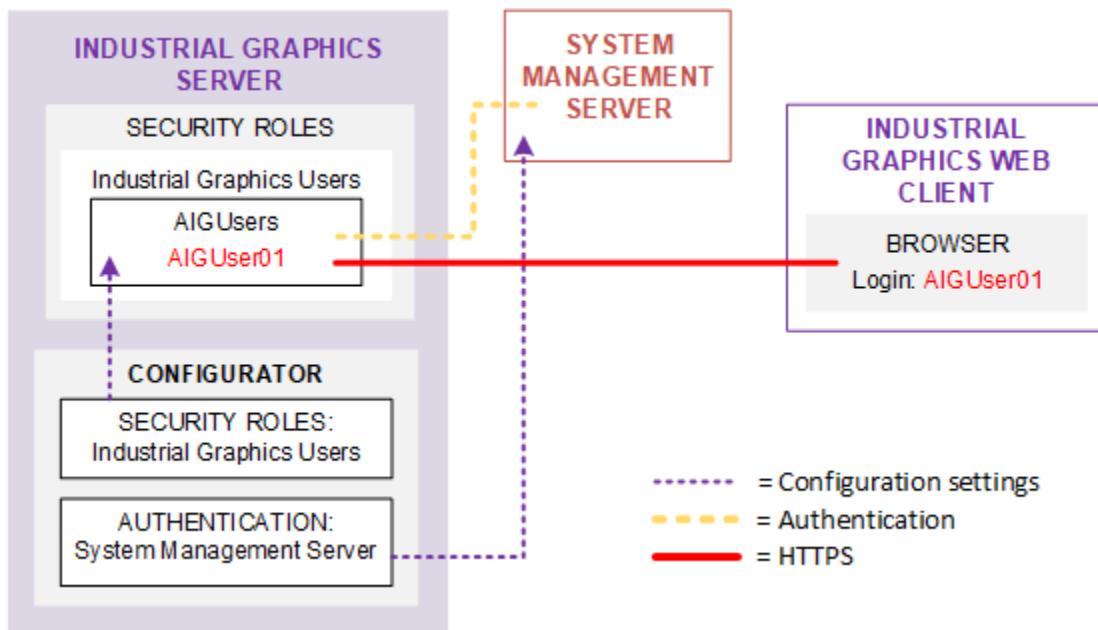

If this is the case, you need to use a Secure Gateway installed in a demilitarized zone (DMZ) to intercept requests from clients. This will use a reverse proxy server to protect the identity of the Industrial Graphics Server from external computers connecting via the Internet.

## Securing clients within your plant network

To secure Industrial Graphics Web Clients that operate within your SCADA system network, use Configurator to set up the following:

- **Authentication** - Connect the Industrial Graphics Server to an SMS.  
See [Use Configurator to Set Up an Industrial Graphics Server](#).
- **Security Roles** - Add the required users to one of the Industrial Graphics security roles on the Industrial Graphics Server.  
See [Configure User Access for an Industrial Graphics Web Client](#).

Once this configuration is complete, the SMS can authenticate a Web Client user and provide an HTTPS connection to the Industrial Graphics Server.

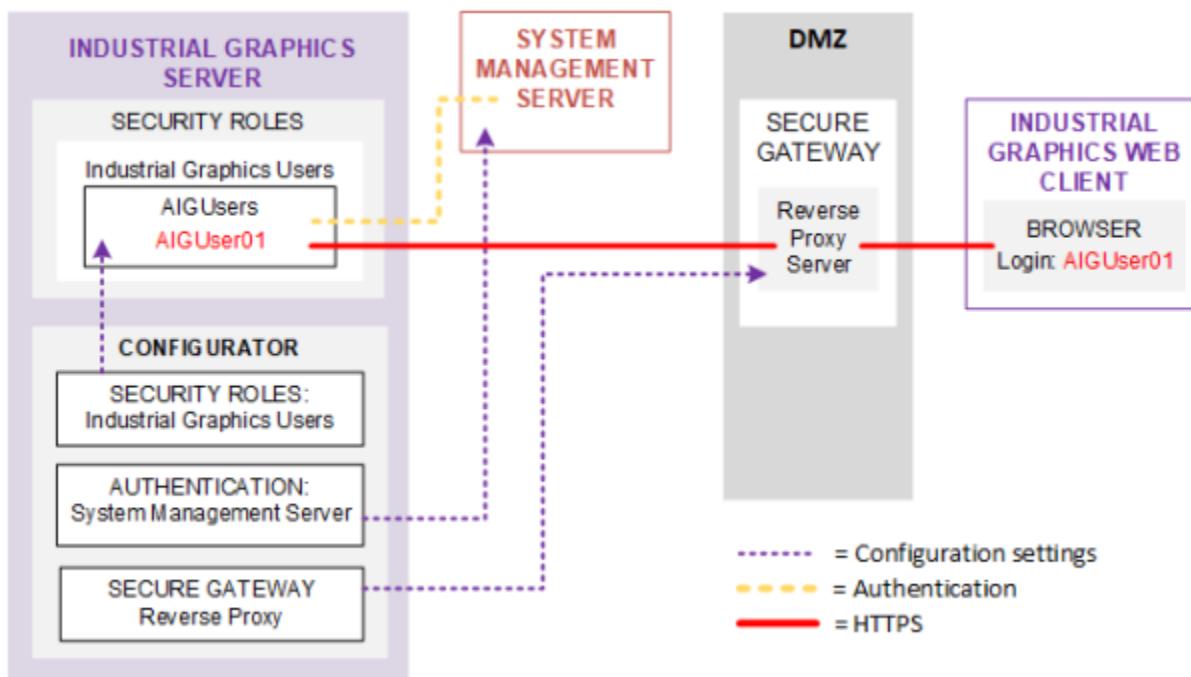

## Securing clients via a Secure Gateway server

To secure Industrial Graphics Web Clients that exist beyond your SCADA system network, use Configurator to set up the following:

- **Authentication** - Connect the Industrial Graphics Server to an SMS.  
For instructions, see [Configure an Industrial Graphics Server using a Secure Gateway](#).
- **Secure Gateway** - Provide the Fully Qualified Domain Name of the reverse proxy server in Configurator's **Secure Gateway** field.  
For detailed configuration instructions, see [Configure an Industrial Graphics Server using a Secure Gateway](#).
- **Security Roles** - Add the required users to one of the Industrial Graphics security roles on the Industrial Graphics Server.  
See [Configure User Access for an Industrial Graphics Web Client](#).

Once this configuration is complete, the SMS can authenticate a Web Client user and provide an HTTPS connection to the Industrial Graphics Server via the Secure Gateway server.

If the Web Client page loads at runtime without a valid security token, the following will occur.

- The Web Client will redirect to a login page.
- The credentials entered by the user will be checked against the Active Directory.
- If the credentials are valid, then Active Directory will provide a security token and return it to the Web Client.
- The Web Client will then grant access to user with the token.

If a security token already exists, then the user will be granted access.

## Configure an Industrial Graphics Server using a Secure Gateway

This topic provides the instructions required to set up an Industrial Graphics Server that needs to communicate with web clients located outside your SCADA system network. It explains how to secure the server with a Secure Gateway using a reverse proxy server.

The examples in this document are based on the following system architecture:

- **computer1** is the computer name of the System Management Server.
- **computer2** is the computer name of the Industrial Graphics Server.
- **computer3** is the computer name of the Secure Gateway.

## Confirm the Industrial Graphics Server is working

Before you configure the Secure Gateway, you need to confirm that the Industrial Graphics Server is set up correctly.

To do this, enter the following address into a browser on a computer within the plant network.

<https://computer2/aig>

If the Industrial Graphics Web Client does not display, see the section on securing clients within your plant network in the topic [Secure the Industrial Graphics Web Client](#).

## Set up the Secure Gateway

The first step is to set up computer3, the Secure Gateway installed in a demilitarized zone (DMZ). This requires the installation of a reverse proxy server to protect the identity of the Industrial Graphics Server from external computers connecting via the Internet.

For this, you will need a valid SSL certificate (.key and .pem files) issued by an authorized entity. This certificate will be used later to set up the System Management Server.

---

**Note:** Self-signed certificates are not recommended for production environments.

---

## Set up the System Management Server

Make the following changes on the System Management Server (computer1).

1. Add the SSL certificate from the Secure Gateway (computer3).  
You need to import the certificate to the Trusted Root.
2. Open the **appsettings.json** file for editing.

This file is part of the Platform Common Services installation on the System Management Server. It is located here:

C:\Program Files (x86)\AVEVA\Platform Common Services\Management Server

3. Add the "PublicOrigin" property to the AppSetting section of the file in the format specified below. Use a fully-qualified domain name (FQDN) to identify the Secure Gateway computer.

```
"PublicOrigin": "https://computer3.mydmzdomain.com"
```

Specify the port number if it is not 443.

```
"PublicOrigin": "https://computer3.mydmzdomain.com:<portNumber>"
```

```
".AppSettings": {
    "AllowGroups": [
        "aaAdministrators"
    ],
    "UserGroupFilters": [
    ],
    "SelfSignedCertificate": "",
    "BaseUrl": "http://+:80/identitymanager",
    "ServiceSource": "Token Host",
    "PublicOrigin": "https://computer3.mydmzdomain.com",
    "CustomOptions": {
        "UseNativeLogon": "true",
        "UsePrincipalSearcher": "false",
        "CheckNestedGroups": "false"
    },
    "SsoSyncOptions": {
        "MaxEntitiesPerChunk": 100,
        "MaxMessageBufferSize": 5242880,
        "InternalLogging": {
            "LogLevel": {
                "Default": "Information",
                "System": "Information",
                "Microsoft": "Information"
            }
        }
    }
},
```

4. Reconfigure the System Management Server.

Go to the System Management Server page in Configurator and confirm that **This machine is the System Management Server** is selected.

Click the **Configure** button.

The changes you have made to the PublicOrigin property will be evident in the Configuration Messages panel. For example, the System Management Server will now be identified by the FQDN of the Secure Gateway computer.

#### Configuration Messages

```
Checking if binding a site to the SSL(HTTPS) port is allowed.  
Ensuring the SSL(HTTPS) port has the correct ACL.  
Updating HTTPS Port 443 in the registry.  
Configuring the certificate binding.  
Certificates are configured.  
Connecting to the System Management Server 'https://computer3.mydmzdomain.com:443'
```

5. You will need to enter the login details for a domain user to connect to the Secure Gateway computer.

If the configuration process is not successful, try the following:

- Ping the Secure Gateway computer before you attempt to configure the System Management Server.
- Confirm that the Secure Gateway SSL certificate has been added correctly.

## Set up the Industrial Graphics Server

---

**Note:** Before you commence, you should confirm that your Plant SCADA project includes the "BUILTIN\Administrators" role. Check the **Roles** view in Plant SCADA Studio's **Security** activity.

---

Make the following changes on the Industrial Graphics Server (computer2).

1. Add the SSL certificate from the Secure Gateway.

You need to import the certificate to the Trusted Root.

2. Open the **appsettings.json** file for editing.

This file is part of the Platform Common Services installation on the Industrial Graphics Server. It is located here:

C:\Program Files (x86)\AVEVA\Platform Common Services\Management Server

3. Add the "PublicOrigin" property to the AppSetting section of the file in the format specified below. Use a fully-qualified domain name (FQDN) to identify the Secure Gateway computer.

"PublicOrigin": "https://computer3.mydmzdomain.com"

Specify the port number if it is not 443.

"PublicOrigin": "https://computer3.mydmzdomain.com:<portNumber>"

```
"AppSetting": {  
    "AllowGroups": [  
        "aaAdministrators"  
    ],  
    "UserGroupFilters": [  
    ],  
    "SelfSignedCertificate": "",  
    "BaseURL": "http://+:80/identitymanager",  
    "ServiceSource": "Token Host",  
    "PublicOrigin": "https://computer3.mydmzdomain.com",  
    "CustomOptions": {  
        "UseNativeLogon": "true",  
        "UsePrincipalSearcher": "false",  
        "CheckNestedGroups": "false"  
    },  
    "SsoSyncOptions": {  
        "MaxEntitiesPerChunk": 100,  
        "MaxMessageBufferSize": 5242880,  
        "InternalLogging": {  
            "LogLevel": {  
                "Default": "Information",  
                "System": "Information",  
                "Microsoft": "Information"  
            }  
        }  
    }  
},
```

4. Open Configurator on the Industrial Graphics Server.
5. Go to the System Management Server page and confirm that **Connect to an existing System Management Server** is selected.
6. Enter the FQDN for the Secure Gateway computer (for example, computer3.mydmzdomain.com).
7. Click the **Configure** button.

The changes you have made to the PublicOrigin property should be evident in the Configuration Messages panel.

8. In Configurator, go to Authentication Settings page.

---

**Note:** The changes to the PublicOrigin setting on the System Management Server will be reflected on the Authentication Settings page. While the FQDN of the Secure Gateway computer is displayed in the System Management Server field, the SMS will continue to operate on the computer on which it was originally configured.

---

9. Enter the FQDN for the Secure Gateway computer in the **Secure Gateway** field.

To enable authentication of users, the Industrial Graphics Server must be registered with your System Management Server.

System Management Server

computer3.mydmzdomain.com:443

Secure Gateway

computer3.mydmzdomain.com

A secure gateway server is a reverse proxy server designed to protect the identity of your Industrial Graphics servers from clients connecting outside your plant network. It should be installed in a DMZ.

10. Click the **Configure** button.

When these steps are complete, you can log in to the Industrial Graphics Web Client via the Secure Gateway computer using the following address:

<https://computer3/aig>

If you attempt to log in from a computer within the plant network, you can access the Industrial Graphics Server directly using the following address:

<https://computer2/aig>

## See Also

[Log On to the Industrial Graphics Web Client](#)

## Configure User Access for an Industrial Graphics Web Client

**Security Roles** are used to manage authentication for Industrial Graphics applications. Any user that requires access to the Industrial Graphics Server via the Web Client needs to be associated with an Industrial Graphics security role.

Two Industrial Graphics security roles are created locally by Plant SCADA when you install an Industrial Graphics Server:

- **Industrial Graphics Users** — provides read-only access to a Plant SCADA system.  
The Windows® User Groups "AIGUsers" is created and associated with this role.
- **Industrial Graphics R/W Users** — provides read and write access to a Plant SCADA system.  
The Windows® User Groups "AIGUsersRW" is created and associated with this role.  
For more information about write access, see [Enable Tag Writes for Industrial Graphics Applications](#).

### To enable access for Industrial Graphics Web Client users:

1. Add the required users to the AIGUsers (read only) or AIGUsersRW (read and write) domain group on the Industrial Graphics Server.  
Or:  
Add the required users to a Windows domain group you have created, and then associate this group with the

appropriate Industrial Graphics security role.

For further instructions, see [Modifying the Members of a Security Role](#).

---

**Note:** To allow authorization in a distributed system, only add domain groups to an Industrial Graphics security role. You should avoid adding individual users to these roles.

2. Any users also need to be a member of a Windows group that is mapped to a valid role within your Plant SCADA project. This is required to enable I/O server requests. See [Roles](#).

---

**Note:** Additional configuration is required if you want to allow Industrial Graphics users to write to variable tags in your Plant SCADA system. See [Enable Tag Writes for Industrial Graphics Applications](#).

## See Also

[Use the Industrial Graphics Web Client](#)

### Log On to the Industrial Graphics Web Client

When you have completed the configurations described in [Secure the Industrial Graphics Web Client](#), authenticated users will be able log in to the Industrial Graphics Web Client. The System Management Server will provide HTTPS access to any users that can be validated from Microsoft Active Directory.

#### To log on to the Industrial Graphics Web Client:

1. Launch the Web Client in a supported browser (see [Browser and Mobile Support](#)).  
The login page appears.
2. Enter your user name and password.
3. Click **Login**.  
 Optionally, you could click on **Windows Integrated** to use the credentials of the user currently logged in to Windows.
4. Use **Sign Out** to log out of the session.

## See Also

[Configure User Access for an Industrial Graphics Web Client](#)

### Licensing for Industrial Graphics Applications in a Web Browser

You need a valid Industrial Graphics Web Server license to login and view application graphics from a web browser. Licensing also extends to hosting application graphics on external websites. For detailed information on licensing, see AVEVA Enterprise Licensing.

Acquiring the license is a two-stage process. After the Web Server starts up, it will first authenticate the user and then determine the user's authorization.

- **Authentication**

The Industrial Graphics Server will verify that a Web Client user is part of a domain group associated with the "Industrial Graphics Users" Security Role. See [Configure User Access for an Industrial Graphics Web Client](#).

If you add a new user to the group, the new user must log off and log in again for the change to take effect.

- **Authorization**

After a user is authenticated, the web server will attempt to acquire a license. If one is not available, then the web client will operate in a [Single Session Mode](#).

If the Web Server has acquired a valid license but did not renew it, the Web Client will be in [Grace Period](#) mode. A notification message will be displayed in the notification page. The message will be logged every time Web Client unsuccessfully attempts to renew the license.

---

**Note:** If the Industrial Graphics Server is already running when a license becomes available, it will not be able to acquire the license until after you have restarted the **AVEVA Industrial Graphics Service** in the Windows Component Services console.

If the Industrial Graphics Server is shutdown, it will release all the licenses it has acquired regardless of the number of client sessions and the current state of the license. All web client sessions will also be terminated immediately.

## Single Session Mode

If the Industrial Graphics Server does not acquire any license at startup, it will operate in the Single Session Mode, which is assigned on a first-come-first-serve basis.

- If a valid license is unavailable and the first session license has been acquired, the Web Client will notify the user that no licenses are available.
- The Industrial Graphics Server allows sessions a [Grace Period](#) if the server has acquired an unlimited license, but subsequently loses the license.

## See Also

[Licensing for Industrial Graphics Applications in a Web Browser](#)

## Grace Period

The Industrial Graphics Web Server will enter the grace period under the below conditions:

- If a valid license is acquired and later expires.
- If a valid license is acquired, but cannot be acquired again.

During the grace period, all Web Client features will be available for connected and new sessions. The Industrial Graphics Web page will display a visual notification that the Industrial Graphics Server is in grace period mode. The grace period is 14 days. After the grace period has ended, the server will continue to function and immediately switch to a single license for one session, on a first come first serve basis. If the same license is acquired, then the Web Server will exit the Grace Period mode.

# Supported Graphical Elements and Known Limitations

## In This Chapter

[Known Limitations](#)

[Properties Supported by All Graphical Elements](#)

[Properties Supported by All Graphic Elements With Some Limitations](#)

[Supported Graphic Elements and Additional Properties](#)

[Supported Animations](#)

## Known Limitations

The Industrial Graphics Web Client will be enhanced with each product release. The following list summarizes the major limitations in the current release.

- Only English locale is supported by the Industrial Graphics Server.
  - For decimal points you need to enter "." (period).
  - For thousands separators you need to enter "," (comma).
- The status of write operations is not reflected by the status element or quality styles applied to elements. Design your pages so that an operator can determine if a write has been set or rejected by displaying the current value.
- Frame windows with special (unsupported) characters in the window name are not supported.
- Indirect tags are not supported.
- Windows Common Controls (WCC) refer to RadioButton Group, CheckBox, Editbox, ComboBox, Calendar, DateTime Picker, and ListBox.
- Bit state animations are not supported.
- Truth table animations are not supported for:
  - Visibility animations
  - Blink animations
  - Value display animations
  - Disable animations.
- Array radio button group animations are not supported.
- Hierarchical Name and Contained Name Display Animations are not supported.
- Multi pen trends are not supported.
- The following script functions are not supported:
  - SendKeys
  - SetBad
  - SetGood
  - SetInitializing
  - SetUncertain

- SignedAlarmAck
- SignedWrite
- WriteStatus
- WWControl
- WWExecute
- WWPoke
- WWRequest
- WWStringFromTime.

---

**Important:** When loading a graphic in the Web Client, unsupported features are logged as warning messages in the System Management Console (SMC) Logger. A generated report will include the warning path.

---

## See Also

[Properties Supported by All Graphical Elements](#)

[Properties Supported by All Graphic Elements With Some Limitations](#)

[Supported Graphic Elements and Additional Properties](#)

[Supported Animations](#)

## Properties Supported by All Graphical Elements

The following properties are supported by all graphic elements in a symbol:

- Angle
- X
- Y
- Width
- Height
- Enable
- Visible
- AbsoluteAnchor
- RelativeAnchor
- Transparency
- ElementStyle
- OwningObject
- Start
- End
- Radius
- Tension
- Custom Property Overrides

**Note:** The ElementStyle property enables users to select a defined element style and apply it to a graphic element. An element style includes options that define color properties like FillColor, LineColor, TextColor and OutlineColor.

## See Also

[Supported Graphical Elements and Known Limitations](#)

## Properties Supported by All Graphic Elements With Some Limitations

The following table lists the properties of graphic elements that can be incorporated with some HTML5 rendering limitations.

Graphic Element Property	Property Limitations
FillColor	Texture is not supported. Some other limitations on FillColor might apply to individual elements.
UnFilledColor	The same limitations of the FillColor property apply to the UnFilledColor property.
LineColor	Texture is not supported.
Font	Only supports the Font Size, Font Type, and Bold or Regular Font Style options of the Font property.
TextColor	Only the Solid Color option of the TextColor property is supported.
FillOrientation	RelativeToScreen is supported only when Color is set as 'Solid' or 'Fill' or 'UnFill'.
FillBehavior	Will always be set to Both.
Runtime Behavior	TabOrder, TabStop, ZoomPercent are not supported on any graphical element.
AutoScale	Is not supported.
ShowGraphic	Is supported.
Line	If the Line graphic is configured with the LineWeight property value more than 1px on the rim of the symbol, it will be Truncated.
Group/Embed Graphic	Supports Visibility, Blink, Disable, Push Button, User Input/Value Display, ShowSymbol and ActionScript animation. Changing the 'Treat as icon', and 'Enabled' properties by script is not supported.

Graphic Element Property	Property Limitations
	<p>%FillHorizontal and %FillVertical animations:</p> <ul style="list-style-type: none"> <li>- Only applies on the group. Not supported for sub elements.</li> <li>- for Button and Image are not supported .</li> <li>- 'Related To Screen' for both group and sub elements are not supported.</li> <li>- when the angle of the sub elements is changed is not supported</li> </ul>

## See Also

[Supported Graphical Elements and Known Limitations](#)

## Supported Graphic Elements and Additional Properties

The following table lists the graphic elements that can be incorporated with some limitations. Any graphic element not listed in this table is not supported.

The table includes a column that lists any limitations of the supported graphic element properties. When using graphics that incorporate color properties, the colors have the same limitations applicable for FillColor, LineColor, and other related graphic properties.

Graphic Elements	Supported Properties	Limitation Notes
Line Polyline Curve 2 Point Arc 3 Point Arc Connector	Line Style: <ul style="list-style-type: none"> <li>• LineWeight</li> <li>• LinePattern</li> <li>• StartCap</li> <li>• EndCap</li> </ul>	StartCap, EndCap: Supported but there maybe slight differences in rendering.
Button	ButtonStyle Text Word Wrap FillOrientation FillColor Alignment	ButtonStyle: Only Standard button style is supported. Word Wrap: Any caption that exceeds the button width will be truncated. FillOrientation:'RelativeToScreen' is only the Color is set. FillColor: Only Solid color is supported. If you have gradients with multiple colors selected, they will be converted to a single color using the first color.

Graphic Elements	Supported Properties	Limitation Notes
		Alignment: Only Centers alignment is supported.
Text	Alignment	Alignment: Only left-top supported.
Image	HasTransparentColor TransparentColor ImageStyle	FillColor, FillPercent and unfilledColor are not supported.
Text Box	Text TextFormat WordWrap LineWeight LinePattern Alignment Font	Flip is not supported
Status	Graphics Expression	Status Style: Only Default configuration is supported.
Trend Pen	Data Source	Trend time Period: Does not support Fixed Type.
Check Box		Selected Value Changes: Irrespective of user settings, only values submitted immediately are supported. Checked: Does not support Checked property.
Radio Button Group	Static Values and Captions States	Selected Value Changes: Irrespective of user settings, only values submitted immediately are supported.
Edit Box		Selected Value Changes: Irrespective of user settings, only values submitted immediately are supported.
Combo Box		Selected Value Changes: Irrespective of user settings, only values submitted immediately are supported. Type: Does not support

Graphic Elements	Supported Properties	Limitation Notes
		MaximumLength
Calendar		<p>Selected Value Changes: Irrespective of user settings, only values submitted immediately are supported.</p> <p>Bold Dates: Is not supported</p> <p>ShowToday: Will always display, even if checked out.</p> <p>Calendar Colors: Is not supported</p>

[Supported Graphical Elements and Known Limitations](#)

## Supported Animations

The following table lists animations supported by the Web Client. When using animations that incorporate color properties, the selected animation colors have the same limitations applicable for FillColor, LineColor, and other related graphic element properties.

**Note:** The following table lists only supported animations. Any animations not listed are not supported by the Web Client.

Animation	Limitations
Element Style	Refer to the graphic elements limitations regarding color, line, and font. The same limitations applicable to graphic elements also apply to Element Style

Animation	Limitations
	<p>animation.</p> <p>Expression Or Reference: Time and Elapsed Time are not supported.</p> <p>Changes to an element style definition become effective only after redeploying or publishing the application.</p> <p>Does not support Windows Common Controls.</p>
Fill Style Line Style Text Style	<p>Refer to graphic element limitations regarding color, line, and font. The same limitations applicable to graphic elements also apply to Element Style animation.</p> <p>Expression Or Reference: Time and Elapsed Time states are not supported.</p> <p>Does not support Windows Common Controls.</p> <p>TextColor: Only Solid Color is supported.</p>
% Fill Horizontal % Fill Vertical	<p>Only RelativeToGraphic is supported.</p>
Slider Horizontal Slider Vertical	<p>A slider can support data binding with a custom property.</p> <p>Slider only supports On Mouse Release when writing to a custom property.</p> <p>Slider does not support Cursor anchor</p> <p>Slider does not support Show Tooltip.</p>
Width Height	<p>Does not support Windows Common Controls.</p>
Orientation	<p>The Relative Anchor or RelativeOrigin are not supported when setting Orientation animation. (Only supported anchor at center).</p>
Value Display	<p>The following display value animations are supported:</p> <ul style="list-style-type: none"> <li>• Boolean value</li> <li>• Analog value</li> <li>• String value</li> <li>• Time value</li> </ul>
Disable	<p>The RadioButton graphic element does not support Disable animation.</p>

Animation	Limitations
Point	Point animation on Curve and ClosedCurve are not supported.
Tooltip	<p>Industrial Graphics Web Client supports Tooltip animation except for Image, Radio Button, Button, and Text graphic elements.</p> <p>Tooltip animation is not supported on Group or embedded symbol.</p> <p>Does not support Windows Common Controls.</p>
Action Scripts	Actions scripts are supported except for functions that invoke dialogs. The ShowGraphic animation is only supported for a Frame window.
Show Symbol	<p>Title: Only supports the default option.</p> <p>Type: Supports Modal and Modeless where the Close button option is checked.</p> <p>Position: Only supports the center where the Client Area x,y value is 0,0</p> <p>Size: Only supports Relative To symbol option.</p> <p>Shortcut: Is not supported.</p>
ShowGraphic	<p>Title: Only supports the default option.</p> <p>Type: Support Modal and Modeless with the Close Button option checked</p> <p>Position: Only supports center, Client Area and x,y value is 0,0</p> <p>Size: Only supports the Relative To Symbol option</p> <p>Shortcut: Is not supported</p>
Hyperlink	Does not support on windows common controls, button, text, and textbox.

## Troubleshooting the Industrial Graphics Web Client

If you are having problems displaying the Industrial Graphics Web Client, you should firstly check the settings described in the topic [Confirm the Settings for an Industrial Graphics Server](#).

**If the Web Client is not displayed, verify the following settings:**

- Confirm that the AVEVA Industrial Graphics Service is running in the Windows® Component Services console.
- Confirm that the AVEVA Plant SCADA Connectivity Service is running in the Component Services console.
- Confirm the user account accessing the Industrial Graphics Web page is associated with the "Industrial Graphics Users" security role (see [Configure User Access for an Industrial Graphics Web Client](#)).
- Confirm that the browser settings have been configured to allow cookies for this web site. Private browsing modes are not supported as they are designed to block cookies by default.
- If IIS is running on the same machine, it may conflict with the Industrial Graphics Web Server.  
If IIS is running and it is not being used, stop and disable the service. If IIS must run, configure to use a port other than Port 80 to avoid conflict.

**If you get a "HTTP Error 404.0 - Not Found" error message when you attempt to launch the Industrial Graphics Web Client:**

- Ensure that Web Client is enabled on the Industrial Graphics Server. Contact your administrator.

**If any graphic primitives or animations are not visible or working as expected:**

- Check the list of unsupported features to see if it is not yet supported by the Web Client.
- Run the Web Client locally via <http://localhost/aig>, browse to the symbol, and look for the compatibility icon to view a list of the unsupported items in the graphic.
- If you use a primitive or animation in a graphic that is not supported, it will be removed and a message logged. The logged message contains the path to a generated CSV report file. You can view the Logger message, and navigate to the report for more information.

**If the selected graphic is displayed but no data is shown or animations are not updated:**

- Ensure Plant SCADA runtime is running if the graphics point to Plant SCADA tags. You should also check if the I/O servers are running.

**If I/O updates are not appearing in the Web Client:**

- This could mean Runtime Manager is not running as a service on your Plant SCADA servers. Check the [Log Viewer](#) for the following message:  
"Failed to connect to 'scada'. Error description: No connection was established with a service endpoint".  
To configure Runtime Manager to run as a service, see [Configure a Runtime Computer for Encryption](#).

**If you get a "Certificate Error: Your connection to this site is not secure" message when accessing the Web Client:**

- This means a valid certificate is not available on the client. Review the process described in the topic [Use SMS Certificates with Web Applications](#).

## Industrial Graphics Web Client Error Handling

Industrial Graphics Web Client provides a uniform error page for displaying expected errors. The error page will be displayed for the following scenarios:

- **No Application** - The Industrial Graphics Web Client could not detect the necessary supporting files for the last application.
- **Permission Denied** - The user currently logged in does not have adequate permission to view the web page. Add the user to the Industrial Graphics Users security role (see [Configure User Access for an Industrial Graphics Web Client](#)).
- **No License Available** - A valid license status is not obtained for the current web session. Confirm that a valid web client license is available.

[Troubleshooting the Industrial Graphics Web Client](#)

## Browser and Mobile Support

### Browser Support

Industrial Graphics Web Client has been tested with the following web browsers:

- Google Chrome
  - Chrome on desktop version 64.0.3282.186 or later
  - Chrome on Android Phone & Pad version 64.0.3282.137 or later
- Microsoft Edge
  - Microsoft Edge on Windows 10 version 41.16299.15.0 or later
  - Microsoft Edge on Surface version 41.16299.248.0 or later
- Apple Safari for IOS version 11.2.6

You will receive an error message if the web browser is not supported.

### Mobile Device Support

Industrial Graphics Web Client supports the following mobile devices and their default browsers:

- Apple iPhone
- Apple iPad

- Android Phone & Tablet
- Microsoft Surface

## Situational Awareness Projects

A Situational Awareness project is designed to support abnormal situation management for operators. It can be used to create a Plant SCADA project that provides accurate information to an operator in a way that can be perceived and acted upon quickly, without overwhelming their cognitive abilities.

This objective is achieved through:

- A consistent look and feel for graphical content.
- The use of standardized color settings, optimized for perceiving process data and alarms.
- The use of objects that conform to an optimized display hierarchy.
- Easy access to information related to the selected context.
- The inclusion of navigation aids and an operator dashboard.

To support these principles, a default layout is applied to projects created using a Situational Awareness Starter project. The layout includes common elements such as a header bar, content area, and a dashboard that displays contextual information and navigational tools. See [Default Layout](#).

Situational Awareness projects differ to other pure template-based projects as they use "Workspace" technology to manage the content of a Master Page that appears on each configured client screen. Each pane in a Master Page displays a page that can be updated independently at runtime based on navigational or contextual changes. The Workspace is responsible for managing contextual updates to those panes by using the association between the hierarchical location of a detected change, and the type of content each pane is configured to display. See [Key Components of a Situational Awareness Project](#).

A set of library objects are also available via an included library project (named "SA\_Library"). The included objects support the Workspace autofill functionality at runtime and maintain a consistent look and feel across a project's display pages (see [Libraries](#)).

---

**Note:** Avoid making changes to the included SA\_Include project for use as a runtime project. A Plant SCADA upgrade will install a new version of the project, which will overwrite any changes you make.

[Interlocks](#)

[Create a Situational Awareness Project](#)

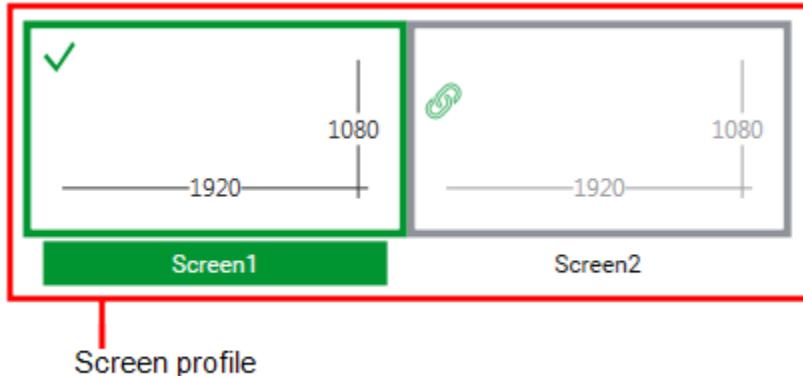

[Customize a Situational Awareness Project](#)

## Key Components of a Situational Awareness Project

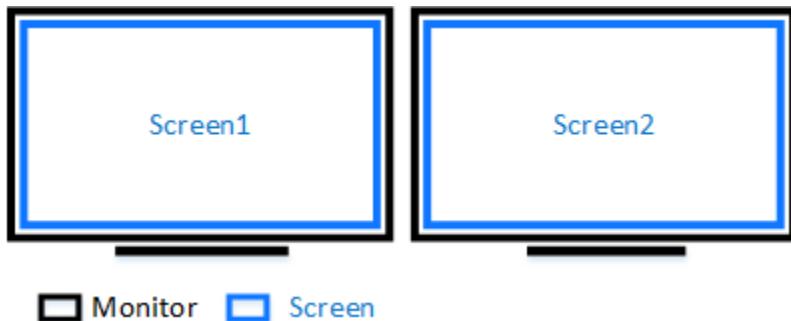

A project created from Situational Awareness Starter Project uses the Workspace architecture to enable the runtime environment to respond to contextual changes. This topic provides an introduction to the key components of this architecture.

- **Screen Profile**

A screen profile defines the arrangement of screens used by a Plant SCADA display client with multiple monitors. You can create a screen profile in the Setup activity in Plant SCADA Studio (see [Screen Profiles](#)).

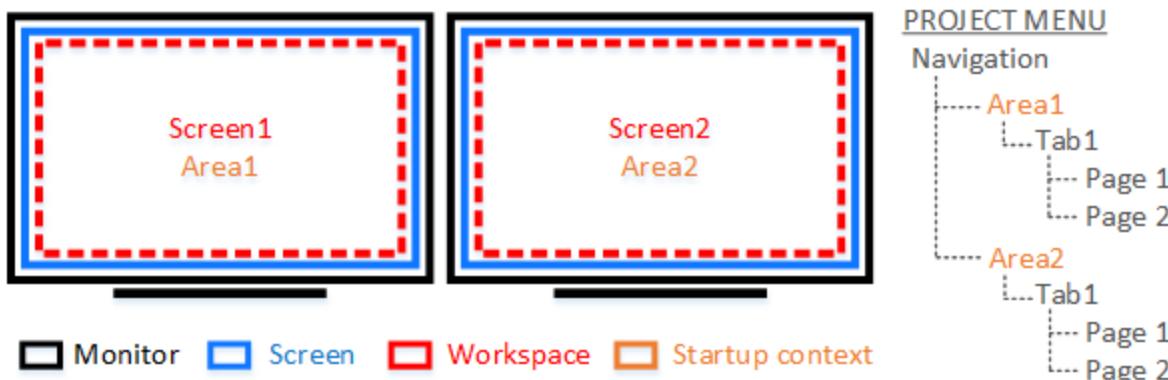

You can then apply a screen profile to a display client using the Screen Setup page of the Computer Setup Wizard.

- **Workspace**

The Workspace is the engine that manages the contextual content changes within each screen. It enables contextual navigation, and optionally provides a tailored, situational awareness-aligned operator experience.

A startup context is set for each Workspace by linking each screen to a Level 1 entry in a project menu named "Navigation". This provides a starting point for any contextual navigation that occurs within the Workspace.

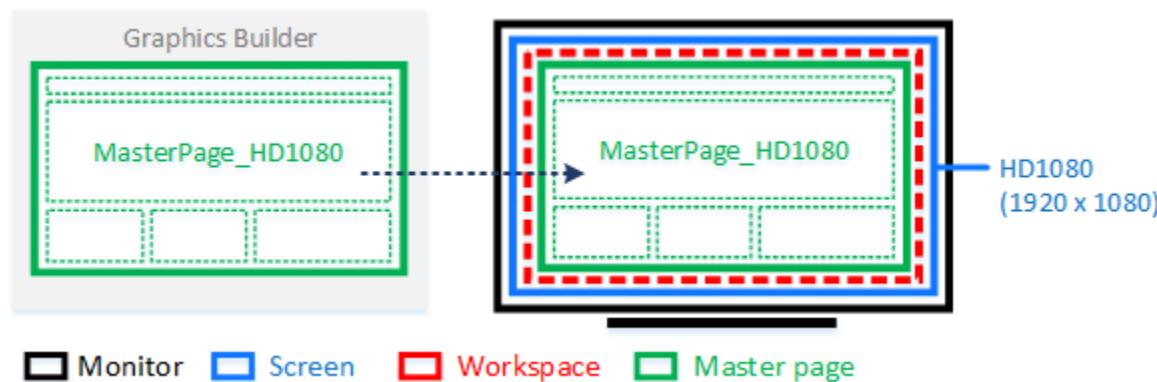

Startup context is set for each screen via the **Screen Setup** page of the Computer Setup Wizard.

For information on how to configure an appropriate navigation menu, see [Prepare the Navigation Menu](#).

- **Master Page**

A master page provides the layout for the content that is managed by a Workspace. It differs from other graphics pages, as it is made up of a set of Panes that each host individual pages at runtime (see "Panes" below).

The size of a master page needs to match the resolution of the screen on which it will display. The master pages that are provided with Plant SCADA come in two resolutions:

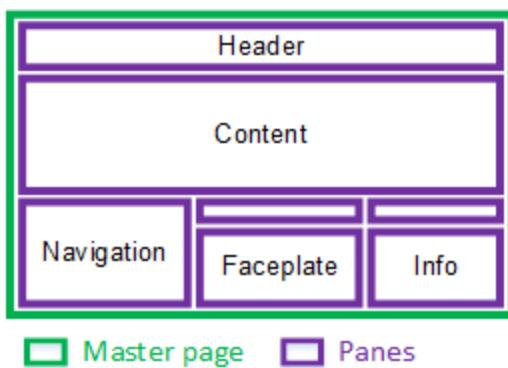

- HD1080 - 16:9 (1920 x 1080)
- UHD4K - 16:9 (3840 x 2160)

To specify the master page that displays on a screen when runtime starts, use the **Screen Setup** page of the Computer Setup Wizard.

To create your own master page, see [Create a Master Page for a Customized Workspace](#).

- **Panes**

Panes are sections within a master page that form a framework for the content that appears at runtime. Each pane hosts a page that can be dynamically updated.

The properties associated with a pane allow you to specify how it behaves when the context of a client changes, the type of content it can display, and how a page fills the space within the pane (see [Configure Panes on a Master Page](#)).

If your project is based on Plant SCADA's Situational Awareness Starter Project, a default layout of panes is available via the included master pages (see [Default Layout](#)).

There are two ways to initiate an update within this architecture:

- Commands — typically used on the Header Bar or a navigation menu to display a page.
- Contextual updates — the content of a pane may update when a piece of equipment comes into context.

Contextual updates are enabled by associating "Content Types" with the equipment and pages in a project. This allows a pane to update automatically when equipment of a particular type comes into context. See [Autofill](#).

## See Also

[Configure Your Project](#)

## Autofill

The Workspace autofill system allows the content on a screen to be automatically updated at runtime based on the current context of a client. Autofill works for all windows that are registered with the workspace, such as the master page window and any popup windows.

For example, if a pump is selected on a display page, the autofill process will update any relevant panes with content that directly relates to the pump, and optionally its parental or child hierarchy.

Autofill works by associating a particular type of content (such as a faceplate or page) with each equipment definition in a project's equipment hierarchy. To align with this, the panes in a workspace can be configured to automatically display matching content types.

When a piece of equipment comes into context, any pane that has autofill enabled will check if the associated content type is the same as the content it is configured to display. If a match is made, the pane will display the content.

To engage Plant SCADA's autofill functionality, you need to perform the following tasks:

- Associate content types with equipment (see [Add Equipment Using Equipment Editor](#)).
- Specify the type of content each pane will display (see [Configure Panes on a Master Page](#))

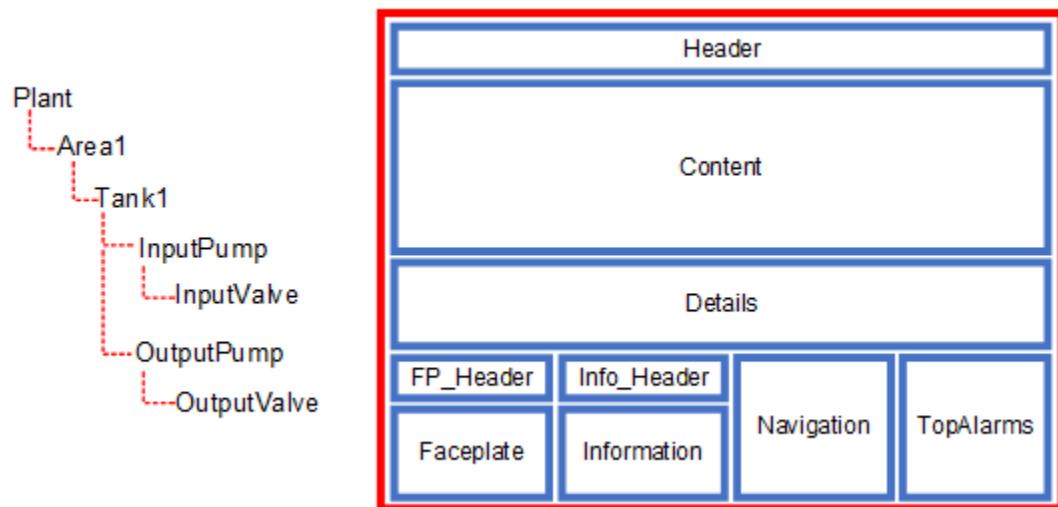

- Specify the type of content for pages in your projects (see [Assign a Content Type to a Page](#))
- Choose the Autofill behavior you want for your system, referred to as the "Context Mode". The default mode is "Current, Then Up, Then Down".

The Context Mode determines if the workspace(s) use content from equipment on higher and lower levels of the equipment hierarchy when context changes, rather than just the selected piece of equipment. To specify how autofill behaves for your system, see [Set the Context Mode for a Workspace](#).

## Example

The following example demonstrates how Context Modes and the configuration of equipment and workspaces allows content to be automatically filled on context change.

The equipment hierarchy below features a tank (Tank1) with an input pump and output pump. Assume that Plant SCADA's autofill functionality will present the content associated with this hierarchy on the following arrangement of panes.

To enable autofilling, the following settings are configured.

### Equipment hierarchy

When you define equipment in a Plant SCADA project, you use the **Content** property to associate each piece of equipment with a particular type of content. In the case of the example above, the following equipment hierarchy is configured.

Equipment	Level	Content	Content Type	Description
Plant	1	Overview_L1	L1	Associated with a level 1 page.
Plant.Area1	2	Area_L2	L2	Associated with a level 2 page.
Plant.Area1.Tank1	3	Tank1_L3	L3	Associated with a level 3 page.
Plant.Area1.Tank1.InputPump	4	Drive_FP	FP	Associated with a drive faceplate.

Equipment	Level	Content	Content Type	Description
Plant.Area1.Tank1.InputPump.InputValve	5	Valve_FP	FP	Associated with a valve faceplate.
Plant.Area1.Tank1.OutputPump	4	Drive_FP	FP	Associated with a drive faceplate.
Plant.Area1.Tank1.OutputPump.OutputValve	5	Valve_FP	FP	Associated with a valve faceplate.

For more information, see [Add Equipment Using Equipment Editor](#).

### Panes

Panes have two properties that determine the outcome of the autofill process.

- **ContentTypes** — defines the type of content the pane will display. You can specify more than one, separated by commas.
- **FillMode** — determines how a pane behaves as context changes. Four fill modes are supported:
  - Static — The content does not change.
  - Autofill — The content will update if the equipment in context has a matching content type.
  - AutofillContextMustMatch — The content will update if the equipment is a direct contextual match and it has content of the type required by the pane (see below).
  - StaticContextMustMatch — The content does not change, but any associations are updated if the equipment is a direct contextual match (see below).

The "ContextMustMatch" options allow you to exclude a pane from a Context Mode setting that allows a workspace to autofill at higher and lower levels of the equipment hierarchy. This means only content that is directly associated with the selected equipment will display.

In the case of the example above, the panes are configured as follows:

Pane	Content Types	Fill Mode	Context Update
Header	—	0 = Static	The pane does not change.
Content	L1, L2	1 = Autofill	The pane will automatically display a level 1 or level 2 page.
Details	L3, L4	1 = Autofill	The pane will automatically display a level 3 or level 4 page.
Faceplate	FP	3 = AutofillContextMustMatch	The pane will only display content associated with the equipment if the

Pane	Content Types	Fill Mode	Context Update
			current context is a direct match.
FP_Header	—	4 = StaticContextMustMatch	The content of the pane will remain static however, any associations will be updated.
Information	—	4 = StaticContextMustMatch	The content of the pane will remain static however, any tag associations will be updated.
Info_Header	—	0 = Static	The pane does not change.
Navigation	—	0 = Static	The pane does not change.
TopAlarms	—	0 = Static	The pane does not change.

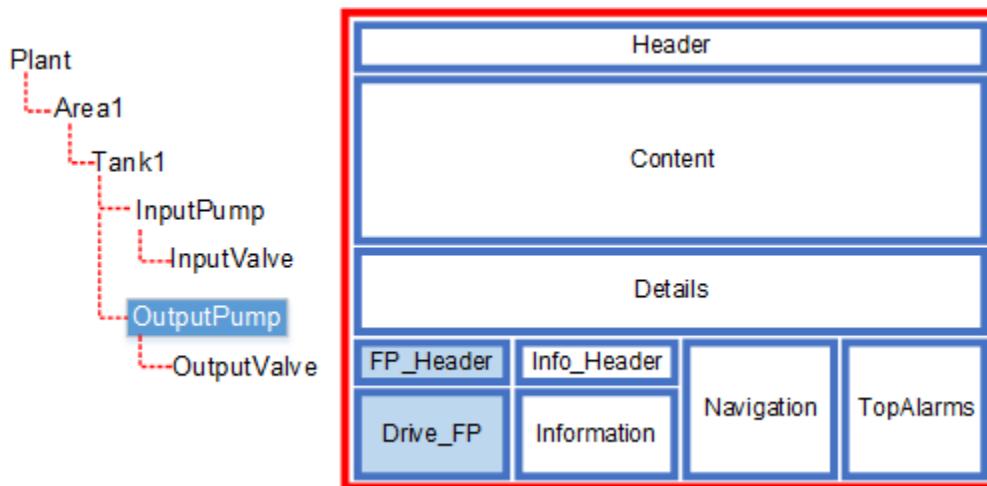

For more information, see [Configure Panes on a Master Page](#).

**Note:** A page can be classified as a particular content type. This allows the system to know what it is, and to match it with a pane content type configuration. See [Assign a Content Type to a Page](#).

The following demonstrates the expected outcome for the above example based on the three available context modes.

- **WS\_CONTEXTMODE\_CurrentOnly**

Only the current piece of equipment is considered when panes are matched with content.

In the case of the example above, the following panes will update when the "OutputPump" is in context.

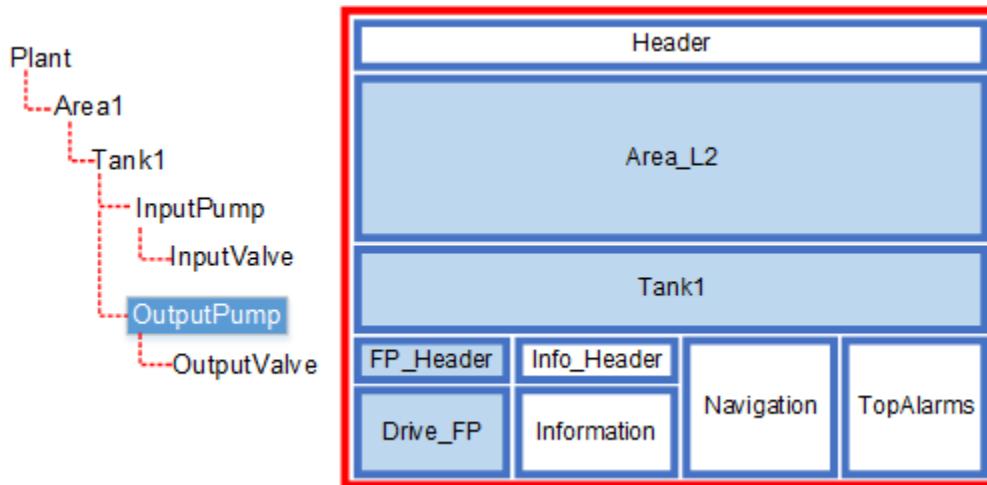

- **Faceplate pane** — 'Plant.Area1.Tank1.OutputPump' is associated with a drive faceplate, which matches

the content type defined for the Faceplate pane. As the FillMode is set to "AutofillContextMustMatch", the faceplate will automatically display in this pane.

- **FP\_Header pane** — The FillMode for this pane is set to "StaticContextMustMatch" which means the displayed page will not change, however any associations will update (for example, the Display Name field).

- **WS\_CONTEXTMODE\_CurrentThenUp**

The current piece of equipment is considered when panes are matched with content. When this process is complete, content types associated with higher levels of the equipment hierarchy are matched with any remaining panes.

In the case of the example above, the following panes will update when the "OutputPump" is in context.

- **Faceplate pane** — 'Plant.Area1.Tank1.OutputPump' is associated with a drive faceplate, which matches the content type defined for the Faceplate pane. As the FillMode is set to "AutofillContextMustMatch", the faceplate will automatically display in this pane.
- **FP\_Header pane** — The FillMode for this pane is set to "StaticContextMustMatch" which means the displayed page will not change, however any associations will update (for example, the Display Name field).

Moving up the hierarchy, 'Plant.Area1.Tank1' is considered next. The following panes will update:

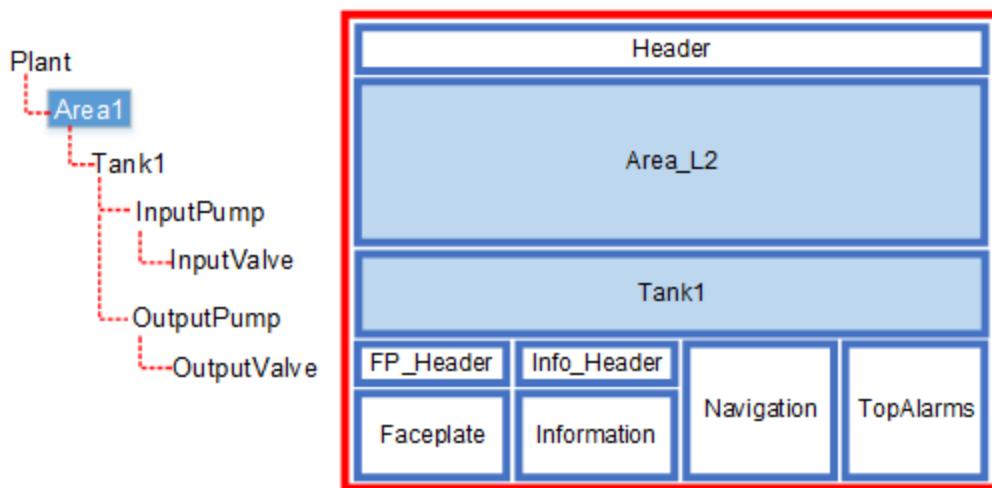

- **Details pane** — 'Plant.Area1.Tank1' is associated with a level three page ("Details\_L3"), which matches the content type defined for the Details pane. As the FillMode is set to "Autofill", the page will automatically display.

Moving up the hierarchy again, 'Plant.Area1' is considered next. The following panes will update:

- **Content pane** — 'Plant.Area1' is associated with a level two page ("Area\_L2"), which matches the content type defined for the Content pane. As the FillMode is set to "Autofill", the page will display.

- **WS\_CONTEXTMODE\_CurrentThenUpThenDown**

The current piece of equipment is considered when panes are matched with content. When this process is complete, equipment on higher levels of the hierarchy are matched with any remaining panes, then equipment on lower levels of the hierarchy are considered.

In the case of the example above, the following panes would be updated when 'Plant.Area1' is in context.

- **Content pane** — 'Plant.Area1' is associated with a level two page ("Area\_L2"), which matches the content type defined for the Content pane. As the FillMode is set to "Autofill", the page will automatically display.

As there are still Autofill panes that are not filled (for example, "Details Pane"), the system begins moving up the hierarchy looking for content.

'Plant' is considered next. It only has content "Overview\_L1" of content type L1, and the only pane that supports that ("Content") has already been filled. The system will then go back to the original context, 'Tank1', and move down the hierarchy to its first child. Only the first child is ever considered when moving down the hierarchy.

Moving down the hierarchy, 'Plant.Area1.Tank1' is considered next. The following pane will update:

- **Details pane** — 'Plant.Area1.Tank1' is associated with a level three page ("Details\_L3"), which matches the content type defined for the Details pane. As the FillMode is set to "Autofill", the page will display.

Moving further down the hierarchy to 'Plant.Area1.Tank1.OutputPump', the FillMode setting for the remaining panes takes affect as the current context is no longer a direct match. The following updates will occur:

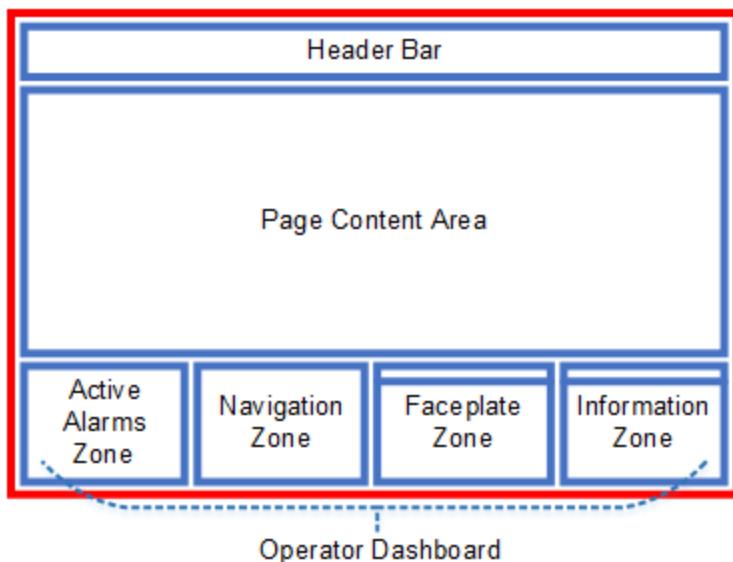

- **Faceplate pane** — As the FillMode is set to "AutofillContextMustMatch", the pane will display its default blank page.
- **FP\_Header pane** — As the FillMode is set to "StaticContextMustMatch", the pane will display its default blank page.

[Key Components of a Situational Awareness Project](#)

## Default Layout

When you create a project using the Situational Awareness Starter project, the default workspace will include the following arrangement of panes.

The [Header Bar](#) includes a set of commands that an operator may require regular access to during runtime.

The Page Content Area displays the pages you create to represent your plant or production facility (see [Create Content Pages](#)).

An operator dashboard also appears along the bottom of the interface. It includes the following sections:

- [Active Alarms Zone](#) (4K only)
- [Navigation Zone](#)
- [Faceplate Zone](#)
- [Information Zone](#).

A set of [Default Alarm Pages](#) can also be launched via the Header Bar.

The master page that is a foundation for this arrangement of panes is available in two screen sizes:

- HD1080 (1920 x 1080, 16:9)
- UHD4K (3840 x2160, 16:9)

---

**Note:** The Active Alarms Zone is not available on the HD1080 version of the workspace. Instead, an HD1080 project includes a **Top 5 Alarms** button on the [Header Bar](#).

In a project created from the Starter Project, the default layout is only applied to a single screen profile for a primary monitor. If you would like to create a screen profile for a display client with multiple monitors, see [Set Up a Screen Profile for Multiple Monitors](#).

## See Also

[Key Components of a Situational Awareness Project](#)

## Header Bar

The default layout for a Situational Awareness project comes with a header bar. It includes a set of commands

that an operator may require regular access to during runtime. These commands can be customized.

Icons	Common tools	Description
	Header Logo	<p>By default the Plant SCADA logo is used. However, this is configurable. To display your own logo in the allocated space, import the logo into Graphics Builder and save it as a symbol in your project. Assign the name of the symbol (in the format "library.symbol") to the project INI parameter [Page]Logo. See <a href="#">Customize the Logo on the Header Bar</a>.</p>
	Home	<p>Displays the home page. The home page is specified in a project's Navigation Menu. The menu's highest Level 1 entry sets the context for the workspace, the Target Page field for the entry identifies the home page. See <a href="#">Prepare the Navigation Menu</a>.</p>
	Page Navigation	<p>Back, Forward and Up page navigation commands. Back and Forward allow you to move between pages in the current browse history or stack. Up allows you to move up a level in a set of hierarchical pages. In multi-monitor systems, the stack is per monitor and not linked. When a log out occurs, the stack is deleted.</p>
	Trends	<p>Opens the trend summary page for the operational area, allowing you to access predefined trends (see <a href="#">Default Trend Pages</a>).</p>
	Active Alarms	<p>Displays alarms that are unacknowledged, or acknowledged and still in an alarm state (see <a href="#">Default Alarm Pages</a>).</p>
	Historical Alarms	<p>Displays an historical log of alarms (see <a href="#">Default Alarm Pages</a>).</p>

Icons	Common tools	Description
	Shelved Alarms	Lists alarms that are temporarily disabled (see <a href="#">Default Alarm Pages</a> ).
	Hardware Alarm	Displays a list of hardware alarms that are unacknowledged, or acknowledged and still in alarm state (see <a href="#">Default Alarm Pages</a> ). A flashing circle underneath the hardware alarm icon indicates there are unacknowledged hardware alarms.  
	Top 5 Alarms	Displays the top 5 active alarms visible to the operator. This button is not included on a header bar for a UHD4K workspace.
<b>Overview (L2)</b> MyPlant > F & B	Page Name	Title of page selected in navigation zone and displayed in page content area. If page is not in the navigation menu the message "Page does not exist in Navigation menu" will be displayed. Underneath the title of the page the menu breadcrumb displays.
<b>User: John Smith</b>	User	Name of logged in user. For example, John Smith is the current logged in user.
	Login	Allows a user to log in to a runtime system, providing access to additional functionality based on the user group or groups to which they belong. The drop-down menu provides access to the Logout command.
	Options	Allows you to toggle visibility of some display options for the objects in a runtime system. Select the relevant option from the drop down list.

Icons	Common tools	Description
		 Show or hide Control Links (see <a href="#">Add a Control Link</a> ).  Show or hide engineering/PV values.  Show or hide labels.
	Help	Opens a pane that displays runtime help.
	Date/Time	The current date and time.
	Shutdown	Shuts down the runtime system.

#### To customize a menu command:

1. In the **Visualization** activity, select **Menu Configuration**.
2. In the **Page** column, locate the menu entries that use the name "Headerbar".
3. Select the item that you want to customize. The **Level 1** column should provide a description of the header bar commands.
4. Go to the **Menu Command** field.
5. Enter a Cicode function, or select one from the drop-down list.
6. Modify the parameters as required.
7. Click **Save**.

**Note:** If you want to change the content of the header bar, you should make a copy of the header bar page (for example, "DefaultHeaderbar\_HD1080" or "DefaultHeaderbar\_UHD4K") and modify it. You can then assign the updated page as the Default Page in the master page's header pane.

#### See also

[Default Layout](#)

#### Active Alarms Zone

**Note:** The Active Alarms Zone only appears on the operator dashboard if the workspace is based on the high definition 4K master page ("Master\_PageMenu1\_UHD4K"). For an HD1080 project, you can view active alarms via the **Top 5 Alarms** button on the [Header Bar](#) or on the [Alarm page](#).

The Active Alarms Zone displays a list of alarms for a runtime system.

Date	Time	Name	Desc	State
◆ 23/08/2017 09:04:...		Drive10_Running_Fa...	Drive10_No_Runn...	ON
◆ 23/08/2017 09:04:...		Drive11_Running_Fa...	Drive11_No_Runn...	ON
◆ 23/08/2017 09:04:...		Drive12_Running_Fa...	Drive12_No_Runn...	ON
◆ 23/08/2017 09:04:...		Drive13_Running_Fa...	Drive13_No_Runn...	ON
◆ 23/08/2017 09:04:...		Drive14_Running_Fa...	Drive14_No_Runn...	ON
◆ 23/08/2017 09:04:...		Drive15_Running_Fa...	Drive15_No_Runn...	ON
◆ 24/07/2017 11:46:...		Drive4_Drive5_Runn...	Drive4_Drive5_N...	ON
◆ 24/07/2017 11:46:...		Drive5_Running_Fal...	Drive5_No_Runni...	ON
◆ 24/07/2017 11:46:...		Drive6_Running_Fal...	Drive6_No_Runni...	ON
◆ 24/07/2017 11:46:...		Drive7a_Running_Fa...	Drive7a_No_Runn...	ON

By default, the alarms are sorted according to the Highest Priority Order setting for the Alarm Server in Plant SCADA Studio. Within each priority, they are listed in the following order:

- Unacknowledged and active
- Unacknowledged and inactive
- Acknowledged and active
- Disabled or Shelved

Within these groups, alarms are listed according to the time they occurred.

If your project is based on the Situational Awareness Starter Project, the default columns presented for each row in the alarms list will include:

- Date – the date when the alarm became active
- Time – the time when the alarm became active
- Name – the name of the alarm tag
- Description – a description of the alarm
- State – the current state of the alarm.

---

**Note:** The default arrangement of columns in the alarms list is based on a display format named "TopActiveAlarms\_UHD4K". You can adjust this format in your project using the **Parameters** view in the **Setup** activity.

---

Each alarm also has an icon that indicates the severity and state of the alarm. The appearance of an icon represents the following:

## Color and shape

The color and shape of an alarm icon indicates the priority of an alarm.

If your project is based on the Situational Awareness Starter Project, the following default icons will be used to indicate priority:

-  High priority alarm
-  Medium priority
-  Low priority alarm

If these icons have been customized, their appearance will be determined by the display properties specified for each alarm priority (see [Configure Display Properties for an Alarm Priority](#)).

## Flashing icon

If an alarm icon is flashing it means the alarm is unacknowledged.

## Transparent icon

If the color of a flashing icon appears at half-intensity, it indicates that the alarm has cleared but remains unacknowledged. The icon will remain transparent and continue to flash until the alarm is acknowledged or reactivated.

You can use the Active Alarms Zone to perform the following actions at runtime:

## Navigate to the associated object

To bring the object associated with an alarm into context, right-click on it and select **Navigate** from the menu that appears.

## Acknowledge an alarm

To acknowledge an alarm, right-click on it and select **Acknowledge** from the menu that appears.

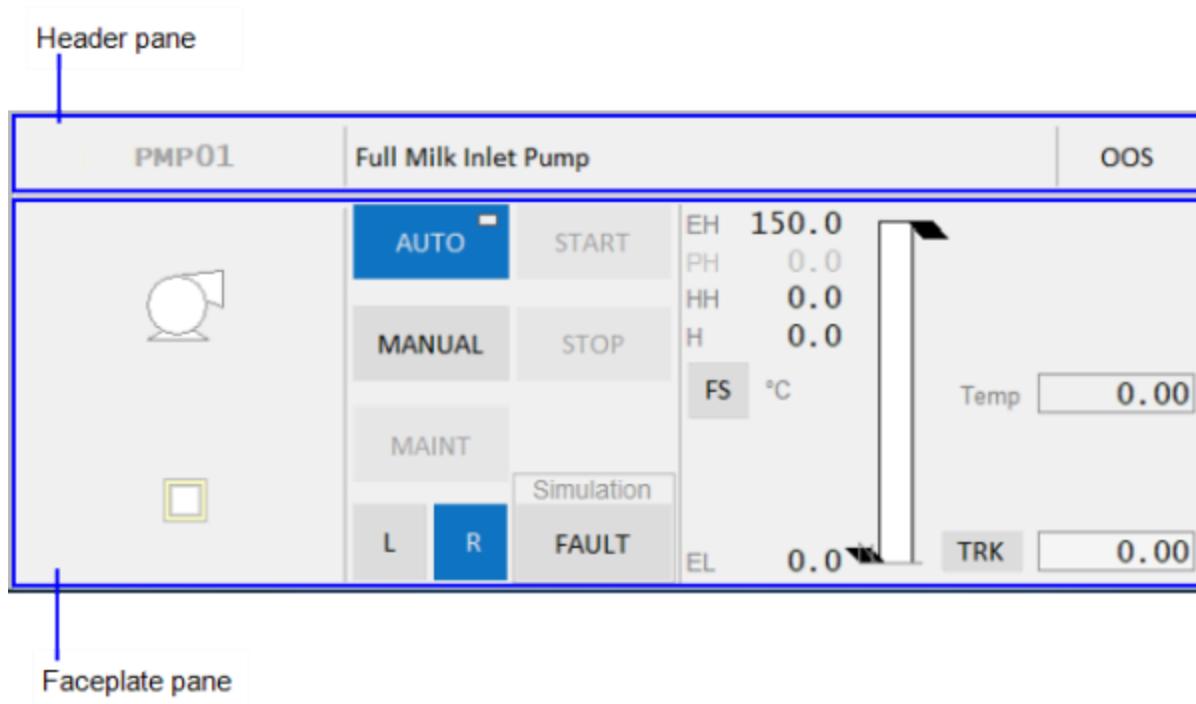

## See Also

[Default Layout](#)

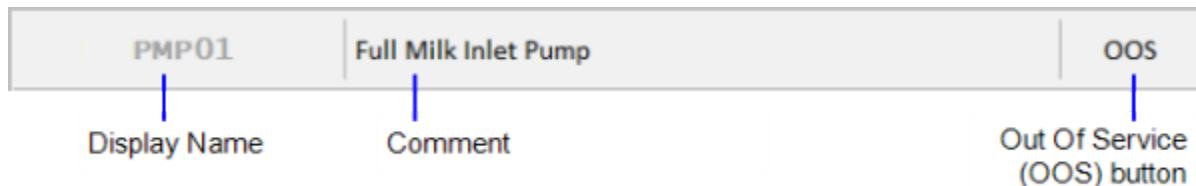

## Faceplate Zone

If an object on a display page has a faceplate associated with it, the faceplate will display in this section of the dashboard when the object is selected.

The area the faceplate section occupies is constructed using two panes.

## Header pane

The header pane includes three parts:

- **Display name** — If a Display Name is configured for the selected piece of equipment, it will display here. Cluster context is also included.  
If a Display Name is not configured for the object, a truncated equipment path for the object will appear. If required, the equipment path can be displayed as a tool tip.
- **Comment** — If a Comment is configured for the selected piece of equipment, it will display here.
- **Out Of Service (OOS) button** — Allows you to put the selected piece of equipment out of service, for example, for maintenance or repair.

While the equipment is out of service, its alarms are suppressed.

The OOS button has three operational states:

- If the button is light grey, it means the equipment is currently operational and cannot be placed out of service. You will need to stop the piece of equipment before you can use the OOS button.
- If the button is active, it indicates that you can use the button to place the piece of equipment out of service.
- If the button is dark grey, it indicates that the piece of equipment is currently out of service.

## Faceplate pane

The faceplate pane behaves in the following ways:

- If the selected object has a faceplate associated with it, it will display here.
- If the selected object does not have a faceplate associated with it, the pane will display "No faceplate available".
- If no object is selected, this pane will display "No object is selected".

## See also

[Default Layout](#)

## Information Zone

The Information Zone appears on the Operator Dashboard. It includes a set of tabs that present different types of information about the object that is currently in context. These tabs include **Alarms**, **Trends** and **Interlocks**.

## Alarms

The Alarms tab displays alarms associated with the object that is currently in context. Alarms are sorted in order of importance with the highest priority alarms displayed at the top of the list. When an alarm clears, it is removed from the list.

ALARM	TREND	INTERLOCKS
◆ 03:49:26 PM V_OP		Drive1_V_OP_HH_P1
◆ 10:10:46 AM S_Running		Drive1_Running_False_P1
▲ 03:49:26 PM OP_TRK		Drive1_OP_TRK_H_P2
▼ 03:49:26 PM V_Feedback		Drive1_V_Feedback_H_P3

Cause	Drive is overheating.
Response	Check the thermostat.
Response Time	00:05:00
Consequence	Drive may fail.

If your project is based on the Situational Awareness Starter Project, the default columns presented for each row in the alarms list will include:

- Time – the time the alarm became active.
- Item – the associated equipment item.
- Tag Name – the name of the alarm tag.

**Note:** The default arrangement of columns is based on a display format that is defined in the SA\_Include

---

system project. The format will be named "InfoAlarm\_HD1080" or "InfoAlarm\_UHD4K", depending on the resolution of the workspace master page. You can adjust this format by modifying [Format]FormatName in the **Parameters** view of the **Setup** activity (see [Project Database Parameters](#)).

---

Each alarm also has an icon that indicates the severity and state of the alarm. If your project is based on the Situational Awareness Starter Project, the following default icons will be used to indicate priority:

-  High priority alarm
-  Medium priority
-  Low priority alarm

If these icons have been customized, their appearance will be determined by the display properties specified for each alarm priority (see [Configure Display Properties for an Alarm Priority](#)).

If an alarm icon is flashing it means the alarm is unacknowledged. If the color of a flashing icon appears at half-intensity, it indicates that the alarm has cleared but remains unacknowledged. The icon will remain transparent and continue to flash until the alarm is acknowledged or reactivated.

You can use the right-click menu on the alarms list to perform the following actions at runtime:

1. **Acknowledge** an alarm.
2. Shelve an alarm. Select one of the following options:
  - **Shelve for ...** — switches the view to the Shelve form, which allows you to disable an alarm for a specified period of time, or indefinitely.
  - **Shelve until ...** — switches the view to the Shelve form, which allows you to disable an alarm until a specified date and time.
3. **Restore** an alarm.

The panel below the alarms list shows user-configured [Provide Cause and Response Information to Operators](#) information for the selected alarm. Up to eight sets of cause and response information can be associated with an alarm; the arrow buttons to the right of the panel allow an operator to navigate through the suggested responses. To add cause and response information to alarms, see [Add Cause and Response Information to Alarms](#).

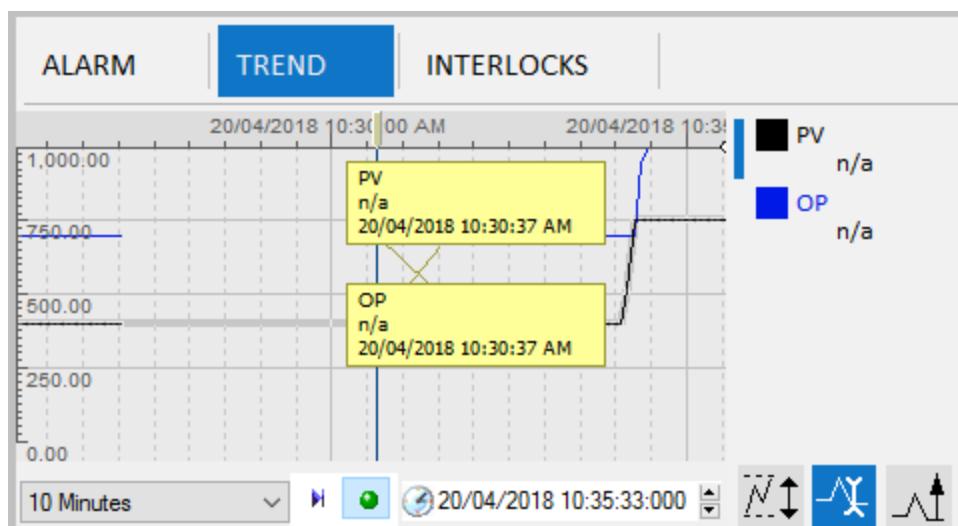

---

**Note:** If an object with an active alarm indicator does not display any alarms in the Information Zone when selected at runtime, it may mean that the alarm indicator has been configured to respond to "child" levels down the equipment hierarchy, or referenced equipment. These indirect equipment locations are not reported in the Alarms Information Zone for a selected piece of equipment. If this situation occurs, use a higher-level alarm count or an alarm page to determine the location of the active alarm.

---

## Trends

The Trend tab displays a graphical view of data associated with the object that is currently in context. This is presented using a compact version of Plant SCADA's Process Analyst.

The chart view displays data for the selected object using a set of pens that are color-coded and listed to the right of the chart. Each pen draws sample values against time. By default, the view will show the first five trends in alphabetical order by tag name.

Pens can be configured in one of the following ways:

- For each equipment item to be displayed on the chart: add an [Define Equipment Runtime Parameters](#) named "InfoZoneTrends" for each equipment to be displayed on the chart.
- As a global default: Configure the INI parameter [Workspace]InfoZoneTrends to display the required [Items](#).
- By a specific Equipment Type: Configure the INI parameter [Workspace]InfoZoneTrends.<Type> where <Type> matches a name in the Equipment Type view. For example, "InfoZoneTrends.Drive". The value of the parameters is a comma-separated list of equipment item names.

The following display commands are available from the navigation bar that runs along the bottom of the chart view.

Tool	Description
<b>10 Minutes</b>	<b>Span Picker</b> The Span Picker contains commonly used predefined time spans that you can select from a drop-down menu. The time span of the trend display represents the difference between the start of the chart and the end time. Selecting a time span adjusts the start time and leaves the end time as it is.
	<b>Synchronize to Now</b> The Synchronize to Now command synchronizes every pen such that the date/time reflects "Now", which is positioned on the right edge of the chart. "Now" is calculated using the current system time.
	<b>Toggle Autoscrolling</b> When Autoscroll is turned on, as time passes the

Tool	Description
	position of the pens moves by the same amount to keep pace. By default, the display is updated every second. When Autoscroll is turned off, as time passes the position in time of pens remain fixed.
 20/04/2018 10:35:33:000 ▲▼	<b>End Date/Time Picker</b> You can use the End Date/Time Picker to specify an end time for the chart view. You can type in a date or time explicitly, or you can use the up/down arrow buttons to increment or decrement the value respectively.

You can also use the following command buttons:

Tool	Description
	<b>Edit Vertical Scale</b> This command allows you to edit the vertical scale of a selected analog pen. It opens a dialog that allows you to enter new minimum and maximum values for Limits or Engineering Scale. The Engineering Scale values are obtained from the source tag. <b>Note:</b> The engineering scale is used by default.
	<b>Toggle Cursor</b> A cursor allows you to determine the value of a pen at a given point in time by dragging the cursor to a specific point on the pen line. A cursor label is used to display the value. This button allows you to toggle the cursor on and off.
	<b>Display in Trend Page</b> This button opens the <a href="#">Default Trend Pages</a> in the main display area, allowing you to view the current trend chart on a larger scale. <b>Note:</b> If you have navigated to the default Trend page using this button and you return to the graphic page and click the <b>Back</b> button, the graphic page that you browsed to last will be displayed (instead of the Trend page).

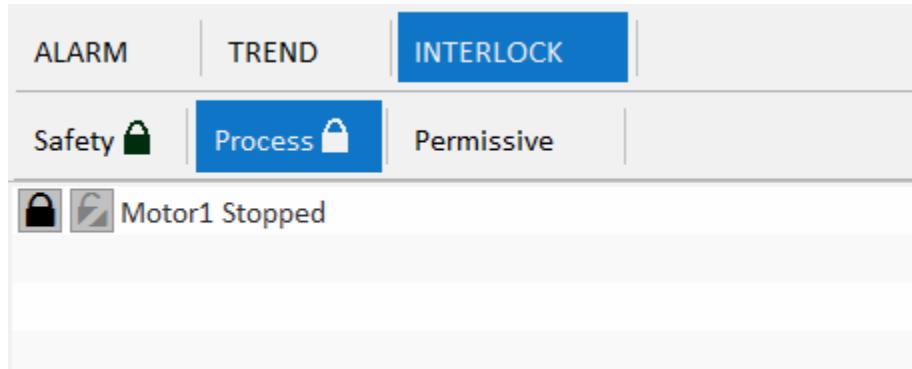

## Interlocks

An interlock is a physical connection between two pieces of equipment that links their operation, so that an event in one piece of equipment will trigger an action in the other (see [Interlocks](#)).

The **Interlocks** tab provides details of any active interlocks that may be associated with the currently selected piece of equipment. It includes a secondary set of tabs that reflect the categories used to identify the nature of an interlock. The Situational Awareness Starter Project provides the following default categories.

- Safety — conditions that cause equipment to stop running.
- Process — conditions that cause equipment within a process to stop running.
- Permissive — conditions that stop equipment from starting.

If there are any active interlocks within a category, a lock symbol is displayed on the associated category tab.

The interlocks are listed on each tab from oldest (triggered first) to most recent. The list includes the following set of default columns.

Column	Description
State	If an interlock is active, a black lock icon is displayed.  If an interlock has cleared, a white box is displayed. 
Bypass	Interlocks can be configured to support a bypass. This means an operator can manually override the interlock, forcing the locked process to be available to start. See <a href="#">Configure a Bypass for an Interlock</a> . If an interlock is capable of being bypassed (but is currently not bypassed), a gray lock icon is displayed.  <b>To bypass an interlock:</b> <ol style="list-style-type: none"><li>1. Right-click on the interlock and select <b>Bypass</b>.</li><li>2. In the Bypass form, enter a <b>Reason</b> for the bypass (if required).</li></ol>

Column	Description
	<p>3. Click <b>Yes</b>.</p> <p>An event will be added to the sequence of event journal in the following format:</p> <p>&lt;Cluster&gt;.&lt;Equipment&gt;.&lt;Item&gt; @ (INTERLOCK BYPASSED:)&lt;Reason&gt;</p> <p>If the interlock is currently bypassed, a purple lock icon is displayed.</p>  <p><b>To remove a bypass:</b></p> <ol style="list-style-type: none"> <li>1. Right-click on the interlock and select <b>Remove Bypass</b>.</li> <li>2. In the Bypass form, enter a <b>Reason</b> for the removing the bypass (if required).</li> <li>3. Click <b>Yes</b>.</li> </ol> <p>An event will be added to the sequence of event journal in the following format:</p> <p>&lt;Cluster&gt;.&lt;Equipment&gt;.&lt;Item&gt; @ (INTERLOCK BYPASS REMOVED:)&lt;Reason&gt;</p> <p>If an interlock is not configured to support a bypass, no icon is displayed in the column.</p>
Comment	A description of the interlock. The description is sourced from the <b>Comment</b> field for the associated Equipment Reference.

**Note:** The default arrangement of columns is based on a display format that is defined in the SA\_Include system project. The format will be named "Interlock\_HD1080" or "Interlock\_UHD4K", depending on the resolution of the workspace master page. You can adjust this format by modifying [\[Format\]FormatName](#) in the **Parameters** view of the **Setup** activity (see [Project Database Parameters](#)).

To go directly to the page on which the interlocking piece of equipment is homed, right-click on an interlock and select **Navigate**.

[Default Layout](#)

## Navigation Zone

The Navigation Zone on the operator dashboard serves two purposes:

- Page navigation — the tabs and buttons can be used to switch between different display pages.
- Alarm counts — each tab and button displays an alarm count for the location it opens, providing an overview of the current alarm conditions.

**Note:** To enable alarm counts in the Navigation Zone, there are a number of project settings that need to be configured correctly. For more information, see [Enable Navigation Zone Alarm Counts](#).

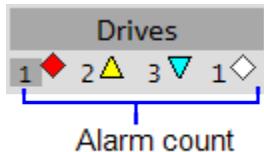

## Page Navigation

The layout of the tabs and buttons is determined by a project's page menu.

Level 1 of the menu sets the overall context for the workspace. The tabs along the navigation section header represent the menu's level 2 entries. The buttons on each tab represent up to 20 lower-level menu entries, displayed from left to right in arrangement determined by the Order property.

## Alarm Counts

Every tab and button in the navigation zone supports an alarm count that indicates how many alarms are currently active for equipment homed on the associated page.

By default, the alarm count represents the following:

- The number of active alarms in the highest priority (that is, the priority with the lowest value)
- The number of active alarms in the next highest priority
- The number of active alarms in the third highest priority
- The number of alarms that are currently shelved.

**Note:** If required, you can use the parameter [Workspace]NumberOfTopPriorities to display an additional alarm count for the fourth highest priority. For more information, see [Add an Additional Alarm Count to the Navigation Zone](#).

The maximum value that can be displayed for each alarm count is 99. If more than 99 alarms are active in a particular category, "99+" will display. You can confirm the exact number of alarms via a tool tip.

Each value appears to the left of an animated icon that indicates the priority the value represents. These icons are configured via the **Small Genie Name** property for each alarm priority. For more information, see [Configure Display Properties for an Alarm Priority](#).

A grey bar is used to highlight the tab and button that contain the most recent unacknowledged alarm that is currently in an ON state. The number next to the priority which is most important will also be highlighted.

For more information on how to prepare a project's menu for the navigation zone of the operator dashboard, see [Prepare the Navigation Menu](#).

## See Also

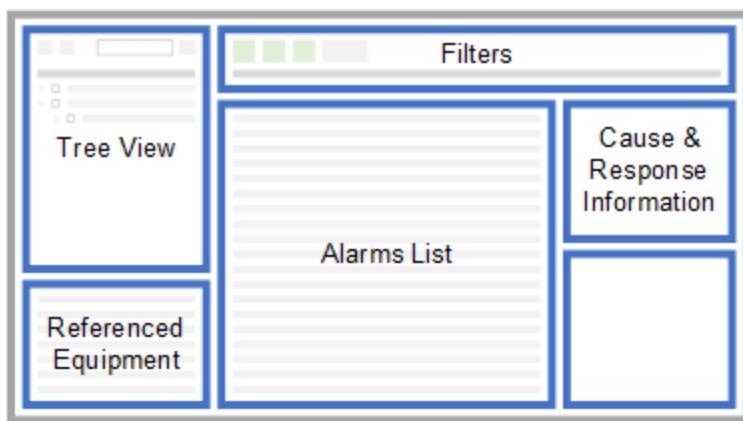

[Default Layout](#)

## Default Alarm Pages

A project created using the Situational Awareness Starter Project will include a set of default alarm pages that are accessible from the runtime [Header Bar](#). Select one of the buttons described in the table below to display an alarm page in the page content area (see [Default Layout](#)).

	Active Alarms	Alarms that are unacknowledged, or acknowledged and still in an alarm state.
	Historical Events	An historical log of alarms and operator activity.
	Shelved Alarms	Alarms that are temporarily shelved/disabled.
	Hardware Alarms	Hardware alarms that are either unacknowledged or acknowledged and still in alarm state.

Apart from the Hardware Alarms page (which includes just a basic alarms list), these pages share a common layout that features the following sections:

## Alarms List

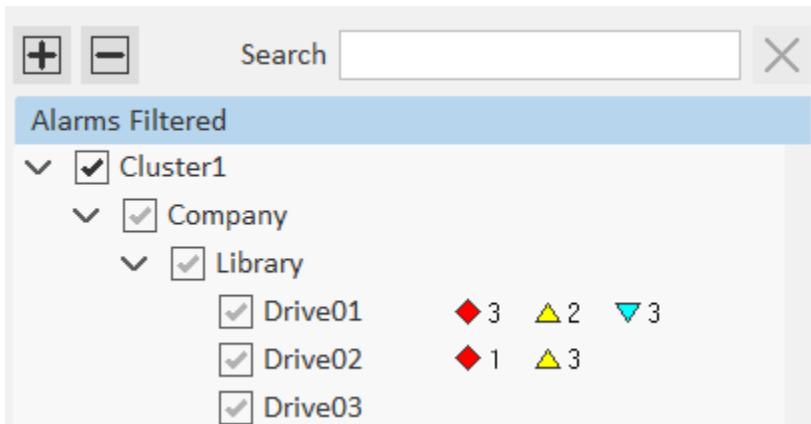

The content of the alarms list is determined by the following:

- The filters that are currently enabled (see *Filters* below).
- Any current selections in the Tree View. The list will only include alarms associated with the selected items (see *Tree View* below) and any selected referenced equipment (see *Referenced Equipment* below).

The default arrangements of columns is determined by the type of alarm page that is displayed and the default format specified for it by the [\[Format\]FormatName](#) parameter. You can rearrange the columns if required.

## Tree View

The tree view provides a hierarchical view of a project's equipment hierarchy. You can use it to filter the displayed list of alarms.

Each item in the tree view includes:

- Check boxes allow you to select one or more items in the tree.
- Alarms counts indicate the number of associated alarms in the top three alarm priorities, as well as the number of shelved alarms.

The alarms list will be filtered to display alarms associated with the selected items.

---

**Note:** You can use the parameter [Workspace]NumberOfTopPriorities to display alarm counts for the top four alarm priorities (instead of the top three). For more setup information, see [Configure Display Properties for a Fourth Alarm Priority](#).

---

To customize a tree view, see [Add a Tree View to a Page](#).

## Filters

This section of an alarms page allows you to filter the alarms list according to priority, state and acknowledgment. The **Current Filter** description indicates if any filters are currently active for the alarms list.

---

**Note:** You can add your own filters buttons to an alarm page using a set of provided Genies. See [Add an Alarm Filter Button](#).

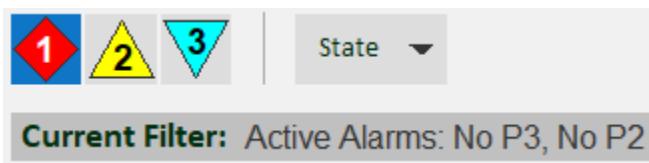

---

### Priority Filters

The alarm priority buttons allow you to filter out alarms included in the top three alarm priorities. By default, the three buttons are selected (as indicated by a colored background).

If you toggle a button off, the alarms assigned to the alarm priority will be removed from the list. The current filter description will indicate that the P1, P2 or P3 alarms are no longer displayed.

The Historical Events page also features a button that allows you to filter out shelved alarms.

You can add a fourth-highest alarm priority filter to alarm pages. See [Add a Fourth Alarm Priority Filter to Alarm Pages](#).

### State Filters

The State filter button allows you to filter out alarms that are in a specific state.

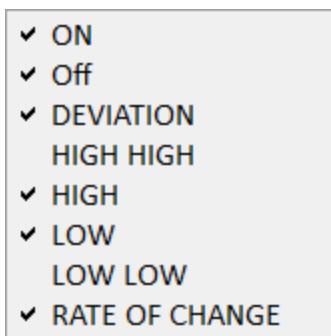

---

**Note:** This button is not available on the Shelved Alarms page.

---

When you click on the button, a check list of alarm states appears.

Select the alarm states that you would like to include in the alarm list. The current filter description will indicate if any states are not selected.

**Current Filter:** Active Alarms: No HIGH HIGH, No LOW LOW

#### Acknowledgment Filters

The Historical Events page also features button that allows you to filter **Acknowledged** and **Unacknowledged** alarms.

Acknowledged

Unacknowledged

By default, both buttons are selected (as indicated by a colored background). If you toggle a button off, the associated alarms will be removed from the list.

#### Cause & Response Information

This section of an alarms page displays cause and response information for a selected alarm (see [Provide Cause and Response Information to Operators](#)).

**Cause and Response for selected alarm:** < >

Cause	Drive1 is overheating.
Response	Check the thermostat.
Response Time	00:05:00
Consequence	Drive may fail.

The information presented includes:

- Cause — a description of the cause of an alarm.
- Response — a description of the appropriate response to an alarm.
- Response Time — the period of time in which the specified response needs to be acted upon.
- Consequence — a description of the likely outcome if the suggested response is not acted upon within the specified response time.

If multiple sets of cause and response properties are configured for an alarm, you can use the arrow buttons at the top right corner to scroll through them.

## Referenced Equipment

This section displays any [Equipment References](#) that are associated with the equipment that is currently selected in the Tree View.

Referenced Equipment		
Equipment	Full Name	Reference Type
<input checked="" type="checkbox"/> PMP01	MyPlant.FullMilk....	Interlock_Proce...

The **Referenced Equipment** header indicates the piece of equipment that is currently selected. The list beneath displays any equipment for which an associated equipment reference has been configured.

You can use the check box at the start of each row to add the referenced equipment to the current filter for the main alarms list. You can also use the **Clear All>Select All** button to toggle the selection of all the equipment references in the list.

If the check box has a grey background, it means the piece of equipment is already selected in the Tree View. If you select **Clear All** while a piece of equipment is in this state, it will deselect the piece of equipment in both the Referenced Equipment list and the Tree View.

### **See Also**

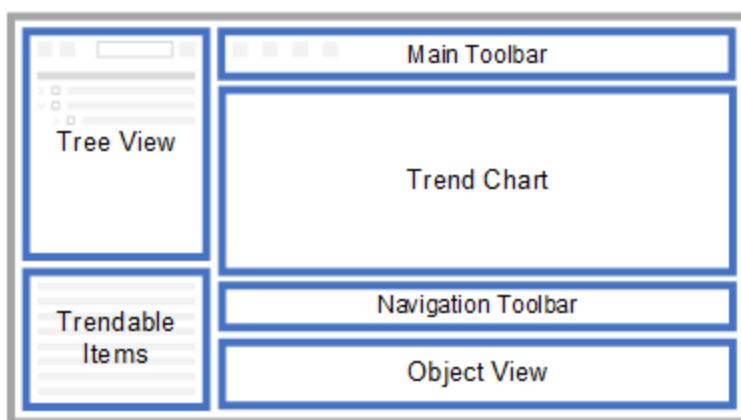

## Default Layout

## Default Trend Pages

A project created using the Situational Awareness Starter Project will include a default trend page that is accessible from the runtime [Header Bar](#). Click on the icon below to display a trend page in the page content area (see [Default Layout](#)).

The default trend page allows you to analyze specific trends and alarms for equipment. The layout of the default trend page features the following sections:

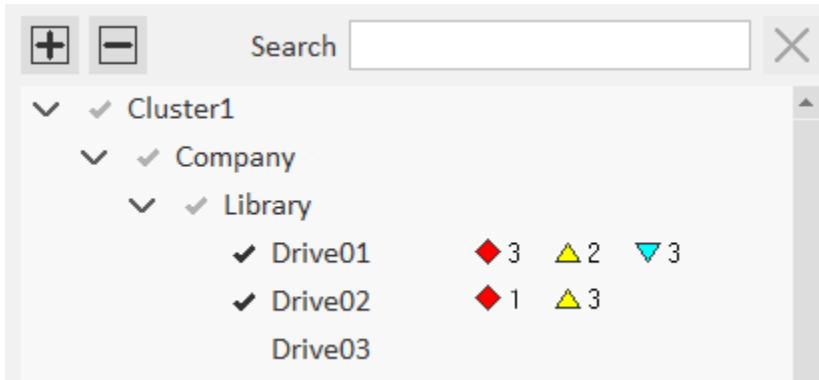

Behaviors that you will observe when you navigate between pages include:

- Navigating to a different page within the Workspace will not affect the trend page. Your pens, currently selected object in the Object Tree and any text entered in the Search box will be retained.
- Navigating to a different page and selecting a different equipment and then navigating back to the trend page will clear the entry in the Search box and also select the equipment in the equipment tree.
- Navigating to a different page and selecting a different equipment and clearing that selection before navigating to the trend page will retain your configuration on the trend page.

**Note:** You can launch the trend page from other pages using the buttons in the Information Zone's Trend tab. This will launch the trend page with the trend for the object selected on that page.

## Tree View

The tree view provides a hierarchical view of a project's equipment hierarchy.

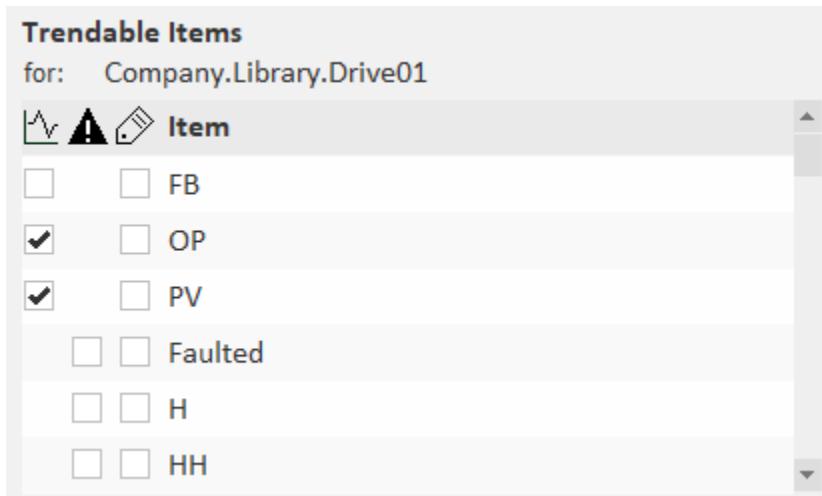

The tree view displays:

- Check marks for objects that have an active trend.
- Gray check marks for objects whose children have an active trend.
- Alarm counts that indicate the number of associated alarms in the top three alarm priorities, as well as the number of shelved alarms.
- Buttons to expand (+) and collapse (-) the tree.
- Search box that you can use to filter the displayed list of objects.

## Trendable Items

The Trendable Items section lists the items associated with each piece of equipment that you can add to the trend chart.

The following icons indicate the 'type' of an item (tag):

	Trend items
	Alarm items
	Instant items (variable)

A check box is displayed for each applicable type. Select the required check boxes to add them to the chart. Up to 16 trends can be added. When the limit is reached, the check boxes are hidden.

## Trend Chart

Displays the trend chart based on the selected equipment and options.

## Main Toolbar

The Main toolbar is located above the chart. It contains commands that allow you to perform general operations, such as save and open views, print reports, and so on. The table below describes the buttons that are included on the main toolbar.

Item	Description
	<b>Load View.</b> Loads a saved view from file. For details, see <a href="#">Load a View</a> .
	<b>Save View.</b> Stores a view to file. For details, see <a href="#">Saving</a>

Item	Description
	<a href="#">a View.</a>
	<b>Print.</b> Displays the standard Windows Print dialog box for printing trend reports. For details, see <a href="#">Printing and Exporting</a> .
	<b>Copy to Clipboard.</b> Copies visible pens to the Windows Clipboard. For details, see <a href="#">Copying Data to the Clipboard</a> .
	<b>Copy to File.</b> Exports visible pens to an Excel-compatible file. For details, see <a href="#">Copying Data to File</a> .
	<b>Add Pen.</b> Displays the Add New Pen(s) dialog box for adding a pen. For details, see <a href="#">Add Pens</a> . <b>Note:</b> Pens added with this button will not be synchronized with the equipment tree and trendable items list.
	<b>Remove Pen.</b> Deletes the currently selected pen from the trend display. For details, see <a href="#">Delete Pens</a> .
	<b>Remove All Pens.</b> Deletes the currently displayed pens from the trend display.
	<b>Lock/Unlock Pens.</b> Toggles the locking of pens. For details, see <a href="#">Lock/Unlock Pens</a> .
	<b>Show/Hide Points.</b> Toggles the display of points representing where sample data was recorded in the archive. For details, see <a href="#">Pens</a> .
	<b>Show/Hide Cursors.</b> Toggles the display of cursors. For details, see <a href="#">Cursors</a> .
	<b>Show/Hide Cursor Labels.</b> Toggles the display of cursor labels. For details, see <a href="#">Using Cursor Labels</a> .
	<b>Find in Model.</b> Locates the equipment for the currently selected pen in the equipment tree.

## Navigation Toolbar

The Navigation toolbar contains commands to allow you to navigate forward or backward through trends, as well as other navigation-related tasks.

A **Start Time Picker** is located on the left-hand side of the navigation toolbar, an **End Time Picker** is located on the right. You can use these to Specify a Start Time and End Time. If a time picker control is using Daylight Savings time, the clock to the left of the control will have a shaded segment.

The **Span Picker** contains commonly used predefined time spans that you can select from a drop-down menu. The time span of the trend display represents the difference between the start time and the end time. Selecting a time span adjusts the start time and leaves the end time as it is. To set a time span that is not included in the list of predefined times, see [Set a Nonstandard Time Span](#). See Also [Lock/Unlock the Time Span](#).

The Navigation toolbar also includes a set of command buttons. You can use these buttons to perform the following tasks:

- [Navigate Time](#)
- [Synchronize to Now](#)
- [Toggle Autoscrolling](#)
- [Zoom In/Zoom Out](#)
- [Undo Last Zoom](#)
- [Toggle Box Zoom](#)
- [Edit Vertical Scale.](#)

## Object View

The Object View displays the list of objects (equipment) displayed in the trend chart along with properties of the pens such as name, color, scale and so on. The following properties are displayed:

Column	Description
Scale	Vertical axis start and end position of the pen.
Engineering Units	Engineering units associated with the pen.
Comment	The trend/alarm comment defined for the pen.
Alarm Name	Name of associated alarm tag.
Cluster	Name of the cluster in which the object is defined.
Error	Displays the error of the last data request. Blank if last data request succeeded.

## Alarms

The principles of Situational Awareness specify that alarm conditions should be signaled using easily recognizable shapes and high-intensity color. This ensures that alarms stand out against the primarily achromatic color scheme used for the runtime interface.

It is also necessary to provide notification for all active alarms, even if they occur on a page that is currently not displayed. Direct access to the page that represents the source of an alarm should also be available when notification occurs.

In the case of the Situational Awareness Starter Project, a default set of six Genies (three large and three small)

are included in the "sa\_priorities" library to facilitate the signaling of alarms in accordance with these principles.

Priority 1  
Emergency

Priority 2  
High

Priority 3  
Low

Genies are also provided to represent when an alarm is "shelved", which means the alarm is disabled for a specified period of time. See [Shelve Alarms](#).

Shelved

---

**Note:** If required, you can customize the appearance of these Genies.

The Genies are used to highlight alarm conditions in the following locations.

#### Alarm Indicators

Alarm indicators are used on content pages to highlight an alarm condition for a specific object or group of objects. They comprise of an alarm flag (the large alarm priority Genie) and an alarm border.

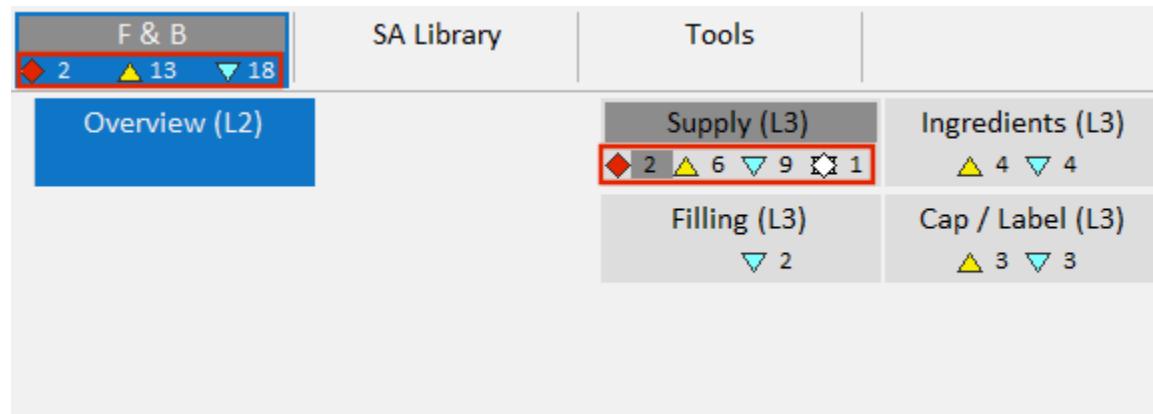

For more information, see [Use Alarm Indicators](#).

#### Navigation Zone

The Navigation Zone provides a system-wide view of current alarms across all pages.

Each tab provides a tally of the top three priority alarms that are active on the pages included on the tab.

Each button provides a tally of the top three priority alarms and shelved alarms for the location it opens.

For more information, see [Enable Navigation Zone Alarm Counts](#).

## Alarm Lists

Small icons are used to highlight the top three alarm priorities in alarms lists.

ALARM	TREND	INTERLOCK
◆ 03:38:27 PM HH		TS01 Full Milk Temperature High H...
▲ 10:40:12 AM LL		TS01 Full Milk Temperature Low Low
▼ 04:32:48 PM L		TS01 Full Milk Temperature Low
▼ 02:59:11 PM H		TS01 Full Milk Temperature High

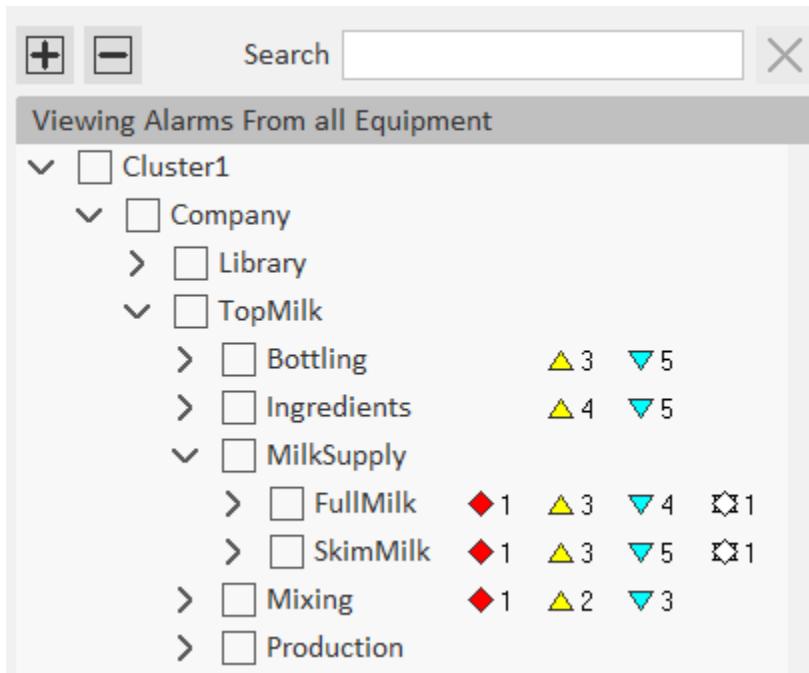

If an alarm is shelved, the priority icon will display a white fill.

This occurs in the following locations:

- Alarms pages (see [Default Alarm Pages](#)).
- The alarms list in the .
- the [Active Alarms Zone](#) (if a UHD4K workspace is used).

## Alarm Page Tree View

The tree view on each alarms page provides an alarm count for the top three alarm priorities and shelved alarms within each branch of the equipment hierarchy (see [Default Alarm Pages](#)).

As well as using color to indicate the priority of an alarm, the appearance of an alarm indicator or icon can be used to show the current state of an alarm.

## Alarm States

The following table shows how different alarm states are indicated for a priority 1 (Emergency) alarm in a project based on the Situational Awareness Starter Project.

State	Alarm Indicator	Alarm icon
On Unacknowledged	 <ul style="list-style-type: none"> <li>The border and flag both flash between colored and white fill.</li> </ul>	 <ul style="list-style-type: none"> <li>The icon flash between colored and white fill.</li> </ul>
On Acknowledged	 <ul style="list-style-type: none"> <li>The alarm border is filled with a half-intensity color.</li> <li>There is no flashing for either element.</li> <li>If the alarm condition clears, the alarm indicator is no longer displayed.</li> </ul>	 <ul style="list-style-type: none"> <li>The icon stops flashing.</li> </ul>
Off Unacknowledged	 <ul style="list-style-type: none"> <li>The alarm border appears in a lighter color.</li> <li>The alarm flag flashes.</li> <li>The alarm border does not flash.</li> </ul>	 <ul style="list-style-type: none"> <li>The icon flash between half-intensity color and white fill.</li> </ul>
Shelved	 <ul style="list-style-type: none"> <li>A white alarm border is shown with a generic alarm flag symbol.</li> </ul>	 <ul style="list-style-type: none"> <li>In an alarms list, the priority icon will appear with a white fill.</li> </ul>  <ul style="list-style-type: none"> <li>In an alarm tree view and the Navigation Zone, a generic shelved icon will appear.</li> </ul>

By default, the six alarm priority Genies are associated with the top three alarm priorities via the display

properties for each priority.

The screenshot shows a software interface with a top navigation bar containing tabs: Setup, Alarming (which is selected and highlighted in blue), Parameters, Screen Profiles, Devices, and Events. Below the navigation bar is a toolbar with buttons for Save, Discard, Copy, Paste, Delete Row(s), and Export All. The main area is titled "Alarm Priorities" and contains a table with three rows of data. The columns are labeled: Priority, Display Name, Library Name, Genie Name, and Small Genie Name. The data rows are:

Priority	Display Name	Library Name	Genie Name	Small Genie Name
1	Emergency	sa_priorities	sa_p1_normal	sa_p1_small
2	High	sa_priorities	sa_p2_normal	sa_p2_small
3	Low	sa_priorities	sa_p3_normal	sa_p3_small

The **Genie Name** property specifies the larger Genie used as an alarm flag; **Small Genie Name** specifies the smaller Genie that is used as an alarm icon. See [Configure Display Properties for an Alarm Priority](#).

The Genies that are used to represent a shelved alarm are associated with an Alarm Mode named "Shelved/Disabled" (see [Configure Display Properties for an Alarm Mode](#)).

## See Also

[Add an Additional Alarm Count to the Navigation Zone](#)

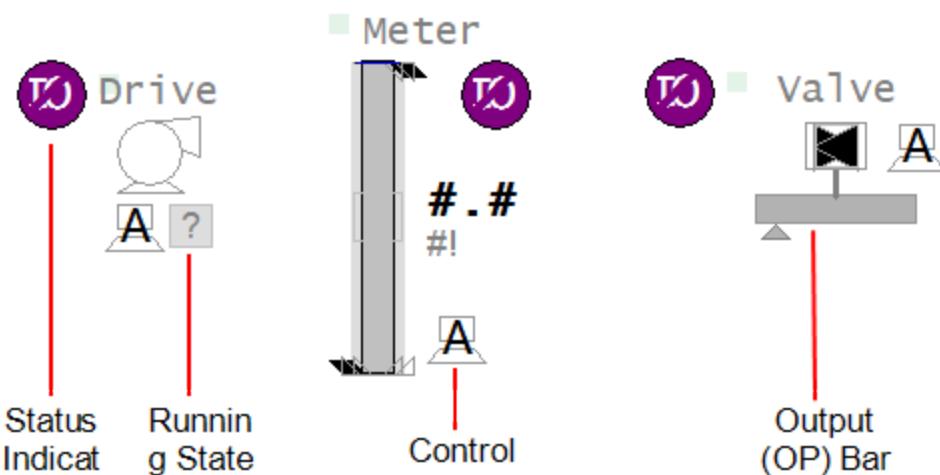

[Add a Fourth Alarm Priority Filter to Alarm Pages](#)

[Create a Custom Flag for an Alarm Indicator](#)

## Libraries

A project created with the Situational Awareness Starter Project will contain "SA\_Library" as an included project. SA\_Library provides a large set of objects that you can use to add content to your graphics pages and faceplates. These objects apply a consistent look and feel to a wide variety of common user interface controls.

The objects include Genies that represent physical pieces of equipment (such as drives, meters, and valves), and a set of common library elements that support them (such as status indicators, running state indicators, control mode indicators, and output bars).

For a complete list of the libraries included in the SA\_Library project, see Situational Awareness Library Project in the System Projects Reference section of the help.

## Composite Genies

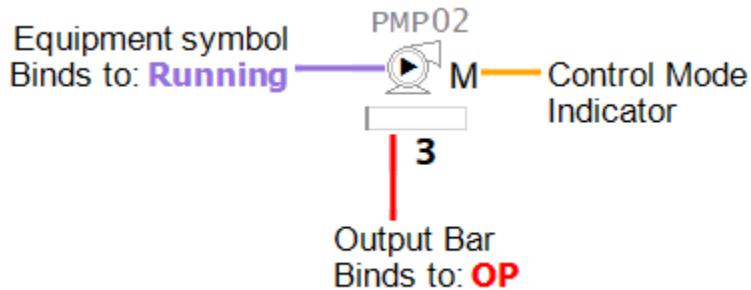

What makes the Situational Awareness Library unique is that many of library objects can be built using a [Composite Genie](#). A Composite Genie is an XML file that defines a set of Genies, options, parameters and layout display rules to determine what is displayed on a page. This is based on user-selected presentation options. The collection of components can be configured as a single entity, greatly reducing the size and complexity of your libraries.

To use a Composite Genie, simply open the XML template that best suits the piece of equipment you want to represent on a page. Ideally, the XML template should match the equipment type that was used to create the equipment instance the Composite Genie will represent. This is recommended, as the components of a Composite Genie are designed to bind to specific equipment items that cannot be changed.

This is straightforward if you have created your equipment instances using the default equipment types provided with the Situational Awareness Starter Project.

## Example

The following drive (PMP02) is from the ExampleSA project. It was created using the "Drive.xml" Composite Genie, which means it binds to the following equipment items.

The equipment items "Running", "CtrlMode", and "OP" are all associated with variable tags that link to the I/O

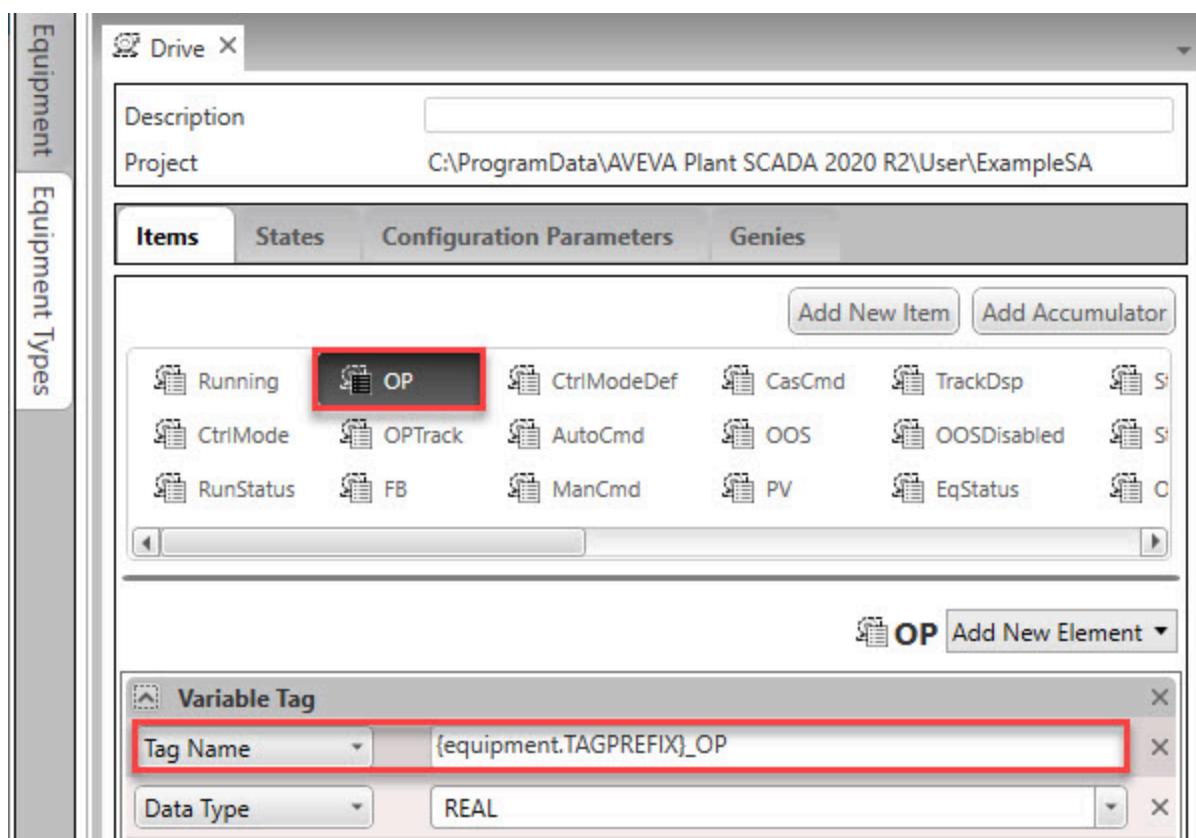

device.

Variables			
	Equipment	Item Name	Tag Name
29	Company.TopMilk.MilkSupply.FullMilk.PMP02	FB	TopMilk_PMP02_FB
30	Company.TopMilk.MilkSupply.FullMilk.PMP02	OP	TopMilk_PMP02_OP
31	Company.TopMilk.MilkSupply.FullMilk.PMP02	ORLow	TopMilk_PMP02_ORLow
32	Company.TopMilk.MilkSupply.FullMilk.PMP02	RunStatus	TopMilk_PMP02_RunStatus
33	Company.TopMilk.MilkSupply.FullMilk.PMP02	ORHigh	TopMilk_PMP02_ORHigh
34	Company.TopMilk.MilkSupply.FullMilk.PMP02	Stopping	TopMilk_PMP02_Stopping
35	Company.TopMilk.MilkSupply.FullMilk.PMP02	StopCmd	TopMilk_PMP02_StopCmd
36	Company.TopMilk.MilkSupply.FullMilk.PMP02	CtrlMode	TopMilk_PMP02_CtrlMode
37	Company.TopMilk.MilkSupply.FullMilk.PMP02	EqStatus	TopMilk_PMP02_EqStatus
38	Company.TopMilk.MilkSupply.FullMilk.PMP02	PRLow	TopMilk_PMP02_PRLow
39	Company.TopMilk.MilkSupply.FullMilk.PMP02	Starting	TopMilk_PMP02_Starting
40	Company.TopMilk.MilkSupply.FullMilk.PMP02	StartCmd	TopMilk_PMP02_StartCmd
41	Company.TopMilk.MilkSupply.FullMilk.PMP02	Stopped	TopMilk_PMP02_Stopped
42	Company.TopMilk.MilkSupply.FullMilk.PMP02	Running	TopMilk_PMP02_Running

These variables tags were generated by Equipment Editor, as PMP02 was based on the "Drive" Equipment Type, and these three items each had a variable tag element defined.

For example, the OP item had a variable tag element that specified the following **Tag Name** syntax:

{equipment.TAGPREFIX}\_OP

In the case of the equipment instance for PMP02, the Tag Prefix was set to "TopMilk\_PMP02\_", resulting in the tag named "TopMilk\_PMP02\_OP".

If you generate your variable tags in this way using the equipment types provided in the Situational Awareness Starter Project, the item bindings required by each library object should fall into place when you use the corresponding Composite Genie. See [Add Equipment Using Equipment Editor](#).

You can change the variable names defined in the equipment type if you want to maintain your own tag naming convention. However, you still need to pair your variables with the relevant equipment items.

---

**Note:** To determine the required bindings for a library object and its default faceplate, search for the object in the [Situational Awareness System Projects](#) section of the help. The description of each library objects lists the `Equipment.Items` it expects.

## Interlocks

In a production environment, an interlock is a physical connection between two pieces of equipment that links their operation, so that an event in one piece of equipment will trigger an action in the other. Typically enabled using PLC logic, interlocks are built into a production system to maintain safety, protect equipment and minimize production costs.

Plant SCADA allows you to represent the interlocks that exist in your system within a Situational Awareness project. The activity associated with an interlock can then be presented to an operator at runtime in the

### Information Zone.

For example, the "Mixing" page in the ExampleSA project includes a mixer that receives ingredients from four supply tanks on the "Ingredients" page.

The mixing tank has an outlet valve (OV07). To ensure that this valve is not open while ingredients are being delivered to the mixer, interlocks exist between OV07 and the valves and pumps that deliver the four ingredients for mixing.

This example will be used to demonstrate the role each of following components play when configuring interlocks in a Situational Awareness project.

#### Equipment References

**Equipment References** are used to represent interlocks in a Situational Awareness project, as they allow you to build relationships in an equipment model that reflect those created by the interlocks that exist in the field.

To support the example above, the following equipment references are configured in the ExampleSA project.

	Cluster	Equipment	Referenced Equipment	Referenced Item
1	Cluster1	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Sugar.VLV09	Open
2	Cluster1	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Sugar.DRV01	Running
3	Cluster1	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Strawberry.DRV03	Running
4	Cluster1	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Strawberry.VLV11	Open
5	Cluster1	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Chocolate.DRV04	Running
6	Cluster1	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Chocolate.VLV12	Open
7	Cluster1	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Malt.DRV02	Running
8	Cluster1	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Malt.VLV10	Open

The **Referenced Item** property specifies the equipment item that will trigger the interlocked state. For example, DRV01 will trigger an interlock when the digital variable associated with its "Running" item equals 1 (TopMilk\_DRV01\_Running = 1).

The **Comment** property can be used to provide a description of the event that caused an interlock to trigger, for example "Sugar DRV01 is Running".

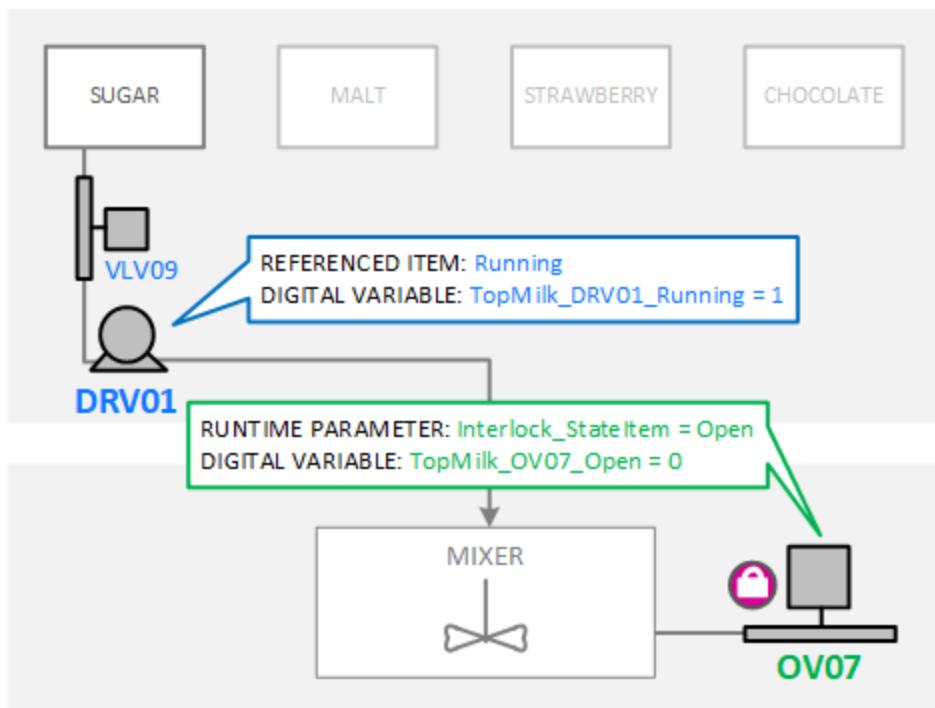

#### "Interlock\_StateItem" Runtime Parameter

When triggering occurs, it causes the "state item" in the interlocked piece of equipment to change. By default, the state item for a piece of equipment is "Running". If this is not the item that should respond to an interlock, you can use the runtime parameter "Interlock\_StateItem" to specify a different state item for a piece of equipment.

For example, OV07 does not have a "Running" item as it is a valve. Interlock\_StateItem is used to specify "Open" as the correct item.

	Cluster	Equipment	Name	Value	Is Tag
1	Cluster1	Company.TopMilk.Mixing.OV07	Interlock_StateItem	Open	FALSE

This enables the interlock behavior demonstrated in the following diagram.

**Note:** The **IsTag** field for a Runtime Parameter defaults to TRUE if no value is specified. If you do not enter FALSE, interlocks will not function correctly.

### Alarms

Alarms are used to generate the events required to track the activity associated with interlocks. They determine how long an interlock has been active, or when it was last active.

In the ExampleSA project, the following digital alarms have been configured for the two pieces of equipment that supply sugar to the mixing tank (DRV01 and VLV09).

Digital Alarms				
	Equipment	Item Name	Alarm Tag	Alarm Name
25	Company.TopMilk.Ingredients.Sugar.DRV01	Running	TopMilk_DRV01_Running	DRV01 Running - Interlock - Start Time
26	Company.TopMilk.Ingredients.Sugar.DRV01	Faulted	TopMilk_DRV01_Faulted	DRV01 Faulted
27	Company.TopMilk.Ingredients.Sugar.LS03	HH	TopMilk_LS03_PV_HH	LS03 Sugar Hopper Level High High
28	Company.TopMilk.Ingredients.Sugar.LS03	H	TopMilk_LS03_PV_H	LS03 Sugar Hopper Level High
29	Company.TopMilk.Ingredients.Sugar.LS03	L	TopMilk_LS03_PV_L	LS03 Sugar Hopper Level Low
30	Company.TopMilk.Ingredients.Sugar.LS03	LL	TopMilk_LS03_PV_LL	LS03 Sugar Hopper Level Low Low
31	Company.TopMilk.Ingredients.Sugar.VLV09	Closed	TopMilk_VLV09_Closed	VLV09 Closed - Interlock - Start Time
32	Company.TopMilk.Ingredients.Sugar.VLV09	Open	TopMilk_VLV09_Open	VLV09 Open - Interlock - Start Time

These alarms monitor the items that are configured to trigger an interlock, providing a record of the start and end times.

Similarly, alarms are configured for the six other pieces of referenced equipment to monitor the items that trigger an interlock.

The following alarm has also been configured to monitor the "Open" item for the outlet valve OV07.

Digital Alarms				
	Equipment	Item Name	Alarm Tag	Alarm Name
1	Company.TopMilk.Mixing.OV07	Open	TopMilk_OV07_Open	OV07 Open - Interlock - Start Time

**Note:** These alarms are intended to be hidden from the operator at runtime. This can be achieved using an alarm category that has **ShowOnActive** and **ShowOnSummary** set to FALSE.

### Interlock Categories

Each equipment reference can also be assigned to a **Category**. In the case of interlocks, the category is used to identify the nature of an interlock. The Situational Awareness Starter Project provides the following default categories.

- **Safety** — conditions that cause equipment to stop running.
- **Process** — conditions that cause equipment within a process to stop running.
- **Permissive** — conditions that stop equipment from starting.

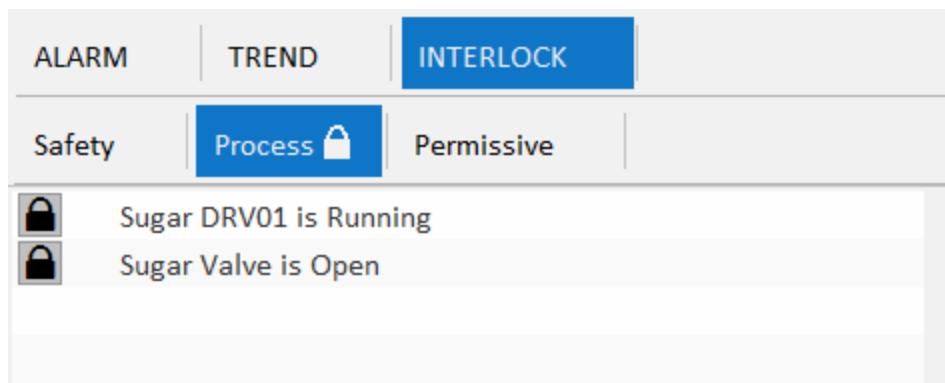

Safety and Process conditions are similar in that both types stop an action when the interlock is triggered. Permissive interlocks are slightly different as they stop an action or process from starting when an interlock is triggered. Process and Permissive interlock conditions may overlap.

In the ExampleSA project, the **Category** specified for each of the equipment references associated with the OV07 output valve is "Interlock.Process".

References				
	Equipment	Referenced Equipment	Referenced Item	Category
1	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Sugar.VLV09	Open	Interlock.Process
2	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Sugar.DRV01	Running	Interlock.Process
3	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Strawberry.DRV03	Running	Interlock.Process
4	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Strawberry.VLV11	Open	Interlock.Process
5	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Chocolate.DRV04	Running	Interlock.Process
6	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Chocolate.VLV12	Open	Interlock.Process
7	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Malt.DRV02	Running	Interlock.Process
8	Company.TopMilk.Mixing.OV07	Company.TopMilk.Ingredients.Malt.VLV10	Open	Interlock.Process

When you view the interlocks at runtime, these categories are represented as a set of tabs in the [Information Zone](#). If an interlock is currently active for a selected piece of equipment, a lock symbol is displayed next to the corresponding category tab.

Based on the category specified, all the interlocks associated with OV07 will appear on the "Process" tab.

The interlocks are listed on each tab from oldest (triggered first) to most recent.

Interlocks can be configured to support a bypass. This means an operator can manually override the interlock, forcing the locked process to be available to start (see [Configure a Bypass for an Interlock](#)). When enabled, an interlock can be bypassed by an operator in the [Information Zone](#).

## Getting Started with a Situational Awareness Project

The following topics will guide you through the process required to create and configure a Situational Awareness Project based on a Starter Project.

- [Create a Situational Awareness Project](#)
- [Set Up a Screen Profile for Multiple Monitors](#).

A project created using the Situational Awareness Starter Project can be compiled immediately, however, there are some settings in the Computer Setup Wizard that you will need to adjust to display the correct content at startup. See [Run the Computer Setup Wizard](#).

## See Also

[Key Components of a Situational Awareness Project](#)

[Configure Your Project](#)

## Create a Situational Awareness Project

When you create a Situational Awareness project, it is recommended that you begin with a Starter project. This provides a set of components that are required to support fundamental runtime functionality. You can then modify and extend a project to suit your needs.

### To create a Situational Awareness project:

1. [Create a Project Using a Starter Project](#).

2. In **Project** field, select "SA\_Style\_1\_MultiRes".

The project that is created will include the following components:

- Two master pages defining a default workspace layout - one in HD 1080 and one in UHD 4K resolution.
- Two sets of page templates (one in HD 1080 and one in UHD 4K) for the pre-configured workspace content.
- A cluster named "Cluster1".
- A server of each server types: "IOServer1", "AlarmServer1", "ReportServer1" and "TrendServer1".
- A memory I/O device named "Internal".
- An I/O device for calculated variables named "Cicode".
- Two pre-configured menus named "Headerbar" and "InformationZone".
- Default Content Types for classifying page content.
- Default Alarm Categories and Priorities.
- A default screen profile targeting your primary screen.
- A set of parameters, accessible from the **Parameters** view in Plant SCADA Studio's **Setup** activity.
- A role named "Administrators" which is linked to the "BUILTIN\Administrators" Windows group and have global privilege of 1 to 8. This allows a user to log in Plant SCADA at runtime using a Windows user account who belongs to the Administrators group of the local machine.

The project will also include three system projects:

- **SA\_Include** – hosts content that is used by a Starter Project. It also includes a set of labels.
- **SA\_Library** – includes graphical content you can use to represent equipment such as meters, drives and valves. This includes a set of Composite Genies that provide a template to easily create multiple objects with a consistent look and feel.
- **SA\_Controls** – includes Genies and controls that support the functionality provided by a Situational Awareness project.

A newly created project can be compiled immediately, however, there are some settings in the Computer Setup Wizard that you will need to adjust to display the correct content at startup. See [Run the Computer Setup Wizard](#).

## See Also

[Set Up a Screen Profile for Multiple Monitors](#)

## Set Up a Screen Profile for Multiple Monitors

Plant SCADA allows you to view your runtime project on multiple monitors. To do this:

1. Create a [Screen Profile](#) in the **Setup** activity.
2. Compile the project.
3. Run the Setup Wizard and complete the [Screen Setup](#) page.

If your project was created using the Situational Awareness Starter Project, you can use the **F12** keyboard key at runtime to reset a display client to its default arrangement of screens.

## See Also

[Run the Computer Setup Wizard](#)

[MultiMonitor Parameters](#)

## Run the Computer Setup Wizard

After compiling your Situational Awareness project, you need to configure pages that you want displayed on startup. To do so, follow these steps:

1. [Run the Setup Wizard](#).
2. Click through the pages of the wizard until you reach the **Screen Setup** page.
3. On the Screen Setup page, select a **Startup Page** for each screen (see [Screen Setup](#)).

You will need to select a master page. To just see a list of master pages in the drop-down menu, select the **Show master pages only** check box. The default master pages provided by the starter project are "Master\_PageMenu1\_HD1080" and "Master\_PageMenu1\_UHD4K". Select the page that matches the resolution of the screen.

4. You will also need to select a **Context** for each screen. The context sets the starting point for any navigation that happens on the screen. It can be any Level1 menu item belonging to the Navigation Menu. If you are running a new project created from the Situational Awareness Starter project, "MyPlant" will be available to select.

## See Also

[Set Up a Screen Profile for Multiple Monitors](#)

## Configure Your Project

The following topics describe how to configure your project content so that it engages with the architecture that supports contextual updates at runtime.

- [Add Equipment Using Equipment Editor](#)
- [Generate Variable Tags](#)
- [Create Content Pages](#)
- [Assign a Content Type to a Page](#)
- [Prepare the Navigation Menu](#)
- [Enable Navigation Zone Alarm Counts](#)
- [Configure Panes on a Master Page](#)
- [Set the Context Mode for a Workspace](#)
- [Configure Interlocks](#)

- [Create a New Faceplate](#)
- [Configure Equipment Selection for Group Objects.](#)

## See Also

[Key Components of a Situational Awareness Project](#)

## Add Equipment Using Equipment Editor

The first step towards adding content for a Situational Awareness project is to create the required [Equipment](#) for your project, which involves the following four tasks.

## Create Custom Equipment Templates

The Situational Awareness Starter Project provides a set of sample equipment templates to help with creating equipment. The equipment template is an XML file that uses proprietary tags and attributes to specify the fields of input and output databases, and define filters and transformation rules that create tags from existing database fields. It uses the existing [TagGen XML Template](#) syntax rules.

As part of creating an equipment template, you need to tailor the equipment templates to suit your physical device. You may need to complete one or more of the following tasks to create a custom template:

1. Define [Equipment Types](#).
2. Add an Item to an [Equipment Type](#) to the equipment types.
3. Add [Configuration Parameters](#) to an [Equipment Type](#) for each equipment type. Parameters defined here would typically be the same across every instance of a particular type of equipment. For example, range of values for the equipment or alarm names and their default values.
4. Create custom tags, if required. You may want to define custom tags (parameters) that may be different depending on the type of equipment. For example, the address or engineering units for different types of meters. In this case, you can [Add a Variable Tag](#) in Plant SCADA Studio.

---

**Note:** By default, the sample equipment templates use analog alarming limits. If you wish to use PLC limits with equipment, see [Associate PLC Limits with Equipment](#).

---

## Create Equipment Instances

Create the required [Equipment Instances](#) in [Equipment Editor](#) based on [Equipment Types](#).

## Organize Equipment into a Hierarchy

An [Equipment Hierarchy](#) provides a model of a plant that can be used to reference the machinery or processes being monitored.

In the case of a Situational Awareness project, equipment definitions are used to drive the functionality that enables a runtime system to respond to the current context of a display client. They can also support navigational features and area-based security. For an example see [Equipment Hierarchy Example](#).

When you configure equipment instances for a project based on the Situational Awareness Starter Project, you

should pay particular attention to the following Equipment Properties:

Property	Description
Display Name	This property allows you to create a meaningful variation of an equipment name that can be easily accommodated in the runtime interface.
Type	<p>This property specifies the <a href="#">Equipment Types</a> that is associated with a piece of equipment. In a project created from a Situational Awareness Starter project, a set of default equipment types are available to support the Composite Genies that are in the SA_Library include project.</p> <p>You should select the equipment type associated with the Composite Genie you will use to create the graphic object for the piece of equipment. For example, if the piece of equipment is a pump, you will be able to create the associated graphic object using the Drive Composite Genie. The equipment type you will need is drive.</p>
Page	<p>This property associates a piece of equipment with a page, that is, the primary page on which the associated graphic object appears. If the graphic object appears on more than one page, the page specified here should represent its primary operational context.</p> <p>This enables an operator to navigate directly to the page that hosts a piece of equipment. For example, on an alarm page you can navigate from a selected piece of equipment in an alarms list directly to the page on which it is displayed.</p> <p>This property is also used to calculate alarm counts for a page in the Navigation Zone.</p> <p><b>Note:</b> If a piece of equipment does not have the <a href="#">Page</a> property set, it will not be included in the alarm counts for its host page. For more information, see <a href="#">Enable Navigation Zone Alarm Counts</a>.</p>
Content	<p>This property allows you to associate the piece of equipment with a particular type of graphical content (see ). For example, you can associate a pump with a drive faceplate ("FP_DOL" or "FP_VSD") or an area with an overview page ("Area_L1"). You can specify multiple content types for each equipment definition using a comma-separated list.</p> <p>When the piece of equipment comes into context, any</p>

Property	Description
	panes that are set to autofill will read this property. If a match is made, the pane will display the specified content. For more information, see <a href="#">Autofill</a> .
Tag Prefix	This property is used to apply a prefix to any variable tags associated with the equipment. This is useful for the creation of the variable tags required to support a Situational Awareness Project.
Area	In a Situational Awareness project, Areas are used to manage user access and privileges at runtime. Use a area number (or label) to assign the equipment to a particular area. Only users with access to this area (and any necessary privileges) will be able to perform operations on the equipment.

## Generate Tags

If you are creating a new Situational Awareness project, after you have created your equipment hierarchy, you need to generate variable tags for the equipment (see [Update Equipment](#)).

**Note:** Tags generated this way are read-only, that is, their values cannot be updated in Plant SCADA Studio.

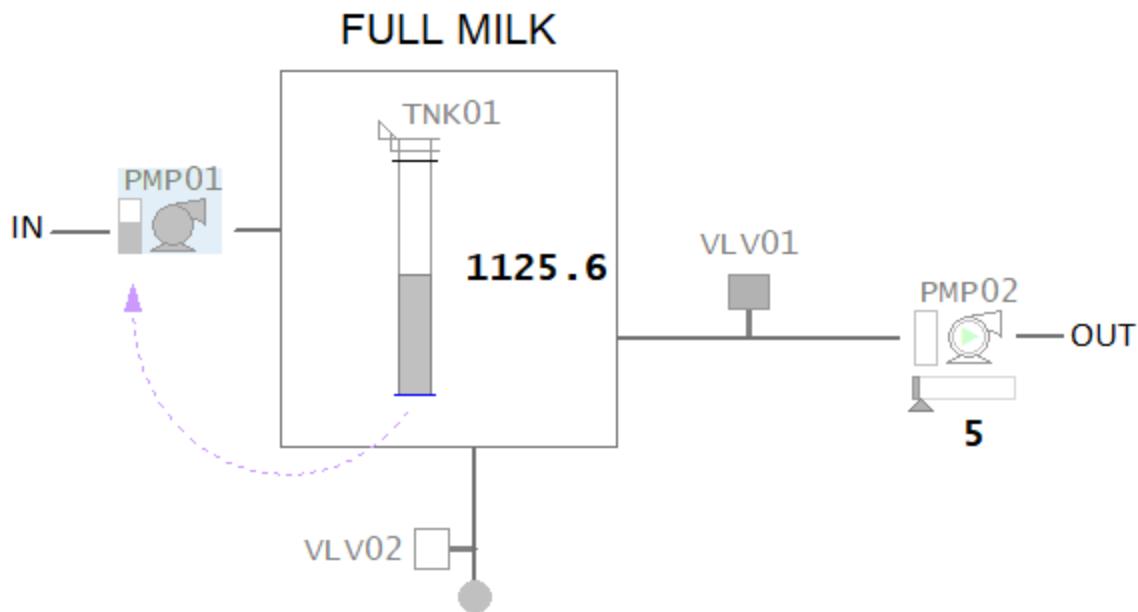

If you are upgrading a previously created project, and would like to use the Situational Awareness Genies with tags in the old project, you will need to migrate the existing tags.

### To migrate existing tags:

1. In the [Equipment Editor](#), build your equipment hierarchy in the right pane. To do this, right click and select **New Equipment**. The Add New Equipment dialog box is displayed.
2. Specify the **Name** and **Project**.
3. Leave the Type as "No type".
4. Click **OK**.
5. In Plant SCADA Studio, navigate to the **System Model** activity. Select **Equipment**.
6. Use the column filtering options to filter the tag names for a piece of equipment.
7. Add the equipment name as specified in the Equipment Editor in step 2.
8. Add the item name for the equipment. Items Names should be the same as the Items displayed in the Equipment Editor, Equipment Types tab.
9. Create the required graphics pages with the equipment instances.
10. [Configure Content Types](#).

## Equipment Hierarchy Example

The example below is a graphics page that represents a tank in a milk production facility.

Composite Genies have been used to represent the following equipment:

- A tank (TNK01)
- An inlet pump for the tank (PMP01)
- An outlet pump for the tank (PMP02)
- A valve for the outlet pump (VLV01)
- A dump valve for the tank (VLV02).

This page would require the following equipment hierarchy to be configured in the Equipment Editor.

Click on an equipment name below for an explanation of the associated equipment property settings.

## TNK01

- **Display Name** — "Supply Tank" has been specified as a name that can be used to identify the tank at runtime, providing a meaningful alternative to the equipment name "MyPlant.FullMilk.TNK01".
- **Type** — the Tank Level will be represented on the page as a 'Meter' Composite Genie. The sample equipment template 'Meter' is used as the equipment type as it contains all the necessary items required for the Composite Genie and its associated faceplate.
- **Page** — TNK01 is represented in its operational capacity on the "FullMilk" page. Therefore, "FullMilk" is specified as the home page for the tank. This means you will be able to directly navigate to the FullMilk page from occurrences of TNK01 in places such as an alarms list.
- **Content** — The content associated with the tank is "FP\_CTRL", which is the name of a faceplate for an Analog Controller. This is one of the default meter faceplates included in a project based on a Situational Awareness Starter Project. When the tank comes into context, the FP\_CTRL faceplate will display in any panes that are set to autofill and have their **Content Type** field set to "FP". See [Content Types](#).

## PMP01

- **Display Name** — "Inlet Pump" has been specified as a name that can be used to identify the pump at runtime, providing a meaningful alternative to the equipment name "MyPlant.FullMilk.PMP01".
- **Type** — the inlet pump will be represented on the page as a 'Drive' Composite Genie. The sample equipment template 'Drive' is used as the equipment type as it contains all the necessary items required for the Composite Genie and its associated faceplate.
- **Page** — PMP01 is represented in its operational capacity on the "FullMilk" page. Therefore, "FullMilk" is specified as the home page for the pump. This means you will be able to directly navigate to the FullMilk page from occurrences of PMP01 in places such as an alarms list.
- **Content** — The content associated with PMP01 is "FP\_DOL", which is the name of a faceplate for a Direct On Line Drive. This is one of the default drive faceplates included in a project based on a Situational Awareness Starter Project. When the pump comes into context, the FP\_DOL faceplate will display in any panes that are set to autofill and have their **Content Type** field set to "FP".

## PMP02

- **Display Name** — "Outlet Pump" has been specified as a name that can be used to identify the pump at runtime, providing a meaningful alternative to the equipment name "MyPlant.FullMilk.PMP02".
- **Type** — the outlet pump will be represented on the page as a 'Drive' Composite Genie. The sample equipment template 'Drive' is used as the equipment type as it contains all the necessary items required for the Composite Genie and its associated faceplate.
- **Page** — TNK01 is represented in its operational capacity on the "FullMilk" page. Therefore, "FullMilk" is specified as the home page for the pump. This means you will be able to directly navigate to the FullMilk page from occurrences of PMP02 in places such as an alarms list.
- **Content** — The content associated with PMP02 is "FP\_VSD", which is the name of a faceplate for a Variable Speed Drive. This is one of the default drive faceplates included in a project based on a Situational Awareness Starter Project. When the pump comes into context, the FP\_VSD faceplate will display in any panes that are set to autofill and have their **Content Type** field set to "FP".

## VLV01

- **Display Name** — "Outlet Valve" has been specified as a name that can be used to identify the valve at runtime, providing a meaningful alternative to the equipment name "MyPlant.FullMilk.VLV01".
- **Type** — the outlet valve will be represented on the page as a 'Valve' Composite Genie. The sample equipment template 'Valve' is used as the equipment type as it contains all the necessary items required for the Composite Genie and its associated faceplate.
- **Page** — VLV01 is represented in its operational capacity on the "FullMilk" page. Therefore, "FullMilk" is specified as the home page for the valve. This means you will be able to directly navigate to the FullMilk page from occurrences of VLV01 in places such as an alarms list.
- **Content** — The content associated with the VLV01 is "FP\_VLV", which is the name of a faceplate for a Simple Valve. This is one of the default meter faceplates included in a project based on a Situational Awareness Starter Project. When the valve comes into context, the FP\_VLV faceplate will display in any panes that are set to autofill and have their **Content Type** field set to "FP".

## VLV02

- **Display Name** — "Dump Valve" has been specified as a name that can be used to identify the valve at runtime, providing a meaningful alternative to the equipment name "MyPlant.FullMilk.VLV02".
- **Type** — the dump valve will be represented on the page as a 'Valve' Composite Genie. The sample equipment template 'Valve' is used as the equipment type as it contains all the necessary items required for the Composite Genie and its associated faceplate.
- **Page** — VLV02 is represented in its operational capacity on the "FullMilk" page. Therefore, "FullMilk" is specified as the home page for the valve. This means you will be able to directly navigate to the FullMilk page from occurrences of VLV02 in places such as an alarms list.
- **Content** — The content associated with the VLV02 is "FP\_VLV", which is the name of a faceplate for a Simple Valve. This is one of the default meter faceplates included in a project based on a Situational Awareness Starter Project. When the valve comes into context, the FP\_VLV faceplate will display in any panes that are set to autofill and have their **Content Type** field set to "FP".

## See Also

[Key Components of a Situational Awareness Project](#)

## Generate Variable Tags

After you have [Add Equipment Using Equipment Editor](#), you need to generate variable tags for the equipment if you are creating a new Situational Awareness project. If you are upgrading a previously created project, and would like to use the Situational Awareness Genies with tags in the old project, you will need to migrate the existing tags.

## Generate Tags for a New Project

Plant SCADA provides sample equipment templates that you can use as guide to create your equipment.

**To generate tags for a new project:**

1. Make a copy of the required equipment templates.
2. Modify the templates to suit your requirements. This is because the templates may not be suitable for certain protocols such as Modbus. In this case, you will need to delete the **Address** property.
3. [Add Equipment Using Equipment Editor](#).
4. Generate the tags (see [Update Equipment](#)).

## Migrating Existing Tags for an Upgraded Project

**To generate tags for an upgraded project:**

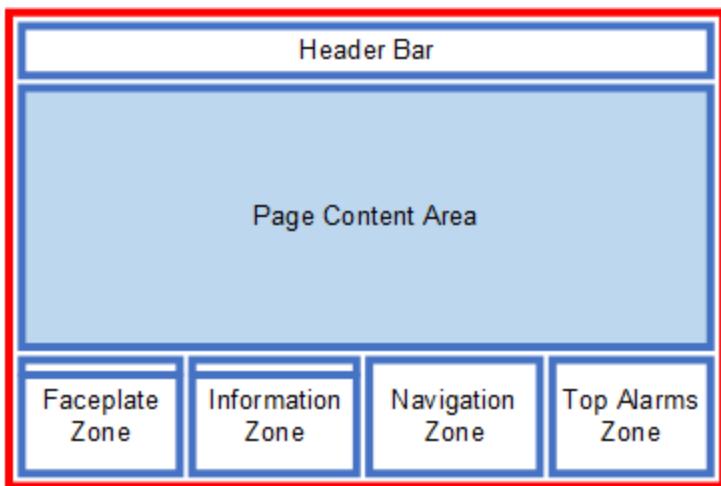

1. In the Equipment Editor, build your equipment hierarchy in the right pane. To do this, right click and select **New Equipment**. The Add New Equipment dialog box is displayed.
2. Specify the **Name** and **Project**.
3. Leave the Type as "No type".
4. Click **OK**.
5. In Plant SCADA Studio, navigate to the **System Model** Activity. Select **Equipment**.
6. Use the column filtering options to filter the tag names for a piece of equipment.
7. Add the equipment name as specified in the Equipment Editor in step 2.
8. Add the item name for the equipment. Items Names should be the same as the Items displayed in the Equipment Editor, Equipment Types tab.
9. Create the required graphics pages with the equipment.
10. Configure the required [Content Types](#).

---

**Note:** If you need only alarm indicators for your upgraded project, create the equipment and map the equipment to alarms in Plant SCADA Studio, **System Model** Activity, **Alarms**.

## Create Content Pages

Content pages display the user-created content that represents a production process or overview. With a Situational Awareness project, it is recommended that you create content pages that are sized according to the pane in which they will appear. In a default Starter Project, this is the Page Content Area.

As the Situational Awareness workspace is available in two screen sizes (HD1080 and UHD4K), the size of Page Content Area will differ according to the resolution of the workspace master page. You need to consider this resolution when you create content pages. A template page named "pagecontent" is available in the SA\_Include project in both resolutions.

If you are building a system that supports multiple resolutions, and you want to adjust the content to suit the increase/decrease in space, then you can apply a suffix to a page name to associate it with a particular resolution. For example, you could create the following pages with duplicated content:

- MyContentPage\_HD1080
- MyContentPage\_UHD4K.

If you use the function `Navigation_ShowTargetPageMultiRes()` to call "MyContentPage", the system will use the suffix to determine which variation of the page to display in the current workspace. For more information, see [Configure a Project that Supports Multiple Screen Resolutions](#).

Your content pages should also adhere to a hierarchy that provides different levels of detail about the processes being monitored. This allows an operator to assess a specific process while maintaining a broad view of the overall status of a plant. For more information, see [Page Levels](#).

#### To create a content page for a Situational Awareness project:

1. Open Graphics Builder.
2. On the **File** menu, select **New**.
3. On the New dialog box, click **Page**. The Use Template dialog box is displayed.
4. In the **Style** field, select "situational\_awareness".
5. In the **Resolution** field, select the resolution appropriate to the host workspace:
  - HD1080 (1920 x 1080, 16:9)
  - UHD4K (3840 x2160, 16:9)
6. In the **Template** section, select "pagecontent".
7. Click **OK**.
8. Save the page with an appropriate name.

If you are creating duplicate pages for a system that uses multiple resolutions, apply the appropriate suffix ("\_HD1080" or "\_UHD4K").

---

**Note:** When you use the PageContent template to create a page, it will include two pre-configured associations that allow the page to engage with a project's equipment hierarchy. Named "\_\_EquipmentName" and "\_\_EquipmentRef", they are accessible via the **Associations** tab of the Page Properties dialog.

---

To activate a page at runtime, you also need to perform the following steps:

- **Assign a Content Type**

It is recommended that you assign a content type to a page to allow it to be correctly handled by the [Autofill](#) process. The content type is used to determine where a page will display within a workspace. For example, if the content type for a page is "L1" (a level one page), it will only display in panes that are configured to display L1 content.

If a page does not have a content type specified, it will display in the pane designated as the "default" pane. By default, this will be the Page Content Area.

For more information, see [Assign a Content Type to a Page](#).

- **Enable navigation**

Runtime navigation for a Situational Awareness project is managed via the [Navigation Zone](#) on the operator dashboard.

To add the page you create to the Navigation Zone, you need to add a menu entry for it using the **Visualization** activity in Plant SCADA Studio. For more information, see [Prepare the Navigation Menu](#).

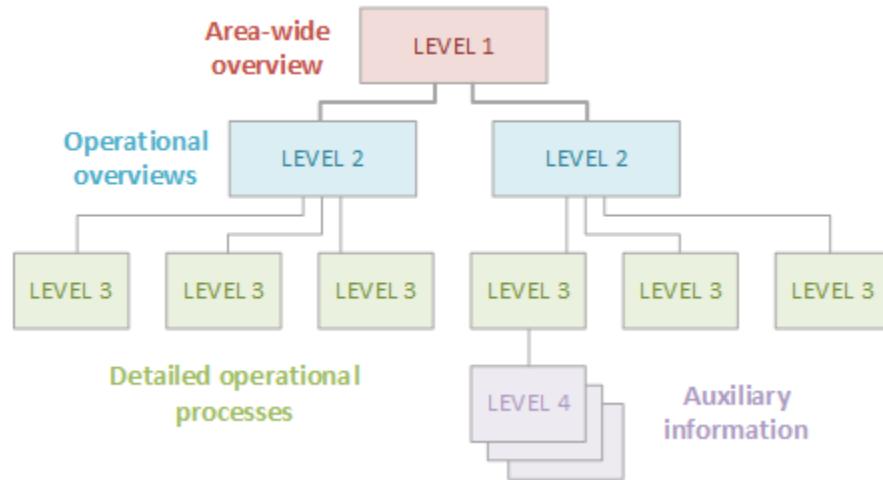

## See Also

[Key Components of a Situational Awareness Project](#)

## Page Levels

The principles of Situational Awareness propose that your content pages should adhere to a hierarchy that provides different levels of detail about the processes being monitored. This allows an operator to assess a specific process while maintaining a broad view of the overall status of a plant.

The following diagram shows the proposed hierarchy of pages.

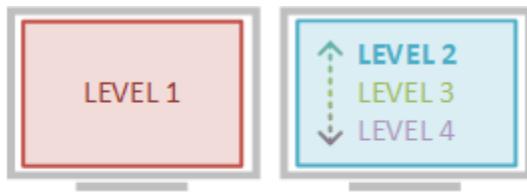

- **Level 1** – Area-wide overview. Pages include KPIs and summary status information.

- **Level 2** – Operational overview. This is the primary operational display. Pages include key operational information related to a particular production process within a facility.
- **Level 3** – Detailed operational processes. Pages includes information about the equipment in a production process and their connections. Level 3 pages are the most similar to traditional SCADA system graphics pages.
- **Level 4** – Auxiliary information. Includes trends, help screens, and so on.

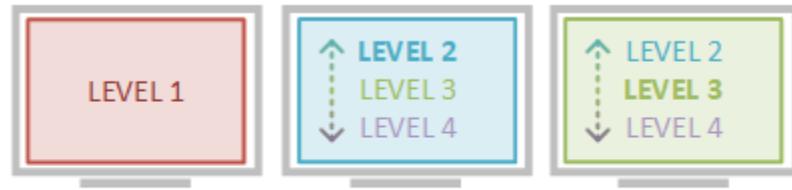

Ideally, a client workstation should have multiple screens with different page levels displayed on each screen. This allows a broader perspective to be maintained while operational details are investigated on lower-level pages.

Typically, a Level 1 page will be on a dedicated screen. An operator would then use a second screen to navigate between Levels 2–4.

Client workstation monitors

In a large system, you might consider having a screen dedicated for each Level 2 area.

Client workstation monitors

You need to consider the impact the page levels will have on your equipment definitions, in particular the **Page** and **Content** properties (see [Add Equipment Using Equipment Editor](#)). If the equipment hierarchy is pre-determined or needs to conform to an industry standard, you should use it as a starting point and plan your page levels accordingly.

If you are using the [Autofill](#) modes "WS\_CONTEXTMODE\_CurrentThenUpThenDown" or "WS\_CONTEXTMODE\_CurrentThenUp", you also need to consider how the page levels align with your equipment hierarchy, as the autofill process will be scanning up and down the hierarchy looking for content to place in your workspace.

## See Also

[Create Content Pages](#)

[Prepare the Navigation Menu](#)

## Assign a Content Type to a Page

When you specify a content type for a page, you determine how the page will be managed by the [Autofill](#)

process and the following workspace page display functions:

- Navigation\_ShowTargetPage
- Workspace\_ShowContent.

For example, if the content type for a page is "L1" (a level one page), it will only display in panes that are configured to display L1 content (see [Page Levels](#)).

Using Content Types, combined with panes that respond to Content Types, will help simplify the maintenance of your system as you will not need to explicitly state where content needs to be shown every time you instruct the system to display a content page. Instead, the system will work this out for itself using your pane configuration and the content type of the page to be displayed.

The content types you can assign to a page are configured in the **Visualization** activity in Plant SCADA Studio (see [Content Types](#)).

#### To assign a content type to a page:

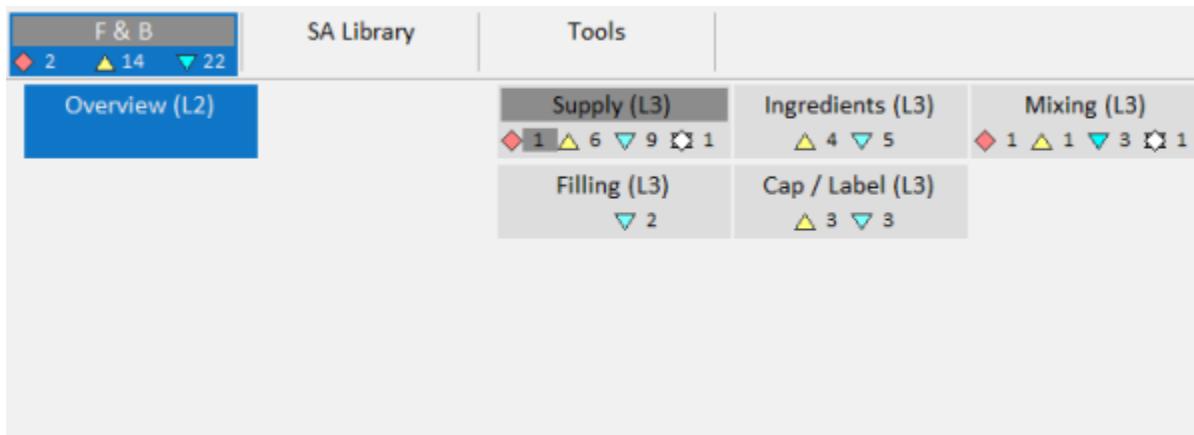

1. In the **Visualization** activity, select **Pages**.
2. Select the required page(s). See [Browse Pages in Plant SCADA Studio](#).
3. Go to the **Content Type** field in the Property Grid.
4. Enter or select a content type. The drop-down list contains the content types that are available to the active project.  
If your project was created using the Situational Awareness Starter project, a default set of content types will be available via the SA\_Include project. For a description, see [Content Types](#).  
If you need to create a new content type, see [Configure Content Types](#).
5. Click **Save**.

[Key Components of a Situational Awareness Project](#)

### Prepare the Navigation Menu

Runtime navigation for a Situational Awareness project is primarily managed via the **Navigation Zone** on the operator dashboard. The image below shows the Navigation Zone from the Example SA project.

The layout of the tabs and buttons in the Navigation Zone is determined by a project's Menu Configuration, which is created using the **Visualization** activity in Plant SCADA Studio (see [Menu Configuration](#)).

The navigation menu for a Situational Awareness project needs to have "Navigation" entered in the **Page** field for each menu entry.

	Page	Level 1	Level 2	Level 3	Menu Command	Target Page	Order
1	Navigation	MyPlant			Navigation_ShowTargetPage()	WhatsNew	
2	Navigation	MyPlant	F & B	Ingredients (L3)	Navigation_ShowTargetPage()	Ingredients_L3	4
3	Navigation	MyPlant	F & B	Supply (L3)	Navigation_ShowTargetPage()	Supply_L3	3
4	Navigation	MyPlant	F & B	Overview (L2)	Navigation_ShowTargetPage()	Overview_L2	1
5	Navigation	MyPlant	F & B				1
6	Navigation	MyPlant	F & B	Cap / Label (L3)	Navigation_ShowTargetPage()	Cap and Label_L3	9
7	Navigation	MyPlant	F & B	Filling (L3)	Navigation_ShowTargetPage()	Filling_L3	8
8	Navigation	MyPlant	F & B	Mixing (L3)	Navigation_ShowTargetPage()	Mixing_L3	5
9	Navigation	MyPlant	SA Library	Valves	Navigation_ShowTargetPage()	Valves	8
10	Navigation	MyPlant	SA Library	Others	Navigation_ShowTargetPage()	Others	10
11	Navigation	MyPlant	SA Library	Drives	Navigation_ShowTargetPage()	Drives	7
12	Navigation	MyPlant	SA Library	Meters	Navigation_ShowTargetPage()	Meters	6
13	Navigation	MyPlant	SA Library				2
14	Navigation	MyPlant	SA Library	Mining	Navigation_ShowTargetPage()	Mining	9
15	Navigation	MyPlant	Tools	Themes	Navigation_ShowTargetPage()	ThemeConfig	4
16	Navigation	MyPlant	Tools				4

To prepare the navigation menu for a Situational Awareness project, follow the instructions below using the Menu Configuration properties as described.

## Set the home page for a workspace

To set the home page for a workspace, use the **Target Page** field for the highest **Level 1** menu entry.

In the case of the ExampleSA project, the home page is the "What's New" page that displays when runtime is launched.

	Page	Level 1	Level 2	Level 3	Menu Command	Target Page	Order
1	Navigation	MyPlant			Navigation_ShowTargetPage()	WhatsNew	
2	Navigation	MyPlant	F & B	Ingredients (L3)	Navigation_ShowTargetPage()	Ingredients_L3	4
3	Navigation	MyPlant	F & B	Supply (L3)	Navigation_ShowTargetPage()	Supply_L3	3
4	Navigation	MyPlant	F & B	Overview (L2)	Navigation_ShowTargetPage()	Overview_L2	1
5	Navigation	MyPlant	F & B				1

You can access the specified home page at runtime from the **Home** button on the header bar.

If your project was created using the Situational Awareness Starter Project, you can also access the home page using the **Home** keyboard key.

**Note:** Alarm counts will not work if the home page specified for your navigation menu differs to the home page specified for your equipment hierarchy (defined via the **Page** field at the hierarchy's root level). See [Enable Navigation Zone Alarm Counts](#).

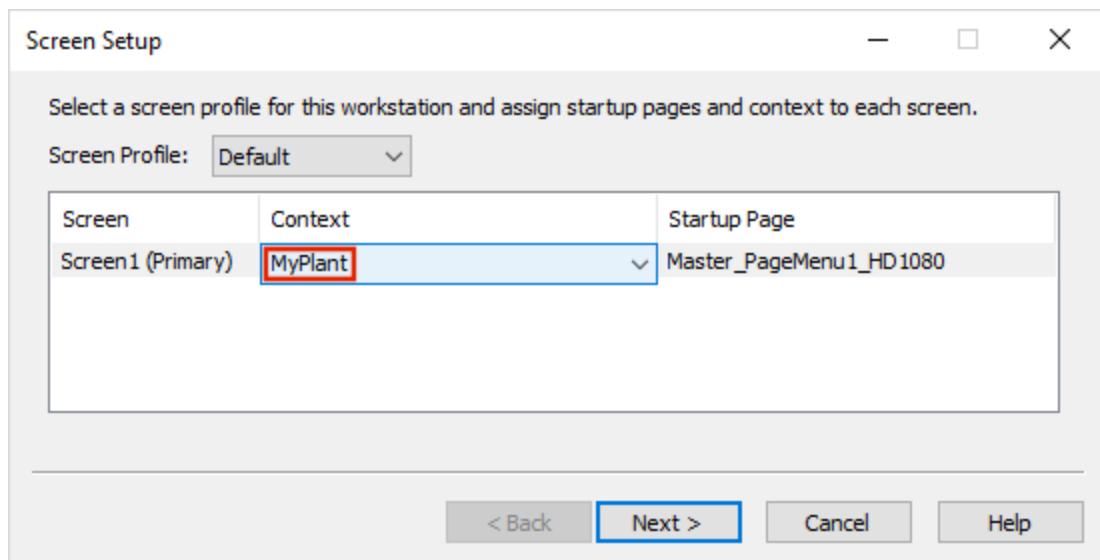

## Configure the startup context for a workspace

The **Level 1** field can be used to specify a startup context for a workspace. This creates a starting point for any navigation that occurs within the workspace.

	Page	Level 1	Level 2	Level 3	Menu Command	Target Page	Order
1	Navigation	MyPlant			Navigation_ShowTargetPage()	WhatsNew	
2	Navigation	MyPlant	F & B	Ingredients (L3)	Navigation_ShowTargetPage()	Ingredients_L3	4
3	Navigation	MyPlant	F & B	Supply (L3)	Navigation_ShowTargetPage()	Supply_L3	3
4	Navigation	MyPlant	F & B	Overview (L2)	Navigation_ShowTargetPage()	Overview_L2	1
5	Navigation	MyPlant	F & B				1
6	Navigation	MyPlant	F & B	Cap / Label (L3)	Navigation_ShowTargetPage()	Cap and Label_L3	9
7	Navigation	MyPlant	F & B	Filling (L3)	Navigation_ShowTargetPage()	Filling_L3	8
8	Navigation	MyPlant	F & B	Mixing (L3)	Navigation_ShowTargetPage()	Mixing_L3	5
9	Navigation	MyPlant	SA Library	Valves	Navigation_ShowTargetPage()	Valves	8
10	Navigation	MyPlant	SA Library	Others	Navigation_ShowTargetPage()	Others	10
11	Navigation	MyPlant	SA Library	Drives	Navigation_ShowTargetPage()	Drives	7
12	Navigation	MyPlant	SA Library	Meters	Navigation_ShowTargetPage()	Meters	6
13	Navigation	MyPlant	SA Library				2
14	Navigation	MyPlant	SA Library	Mining	Navigation_ShowTargetPage()	Mining	9
15	Navigation	MyPlant	Tools	Themes	Navigation_ShowTargetPage()	ThemeConfig	4
16	Navigation	MyPlant	Tools				4

If you have a display client with multiple monitors, you can use assign a different **Level 1** entry to each screen.

To associate a **Level 1** entry with the workspace on a particular screen, use the **Context** column on the **Screen Setup** page of the Computer Setup Wizard.

At runtime, the **Level 1** entry will appear in the menu breadcrumbs on the workspace header bar.

## Create the Navigation Zone tabs

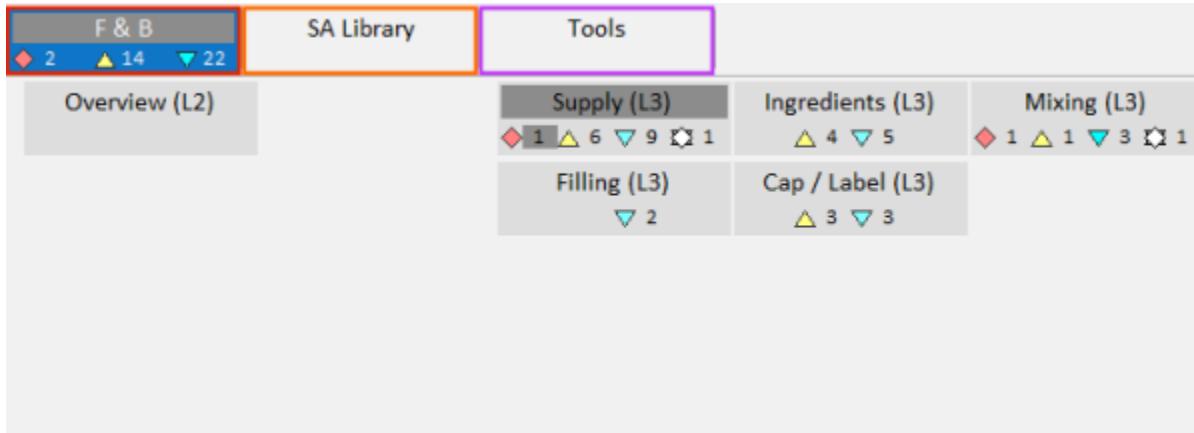

The **Level 2** entries set the tabs along the Navigation Zone header.

Page	Level 1	Level 2	Level 3	Menu Command	Target Page	Order
1	Navigation	MyPlant		Navigation_ShowTargetPage()	WhatsNew	
2	Navigation	MyPlant	F & B	Navigation_ShowTargetPage()	Ingredients_L3	4
3	Navigation	MyPlant	F & B	Navigation_ShowTargetPage()	Supply_L3	3
4	Navigation	MyPlant	F & B	Navigation_ShowTargetPage()	Overview_L2	1
5	Navigation	MyPlant	F & B			1
6	Navigation	MyPlant	F & B	Navigation_ShowTargetPage()	Cap and Label_L3	9
7	Navigation	MyPlant	F & B	Navigation_ShowTargetPage()	Filling_L3	8
8	Navigation	MyPlant	F & B	Navigation_ShowTargetPage()	Mixing_L3	5
9	Navigation	MyPlant	SA Library	Navigation_ShowTargetPage()	Valves	8
10	Navigation	MyPlant	SA Library	Navigation_ShowTargetPage()	Others	10
11	Navigation	MyPlant	SA Library	Navigation_ShowTargetPage()	Drives	7
12	Navigation	MyPlant	SA Library	Navigation_ShowTargetPage()	Meters	6
13	Navigation	MyPlant	SA Library			2
14	Navigation	MyPlant	SA Library	Navigation_ShowTargetPage()	Mining	9
15	Navigation	MyPlant	Tools	Navigation_ShowTargetPage()	ThemeConfig	4
16	Navigation	MyPlant	Tools			4

By default, only five tabs will fit across the Navigation Zone for a project based on the HD1080 master page, and

six will fit for a UHD4K master page. Be aware that these limits will be reduced by one if you customize your navigation tabs to include an additional alarm count (see [Add an Additional Alarm Count to the Navigation Zone](#)). A compile error message will be generated if the number of Level 2 entries exceeds these limits.

In the case of **Level 2** menu entries, the **Order** field is used to determine how the tabs will appear from left to right.

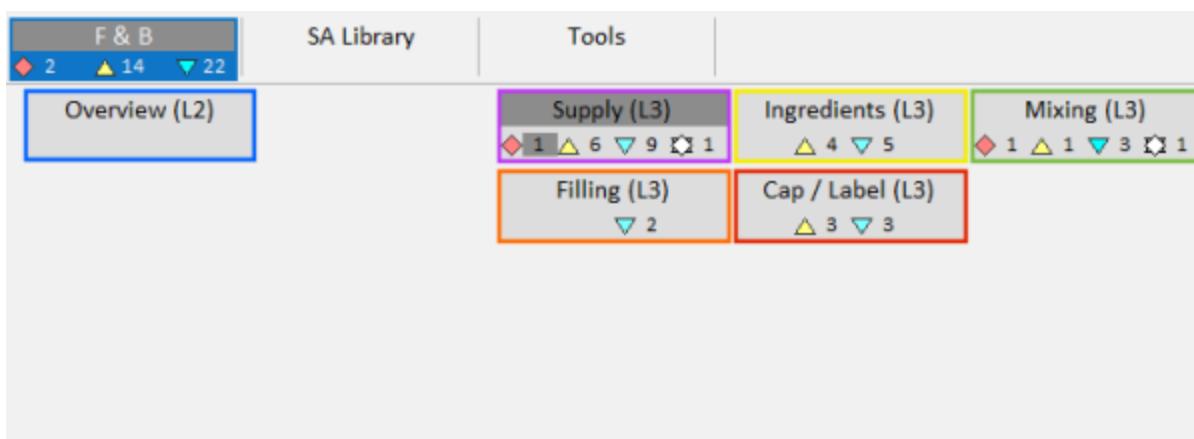

**Note:** It is recommended that you do not specify a **Target Page** for a **Level 2** menu entry, as this will allow an operator to select a tab and assess the associated alarms without navigating away from the page that is currently displayed.

## Configure the page buttons

The **Level 3** fields set the buttons that appear on each tab. Up to 20 menu entries are supported on each tab.

Page	Level 1	Level 2	Level 3	Menu Command	Target Page	Order
1	Navigation	MyPlant	F & B			1
2	Navigation	MyPlant	F & B	Cap / Label (L3)	Navigation_ShowTargetPage()	9
3	Navigation	MyPlant	F & B	Filling (L3)	Navigation_ShowTargetPage()	8
4	Navigation	MyPlant	F & B	Ingredients (L3)	Navigation_ShowTargetPage()	4
5	Navigation	MyPlant	F & B	Mixing (L3)	Navigation_ShowTargetPage()	5
6	Navigation	MyPlant	F & B	Overview (L2)	Navigation_ShowTargetPage()	1
7	Navigation	MyPlant	F & B	Supply (L3)	Navigation_ShowTargetPage()	3

The **Order** field determines the arrangement of buttons on a tab (see *Set the Order field below*).

Notice that the "Overview" button indicates that it links to an "(L2)" (level 2) page. This refers to the location of the page in the hierarchy of pages (see [Page Levels](#)), it does not relate to the fields in your menu configuration. The page buttons you create using **Level 3** of the menu configuration can link to any level in your project's page hierarchy.

## Set the Order field

The **Order** field determines the arrangement of buttons on a tab, as mapped out below.

Level 2				
Order = 1	Order = 2	Order = 3	Order = 4	Order = 5
Order = 6	Order = 7	Order = 8	Order = 9	Order = 10
Order = 11	Order = 12	Order = 13	Order = 14	Order = 15
Order = 16	Order = 17	Order = 18	Order = 19	Order = 20

If no value is specified for the **Order** property, a default value of zero (0) is applied. If two or more items on a common branch of the menu hierarchy have the same value, the layout is determined by the order in which they appear in the in the menu configuration database. The first item in the database will fill the first available gap in the layout of buttons, the next item will fill the next available gap, and so on.

## Set the Target Page field for each button

The **Target Page** field specifies the page to open when the button associated with a menu item is clicked.

The **Menu Command** field specifies the command to use to open the page associated with a menu item. Use the command "Navigation\_ShowTargetPage" in the property.

Where duplicated variations of a page exist to suit HD1080 and UHD4K screen resolutions, the page that is displayed is determined by the resolution of the host workspace. This means it is not necessary to add the suffix "\_HD1080" or "\_UHD4K" to the end of a page name specified in the **Target Page** field. For more information, see [Configure a Project that Supports Multiple Screen Resolutions](#).

---

**Note:** To enable the Navigation Zone alarm counts, the page name you specify in the **Target Page** property needs to be the same as the name used for the **Page** property for the associated equipment definition. This allows the system to count the top three priorities and shelved alarms for all equipment that is 'homed' on that page. See [Enable Navigation Zone Alarm Counts](#).

---

**Note:** To enable alarm counts in the Navigation Zone, there are a number of project settings that need to be configured correctly. For more information, see [Enable Navigation Zone Alarm Counts](#).

---

## See Also

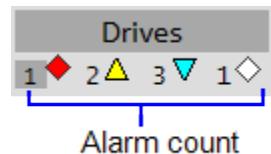

[Prioritize Alarms](#)

[Configure Display Properties for an Alarm Priority](#)

## Enable Navigation Zone Alarm Counts

Every tab and button in the Navigation Zone supports an alarm count that indicates how many alarms are currently active on the associated page (for more details, see [Navigation Zone](#)).

Each value appears to the left of an animated icon that indicates the priority the value represents.

---

**Note:** You can use the parameter [Workspace]NumberOfTopPriorities to display alarm counts for the top four alarm priorities (instead of the top three). For more information see [Add an Additional Alarm Count to the Navigation Zone](#).

---

To enable alarm counts in the Navigation Zone, you should check that the following project settings are correctly configured.

## Confirm that equipment is "homed"

To include a piece of equipment in the alarm count for a page, the piece of equipment needs to be "homed" to the page. This is achieved by setting the **Page** property in an equipment definition. The **Page** property associates a piece of equipment with the page that represents its primary operational context.

## Confirm that alarms have a category

Alarm counts require alarms to be associated with an alarm category. A category then needs to be mapped to one of the three highest priority numbers in your project. The workspace considers 1 as the highest, and 255 as the lowest.

See [Add an Alarm Category](#).

## Configure the priority icons

The priority icons are configured via the **Small Genie Name** property for each alarm priority. For more

information, see [Configure Display Properties for an Alarm Priority](#).

**Note:** Alarm counts will not work if the home page specified for your navigation menu differs to the home page specified for your equipment hierarchy (as defined in the **Page** field for the root level of your equipment hierarchy). See "Set the home page for a workspace" in the topic [Prepare the Navigation Menu](#).

## Configure Panes on a Master Page

Panes are configured while the master page for the host workspace is displayed in Graphics Builder.

You need to define settings such as:

- The page that will display in the pane at startup
- If **Autofill** is enabled for the pane
- The type of content that the pane will display
- How the content of a pane will change as the pane is resized
- If the pane has scroll bars.

### To configure a pane's properties:

1. Open Graphics Builder.
2. Open the master page for the workspace that includes the pane you would like to configure.  
If your project was created using the Situational Awareness Starter Project, the default name for the workspace master page will be "Master\_PageMenu1\_<resolution>".
3. When the master page is open, double click on the pane that you would like to configure. The Pane Properties dialog will display.
4. Make the required changes to the dialog fields. For a description of the properties, see below.
5. Click **OK**.

## Pane Properties

Property	Description
Name	The name used to identify the pane. The name needs to be unique; two panes on the same page cannot have the same name. The syslog.dat file for the client will log a message if it detects duplicate panes.
Default Page	The name of the page that the pane will display at startup. If the <b>FillMode</b> for the pane is set to an Autofill option, this page will also display when a context change results in the pane having no content to display.
Display Mode	Determines how the content of a pane will change as the pane is resized. Use one of the following integers to specify a display mode:

Property	Description
	<ul style="list-style-type: none"> <li>• <b>1 = Stretch</b> — the displayed page will continue to fill the pane as it changes size.</li> <li>• <b>2 = Maintain aspect ratio</b> — the displayed page will enlarge and reduce in size in proportion with the pane, however it will maintain its aspect ratio.</li> <li>• <b>3 = Maintain size</b> — the displayed page will not change in size as the pane is resized. If the page is larger than the pane it will be clipped, or scroll bars will appear if enabled.</li> </ul>
Is Default Pane?	<p>Set this property to TRUE if you want the pane to be the default pane within the workspace. This will make the pane the primary point of reference for the workspace. The default pane is used to display pages that have no content type defined.</p> <p>Each workspace can only contain one default pane. The syslog.dat file for a client will indicate if a default pane is not specified.</p> <p>The workspace Header Bar will refer to the page displayed in the default pane to source the active page title and breadcrumbs. This will also determine the current selection in the Navigation Zone.</p>
Display Scrollbars	<p>Determines if the pane will include scrollbars at runtime.</p> <ul style="list-style-type: none"> <li>• FALSE = No scrollbars.</li> <li>• TRUE = Use scrollbars.</li> </ul> <p>Scrollbars will only appear if the pane's <b>DisplayMode</b> property is set to 3 (maintain size), and the page displayed is larger than the pane.</p>
Fill Mode	<p>Determines how the content of a pane is updated as context changes. Use one of the following integers to specify a fill mode:</p> <ul style="list-style-type: none"> <li>• <b>Static</b> — the content and equipment assignments within the pane remain unchanged when equipment context changes.</li> <li>• <b>StaticContextMustMatch</b> — the content does not change, but any associations are updated to match the new equipment context (see below).</li> </ul>

Property	Description
	<ul style="list-style-type: none"><li>• <b>Autofill</b> — the pane will check the content specified for the equipment that comes into context. If it matches the pane's <b>ContentTypes</b> setting, the pane will display the content. If there is no valid content for the pane linked to the new equipment context, content may be sourced by traversing up/down the equipment hierarchy. See <a href="#">Autofill</a> for configuration examples.</li><li>• <b>AutofillContextMustMatch</b> — The same as Autofill, however content directly associated with the new equipment context will be used to fill the pane. The content will only be updated if the equipment is a direct contextual match (see below).</li></ul> <p>See <a href="#">Autofill</a> for configuration examples.</p>
ContentTypes	<p>Defines the type of content the pane will display. You can specify zero or more types as a comma separated list. Specifying no content type is acceptable for a static pane, but it is recommended that any other type of pane has at least one content type specified.</p> <p>The content types you can use are configured in <b>Visualization</b> activity.</p> <p>At runtime, only pages with a content type that matches with the pane will be displayed. See <a href="#">Content Types</a>.</p>
Excluded Autofill Panes	<p>Allows you to specify panes that will not display updated content when an equipment context change is triggered from this pane. When the context changes in the current pane, the content in the excluded panes will remain static. However, the context in excluded panes will still be updated. Any pane in the workspace or a linked workspace can be excluded.</p> <p>Specify the name(s) of one or more panes or nested panes that you want to exclude from autofill. Use a comma to specify more than one pane name.</p> <p>For more information, see <a href="#">.</a></p>
Tab Header Pane Name	<p>If you want the content of the pane to be controlled via a set of tabs, you can use this property to indicate the pane where the associated tab bar is located.</p> <p>Enter the name of the pane that hosts a page with the tab bar Genie on it.</p>

Property	Description
Tab Control Name	Enter the name of the tab bar Genie that you would like to use to control the content of the pane. The tab control needs to be located on the page of the pane specified in the <b>Tab Header Pane Name</b> property (see above).
Equipment Reference Associations: Categories	This field allows you to associate a pane with an equipment reference category, or a comma-separated list of equipment reference categories (see "Category" in the topic <a href="#">Define Equipment References</a> ). When a piece of equipment comes into context, any equipment references within the specified category will be used to create Super Genie associations for a displayed page. For more information, see <a href="#">AssEquipReferences</a> .

## Excluding Panes

As described above, you can use the Pane Properties dialog box to add a list of panes that you wish to exclude from autofill. Excluded panes will show the same content regardless of the context. If the current pane changes context, content in the panes specified in the **Exclude Autofil Panes** box will not be updated.

**Note:** The context within excluded panes will be updated when the context of the current page changes.

It is also possible to exclude panes at runtime by using a page environment variable. To do this:

1. Open the page that contains the context that will change.
2. Open the Page Properties dialog box.
3. Select the Environment tab.
4. Click **Add**. The Edit Properties dialog box is displayed.
5. In the **Property** box, type the property name `ExcludedAutoFillPanes`.
6. In the **Value** box, specify the name(s) of one or more panes that you want to exclude from autofill.
7. Click **OK** to close the Edit Properties dialog box.
8. Click **OK** to close the Page Properties dialog box.

**Note:** A pane can display a page that includes its own set of panes, creating a multi-level arrangements of nested panes. See [Use Nested Panes](#).

## See also

- [Set the Context Mode for a Workspace](#)  
[Create a Master Page for a Customized Workspace](#)

## Set the Context Mode for a Workspace

Context mode is a workspace setting that determines if the autofill process will respond to equipment on higher and lower levels of the equipment hierarchy when context changes.

There are three context modes you can use:

- CurrentOnly — only the current piece of equipment is considered when panes scan for the type of content they are configured to display.
- CurrentThenUp — the current piece of equipment is considered when panes scan for matching content. When this process is complete, content types on higher levels of the equipment hierarchy are matched with any remaining panes.
- CurrentThenUpThenDown — the current piece of equipment is considered when panes scan for matching content. When this process is complete, equipment on higher levels in the equipment hierarchy are matched with any remaining panes, then equipment on lower levels of the hierarchy.

The Context Mode setting should be consistent across all clients in a system.

See [Autofill](#) for configuration examples.

## Set context mode in the project database

If your project was created using the Situational Awareness Starter Project, the ContextMode parameter will already be included as a database parameter with a default value of 3 (CurrentThenUpThenDown). To configure the parameter:

1. In the **Setup** activity, select **Parameters**.
2. In the **Section Name** column, locate or enter "Workspace".
3. In the **Name** column, locate or enter "ContextMode".
4. Enter the **Value** that represents the context mode you would like to use:
  - 1 = CurrentOnly
  - 2 = CurrentThenUp
  - 3 = CurrentThenUpThenDown.
5. Click **Save** to add the record to the database.

If you set (or change) parameters in the project database, you need to re-compile the project before the new parameter settings are used.

For a description of a workspace, see [Key Components of a Situational Awareness Project](#).

## Configure Interlocks

Plant SCADA allows you to represent the interlocks that exist in a production facility within a Situational Awareness project (see [Interlocks](#)). The activity associated with an interlock can then be presented to an operator at runtime in the [Information Zone](#).

To configure interlocks in your Plant SCADA project you need to complete the following tasks.

## Create the required equipment references

Equipment References allow you to create connections in your equipment model that reflect the interlocks that exist in the field. They are defined in the **Equipment** view of the **System Model** activity (see [Define Equipment References](#) for more information).

When defining an equipment reference to represent an interlock, use the following fields:

Field	Description
Equipment	Enter the name of the piece of equipment that will change state when an interlock is triggered. By default, the "Running" item will change state when an interlock is triggered. If this is not the correct item, use the runtime parameter "Interlock_StateItem" to specify a different state item (see <i>Set the "Interlock_StateItem" Runtime Parameter</i> below).
Referenced Equipment	Enter the name of the piece of equipment where the triggering action will occur.
Referenced Item	Enter the name of the equipment item in the referenced equipment that will trigger the interlock when a change of state occurs.
Category	Identify the type of interlock you are creating. Enter the whole name of the category in the format "Interlock.<category>". The Situational Awareness Starter Project provides the following categories: <ul style="list-style-type: none"><li>• <b>Interlock.Safety</b> — conditions that cause equipment to stop running.</li><li>• <b>Interlock.Process</b> — conditions that cause equipment within a process to stop running.</li><li>• <b>Interlock.Permissive</b> — conditions that stop equipment from starting.</li></ul>
Comment	Enter a description of the interlock in the <b>Comment</b> field. If no comment is entered, the Information Zone will display the 'cluster.equipment.item' name.

You can also use an Equipment Reference to configure a bypass for an interlock. See [Configure a Bypass for an Interlock](#).

## Configure interlock trigger items

By default, the "Running" item will change state when an interlock is triggered by a referenced piece of equipment. If required, you can specify a different state item. To do this, use the runtime parameter

"Interlock\_Stateitem".

Runtime parameters are defined in the **Equipment** view of the **System Model** activity (see [Define Equipment Runtime Parameters](#) for more information).

When defining the runtime parameter, use the following fields:

Property	Description
Cluster	Enter the name of the cluster to which the equipment is assigned.
Equipment	Enter the name of the piece of equipment that will change state when an interlock is triggered.
Name	A name for the parameter, in this case "Interlock_StateItem". This indicates that an alternative item name (entered in the Value column) has been defined.
Value	Enter the name of the equipment item that will change state when an interlock is triggered.
Is Tag	Set this to FALSE. This field defaults to TRUE if no value is specified. If you do not enter FALSE, interlocks will not recognize your state item and not function correctly.

**Note:** You can change the default state item from "Running" for all equipment at a global level using the INI parameter [\[Interlock\]StateItem](#).

## Create the required alarms

Alarms are used to generate the events required to track interlock activity. They are used to determine how long an interlock has been active, or when it was last active.

To support interlocks, you need to configure the following alarms:

- One for the item that changes state when an interlock is triggered.
- One for each of the items that trigger an interlock in any referenced equipment.

**Note:** It is recommended that these alarms be hidden from the operator. To do this, assign the alarms to an alarm category that has the **ShowOnActive** property set to FALSE. If you want the operator's reason for a bypass to appear on the SOE page, set the **ShowOnSummary** to TRUE. See [Add an Alarm Category](#).

## See Also

[Configure a Bypass for an Interlock](#)

## Configure a Bypass for an Interlock

You can configure an [Interlocks](#) so that it can be bypassed. This means an operator can manually override an interlock, making a locked process available to start.

A bypass is implemented at runtime via the **Interlock** tab on the **Information Zone**. For further instructions, see [Information Zone](#).

### To configure a bypass for an interlock

A bypass is configured via the equipment reference that defines the relationship between the two pieces of equipment (see [Configure Interlocks](#)).

To enable a bypass, complete the following **Custom** properties:

- **Custom 1** — BypassStatus - enter the name of the tag that controls the bypass status for the interlock.
- **Custom 2** — BypassCommand - enter the name of the tag that when written to will bypass an interlock.
- **Custom 3** — RemoveBypassCommand - enter the name of the tag that when written to will remove a bypass for an interlock.
- **Custom 4** — EnableBypass/Reset - enter the name of a tag to disable the bypass command. If this tag exists, then the bypass and reset commands will be enabled if the value of this tag is 1.

You need to have variable tags for the bypass states for the referenced equipment. For example, for Motor1 you would configure four variable tags, one for each bypass state:

Variables				
Row	Equipment	Item Name	Tag Name	Cluster
2454	Motor1	BypassStatus	Motor1_BypassStatus	Cluster1
2455	Motor1	BypassCommand	Motor1_BypassCommand	Cluster1
2456	Motor1	RemoveBypassCommand	Motor1_RemoveBypassCommand	Cluster1
2457	Motor1	EnableBypass	Motor1_EnableBypass	Cluster1

**Note:** If custom field 4 is empty, and any of the remaining fields are completed, then the "Reset" and "Bypass" commands will be enabled. Otherwise, if the four custom fields are complete, then the "Reset" and "Bypass" commands will be disabled unless the tag specified in this field is 1.

### Bypass permissions

The ability to initiate a bypassed depends on the privileges defined for the piece of equipment that changes state in response to an interlock trigger.

The function GetPrivEx is used to retrieve the privilege of the interlocked piece of equipment. If the privilege level assigned to the current user does not match the privilege level of the interlocked equipment, the options to bypass and remove a bypass will not be available.

## SOE event journal limitations

Bypassing an interlock adds an event to the sequence of events (SOE) journal. The event message uses the following format:

<Cluster>.<Equipment>.<Item> @(**INTERLOCK BYPASSED:**)<Reason>

The length of the message field in the SOE is 254 characters. If <Cluster>.<Equipment>.<Item> has more than 160 characters, it will be truncated from the beginning.

For example, if the name of a piece of equipment is "Cluster1.Equip1.....Equip10.Item" (which contains 167 characters), the name will be truncated to "1.Equip1.....Equip10.Item".

The truncated equipment name needs to be globally unique, otherwise the bypass information will not display in the remove bypass form. A hardware alarm "Named object already exists" will also be raised.

The length of the reason an operator can specify depends on equipment name and the localized string of "INTERLOCK BYPASSED:". For example, if the equipment name is 80 characters long and the localized string of "INTERLOCK BYPASSED:" is 20 characters long, the operator can type 153 characters as the reason for the bypass. If the operator types more than 153 characters, the text will be truncated from the end.

Similarly, removing an interlock bypass adds an event to the SOE journal. The message of the event is in the following format:

<Cluster>.<Equipment>.<Item> @(**INTERLOCK BYPASS REMOVED:**)<Reason>

Again, if <Cluster>.<Equipment>.<Item> has more than 160 characters, it will be truncated from the beginning.

The length of the reason provided for removing a bypass depends on the equipment name and the localized string of "INTERLOCK BYPASS REMOVED:". For example, if the equipment name is 80 characters long and the localized string of "INTERLOCK BYPASS REMOVED:" is 26 characters long, a user can type 147 characters as the bypass reason. If the

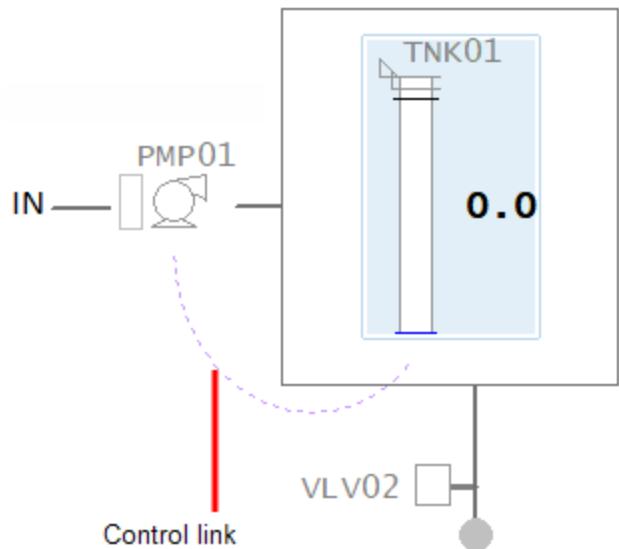

user types more than 148 characters, the text will be truncated from the end.

## Add a Control Link

A control link is a visual link that indicates a relationship between a controller and an associated controller element.

A control link can be drawn in any direction. It becomes visible when either of the objects to which it is connected is selected by the user.

#### To create a content page for a Situational Awareness project:

1. In Graphics Builder, open the required page.
2. Use an ellipse object to draw a line on the page that links the two related items.

To create the required line:

- Go to the **Appearance | General** tab and select **Arc** as the ellipse object type. Use the **Start Angle** and **End Angle** settings to specify the end points for the line.
- Set the line **Color** (pink is recommended).
- Set the **Style** to **Dot**.

3. Go to the **Appearance | Visibility** tab.
4. In the **Hidden when** field, use the Cicode function to control the appearance of the control link.  
For example, to configure the control link in the image above, you would use the following:  
`NavigationLink_IsHidden("MyPlant.FullMilk.TNK01", "MyPlant.FullMilk.PMP01", TRUE)`

5. Click **OK** and save your changes.

It is recommended that you also add an arrow head to the line to indicate which piece of equipment has control. Use a filled polygon for the arrow head and create an object group. You can then perform steps 3 and 4 using the Group Properties dialog.

#### See Also

[Key Components of a Situational Awareness Project](#)

#### Create a New Faceplate

You can use one of the sample faceplates in the required resolution (HD1080 or 4K) to create your own faceplate. Sample faceplates are located in the SA\_Style\_1\_MultiRes project.

**To create a new faceplate, follow these steps:**

1. Modify an existing sample faceplate.

Or:

Create a copy of an existing faceplate.

Or:

Create a new page in Graphics Builder using the "faceplate" template in the required resolution.

---

**Note:** The sample faceplates use a specific set of items to display controls at runtime. You can build your faceplate using these items, which are listed in the topics that describe the faceplates for meters, drives and valves.

---

2. Save your page.
3. Go to Plant SCADA Studio.
4. In the **Visualization activity | Pages**, set the **Content Type** for the above page to "FP". Content of this type will automatically display in the [Faceplate Zone](#) of the workspace.
5. Click **Save**.
6. In Plant SCADA Studio, **System Model activity | Equipment**, locate the equipment for which you are creating the faceplate.
7. Add the name of the page you created earlier to the **Content** field for the equipment. It can include a comma separated list.
8. Click **Save**.

---

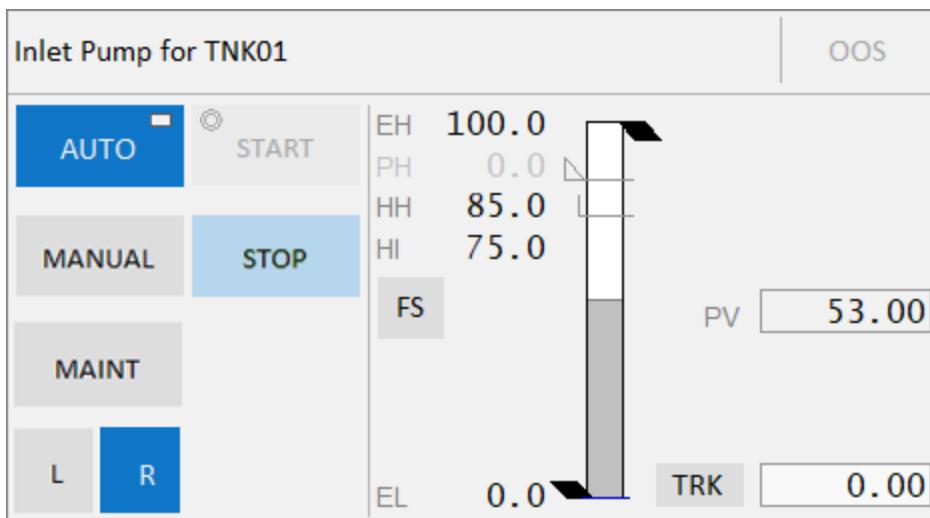

**Note:** User interaction with faceplates is achieved through command tags (items) associated with the various components of a faceplate. Items are listed in the individual faceplate topic. Buttons on a faceplate are designed to support this interaction. However, tags in Plant SCADA need to be mapped to the tags that you have configured on your PLCs. For example, tags for starting a drive (StartCmd) and displaying its status (CtrlMode) available in Plant SCADA. Similarly, tags for starting the drive and displaying its status would exist on your PLC. These two sets of tags need to be mapped to each other for the buttons on the drive faceplate to work. If the mapping is not created, buttons on the faceplates will not function. Refer to the example below to understand how this works.

---

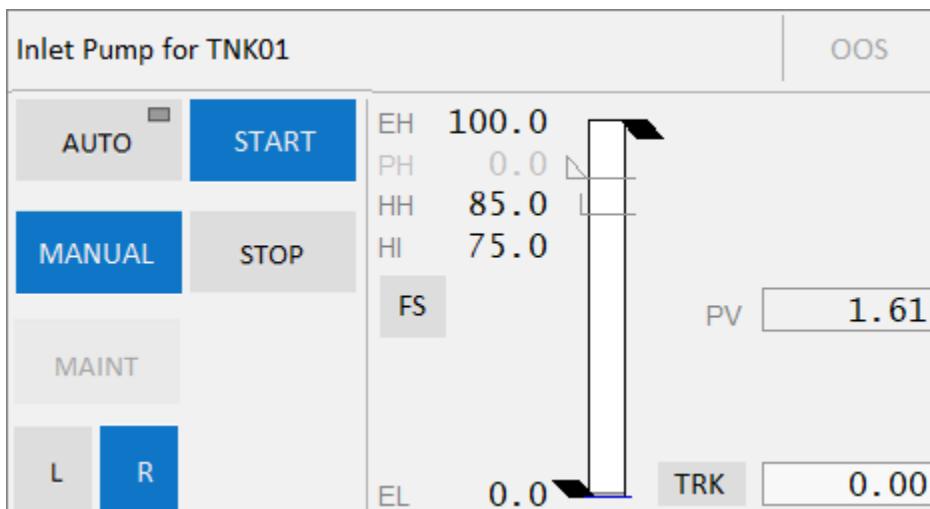

## Example

This example illustrates how tags are used to achieve interaction with faceplates.

The CtrlModeDef tag sets the default mode of operation for a piece of equipment. If you set this tag to 0 for a pump, the default mode of a pump will be Auto. That is indicated on the faceplate by a rectangle in the top-right corner of the **Auto** button on the faceplate as shown below.

The CtrlMode tag represents the current mode for a piece of equipment. If the CtrlModeDef (default) and CtrlMode (current) have different values, the current mode will be displayed in green. For example, the CtrlModeDef = 0 (Auto) and the CtrlMode = 1 (Manual), the **Manual** button will be displayed in green. Clicking the **Manual** button will set the ManCmd tag to 1.

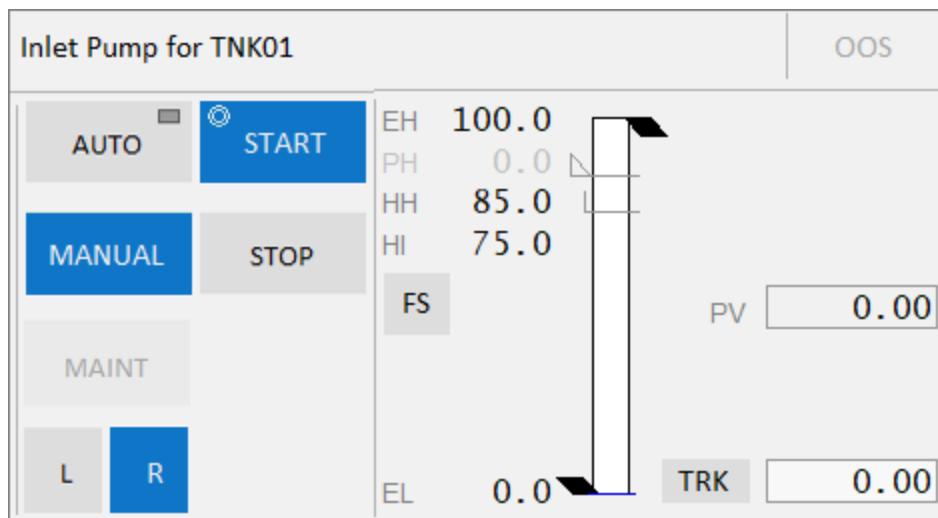

If the pump is not running, the **Start** button will also be displayed in green to allow you to manually start the pump. If the pump is running, the **Stop** button will be green allowing you to manually stop the pump. The **Auto** button will continue to display the rectangle to indicate that it is the default mode. Note that the **Start** and **Stop** buttons are available only when the mode is Manual.

---

**Note:** Clicking any button will set its <name>Cmd tag to 1. For example, clicking the **Manual** button will set ManCmd to 1.

---

When you click one of the buttons, a circle will appear in the top-left corner to indicate that a command (**Start** in the above image) has been sent to the PLC mapped to the corresponding tags. Once the Start command is completed, the circle will disappear as the PLC sets StartCmd to 0 (or StopCmd to 0 in case you clicked the **Stop** button). In addition, the PLC sets the value of the Running tag to 1 (Stopped tag if you clicked the **Stop** button). When you click Stop, the value of the Stopped tag is 1.

## Configure Equipment Selection for Group Objects

Some Composite Genie can be configured to represent multiple pieces of equipment.

Examples are the Drive for a Duty/Standby Pump, or a Fan Group. The XY Bar Graph and Polar Star are other examples.

When a Composite Genie is configured to represent multiple pieces of equipment, the operator can still select it on a page. The faceplate that is displayed will be that of the first object in the group.

To allow selection of the other objects in the group, all must share the same faceplate, and references must be setup between the group object and the equipment it is grouping. The faceplate itself must also have 'n' copies of the MEO Selector Genie to allow selection of each piece of equipment.

To configure equipment selection for group objects, you need to perform the following steps.

## Configure the group of Equipment Running State Indicators using Equipment References

The link created between the grouping equipment object and the referenced equipment does not need to be one of parent/child, instead the reference can be made to equipment outside the hierarchy. See for more

information.

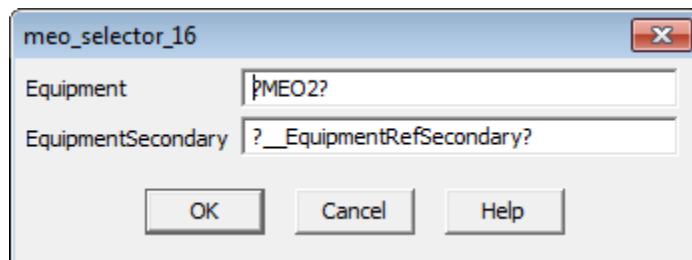

### To configure links between the grouping object and the equipment being grouped:

1. In the **System Model** activity, select **Equipment**.
2. On the menu below the Command Bar, select **References**.

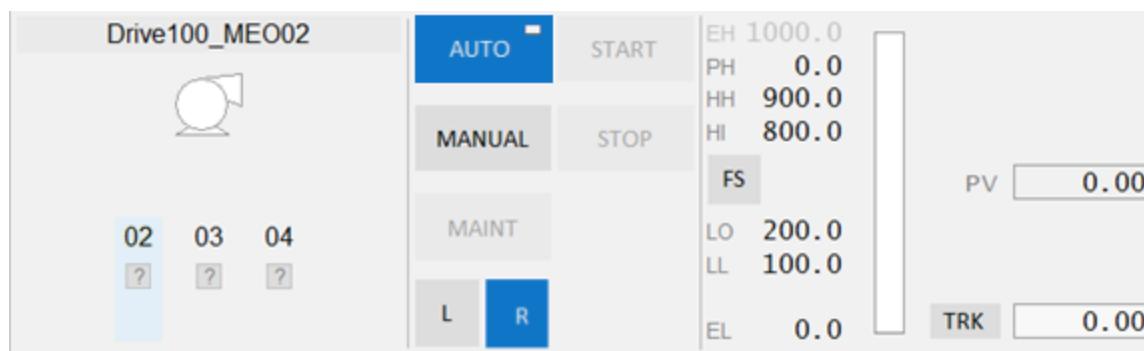

The list of equipment references will display in the Grid Editor.

Row	Cluster	Equipment	Referenced Equipment	Referenced Item	Category	Order	Association
1	Cluster1	Company.TopMilk.Mixin	Company.TopMilk.Ingredients	Open	Interlock.Process	1	
2	Cluster1	Company.TopMilk.Mixin	Company.TopMilk.Ingredients	Running	Interlock.Process	2	
3	Cluster1	Company.TopMilk.Mixin	Company.TopMilk.Ingredients	Running	Interlock.Process	4	
4	Cluster1	Company.TopMilk.Mixin	Company.TopMilk.Ingredients	Open	Interlock.Process	3	
5	Cluster1	Company.TopMilk.Mixin	Company.TopMilk.Ingredients	Running	Interlock.Process	6	
6	Cluster1	Company.TopMilk.Prod	Company.TopMilk.Production		MEO	1	Meter1
7	Cluster1	Company.TopMilk.Prod	Company.TopMilk.Production		MEO	2	Meter2
8	Cluster1	Company.TopMilk.Prod	Company.TopMilk.Production		MEO	3	Meter3

3. Add a row to the Grid Editor.
  4. Type the required information in each column, or in the field select the information from the drop down menu. (See [Define Equipment References](#) for a description of the properties of each column).
  5. In the Category column enter **MEO**.
- MEO stands for Multiple Equipment Object. So MEO1 is the first object in the group (Multiple Equipment Object 1) and so on.
6. In the Association column enter the name of the association for the referenced equipment, for example, MEO1 or MEO2 or so on. Association names are passed to the 'meo\_selector\_xx' Genie instance on faceplates using Super Genie syntax ?MEO2?. A Super Genie association is created for each reference, using the name specified in the Association column.

In the starter project the equipment with "MEO1" will appear in the first position on the faceplate (to the left), MEO2 will be in the second position, and so on. It is not necessary to start at MEO1 if you have three MEOs, then use MEO2, MEO3, MEO4 to use the center positions on the faceplate.

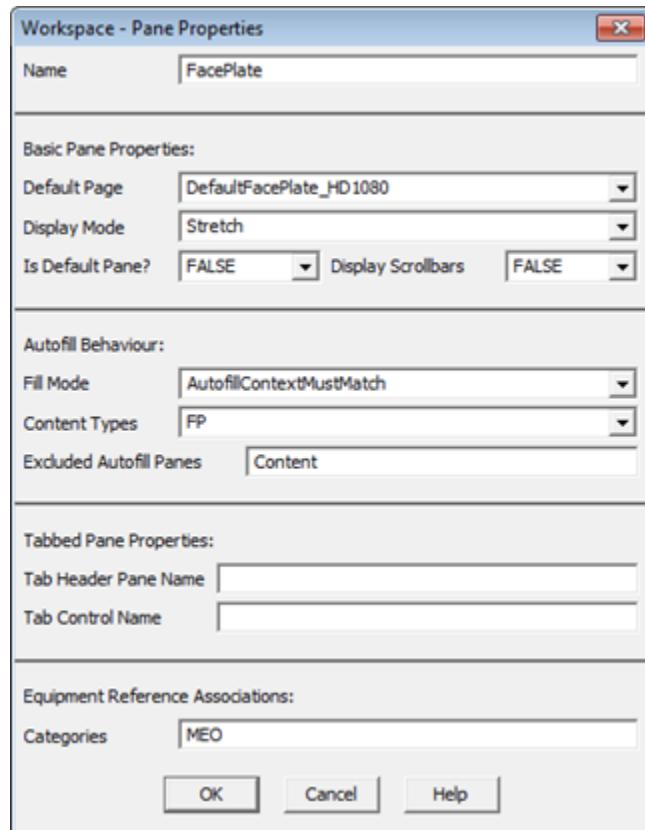

**Note:** The category name "MEO" and association names "MEO1" to "MEO5" are not fixed. They are the values used by the default master page and example faceplates in the starter project. You can create your own pages with different names and, if required, have more than five equipment selectors.

7. Complete the property grid.
8. Click **Save**.

## Verify that the Workspace Pane Properties for the faceplate has the correct category

The category is defined in the pane properties for the Faceplate pane in the Master\_PageMenu1 page:

**Note:** If you have configured your own faceplate, verify the category entered in the Workspace pane properties dialog is the same entered when creating your references to related equipment.

**Note:** In advanced configuration a workspace pane can have zero or more categories configured in the Categories field (comma-separated list). For each category, a super-genie association is created for each

---

reference, using the name specified in the Association column.

---

## See Also

[Configure Your Project](#)

## Configure a Project that Supports Multiple Screen Resolutions

A Situational Awareness project can be configured to support multiple screen resolutions using two methods:

- By creating content that can be shared across resolutions.
- By explicitly defining content for a particular resolution using a resolution suffix. The appropriate content is then matched to the resolution of the host workspace at runtime.

At runtime, when a request is made to display a page, the workspace will first look for a page that has a resolution extension that matches the resolution of the host workspace master page. If a version of the page with the requested extension does not exist, it will next attempt to display a page without an extension.

Both these methods allows clients to use the same project configuration (including menus, equipment and pages) on different resolution screens.

You can mix and match these methods in your project. For example, you may decide that 90% of your mimics can be shared across resolutions, but 10% need to be optimized for HD and UHD resolutions.

## Create content that can be shared across screen resolutions

In most cases, the content you create will successfully adjust based upon the **Display Mode** of the pane it is displayed in (see [Configure Panes on a Master Page](#)).

If you want to share content across resolutions, do not add a resolution suffix to your faceplate or page names.

## Explicitly define content for a particular resolution

In some cases it may be necessary to explicitly create content to suit a particular resolution. For example, if you mostly have UHD4K monitors in a plant and just a few HD1080 monitors, you will want your project's content to take advantage of the available screen space on the UHD4K screens. However, you may need to create an HD1080 version of some pages for the content to display appropriately on a smaller screen. If this is the case, you could create an HD1080 version of any pages that needs to be adjusted.

Two screen resolutions are supported in this way:

- HD1080 (1920 x 1080, 16:9)
- UHD4K (3840 x 2160, 16:9)

To create content that is specific to a resolution, add one of the following extensions to the end of your faceplate or page names.

- \_HD1080
- \_UHD4K

For example, you could create the following variations of the same content page:

- **MyPage\_HD1080** page would be 1920 x 720 pixels to fit the content pane on an HD1080 workspace.
- **MyPage\_UHD4K** page would be 3840 x 1768 pixels to fit the content pane on an UHD4K workspace.

At runtime, the extension that matches the resolution of the host workspace master page will be used.

The feature also requires that anywhere a page name is called, such as the **Target Page** field of a menu, the extension needs to be *left off* the page name. The workspace will read the page name and automatically look for a version that has a matching resolution suffix.

This feature applies to:

- the **Target Page** field for a Situational Awareness navigation menu.
- the **Content** and **Page** fields for an Equipment definition.
- Workspace\_ShowContent.

- Navigation\_ShowTargetPage.

---

**Note:** When using this feature, you need to be careful not to specify a full page name (with the resolution prefix) when calling a page. This is particularly true when using Plant SCADA Studio, as the interface allows you to select a full page name.

---

## See also

[Create Content Pages](#)

[Create a Master Page for a Customized Workspace](#)

## Create a Master Page for a Customized Workspace

The SA\_Include project has a Pane Genie that you can paste on a master page, allowing you to create a customized framework for a workspace.

For a description of a workspace, see [Key Components of a Situational Awareness Project](#).

---

**Note:** Master pages need to call the function "Workspace\_Init()" in their OnPageShown event.

---

### To customize the master page for a workspace:

1. Open Graphics Builder.
2. Create a page using the "Master" template, in the resolution that will match the display client screen. Ideally, the name you give to a master page should start with "Master" to make it easy to find.

Or:

Use **Save As** to create a copy of a workspace master page that you would like to modify.

3. Verify that the Content Type applied to the page is "Master". See [Assign a Content Type to a Page](#).
4. From the Graphics Builder Edit menu, select Paste Genie.

Or:

From the Drawing Toolbox, select the Genie icon.

The Paste Genie dialog will appear.

5. In the Library field, select "sa\_workspace".
6. In the Genie section, select "pane".

The Pane Genie will appear on the page.

7. Relocate and resize the pane as required.

The Pane Properties dialog will also appear when you paste the Genie on the master page.

The dialog defines setting such as:

- The page that will display in the pane at startup
- If autofill is enabled for the pane
- The type of content that the pane will display
- How the content of a pane will change as the pane is resized

- If the pane has scroll bars.
8. Make the required changes to the dialog fields. For a description of the Pane Properties, see below.
9. Click OK.

---

**Note:** If you are editing an existing master page, be aware that any adjustments to a pane will mean any content designed for that pane should be resized accordingly. Not doing this will result in scaling of the content, which may not be desired. If resizing SA\_Include pages, make your changes on a copy of the original pages. This will mean your changes will not be lost when the content of the SA\_Include is updated in a future release.

---

## Pane Properties

Property	Description
Name	The name used to identify the pane. The name needs to be unique; two panes on the same page cannot have the same name. The syslog.dat file for the client will log a message if it detects duplicate panes.
Default Page	The name of the page that the pane will display at startup. If the <b>FillMode</b> for the pane is set to an Autofill option, this page will also display when a context change results in the pane having no content to display.
Display Mode	<p>Determines how the content of a pane will change as the pane is resized. Use one of the following integers to specify a display mode:</p> <p><b>1 = Stretch</b> — the displayed page will continue to fill the pane as it changes size.</p> <p><b>2 = Maintain aspect ratio</b> — the displayed page will enlarge and reduce in size in proportion with the pane, however it will maintain its aspect ratio.</p> <p><b>3 = Maintain size</b> — the displayed page will not change in size as the pane is resized. If the page is larger than the pane it will be clipped, or scroll bars will appear if enabled.</p>
Is Default Pane?	<p>Set this property to TRUE if you want the pane to be the default pane within the workspace. This will make the pane the primary point of reference for the workspace. The default pane is used to display pages that have no content type defined.</p> <p>Each workspace can only contain one default pane. The syslog.dat file for a client will indicate if a default pane is not specified.</p> <p>The workspace Header Bar will refer to the page</p>

	displayed in the default pane to source the active page title and breadcrumbs. This will also determine the current selection in the Navigation Zone.
Display Scrollbars	Determines if the pane will include scrollbars at runtime.  FALSE = No scrollbars.  TRUE = Use scrollbars.  Scrollbars will only appear if the pane's <b>DisplayMode</b> property is set to 3 (maintain size), and the page displayed is larger than the pane.
Fill Mode	Determines how the content of a pane is updated as context changes. Use one of the following integers to specify a fill mode:  <b>Static</b> — the content and equipment assignments within the pane remain unchanged when equipment context changes. <b>StaticContextMustMatch</b> — the content does not change, but any associations are updated to match the new equipment context (see below). <b>Autofill</b> — the pane will check the content specified for the equipment that comes into context. If it matches the pane's ContentTypes setting, the pane will display the content. If there is no valid content for the pane linked to the new equipment context, content may be sourced by traversing up/down the equipment hierarchy. <b>AutofillContextMustMatch</b> — The same as Autofill, however content directly associated with the new equipment context will be used to fill the pane. The content will only be updated if the equipment is a direct contextual match (see below).  See <a href="#">Autofill</a> for configuration examples.
ContentTypes	Defines the type of content the pane will display. You can specify zero or more types as a comma separated list. Specifying no content type is acceptable for a static pane, but it is recommended that any other type of pane has at least one content type specified.  The content types you can use are configured in <b>Visualization</b> activity.  At runtime, only pages with a content type that matches with the pane will be displayed. See <a href="#">Content Types</a> .

Excluded Autofill Panes	<p>Allows you to specify panes that will not display updated content when an equipment context change is triggered from this pane. When the context changes in the current pane, the content in the excluded panes will remain static. However, the context in excluded panes will still be updated. Any pane in the workspace or a linked workspace can be excluded.</p> <p>Specify the name(s) of one or more panes or nested panes that you want to exclude from autofill. Use a comma to specify more than one pane name.</p> <p>For more information, see <i>Excluding Panes</i> below.</p>
Tab Header Pane Name	<p>If you want the content of the pane to be controlled via a set of tabs, you can use this property to indicate the pane where the associated tab bar is located.</p> <p>Enter the name of the pane that hosts a page with the tab bar Genie on it.</p>
Tab Control Name	<p>Enter the name of the tab bar Genie that you would like to use to control the content of the pane. The tab control needs to be located on the page of the pane specified in the <b>Tab Header Pane Name</b> property (see above).</p>

Equipment Reference Associations: Categories	This field allows you to associate a pane with an equipment reference category, or a comma-separated list of equipment reference categories (see "Category" in the topic <a href="#">Define Equipment References</a> ). When a piece of equipment comes into context, any equipment references within the specified category will be used to create Super Genie associations for a displayed page. For more information, see <a href="#">AssEquipReferences</a> .
--	---

## Excluding Panes

As described above, you can use the Pane Properties dialog box to add a list of panes that you wish to exclude from autofill. Excluded panes will show the same content regardless of the context. If the current pane changes context, content in the panes specified in the Exclude Autofill Panes box will not be updated.

**Note:** The context within excluded panes will be updated when the context of the current page changes.

It is also possible to exclude panes at runtime by using a page environment variable. To do this:

1. Open the page that contains the context that will change.
2. Open the Page Properties dialog box.
3. Select the Environment tab.
4. Click **Add**. The Edit Properties dialog box is displayed.
5. In the **Property** box, type the property name `ExcludedAutoFillPanes`.
6. In the **Value** box, specify the name(s) of one or more panes that you want to exclude from autofill.
7. Click **OK** to close the Edit Properties dialog box.
8. Click **OK** to close the Page Properties dialog box.

**Note:** A pane can display a page that includes its own set of panes, creating a multi-level arrangement of nested panes. See [Use Nested Panes](#).

[Create a Master Page for a Customized Workspace](#)

## Configure Display Properties for a Fourth Alarm Priority

By default, a Situational Awareness project will only display alarm counts for the top three alarm priorities in the Navigation Zone and Tree Views. However, you can include a fourth highest alarm priority count in these locations if required.

To enable a fourth alarm count, you need to set the parameter [Workspace]NumberOfTopPriorities to 4.

You also need to configure the display properties for the fourth alarm priority.

---

**Note:** The Genie "sa\_p4\_small" is provided in the SA\_Controls project to represent the fourth-highest priority alarms. To associate this Genie with alarm priority 4, use the **Small Genie Name** property. You can use your own Genie if required.

---

### Configure the display properties for the fourth alarm priority

1. In the **Setup** activity, select **Alarming**.
2. On the menu below the Command Bar, select **Alarm Priorities**.

If you have used the starter project, you will see the following default priorities.

Row	Priority	Display Name	Short Name	Comment	Show on Indicator
1	1	Emergency	E	P1 alarm priority	
2	2	High	H	P2 alarm priority	
3	3	Low	L	P3 alarm priority	

3. Add a new row for the fourth alarm priority.
4. Enter the required property values (see the *Alarm Priority Properties* table below).
5. Modify the properties for alarm priority 3 so that it now represents "medium" alarms.
  - Priority = 3
  - Display Name = Medium
  - Short Name = M

**Note:** The Alarm Priority property **Show On Active** must be blank (TRUE) for the alarm counts to show on the Page Navigation zone and Tree View.

6. Save your changes.
7. On the menu below the Command Bar, select **Alarm Categories**
8. Associate an alarm **Category** with the fourth alarm **Priority**.

Row	Category	Priority	Show on Active	Show on Summary	Comment
1	1	1			Emergency alarms
2	2	2			High priority alarms
3	3	3			Medium priority alarms
4	4	4			Low priority alarms

9. Save your change.

## Alarm Priority Properties

Field	Description
Priority	4
Display Name	Low

Field	Description
<b>Short Name</b>	L
<b>Comment</b>	P4 alarm priority
<b>UnAck On Foreground Color</b>	0x00FF00FF
<b>UnAck On Background Color</b>	0x00FFFFFF
<b>Ack On Foreground Color</b>	0x00FFBFFF
<b>Ack On Background Color</b>	0x00FFBFFF
<b>UnAck Off Foreground Color</b>	0x00FFBFFF
<b>UnAck Off Background Color</b>	0x00FFBFFF
<b>Library Name</b>	sa_priorities
<b>Genie Name</b>	sa_p4_normal (This Genie is used for the Alarm Indicator.)
<b>Small Genie Name</b>	sa_p4_small

If you want to add a fourth highest alarm priority count to the Navigation Zone, additional configuration steps are required. For more information, see [Add an Additional Alarm Count to the Navigation Zone](#).

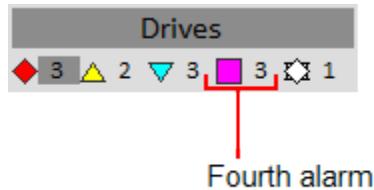

You can also add a fourth-highest alarm priority filter to alarm pages. See [Add a Fourth Alarm Priority Filter to Alarm Pages](#).

---

**Note:** Alarm counts will not work if the home page specified for your navigation menu differs to the home page specified for your equipment hierarchy (as defined in the **Page** field for the root level of your equipment hierarchy). See "Set the home page for a workspace" in the topic [Prepare the Navigation Menu](#).

## Add an Additional Alarm Count to the Navigation Zone

By default, the tabs and buttons in the [Navigation Zone](#) include alarm counts for the top three alarm priorities. If required, you can add an additional alarm count that represents the fourth highest alarm priority.

To add a fourth alarm count to the Navigation Zone's tabs and buttons, you need to perform the following tasks.

### Adjust the parameter [Workspace]NumberOfTopPriorities

Set the parameter [Workspace]NumberOfTopPriorities[Workspace]NumberOfTopPriorities to 4.

## Change the default Navigation Zone page

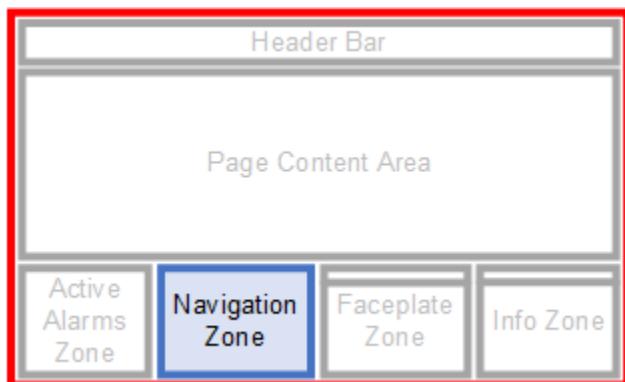

The default page that the Navigation Zone is based on is not able to support the wider tabs and buttons required to display an additional alarm count. To change to the required Navigation Zone page:

1. Go to Graphics Builder.
2. Open the master page for your project. By default, this page will be called "Master\_PageMenu1\_HD1080" or "Master\_PageMenu1\_UHD4K" (depending on the resolution your project uses).
3. Locate the pane that hosts the Navigation Zone.

For **Master\_PageMenu1\_HD1080**, the Navigation Zone pane is located here:

For **Master\_PageMenu1\_UHD4K**, the Navigation Zone pane is located here:

4. Double-click on the pane to open the Pane Properties dialog. If the **Name** field does not display "Navigation", you have double-clicked on the wrong pane.
5. Enter the required page name in the pane's **Default Page** field.
  - For an HD1080 project, enter "PageNav4\_1TabRow\_HD1080".
  - For a UHD4K project, enter "PageNav4\_1TabRow\_UHD4K".
6. Save your changes.

## Configure the display properties for the fourth alarm priority

You should confirm that a fourth alarm priority is appropriately configured in your project. For more information, see [Configure Display Properties for a Fourth Alarm Priority](#).

**Note:** Alarm counts will not work if the home page specified for your navigation menu differs to the home page

---

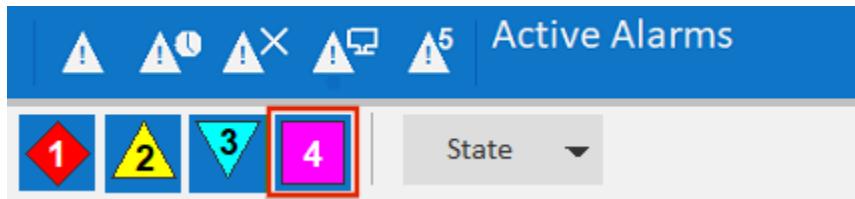

specified for your equipment hierarchy (as defined in the **Page** field for the root level of your equipment hierarchy). See "Set the home page for a workspace" in the topic [Prepare the Navigation Menu](#).

---

## Add a Fourth Alarm Priority Filter to Alarm Pages

You can add a fourth-highest alarm priority filter to the following alarm pages:

- Active Alarms
- Historical Events
- Shelved Alarms.

To achieve this, you need to perform the following steps:

### Adjust the parameter [Workspace]NumberOfTopPriorities

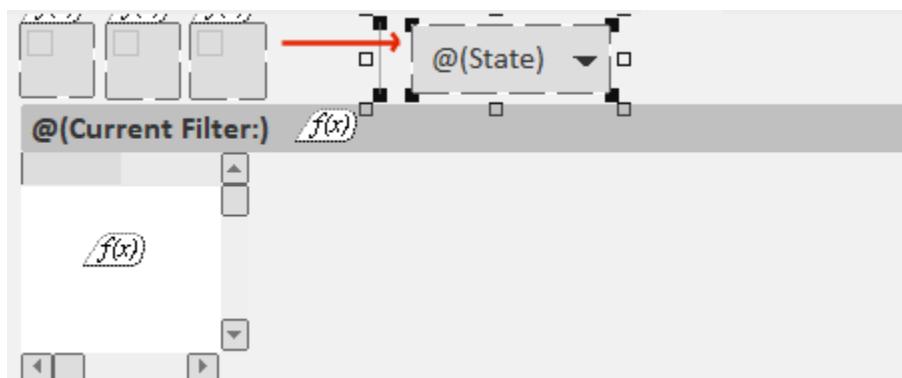

Set the parameter [Workspace]NumberOfTopPriorities to 4.

### Configure the display properties for the fourth alarm priority

You should confirm that a fourth alarm priority is appropriately configured in your project. For more information, see [Configure Display Properties for a Fourth Alarm Priority](#).

### Modify the required alarm page

1. In Graphics Builder, open the alarm page you would like to modify (in the appropriate resolution). The default page names are as follows:
  - Active Alarms - "DefaultAlarm\_HD1080" or "DefaultAlarm\_UHD4K".
  - Historical Events - "DefaultSoE\_HD1080" or "DefaultSoE\_UHD4K".
  - Shelved Alarms - "DefaultShelved\_HD1080" or "DefaultShelved\_UHD4K".
2. On the filter bar, move the separator and "State" button to the right to make room for a fourth priority button.

---

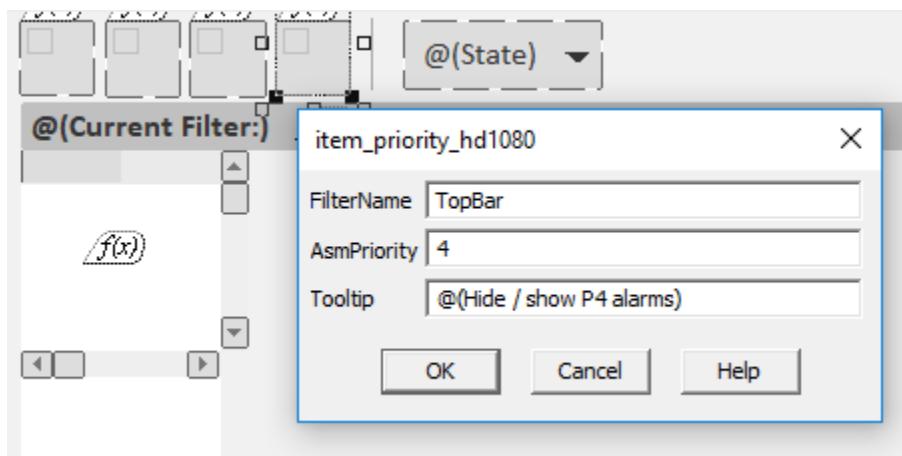

**Note:** If you are modifying the Historical Events page, a fourth alarm button will already exist that is used to filter shelved alarms. In this case, you will need to make room for your fourth alarm priority button between

---

---

the third and fourth buttons.

3. Duplicate one of the existing Item Priority Genies (for priority 1, 2 or 3), and position it in the space you have created.
4. Double-click on the duplicated Genie to display the Genie Parameters dialog.
5. Change the **AsmPriority** field to "4", and adjust the **Tooltip** text.

6. Save your changes.

## See also

[Add an Alarm Filter Button](#)

## Format an Alarm List for a Specific Screen Resolution

You can customize the format used for an alarms list that is displayed on a Situational Awareness alarms page. This allows you to present the list in a way that will suit a particular screen resolution. For example, you can make the columns wider to suit a page that will display on a UHD 4K monitor.

### To customize an alarms list for a specific screen resolution:

1. Use the **[Format]FormatName** parameter to define the alarms list format you want to use for a particular screen resolution.

The following three examples show the default format used for each of the generic alarm pages included in the Situational Awareness Starter Project. You can use one of these as the basis for a new format that is defined to suit a specific screen resolution.

- **[Format]Alarm** = the alarm list format for the generic alarm page.

```
[Format]Alarm =
{PriorityAndState,25}{OnDate,80}{OnTime,90}{Name,250}{State,40}{Cluster,70}{Equipment,220}{I
```

- **[Format]Summary** = the alarm list format for the generic alarm summary page.

```
[Format]Summary =
{PriorityAndState,25}{Name,250}{SumState,40}{OnDate,80}{OnTime,90}{OffDate,80}{OffTime,90}{D
```

- **[Format]SOE** = the alarm list format for the generic sequence of events page.

```
[Format]SOE =
{PriorityAndState,25}{Date,80}{Time,90}{Message,250}{Name,250}{State,40}{Cluster,70}{Equipment,100}
```

For example, you could create [Format]SOE\_UHD4K for a sequence of events page that will display on a 4K monitor. Use the width attribute in each field to specify how wide each column will be (in pixels). For example:

```
[Format]SOE_UHD4K =
{PriorityAndState,50}{Date,160}{Time,180}{Message,500}{Name,500}{State,80}{Cluster,140}{Equipment,100}
```

2. In Graphics Builder, open the alarm page you want to apply the new format to and display the Page Properties.
3. Go to the **Event** tab, and select the **On page entry** event.

By default, Situational Awareness alarm pages will have the following Cicode function configured as the **On page event command**.

```
AlarmPage_Init(AlarmPage_GetDefaultParameters("<res>"), "<res>", <type>)
```

Where:

- <res> = the resolution suffix (for example, HD1080, UHD4K)
- <type> = the display type (for example, 0 = active alarms, 3 = shelved alarms, 15 =SOE).

4. Add the alarm format name defined in step 1 as the fourth argument to the function.

For example, if you configured the format "SOE\_UHD4K", the expression should be as follows:

```
AlarmPage_Init(AlarmPage_GetDefaultParameters("UHD4K"), "UHD4K", 15, "SOE_UHD4K")
```

5. Save your changes, and compile and run the project.

The columns displayed on the alarm page will now be based on the format you have specified.

[Create Content Pages](#)

## Apply a Customized Font to Selected Alarms

If you have created a project from the Situational Awareness Starter Project, you can customize the font used for selected alarms in an alarms list.

This is achieved by creating the following fonts in your project.

- **SA\_AlmSelRow** - for HD1080 resolution projects.
- **SA\_AlmSelRow4K** - for 4K resolution projects.

### To apply a customized font to selected alarms:

1. In the **Standards** activity, select **FONTS**.
2. On a new row, define the "SA\_AlmSelRow" and/or the "SA\_AlmSelRow4K" font and adjust the properties as required.

---

**Note:** You can refer to the fonts defined in the SA\_Include project to determine the properties used by

---

default in an alarms list.

3. Save your changes and compile the project.

The font you have defined will now be applied to the selected alarm in an alarms list.

[Format an Alarm List for a Specific Screen Resolution](#)

## Customize the Logo on the Header Bar

The default header bar for a Situational Awareness project comes with a Plant SCADA logo. This logo can be changed.

---

**Note:** The logo you use needs to be a bitmap.

### To customize the logo:

1. Open Graphics Builder.
2. On the **File** menu, select **New**.

Or:

Select the **New** button.

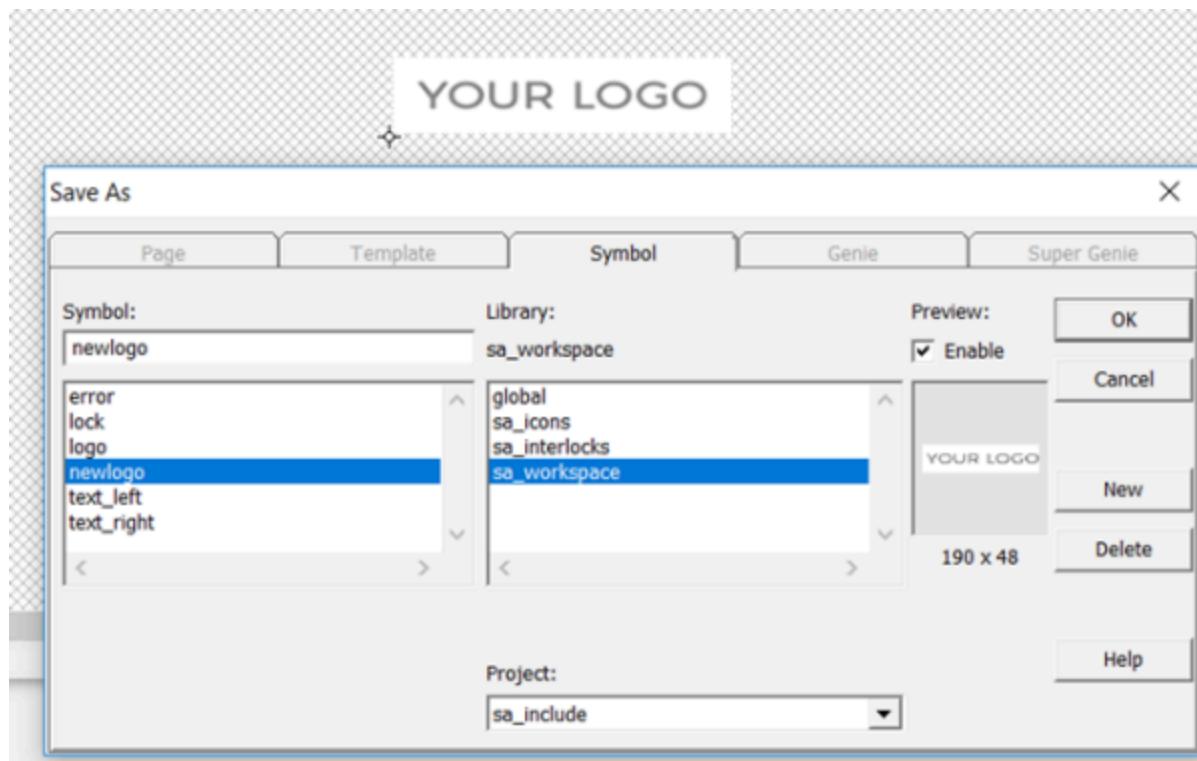

3. The New Dialog box is displayed.
4. On the New dialog box, click **Symbol**.
5. On the **File** menu, select **Import**.
6. From the Import Dialog Box, locate the logo you want to use and click **Open**.
7. The logo is placed onto the symbol page. Position the logo so that the anchor point is at the bottom right corner.

---

**Note:** If you create a new logo using the drawing tools in Graphics Builder, before saving the symbol you need to select all of the objects and select **Convert to Bitmap** from the **Tools** menu. The symbol used by the logo should only contain one bitmap object.

8. Save the symbol, for example, in the "sa\_include" project and the "sa\_workspace" library.

9. Click **OK**.
10. In Plant SCADA Studio, go to the **Project** activity and select **Home**.
11. From the Command Bar, go to the drop-down next to the **Setup Wizard** and select **Setup Editor**.
12. In the **Parameter Details** section of the Setup Editor, enter the following:
  - Section: Page
  - Parameter: Logo
  - Value: <libraryname>.<logoname>  
For example, "sa\_workspace.newlogo".
  - Click **Add**.
13. Save the changes to the INI file.
14. Compile and run the project.

## Add a Tree View to a Page

A tree view is a control that provides a hierarchical view of the information on a page. For example, a tree view is used on the default Active Alarms page in a Situational Awareness Starter Project. You can use it to filter the

displayed list of alarms.

The tree view on the Active Alarms page

Each item in a tree view is a Genie that supports the following functionality:

- Check boxes allow you to select one or more items in the tree.
- Alarms counts indicate the number of associated alarms in the top three alarm priorities, as well as the number of shelved alarms. Alarm and shelve counts will only apply to an equipment data source.

**Note:** You can use the parameter [Workspace]NumberOfTopPriorities to display alarm counts for the top four alarm priorities (instead of the top three). For more setup information, see [Configure Display Properties for a Fourth Alarm Priority](#).

To add a tree view to a page you need to use the Tree View Genie. The Genie's parameters are divided into five main groups:

- Basic Setup parameters — primarily used to specify the data source on which the tree is based.
- Search parameters — identify the object used to input search text at runtime.
- Display parameters — define the size of the space the tree view occupies and the components that will appear at runtime.
- Event parameters — define the functions that are executed when an operator interacts with the Genie at runtime.
- Customization parameters — enable advanced customization of a tree view.

When the Genie is pasted on a page, the Genie Parameters Dialog Box is displayed. See below for a description of each parameter.

## Genie Parameters

### Basic Setup Parameters

Parameter	Description
Datasource	Specifies the menu on which the tree is based. You can enter the name of a menu you have created

Parameter	Description
	<p>using the <b>Menu Configuration</b> view in the <b>Visualization</b> activity (see <a href="#">Prepare the Navigation Menu</a>).</p> <p>Alternatively, you can use the name of a menu that is created at runtime using the <code>MenuGetPageNode</code> Cicode function.</p> <p>You can also enter "<code>__EquipmentModel</code>" to use the equipment hierarchy defined for the current project.</p>
Use Display Names	<p>Determines if display names are used to label equipment in the tree view.</p> <p>A display name is a meaningful name that can be defined for piece of equipment using the <b>Display Name</b> property (see <a href="#">Equipment Properties</a>).</p> <p>If the tree view is displaying the equipment model:</p> <ul style="list-style-type: none"> <li>TRUE = Equipment display names are used</li> <li>FALSE = Equipment names are used.</li> </ul> <p>If this is set to TRUE and no Display Name is configured, the equipment name will be used instead.</p> <p>If the tree view is displaying a generic menu structure:</p> <ul style="list-style-type: none"> <li>TRUE = Menu item comments are used</li> <li>FALSE = Menu item names are used.</li> </ul>

### Search Parameters

Parameter	Description
Search Box Name	<p>This field specifies the name of the <code>ciText.TextBox</code> object that the tree view will use as its input for the search text at runtime. The name to enter is defined in the <b>Text Object Properties</b> dialog on the <b>Access</b> tab.</p> <p>By default, "Search" is used.</p>

### Display Parameters

Parameter	Description
Treeview Height	<p>The height of the area the tree view will occupy (in pixels).</p> <p>If the length of the expanded tree extends beyond the height specified here, a vertical scroll bar will appear.</p>
Treeview Width	<p>The width of the area the tree view will occupy (in pixels).</p> <p>If the width of the expanded tree extends beyond the</p>

Parameter	Description
	left edge of the alarm count list, a horizontal scroll bar will appear.
Row Height	The amount of space that will be available to each row within the tree view.
Display Checkboxes	<p>Determines if a check box is displayed for each item in the tree.</p> <p>TRUE = Check boxes are displayed.</p> <p>FALSE = Check boxes are not displayed.</p>
Auto-check Children	<p>Determines if the check boxes within the lower levels of a branch are automatically checked when a parent item is checked.</p> <p>TRUE = Children are automatically checked.</p> <p>FALSE = Children are not automatically checked.</p>
Display Alarms	<p>Determines if alarm counts for the top three alarm categories are displayed for each item in the tree.</p> <p>TRUE = Alarm counts for the top three alarm categories are displayed.</p> <p>FALSE = Alarm counts for the top three alarm categories are not displayed.</p> <p>If the branch is collapsed, the values will represent the number of active alarms for each category within the current branch and its lower levels.</p> <p>If a node is expanded, the count will only show alarms for that node, as the counts for its children will now be visible on the child nodes.</p> <p><b>Note:</b> You can use the parameter to display alarm counts for the top four alarm priorities (instead of the top three).</p>
Display Shelved	<p>Determines if an alarm count for shelved alarms is displayed for each item in the tree.</p> <p>If the branch is collapsed, the values will represent the number of shelved alarms for each category within the current branch and its lower levels.</p> <p>If a node is expanded, the count will only show shelved alarms for that node, as the counts for its children will now be visible on the child nodes.</p> <p>TRUE = Alarm count for shelved alarms is displayed.</p> <p>FALSE = Alarm count for shelved alarms is not displayed.</p>

**Event Parameters**

<b>Parameter</b>	<b>Description</b>
On Init Complete Function	Represents the name of the function that is invoked when the tree view completes initialization.  <code>OnInitCompleteFunction(INT nTreeviewAN)</code> The argument <i>nTreeviewAN</i> is expected, it is the animation number of the tree view that fires the event.
On Check Function	Represents the name of the function that is invoked upon the checked event.  <code>OnCheckFunction(INT hMenuItem)</code> The argument <i>hMenuItem</i> is expected. It is the handle to the menu item that is represented by the tree node on which the check box has just been clicked.
On Left Click Function	Represents the name of the function that is invoked upon the left click event.  <code>OnLeftClickFunction(INT hMenuItem)</code> The argument <i>hMenuItem</i> is expected. It is the handle to the menu item that is represented by the tree node that has just been left-clicked.
On Right Click Function	Represents the name of the function that is invoked upon the right click event.  <code>OnRightClickFunction(INT hMenuItem)</code> The argument <i>hMenuItem</i> is expected. It is the handle to the menu item that is represented by the tree node that has just been right-clicked.

**Customization Parameters**

<b>Parameter</b>	<b>Description</b>
View Genie	Refers to the Genie that is called to display each item in the tree. By default, the Tree View Item Genie in the "sa_controls" library is used ( <code>sa_controls.treeviewitem</code> ).  You can use this parameter to substitute the default Genie with your own. This will allow you to customize the appearance of the tree and the features it supports.
View Init Function	The Cicode function that is called to initialize the <b>View Genie</b> (see above) for each row.  By default, a system function called

Parameter	Description
	" <code>_Treeview_InitViewGenie_&lt;resolution&gt;</code> " is used (for example, " <code>_Treeview_InitViewGenie_HD1080</code> ").
Fill Function	<p>This function is called on each page scan to manage data updates in the tree view when the tree view state changes (for example, when scrolling, expanding, or collapsing occurs).</p> <p>By default, a system function called "<code>_Treeview_Update</code>" is used.</p>
View Model Data Size	<p>Specifies the number of custom fields per tree view item to be allocated for user data. The data in these fields will be updated by the function specified in the parameter <b>Datasource Item Retrieve Function</b> (see below).</p> <p>This parameter is set to zero (0) by default.</p>
View Model Init Function	<p>Custom function to configure the additional columns specified by the parameter 'View Model Data Size'. This function is called once when the tree view is initialized.</p>
Datasource Item Retrieve Function	<p>A custom function that loads additional user data for the tree view. This function is called whenever the tree view data is refreshed (for example, when scrolling, expanding, or collapsing occurs). The number of custom fields to be updated by this function is defined by the parameter <b>View Model Data Size</b> (see above).</p>
Is Source Ready Function	<p>Enter the name a function that is used to determine if the data source is ready.</p> <p>The tree view initialization code will run the function (in addition to the checks for navigation initialized and workspace system initialized) before allowing the tree view to be displayed.</p> <p>If this function does not return TRUE within five seconds of displaying the page, the tree view initialization will time out. This function needs to return an INT (TRUE or FALSE) and takes a single argument, INT nTreeViewAN.</p>
Datasource Watcher Function	<p>Enter a Cicode function that will be used to monitor the tree view's associated data source for any updates. The function will be called when the Tree View Genie is initialized, and needs to be responsible</p>

Parameter	Description
	<p>for triggering a reload if required.</p> <p>The function will run continuously, so it should not return any values. It also needs to accept the arguments <i>sDatasource</i> and <i>hTreeviewAN</i>.</p> <p>If you are using the Tree View Genie to display the entire equipment model (for example, if the <b>Datasource</b> parameter is set to "<code>__EquipmentModel</code>"), you can enter the following function name to trigger a reload of the tree whenever the equipment model changes:</p> <p><code>_Treeview_MonitorEquipmentModel</code></p>
Can Check Items Function	<p>A custom function that is used to determine if tree view item checking is allowed.</p> <p>By default, toggling the checked state of a tree view item is allowed at runtime. This function provides a way to disable the check boxes on all items if required.</p> <p>For example, you may want to disable checking if the data that the tree view will interact with is not ready, or if the current user does not have sufficient privileges.</p> <p>The function needs to return a value of TRUE or FALSE.</p>

#### AN Parameter

Parameter	Description
AN	A unique ID for the Genie object.

**Note:** You can use the **View Genie** parameter to substitute the default Genie with your own. This will allow you to customize the appearance of the tree and the features it supports.

#### See Also

[Key Components of a Situational Awareness Project](#)

[Configure Your Project](#)

#### Add an Alarms List to a Page

You can add an alarms list to a page using the following Genies:

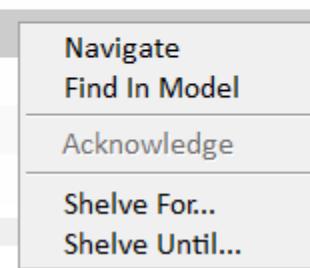

- Alarm List Genie — creates an alarm list with a header row and scroll bars.
- Alarm List Vertical Genie — creates an alarms list with no header row and just a vertical scroll bar.

These Genies use the `AlarmListCreate` Cicode function to create a basic alarms list.

...	Date	Time	Name
▲	26/03/2018	10:35:30 AM	Drive1_OP_TRK_H_P2
▼	26/03/2018	10:35:27 AM	Drive1_V_Feedback_H_P3

## Add an alarm list Genie

To add an alarm list Genie ("alarmlist" or "alarmlist\_v") to a page:

1. Open a page in Graphics Builder.
2. Click the **Paste Genie** button in the objects toolbox.

Or, select **Paste Genie** from the **Edit** menu.

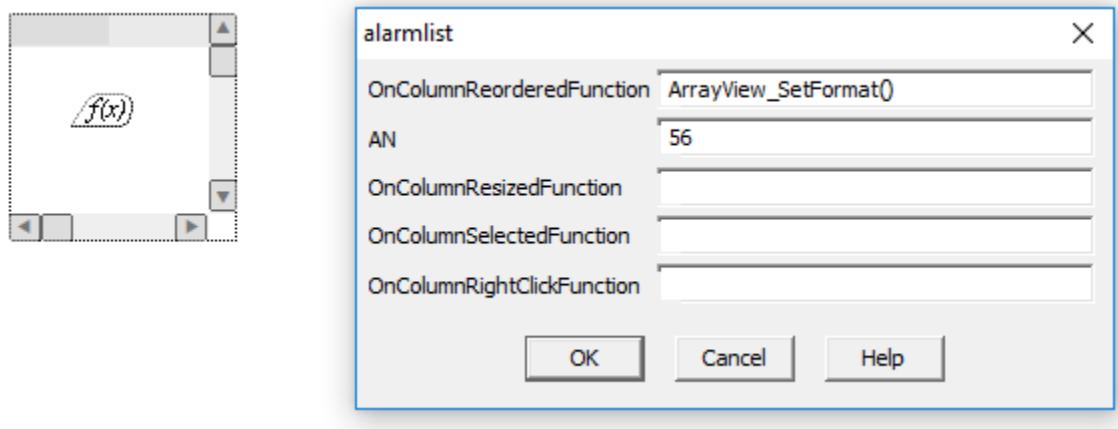

3. In the Paste Genie dialog, select the **Library** "sa\_controls".
4. Select one of the following from the **Genie** list and click **OK**.
  - alarmlist = Alarm List Genie
  - alarmlist\_v = Alarm List - Vertical Genie

The Genie is pasted onto the graphics page. A dialog box will open, prompting you to configure the parameters for the Genie.

The **Alarm List Vertical Genie** dialog box will show the **AN** parameter. The number that is displayed is the **AN** value that was automatically applied to the Genie when it was pasted on the page.

The **Alarm List Genie** dialog box will include some additional parameters that enable runtime interaction with the header row. By default, the **OnColumnReorderedFunction** will display "ArrayView\_SetFormat()". This is a system function that allows an operator to rearrange the header row columns at runtime. The other parameters can be left blank.

5. Click **OK** to close the parameters dialog box.

To load alarm data into the list at runtime, you need to call the [AlarmListCreate](#) Cicode function as an On Page Entry command in the Page Properties dialog.

6. In Graphics Builder, right-click on the page and select **Page Properties** from the menu that appears.

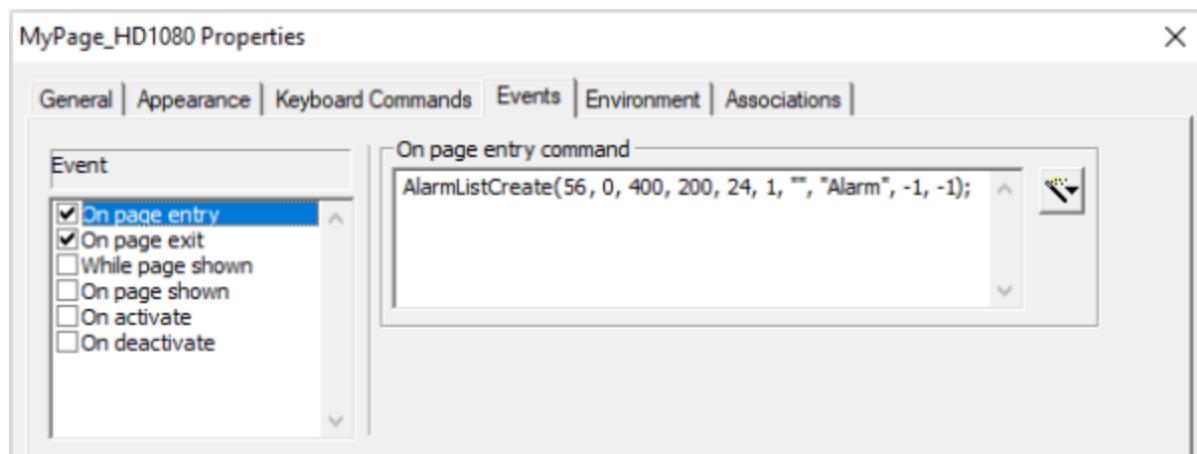

Or:

From the **File** menu, select **Properties**.

The Page Properties dialog box will appear.

7. On the **Events** tab, select the **On page entry** event.

8. In the **On page entry command** field, configure the AlarmListCreate Cicode function as required.

The value specified for the *nAN* argument needs to match the AN number applied to the alarm list Genie.

9. On the **Events** tab, select the **On page exit** event.
10. In the **On page exit command** field, configure the [AlarmListDestroy](#) Cicode function. For example,  
`AlarmListDestroy(56);`
11. Click **OK**, and **Save** your page.

You can now run your project and view the alarms list.

## Add the List Row Genie

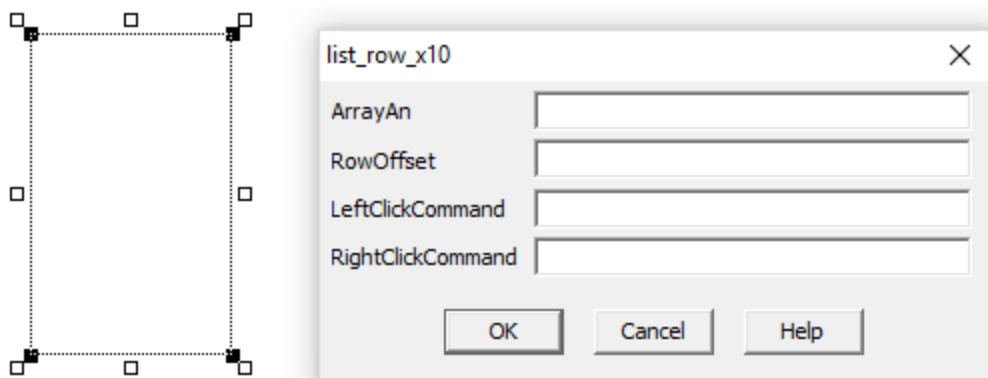

1. In Graphics Builder, open the page that includes the list to which you want to add a List Row Genie.
2. Click the **Paste Genie** button in the objects toolbox.

Or, select **Paste Genie** from the **Edit** menu.

3. In the Paste Genie dialog, select the **Library** "sa\_controls".
4. Select one of the following from the **Genie** list, based on the approximate size of the list you require.
  - list\_row\_x5 – use this to create a list with up to 5 rows.
  - list\_row\_x10 – use this to create a list with up to 10 rows.
  - list\_row\_x40 – use this to create a list with up to 40 rows.
  - list\_row\_x80 – use this to create a list with up to 80 rows.

The Genie is pasted onto the graphics page. A dialog box will open, prompting you to configure the parameters for the Genie.

**Note:** There is no need to adjust the size of the List Row Genie on a graphics page to fill an area. The required space will be determined at runtime by the size of the list with which it is associated.

5. In the **ArrayAN** field, enter the AN value for the associated list.

You can use the Cicode function [DspGetAnFromName](#) to retrieve the AN. For example:

```
DspGetAnFromName("AlarmList").
```

6. To enable the default set of right-click commands that are available on the default alarm page, go to the **RightClickCommand** field and enter the following:

```
AlarmPage_AlarmListOnRightClick()
```

If you want to use a custom set of commands, you can add your own Cicode.

7. Click **OK**, and **Save** your page.

You can now run your project and view the alarms list.

## See Also

[Create Priority and State Symbols for an Alarms List](#)

[Key Components of a Situational Awareness Project](#)

[Configure Your Project](#)

## Add a Generic List to a Page

You can add a generic list to a page using the following Genies:

- Generic List Genie — creates a list with a header row and scroll bars.
- Generic List Vertical Genie — creates a list with no header row and just a vertical scroll bar.

To apply formatting to the list rows and enable on-click commands, you can also add the .

## Add a list Genie

To add a list Genie ("genericlist" or "genericlist\_v") to a page:

1. Open a page in Graphics Builder.

2. Click the **Paste Genie** button in the objects toolbox.

Or, select **Paste Genie** from the **Edit** menu.

3. In the Paste Genie dialog, select the **Library** "sa\_controls".
4. Select one of the following from the **Genie** list and click **OK**.

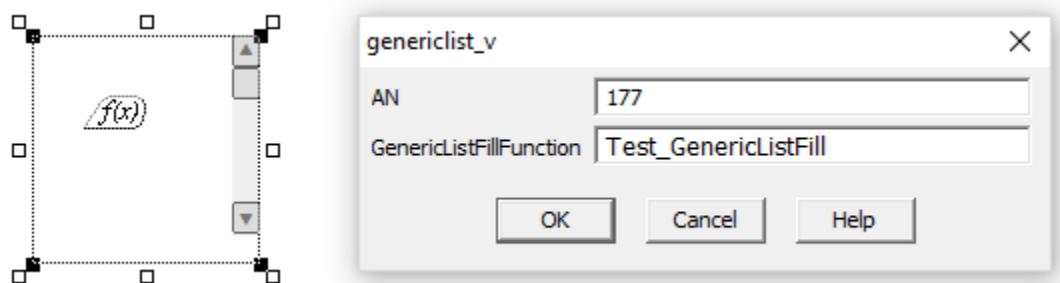

- genericlist = Generic List Genie
- genericlist\_v = Generic List Vertical Genie

The Genie is pasted onto the graphics page. A dialog box will open, prompting you to configure the parameters for the Genie.

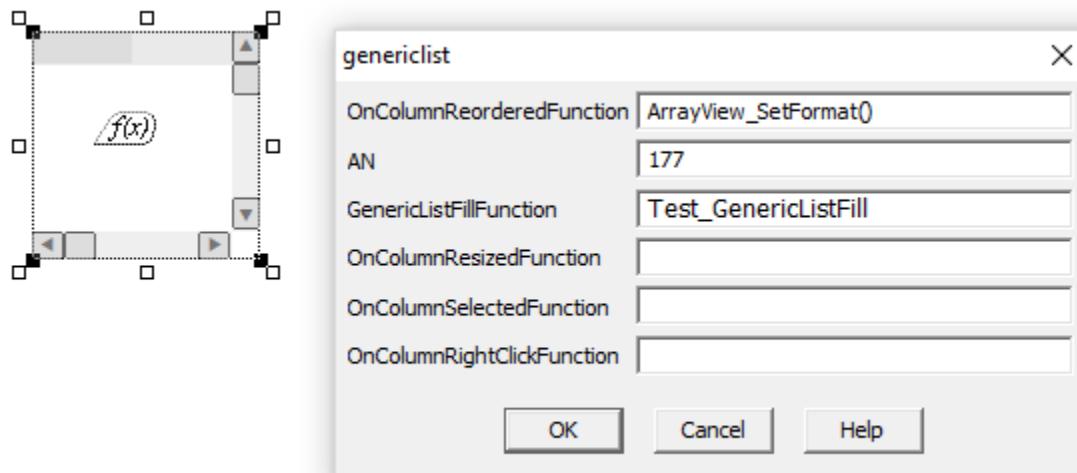

The **Generic List Vertical Genie** dialog box will show the following parameters:

- **AN** — the number that is displayed is the ANvalue that was automatically applied to the Genie when it was pasted on the page.
- **GenericListFillFunction** — this field specifies the user Cicode function to be called at runtime to populate the list. The function needs to retrieve the data to be displayed.

In the example below, "Test\_GenericListFill" has been entered. To view the custom Cicode that this function calls, see the Cicode examples below.

The **Generic List Genie** dialog box will include some additional parameters that enable runtime interaction with the header row. By default, the **OnColumnReorderedFunction** will display "ArrayView\_SetFormat()". This is a system function that allows an operator to rearrange the header row columns at runtime.

5. Click **OK** to close the parameters dialog box.

To load data into the list at runtime, you need to call the required Cicode function as an On Page Entry command in the Page Properties dialog.

6. In Graphics Builder, right-click on the page and select **Page Properties** from the menu that appears.

Or:

From the **File** menu, select **Properties**.

The Page Properties dialog box will appear.

7. On the **Events** tab, select the **On page entry** event.

8. In the **On page entry command** field, enter the required expression.

For this example, the "Test\_GenericListCreate" function is entered. To view the custom Cicode that this function calls, see the Cicode examples below.

9. On the **Events** tab, select the **On page exit** event.

10. In the **On page exit command** field, enter an expression to destroy the list that has been created. For an example, search locate "Test\_GenericListDestroy" in the example Cicode below.

11. Click **OK**, and **Save** your page.

## Add the List Row Genie

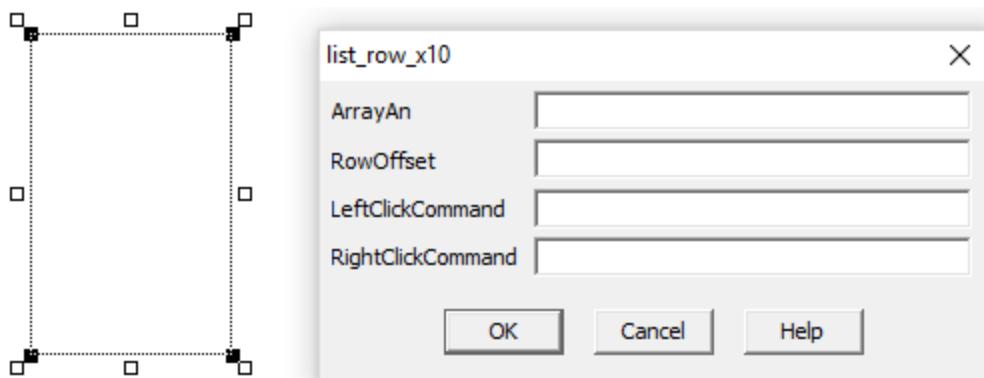

1. In Graphics Builder, open the page that includes the list to which you want to add a List Row Genie.
2. Click the **Paste Genie** button in the objects toolbox.

Or, select **Paste Genie** from the **Edit** menu.

3. In the Paste Genie dialog, select the **Library** "sa\_controls".
4. Select one of the following from the **Genie** list, based on the approximate size of the list you require.
  - list\_row\_x5 – use this to create a list with up to 5 rows.
  - list\_row\_x10 – use this to create a list with up to 10 rows.
  - list\_row\_x40 – use this to create a list with up to 40 rows.
  - list\_row\_x80 – use this to create a list with up to 80 rows.

The Genie is pasted onto the graphics page. A dialog box will open, prompting you to configure the parameters for the Genie.

**Note:** There is no need to adjust the size of the List Row Genie on a graphics page to fill an area. The required space will be determined at runtime by the size of the list with which it is associated.

5. In the **ArrayAN** field, enter the AN value for the associated list.

You can use the Cicode function [DspGetAnFromName](#) to retrieve the AN. For example:

`DspGetAnFromName("GenericList").`

6. To enable on-click commands, go to the **LeftClickCommand** and/or **RightClickCommand** fields and enter the required Cicode.

See the Cicode example [Test\\_GenericListRightClick](#) below.

7. Click **OK**, and **Save** your page.

You can now run your project and view the alarms list.

## Cicode Examples

The following Cicode provides an example of how to create the following generic list using Plant SCADA's Array Functions. The list displays random numbers with column and row identifiers.

Column1	Column2	Column3	Column4
C1R1>95	C2R1>80	C3R1>94	C4R1>65
C1R2>40	C2R2>35	C3R2>51	C4R2>58
C1R3>9	C2R3>81	C3R3>71	C4R3>54
C1R4>79	C2R4>80	C3R4>44	C4R4>39
C1R5>20	C2R5>86	C3R5>14	C4R5>58
C1R6>46	C2R6>44	C3R6>13	C4R6>86
C1R7>41	C2R7>28	C3R7>51	C4R7>32
C1R8>5	C2R8>94	C3R8>20	C4R8>72
C1R9>58	C2R9>63	C3R9>22	C4R9>75
C1R10>8	C2R10>71	C3R10>13	C4R10>24

### [Test\\_GenericListCreate](#)

[Key Components of a Situational Awareness Project](#)

[Configure Your Project](#)

## Add an Alarm Filter Button

You can add your own alarm filter buttons to one of the [Default Alarm Pages](#) in a Situational Awareness project.

The following Alarm Filter Genies allow you to add buttons that provide basic filter functionality to an alarm page:

- Item Acknowledged Genie (HD1080)
- Item Acknowledged Genie (UHD4K)
- Item Priority Genie (HD1080)
- Item Priority Genie (UHD4K)
- Item Shelved Genie (HD1080)
- Item Shelved Genie (UHD4K)
- Item State Genie (HD1080)
- Item State Genie (UHD4K)
- Item Unacknowledged Genie (HD1080)
- Item Unacknowledged Genie (UHD4K).

You can also use the Item Base Genie to create a button that implements a custom filter.

---

**Note:** The default hardware alarms page does not support filter buttons.

---

## Add an alarm filter button using a Genie

To add an alarm filter button to a default alarm page:

1. In Graphics Builder, open the alarm page to which you want to add a filter button.

The default alarm pages have the following names:

- DefaultAlarm\_HD1080 (Active Alarms Page HD1080)
- DefaultAlarm\_UHD4K (Active Alarms Page UHD4K)
- DefaultSOE\_HD1080 (Historical Events Page HD1080)
- DefaultSOE\_UHD4K (Historical Events Page UHD4K)
- DefaultShelved\_HD1080 (Shelved Alarms Page HD1080)
- DefaultShelved\_UHD4K (Shelved Alarms Page UHD4K)

2. Locate the filters section at the top of the page. The filters section will contain any Alarm Filter Genies that already appear on the page.
3. Click the **Paste Genie** button in the objects toolbox, or select **Paste Genie** from the **Edit** menu.
4. In the Paste Genie dialog, select the "sa\_filter" library.
5. Select the required Alarm Filter Genie from those listed above. The name of the Genie will reflect the type of filtering it supports.  
A dialog will open prompting you to configure the parameters for the Genie. For a description of each parameters, click on appropriate link in the list of Alarm Filter Genies above.
6. Enter the required values, and click **OK** to close the dialog.

## Add a custom alarm filter button using the Item Base Genie

To add a custom alarm filter button to a default alarm page:

1. In Graphics Builder, open the alarm page to which you want to add a custom filter button.  
The default alarm pages have the following names:
  - DefaultAlarm\_HD1080 (Active Alarms Page HD1080)
  - DefaultAlarm\_UHD4K (Active Alarms Page UHD4K)
  - DefaultSOE\_HD1080 (Historical Events Page HD1080)
  - DefaultSOE\_UHD4K (Historical Events Page UHD4K)
  - DefaultShelved\_HD1080 (Shelved Alarms Page HD1080)
  - DefaultShelved\_UHD4K (Shelved Alarms Page UHD4K)
2. Locate the filters section at the top of the page. The filters section will contain any Alarm Filter Genies that already appear on the page.
3. Click the **Paste Genie** button in the objects toolbox, or select **Paste Genie** from the **Edit** menu.
4. In the Paste Genie dialog, select the "sa\_filter" library.
5. Select the "Item Base Genie" and click **OK**.  
A dialog will open prompting you to configure the parameters for the Genie. For a description of each parameters, see Item Base Genie.
6. Enter the required values, and click **OK** to close the dialog.

---

**Note:** The Default Alarm Pages incorporate an alarm filter named "TopBar". To implement the expected filtering functionality, you can enter "TopBar" as the **Filter Name** in the Genie parameters. If you need to create your own custom filter, use the Item Base Genie. You can then use the **FilterExpr** parameter to enter a Cicode expression that returns the name of a custom filter.

[Add a Fourth Alarm Priority Filter to Alarm Pages](#)

## Create a Set of Tabs for a Pane

You can use the Tab Bar Genie to create a set of tabs for a pane, just like those displayed in the Information Zone

on the Situational Awareness dashboard.

The screenshot shows the AVEVA Plant SCADA Graphics interface. At the top is a tab bar with three tabs: 'ALARM' (selected and highlighted in blue), 'TREND', and 'INTERLOCKS'. Below the tabs is a list of alarms:

Time	Category	Description
03:49:26 PM	V_OP	Drive1_V_OP_HH_P1
10:10:46 AM	S_Running	Drive1_Running_False_P1
03:49:26 PM	OP_TRK	Drive1_OP_TRK_H_P2
03:49:26 PM	V_Feedback	Drive1_V_Feedback_H_P3

Below the alarm list is a detailed view of the first alarm:

Cause	Drive is overheating.
Response	Check the thermostat.
Response Time	00:05:00
Consequence	Drive may fail.

If the available space cannot accommodate the configured tabs, you can access those that are not displayed via the drop-down menu to the right of the tabs. You can also enable "pinning", which allows an operator to specify that a particular tab remains displayed.

To configure a set of tabs, you need to perform the tasks described below.

## Create a menu

The Tab Bar Genie calls a menu defined in a project's Menu Configuration database. You will need to create an appropriate menu in Plant SCADA Studio's **Visualization** activity (see [Menu Configuration](#)).

In the case of a menu created for a set of tabs, use the following fields:

- The **Page** property is used to give the tabbed menu a name.
- The **Level 1** entries define the tabs that appear.
- The **Target Page** property determines what will be displayed in the content pane when a tab is selected.

You can also customize the tabs using the following properties:

- The **Symbol** property allows you to display a lock icon on the tab. Enter any value if you want the lock to display. You can use the **Custom 2** property (see below) to hide the icon if required.
- The **Checked** property allows you to specify if a tab is pinned by default. Leaving the field blank will mean the tab is not pinned by default. Any other value will mean the tab is pinned by default. This setting will only work if pinning is enabled for the tab bar. This is determined by the **Can Tabs Be Pinned?** parameter in the Tab Bar Genie (see [Configure the tab bar genie](#) below).
- The **Menu Command** property can be used to specify a Cicode expression that is executed when the associated tab is selected.
- The **Custom 1** property determines if the **Close** button will appear on the tab. If you leave this field blank, the Close button will appear. Any other value will hide the Close button.

- The **Custom 2** property determines if the icon identified in the **Symbol** field will appear on the tab. If you leave this field blank, the icon will appear. Any other value will hide the icon.
- The **Custom 3** property determines if a label will appear on the tab. If you leave this field blank, the label will appear. Any other value will hide the label.

**Note:** The **Custom 4 – Custom 8** fields are reserved for system use.

## Create the host panes

Two adjacent panes are required to support a set of tabs:

- Header pane - hosts a page with the Tab Bar Genie on it
- Content pane - displays the target page that is associated with a selected tab.

The two are linked with each other via the Pane Properties for the content pane. The following Tabbed Pane Properties are used:

- **Header Pane Name** — identifies the associated header pane
- **Tab Control Name** — identifies the Tab Bar Genie in the header pane that determines what the content pane will display.

## Create the required pages

You need to create the following pages:

- Header page — you need an appropriately sized page that will occupy the header pane and host the Tab Bar Genie.
- Content pages — you need appropriately sized pages for each item specified in the menu you created. The page names need to match those defined in the **Target Page** field for each menu entry.

## Configure the Tab Bar Genie

Lastly, you need to configure the Tab Bar Genie parameters. To display the Genie Parameters dialog box, double-click on the Genie, or select **Genie Parameters** from the right-click menu. Make the required adjustments to the following fields.

Parameter	Description
Default Tabs Menu Name	Enter the name of the menu you configured to define the tabs that will display.
OnInit Function Name	If required, specify a Cicode function that is executed when the tab bar initialization has completed.
Can Tabs be Pinned?	Specify if an operator can pin a tab so that it remains displayed. TRUE = Pinning is enabled FALSE = Pinning is not enabled.

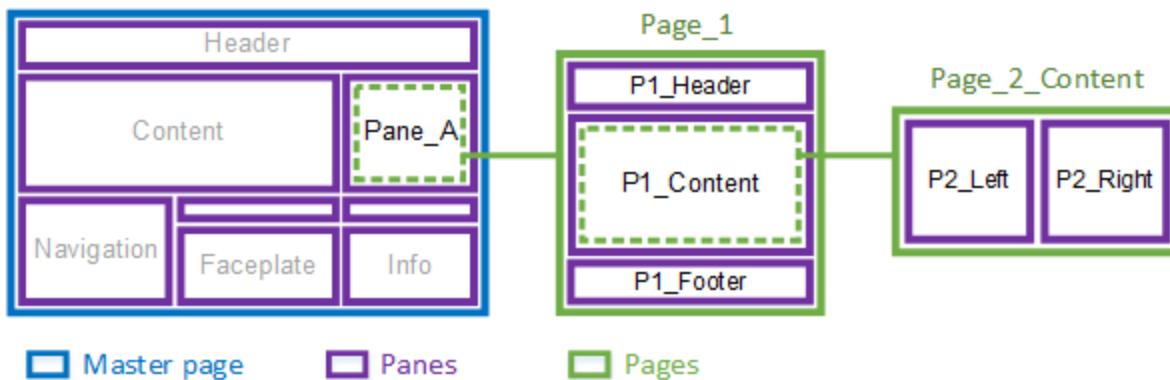

Parameter	Description
Max Open Items	If required, sets a limit on the number of menu items that are included on the tab bar at runtime.  The menu items are selected according to the value set for <b>Order</b> property. If the Order property is not configured, items are selected according to the order in which they were added to the Menu Configuration database.
Tab Bar Width	Specify the width of the tab bar in pixels.
Max Tab Width	Specify the maximum width for each tab in pixels.
Use for 4K Page?	Specify if the tab bar will appear on a UHD4K master page.  TRUE = The tab bar will be used in a UHD4K project. FALSE = The tab bar will not be used in a UHD4K project.
Allow Duplicate Content?	Determines if multiple tabs can display the same content.  TRUE = Multiple tabs can display the same page. FALSE = Each tab displays a different page (default).  For example, you could set this to TRUE if you need two tabs to display the same page, but with a different filter applied.

[Key Components of a Situational Awareness Project](#)

## Use Nested Panes

A pane can display a page that includes its own set of panes, creating a multi-level arrangement of nested panes.

In the example above, Pane\_A on the master page is configured to display a page called "Page\_1". Page\_1 includes its own sets of panes:

- P1\_Header
- P1\_Content
- P1\_Footer.

The P1\_Content pane is configured to display a page called "Page\_2\_Content", which in turn has two panes:

- P2\_Left
- P2\_Right.

When displaying content, you can address nested panes using dot (.) notation. For example, you could use the following to address the P2\_Left pane:

`Pane_A.P1_Content.P2_Left`

To use nested panes, you need to perform the following tasks:

## Create a page that includes nested panes

1. Open Graphics Builder.
2. Create a page using the **Style** "situational Awareness" and the **Template** "blank".
3. Display the Page Properties.

From the **File** menu, select **Properties**.

Or:

Right-click on the page and select **Properties**.

4. On the **Environment** tab, **Add** a variable.
5. Enter the following values in the Edit Property dialog box:

**Property:** HasPanes

**Value:** 1

This setting instructs the workspace to initialize the panes, display their default content, and consider them when contextual updates occur.

6. On the **Appearance** tab, use the **View Area** settings to define a size for the page that is appropriate to the

pane that will host it.

---

**Note:** If you need to create a large number of pages for a custom-sized pane, consider creating a page template that matches the pane's size.

7. Configure the remaining properties for the page as required.
8. Click **OK**.
9. **Save** the page.

You can then add panes to the page using the procedure described in [Create a Master Page for a Customized Workspace](#). Use the page you have just created, and start at step 3.

## Configure the pane that will host the page

1. In Graphics Builder, open the page that will host the nested panes.
2. Double click on the pane that will display the nested panes. The Pane Properties dialog will appear.
3. In the **Default Page** field, enter the name of the page you created.
4. Configure the remaining properties as required.
5. Click **OK**.
6. **Save** the page.

## Enable autofilling

To enable [Autofill](#) in nested panes you use [Content Types](#). For example, you could use **Pane\_A** in the diagram above to display a report for a piece of equipment that is currently in context. To do this, you would use the following settings:

- The pane **Pane\_A** will have its Content Type property set to 'Report'.
- The page **Page\_1** will have its Content Type set to 'Report'.
- The pane **P2\_Left** will have its Content Type property set to 'Report\_Text'.
- The pane **P2\_Right** will have its Content Type property set to 'Report\_Chart'.
- Pages that appear in **P2\_Left** (for example, "Report\_1"), will have their Content Type set to 'Report\_Text'.
- Pages that appear in **P2\_Right** (for example, "Chart\_1"), will have their Content Type set to 'Report\_Chart'.

If you then want to display a report for a piece of equipment, you need to enter the names of the associated pages as a comma-separated list in the **Content** property for the equipment. In the example above, this would be "Page\_1, Report\_1, Chart\_1".

For more information, see the following:

- [Configure Panes on a Master Page](#)
- [Configure Content Types](#)
- [Assign a Content Type to a Page](#).

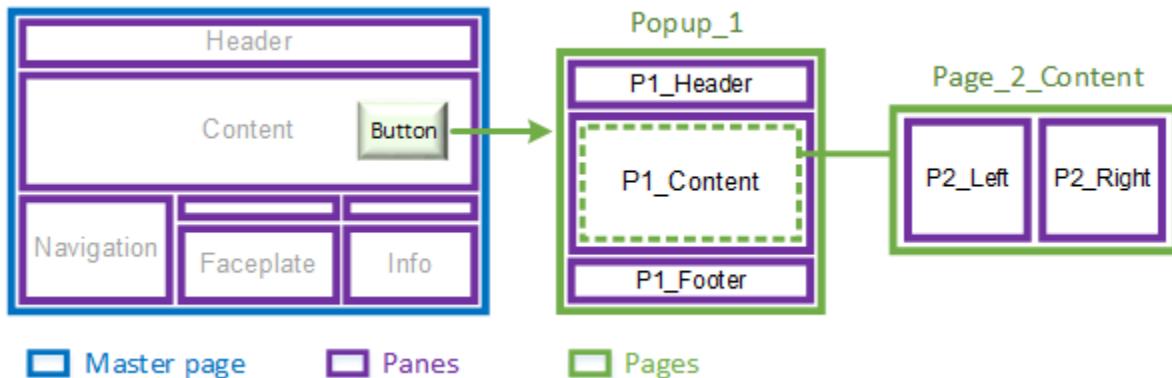

## See Also

[Create a Pop-up Window with Panes](#)

[Workspace\\_ShowContent](#)

## Create a Pop-up Window with Panes

You can create a pop-up window that includes a set of panes.

In the example above, a button in the main content area launches a pop-up window called "Popup\_1".

Popup\_1 includes its own sets of panes:

- P1\_Header
- P1\_Content
- P1\_Footer.

The P1\_Content pane is configured to display a page called "Page\_2\_Content", which in turn has two nested panes:

- P2\_Left
- P2\_Right.

When displaying content, you can address the panes in a pop-up window using the following dot (.) notation. For example, you could use the following to address the P2\_Left pane:

`Popup_1.P1_Content.P2_Left`

To launch a pop-up window, use the Cicode function WinNewAt.

To create the required content for the window, perform the following tasks:

## Create a page that will display in the pop-up window

1. Open Graphics Builder.
2. Create a page using the **Style** "situational Awareness" and the **Template** "blank".
3. Display the Page Properties.  
From the **File** menu, select **Properties**.

Or:

Right-click on the page and select **Properties**.

4. On the **Appearance** tab, use the **View Area** settings to define a size for the page that is appropriate to the pop-up window that will host it.
5. Configure the remaining properties for the page as required.
6. Click **OK**.
7. Save the page.

If you want to include panes on the page, you will also need to perform the following steps.

1. Display the Page Properties.
2. On the **Environment** tab, Add a variable.
3. Enter the following values in the Edit Property dialog box:

**Property:** HasPanes

**Value:** 1

This setting instructs the workspace to initialize the panes, display their default content, and consider them when contextual updates occur.

4. Click **OK**.
5. Save the page.

You can then add panes to the page using the procedure described in [Create a Master Page for a Customized Workspace](#). Use the page you have just created, and start at step 3.

## Enable autofilling

You can enable [Autofill](#) in a pop-up window. For example, you could use Popup\_1 in the diagram above to display a report for a piece of equipment that is currently in context. To do this, you would use the following settings:

- The pane **P1\_Content** will have its Content Type property set to 'Report'.
- The page **Page\_2\_Content** will have its Content Type set to 'Report'.
- The pane **P2\_Left** will have its Content Type property set to 'Report\_Text'.
- The pane **P2\_Right** will have its Content Type property set to 'Report\_Chart'.
- Pages that appear in **P2\_Left** (for example, "Report\_1"), will have their Content Type set to 'Report\_Text'.
- Pages that appear in **P2\_Right** (for example, "Chart\_1"), will have their Content Type set to 'Report\_Chart'.

If you then want to display a report for a piece of equipment, you need to enter the names of the associated pages as a comma-separated list in the **Content** property for the equipment. In the example above, this would be "Page\_2\_Content, Report\_1, Chart\_1".

For more information, see the following:

- [Configure Panes on a Master Page](#)
- [Configure Content Types](#)
- [Assign a Content Type to a Page](#).

[Workspace\\_ShowContent](#)

## Use Navigational Genies on Content Pages

The SA\_Include project contains a set of navigational Genies that you can use to direct an operator through a production process that spans multiple graphics pages. The Genies indicate the direction of a link, and include a label that describes the consecutive location. Clicking on the Genie at runtime will take you directly to the linked page (except where a Static Link Genie has been used).

The following navigational Genies are included in the "sa\_navigation" library:

### Link Left/Right

The left and right navigational Genies can be used to link pages that are a part of a linear process.

The link is defined using the path to a menu item in the project's Navigation menu. For example, "Plant1.Area1.MyPage".

You can also indicate that a left/right Genie points to a location that is on a different "console". This means the target is part of a process that is not usually monitored by the current client. For example, a link in a production area of a plant may point to a destination in the warehouse.

To indicate that it points to a different console, the Genie will appear with a gray background.

You can also use a left/right Genie as a control link. This allows you to associate a piece of equipment with the Genie; the Genie will only appear when their associated object is in context.

The navigational Genies will display a purple drop-shadow when configured as a control link.

---

**Note:** Control Links can be enabled or disabled by selecting **Options | Show/Hide Control Links** on the Header Bar.

### Link Up/Down

The up and down navigational Genies can be used to link to pages that are on a different level of a project's menu.

The link is defined using the path to a menu item in the project's navigation menu. For example, an up Genie could point to "Plant1", and a down Genie "Plant1.Area1.MyPage".

## Static Links

The static link Genies function primarily as a label; they are not designed to provide a direct link to a destination.

You can also specify that a static link identifies a location that is on a different console.

### To add a navigational Genie to a page:

1. Open a page in Graphics Builder.
2. Click the **Paste Genie** button in the objects toolbox.

Or, select **Paste Genie** from the **Edit** menu.

3. In the Paste Genie dialog, select the **Library** "sa\_navigation".
4. Select one of the following from the **Genie** list and click **OK**.
  - link\_d = link down
  - link\_l = link left
  - link\_r = link right
  - link\_u = link up
  - slink\_l = static link left
  - slink\_r = static link right.

The Genie is pasted onto the graphics page. A dialog will open, prompting you to configure the properties of the Genie. For a description of the properties, see below.

5. Click **Save**.

## Link Left & Link Right

Field	Description
Menu Item	<p>The path to the linked item in the project's Menu Configuration. This is specified using the following notation:</p> <p>&lt;Level1&gt;.&lt;Level2&gt;.&lt;Level3&gt;.&lt;Level4&gt;.&lt;Level5&gt;.&lt;Level6&gt;</p> <p>For example, "Plant1.Area1.MyPage"</p> <p>The menu item needs to be included under the "Navigation" menu (defined in the <b>Page</b> field). As "Navigation" is assumed as the top level of the path, there is no need to enter it at the start of the menu</p>

Field	Description
	item path.
Tooltip	An optional description of the Genie that appears when the mouse points at it.
Use for 4K Page?	<p>Determines if the Genie will appear on a page that displays within a UHD4K workspace.</p> <p>TRUE = The Genie will appear in a UHD4K workspace.</p> <p>FALSE = The Genie will not appear in a UHD4K workspace.</p>
Links to another console?	<p>Allows you to indicate that a Genie points to a destination on a different console, which is a destination that is not usually monitored by the current client.</p> <p>TRUE = The Genie points to a different console.</p> <p>FALSE = The Genie does not point to a different console.</p> <p>If set to TRUE, the Genie will display a gray background.</p>
Use as Control Link?	<p>Determines if the Genie will function as a control link.</p> <p>TRUE = The Genie will use a control link.</p> <p>FALSE = The Genie will not use a control link.</p> <p>If set to TRUE, the Genie will display a purple drop-shadow.</p>
Control Signal Equipment	The piece of equipment that is associated with the left/right Genie. The Genie will only appear when their associated object is selected.
Controlled Equipment	The piece of equipment that the Control Link points to. When you click on the Genie, the page associated with the piece of equipment will display.

## Link Up & Link Down

Field	Description
Menu Item	<p>The path to the linked item in the project's Menu Configuration. This is specified using the following notation:</p> <p>&lt;Level1&gt;. &lt;Level2&gt;. &lt;Level3&gt;. &lt;Level4&gt;. &lt;Level5&gt;. &lt;Level6&gt;</p>

Field	Description
	For example, "Plant1.Area1.MyPage" The menu item needs to be included under the "Navigation" menu (defined in the <b>Page</b> field). As "Navigation" is assumed as the top level of the path, there is no need to enter it at the start of the menu item path.
Tooltip	An optional description of the Genie that appears when the mouse points at it.
Use for 4K Page?	Determines if the Genie will appear on a page that displays within a UHD_4K workspace. TRUE = The Genie will appear in a UHD4K workspace. FALSE = The Genie will not appear in a UHD4K workspace.

## Static Link Left & Static Link Right

Field	Description
Label	The label that will appear on the Genie.
Tooltip	An optional description of the Genie that appears when the mouse points at it.
Use for 4K Page?	Determines if the Genie will appear on a page that displays within a UHD_4K workspace. TRUE = The Genie will appear in a UHD4K workspace. FALSE = The Genie will not appear in a UHD4K workspace.
Links to another console?	Allows you to indicate that a Genie points to a destination on a different console, which is a destination that is not usually monitored by the current client. TRUE = The Genie points to a different console. FALSE = The Genie does not point to a different console. If set to TRUE, the Genie will display a gray background.

SA\_Include Navigational Genie Library

## Apply a Color Theme to a Workspace

If you have created a project from the Situational Awareness Starter Project, you can change the theme color used for the workspace(s). This will change the color of the following items:

- Header bar
- Navigation Zone buttons and tabs
- Information Zone buttons and tabs
- Display page buttons
- Selection rectangle.

There are five default color themes you can use:

- Blue (default) — blue header with blue selection/control highlighting
- Grey — grey header with green selection/control highlighting
- Green — green header with green selection/control highlighting
- Indigo — indigo header with indigo selection/control highlighting
- Orange — orange header with orange selection/control highlighting
- Dark — black header with green selection/control highlighting.

For the Grey and Dark themes, green is used for the selection rectangle, buttons and tabs.

### To apply a color theme to a project's workspaces:

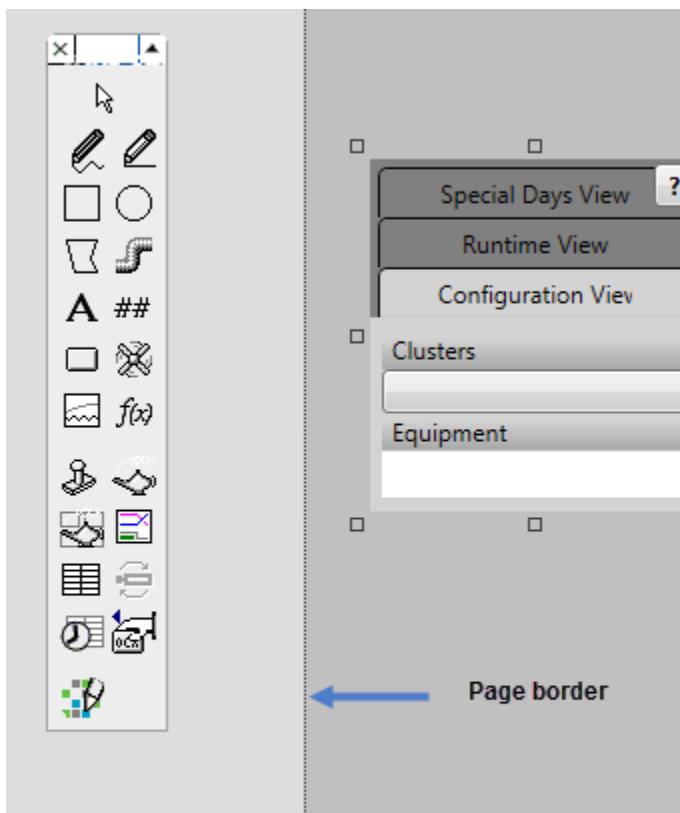

1. In the **Standards** activity, select **Labels**.
2. In the Grid Editor, locate the following label:
  - **Label Name:** \_THEME\_Default
3. In the **Expression** field, specify the required theme color using one of the following labels:
  - THEME\_Blue
  - THEME\_Grey
  - THEME\_SEGreen
  - THEME\_Dark
  - THEME\_Indigo
  - THEME\_Orange
4. Click **Save**.

For a description of a workspace, see [Key Components of a Situational Awareness Project](#).

## Use a Scheduler Control in a Situational Awareness Project

When using a Scheduler control in your Situational Awareness project, it is recommended you add a Scheduler

instance to your project's master pages outside of the page bounds to avoid possible delays when loading Scheduler pages.

Scheduler Control added to master page outside of page border.

To add a Scheduler instance to a master page, follow the steps outlined in [Add the Scheduler ActiveX Object to a Page](#).

Once pasted on the master page, move and position the Scheduler control outside the page border.

## Defining a Right Click Action on Equipment

In a Situational Awareness Project, you can define a right-click action/command for a piece of equipment using a callback. This is achieved by specifying a custom function for the label "\_CALLBACK\_EquipmentRightClick".

In a project created from the Situational Awareness Starter Project, the default function specified for the label is "DefaultEquipmentRightClickCallback". To change this:

1. Go to the **Standards** activity and select **Labels**.
2. Locate the "\_CALLBACK\_EquipmentRightClick" label.

	Label Name	Expression
1	_CALLBACK_EquipmentRightClick(sEquip, sEquipSecondary)	DefaultEquipmentRightClickCallback(sEquip, sEquipSecondary)
2	_CALLBACK_FaceplateHeaderDisabled(sEquip, sEquipSecondary)	DefaultFaceplateHeaderDisabledCallback(sEquip, sEquipSecondary)
3	_CALLBACK_OutOfService(sEquip, sEquipSecondary)	DefaultOutOfServiceCallback(sEquip, sEquipSecondary)
4	_THEME_Default	THEME_Blue

3. In the **Expression** field, enter a custom function.

The function you create needs to take the following two arguments:

- sEquip - the current primary equipment context
- sEquipSecondary - the current secondary equipment context.

4. **Save** your changes.

If you do not define a label specifying a custom function (or the default function), a callback error message will be generated when you compile your project.

# System Projects

This section of the help provides reference information about the system projects that are included with a Plant SCADA installation. This includes a description of the content of each project and how it can be implemented in a user project.

The system projects described here include:

- **Situational Awareness System Projects** — see [Situational Awareness System Projects](#).
  - **SA\_Include** — see [Situational Awareness Include Project](#)
  - **SA\_Controls** — see [Situational Awareness Controls Project](#)
  - **SA\_Library** — see [Situational Awareness Library Project](#)
- **Sxw\_Style\_Include** — see [StruxureWare \(SxW\) Templates Project](#)
- **Tab\_Style\_Include** — see [Tab Style Templates Project](#)
- **Library\_Controls** — see [Library Controls Include Project](#)
- **Include Project** — see [Include Project Specifications](#).

## See Also

[Project Types](#)

## Situational Awareness System Projects

When you create a project using the Situational Awareness Starter project, the following three system projects are included:

- **Situational Awareness Include Project**: Contains public functions and Genie libraries.
- **Situational Awareness Library Project**: Contains the controls, common controls and priorities Genie libraries.
- **Situational Awareness Controls Project**: Contains a set of Genies for common user interface controls for meter, drive and valve objects.

↳ ExampleSA	<b>Active Project</b>	8.10.0000	May 28th 2018	Workspace and Situational Awareness Example Project
↳ SA_Controls		8.10.0000	May 24th 2018	Situational Awareness Common GUI Controls
↳ SA_Include		8.10.0000	May 24th 2018	Situational Awareness Workspace
↳ SA_Library		8.10.0000	May 24th 2018	Situational Awareness Library Objects

For more information, see [Create a Project Using a Starter Project](#).

When you create a Situational Awareness project that is not based on the starter project but created using the Situational Awareness project template, only the SA\_Library project is included, which in turn includes the SA\_Controls project. For more information, see [Create a Standard Project](#).

**Note:** The library project (SA\_Library) is not included with such a project.

↳ ExampleSA_1	<b>Active Project</b>	1.0	14/08/2018	
↳ SA_Include		8.10.0000	May 24th 2018	Situational Awareness Workspace
Include		8.10.0000	May 24th 2018	Standard Citect include project.
↳ SA_Controls		8.10.0000	May 24th 2018	Situational Awareness Common GUI Controls

**Note:** Avoid making changes to the included system projects for use as a runtime project. A Plant SCADA upgrade will install a new version of the projects, which will overwrite any changes you make.

[Situational Awareness Projects](#)

## Situational Awareness Include Project

The Situational Awareness Include Project (named "SA\_Include") is an include project contains the following:

- [Public Functions](#)
- [SA\\_Include Genie Libraries](#).

This project is included when you create a project using the Situational Awareness Starter project.

**Note:** The SA\_Include project is a system include project, and only appears in the Project list tree if the **System Projects** filter is applied in the Projects activity.

## Public Functions

The Situational Awareness Include project, sa-include, contains public Cicode functions that can be used to customize your installation of Plant SCADA Studio, navigation, themes and workspaces. The following categories of functions are available:

- **Debugging functions:** Allow you to trace the user's actions for a workspace and its components. Traced output is written to syslog.dat, which you can review to address any issues encountered.
- **Equipment functions:** Allow you to pass or retrieve equipment context and retrieve workspace content using the equipment context.
- **Help functions:** Allow you customize the display of help in a floating window or a pane within a workspace.
- **Navigation functions:** Allow you to display a specific page in the workspace and add the transition to the navigation stack.
- **NavLink functions:** Allow you to hide the navigation link genies on a page.
- **Security functions:** Allow for security-related operations within workspaces and faceplates.
- **TabBar functions:** Allow you to add tabs to a workspace and control the display if open items do not fit on the display.
- **Theme functions:** Allow for set the basic theme of a workspace and its components, or add custom themes.
- **Workspace functions:** Allow you to:
  - display customized content in any pane
  - set equipment-based context for a workspace

- set the content type for a workspace pane

Below is a list of available functions:

<b>Debugging Functions</b>	<a href="#">Debug_SetTraceLevel</a> <a href="#">Debug_Trace</a>

--	---

## Debug\_SetTraceLevel

Sets the level of tracing. Setting the trace level to Information will include Warning and Error. Setting it to Warning will include Error. The tracing information is stored in the syslog.dat file.

---

**Note:** Setting the trace level to Information can log a lot of information to the syslog.dat file and may affect performance.

---

You can also configure the default for your project by setting the parameter [\[Debug\]UserTraceMode](#). When setting the trace level through the parameter, you need to set it to the numeric value of the trace level:

- TRACE\_Error: 1
- TRACE.Warning: 2
- TRACE.Information: 3
- TRACE\_Suspend: 0

Setting the trace level to 0 (TRACE\_Suspend) will stop the logging.

## Syntax

**Debug\_SetTraceLevel(INT *nTraceLevel*)**

*nTraceLevel*

The trace level labels defined in the sa\_include project. The default trace level is 2.

## Return Value

Returns -1 if the specified trace level does not exist. Returns 1 if setting the level was successful.

## Example

```
Debug_SetTraceLevel(TRACE_Error);
```

## Related Functions

[Debug\\_Trace](#)

## See Also

[Public Functions](#)

### Debug\_Trace

Adds a trace message to the syslog.dat file. The message is classified by trace level, module and function.

**Note:** It is recommended that this function be used sparingly because it is called even when tracing is turned off.

## Syntax

`Debug_Trace(STRING sModule, STRING sFunction, STRING sMessage, INT nLevel=TRACE_Information)`

*sModule*

The module of the function that generated the trace message.

*sFunction*

The function which generated the trace message.

*sMessage*

The trace message to output.

*nLevel*

The TRACE\_<level> Labels defined in sa\_include. See [Debug\\_SetTraceLevel](#) for the list of values.

## Return Value

N/A.

## Example

```
Debug_Trace("Workspace", "_Workspace_FindPane", "Pane '" + sSearchTerm + "' not found.",  
TRACE_Error);
```

## Related Functions

[Debug\\_SetTraceLevel](#)

## See Also

[Public Functions](#)

### Equipment\_GetContent

Returns the content of the equipment instance referenced by the specified menu item. This function should be used with the built equipment models which are loaded into menus.

## Syntax

Equipment\_GetContent(INT *hMenuItem*)

*hMenuItem*

Menu item from which to retrieve the equipment content.

## Return Value

A comma separated list of page names belonging to the equipment. The content returned will be the combination of both the equipment's 'Page', and its 'Content' fields.

## Related Functions

[Equipment\\_GetContext](#)

## See Also

[Public Functions](#)

## Equipment\_GetContext

Returns the fully qualified context of the equipment referenced by the specified menu. This function should be used with the built equipment models which are loaded into menus.

## Syntax

Equipment\_GetContext(INT *hMenuItem*)

*hMenuItem*

Menu item from which to retrieve the equipment context.

## Return Value

<cluster name>.<equipment path>

## Related Functions

[Equipment\\_GetContent](#)

## See Also

[Public Functions](#)

## EquipmentStatus\_Drive\_GetValue

Maps the various item names for the status items within the PLC into the states required by the status indicator for a drive object.

### Syntax

EquipmentStatus\_Drive\_GetValue(STRING *sEquipment*, STRING *sEquipmentValueItem*)

*sEquipment*

The name of the equipment that has been selected.

*sEquipmentValueItem*

The name of the item to use for the equipment "value".

### Return Value

The status as calculated by \_EquipmentStatus\_UpdateValue for the supplied arguments.

### Related Functions

[Equipment\\_GetContext](#)

### See Also

[Public Functions](#)

## EquipmentStatus\_Meter\_GetValue

Maps the various item names for the status items within the PLC into the states required by the status indicator for a meter object.

### Syntax

EquipmentStatus\_Meter\_GetValue(STRING *sEquipment*, STRING *sEquipmentValueItem*)

*sEquipment*

The name of the equipment that has been selected.

*sEquipmentValueItem*

The name of the item to use for the equipment "value".

### Return Value

The status as calculated by \_EquipmentStatus\_UpdateValue for the supplied arguments.

## Related Functions

[Equipment\\_Context](#)

## See Also

[Public Functions](#)

### EquipmentStatus\_Valve\_GetValue

Maps the various item names for the status items within the PLC into the states required by the status indicator for a valve object.

## Syntax

EquipmentStatus\_Valve\_GetValue(STRING *sEquipment*, STRING *sEquipmentValueItem*)

*sEquipment*

The name of the equipment that has been selected.

*sEquipmentValueItem*

The name of the item to use for the equipment "value".

## Return Value

The status as calculated by \_EquipmentStatus\_UpdateValue for the supplied arguments.

## Related Functions

[Equipment\\_Context](#)

## See Also

[Public Functions](#)

### GetPrivEx

Checks if the current user has the required privilege for a specified area and a specified piece of equipment.

If you have specific additional security requirements per equipment, you can set the default

'\_CALLBACK\_EquipmentSecurity' label to a custom function of your own so that it will be called in addition to the default security check. The current default function is "DefaultEquipmentSecurityCallback".

The '\_CALLBACK\_EquipmentSecurity' label is set by default in the SA\_Style1\_MultiRes starter project. To view go to Standards | Labels.

	Label Name	Expression
1	_CALLBACK_EquipmentRightClick(sEquip, sEquipSecondary)	DefaultEquipmentRightClickCallback(sEquip, sEquipSecondary)
2	_CALLBACK_FaceplateHeaderDisabled(sEquip, sEquipSecond	DefaultFaceplateHeaderDisabledCallback(sEquip, sEquipSecond
3	_CALLBACK_OutOfService(sEquip, sEquipSecondary)	DefaultOutOfServiceCallback(sEquip, sEquipSecondary)
4	_THEME_Default	THEME_Blue

**Note:** The default callback function does not use the *sOperation* or *sArg* fields.

## Syntax

GetPrivEx(INT *nPriv*, INT *nArea* [, STRING *sEquipment* [, STRING *sOperation* [, STRING *sArg*]]])

*nPriv*

The privilege level - 0 to 8.

*nArea*

The area of privilege - 0 to 255.

*sEquipment*

Equipment reference in which you are interested. It does not need to be in the same area. This is an optional parameter.

*sOperation*

The reason for privilege request. This is an optional parameter.

*sArg*

Custom argument to be passed to callback function, which is defined by its caller. This is an optional parameter.

## Return Value

Returns 1 if the user has the specified privilege in the area, or 0 (zero) if the user does not have the privilege.

## Example

Example below outlines using a custom function to determine if the user can bypass or removebypass when working with interlocks.

```
// Extended callback that supports interlocks context
GLOBAL STRING g_sInterlockBypassOperation = "Interlock.Bypass"; // Interlock Bypass
Operation
GLOBAL STRING g_sInterlockRemoveBypassOperation = "Interlock.RemoveBypass"; // Interlock
Remove Bypass Operation
PUBLIC
INT
FUNCTION CustomSecurityCallback(INT nPriv, INT nArea, STRING sEquipment, STRING sOperation,
STRING sArg)
    STRING sCategory;
```

```
STRING sInterlockingItem;
INT nResult = 1;
sCategory = Interlocks_GetSecurityCallbackCategory(sArg);
SinterlockingItem = Interlocks_GetSecurityCallbackReferencedItem(sArg);
TraceMsg("Interlocks CustomSecurityCallback: " + sEquipment + "/" + sArg + "/" +
sOperation + "/" + sCategory + "/" + sInterlockingItem);
IF (sOperation = g_sInterlockBypassOperation) THEN
    TraceMsg(sInterlockingItem + " in interlock category " + sCategory + " is being
bypassed for " + sEquipment);
    // Don't allow bypass for 'GuestEngineer'
    IF Name() = "GuestEngineer" THEN
        nResult = 0;
    END
ELSE
    IF (sOperation = g_sInterlockRemoveBypassOperation) THEN
        TraceMsg(sInterlockingItem + " in interlock category " + sCategory + " is
removing bypass for " + sEquipment);
        // Don't allow removebypass for 'GuestManager'
        IF Name() = "GuestManager" THEN
            nResult = 0;
        END
    END
END
RETURN nResult;
END
```

## See Also

[Public Functions](#)

## Help\_DisplayFloating

Displays the help page in a floating window.

## Syntax

Help\_DisplayFloating(INT *bAutoPosition*, INT *nPositionMode*, INT *x*, INT *y*)

*bAutoPosition*

TRUE window will be placed near the focused object. FALSE will use the x/y coordinates

*nPositionMode*

Determines the position where the window will be placed. This can take the following values:

0 - use the passed x and y co-ordinates

1 - place below the focused object

2 - place below the Header Bar Help button

*x*

*x* position of the left of the window.

*y*

*y* position of the top of the window.

## Return Value

N/A

## Example

```
Help_DisplayFloating(FALSE, WndInfo(0), 0)
```

## Related Functions

[Help\\_DisplayInPane](#)

## See Also

[Public Functions](#)

## Help\_DisplayInPane

Displays the help page in a pane.

## Syntax

```
Help_DisplayInPane(STRING sPane, STRING sWorkspaceName)
```

*sPane*

The name of the pane in which to display the help page. To ensure the help displays without scaling, ensure your pane is sized to match the desired help page size.

*sWorkspaceName*

The name of the workspace in which to display the pane. Specify "" to display in *sPane* of the workspace of the current window (default). This is an optional parameter.

## Return Value

N/A

## Example

```
Help_DisplayInPane("MyPane")
```

## Related Functions

[Help\\_DisplayFloating](#)

## See Also

[Public Functions](#)

### Navigation\_ShowHomePage

Shows the home page of the current workspace's context in the specified workspace.

**Note:** If your project contains "Home\_HD1080" and "Home\_UHD4K" variations of the home page to support multiple screen resolutions, passing "Home" will automatically display Home\_HD1080 if the workspace master page also has \_HD1080 as its extension. For more information, see [Configure a Project that Supports Multiple Screen Resolutions](#).

## Syntax

`Navigation_ShowHomePage([STRING sWorkspaceName])`

*sWorkspaceName*

The name of the workspace in which the home page will be displayed. This is an optional parameter. The default value for this parameter is "", which uses the workspace of the current window.

## Return Value

N/A

## Related Functions

[Navigation\\_ShowTargetPage](#), [NavigationLink\\_IsHidden](#)

## See Also

[Public Functions](#)

### Navigation\_ShowTargetPage

Displays the page specified in the **Target Page** field configured for the current Navigation Menu Item.

This function should only be called as a menu command of a menu item. If your project is using multiple resolutions, you only need to specify the first part of your page name and the workspace will choose the best version to suit the required screen resolution. For example, if you have "MyPage\_HD1080" and "MyPage\_UHD4K", just specify "MyPage". For more information, see [Configure a Project that Supports Multiple Screen Resolutions](#).

## Syntax

`Navigation_ShowTargetPage([STRING sPaneRef [, STRING sEquipmentContext [, STRING sEquipmentSecondaryContext [, STRING sWorkspaceName]]]])`

***sPaneRef***

Name of the pane in which to display the target page. This is an optional parameter. This is the format of "<panename>.<panename>" if needing to display in a nested pane. If not specified, a pane that hosts the content type of the target page will be used. The default is "", which displays the page in the default pane.

***sEquipmentContext***

Equipment context to set for the page. This is an optional parameter. If not specified, the current context of the workspace will be cleared. The default value is label WS\_CONTEXT\_Clear, which clears the context. If set to "", it retains the existing context.

***sEquipmentSecondaryContext***

The value of the equipment name that is set as the secondary context for related equipment. This is an optional parameter. For example, for a Polar Star Composite Genie, this will be the value specified in the **Equipment Name** option in the Presentation Options dialog box. This is used to determine the number of symbols to be displayed for MEOs. The default value is "", which retains the existing context.

***sWorkspaceName***

The name of the workspace in which to display the page. This is an optional parameter. If not specified, the workspace of the current window will be used. The default is "", which uses the workspace of the current window.

## Return Value

N/A

## Related Functions

[Navigation\\_ShowHomePage](#), [NavLink\\_IsHidden](#)

## See Also

[Public Functions](#)

## NavLink\_IsHidden

Checks if link object should be hidden based on whether the selected equipment is a member of the control group. See Use Navigational Genies on Content Pages.

## Syntax

NavLink\_IsHidden(STRING *sEquipFrom*, STRING *sEquipTo* [, INT *bIsControlLink*])

***sEquipFrom***

The name (path) of the equipment that the control link is from. Set this to empty if have none.

***sEquipTo***

The name (path) of equipment that the control link links to. Set this to empty if have none.

***bIsControlLink***

Indicates whether the link is a control link. Default value is TRUE. This is an optional parameter.

#### Return Value

Returns FALSE (not hidden) if the selected equipment belongs to the control group; otherwise it returns TRUE.

#### Example

```
NavigationLink_IsHidden("AlarmSite.Area2.Equipment1","AlarmSite.Area2.Equipment11",TRUE)
```

## Related Functions

[Navigation\\_ShowHomePage](#), [Navigation\\_ShowTargetPage](#)

## See Also

[Public Functions](#)

### **TabBar\_AddTab**

Adds a new tab to a given tab control.

## Syntax

```
TabBar_AddTab(INT nTabBarAN, INT bActivate, STRING sTabLabel, STRING sContent [, STRING sEquipmentContext [, STRING sEquipmentSecondaryContext [, STRING sIcon [, INT bCanClose [, INT bIsPinned [, STRING sOnActivateCommand]]]]]])
```

*nTabBarAN*

The AN of the tab bar to which the tab will be added.

*bActivate*

Activate the tab after adding it.

*sTabLabel*

Display label of the tab.

*sContent*

Page Name to display.

*sEquipmentContext*

Equipment to which the content belongs. The default value is "".

*sEquipmentSecondaryContext*

Secondary equipment to which the content belongs. The default value is "".

*sIcon*

Not used.

*bCanClose*

Indicates whether the tab can be closed by the operator. The default value is TRUE.

*bIsPinned*

Indicates whether the tab is pinned (TRUE) or unpinned (FALSE). The default value is FALSE.

**sOnActivateCommand**

Command to run after the tab is activated. This is an optional parameter. The default value is "", which means no command will be run. This parameter can take the following values:

h:<menu handle>  
<function>(<arguments>)

**Return Value**

The ID of the tab (opened item number)

**Related Functions**

[TabBar\\_GetOpenItemCount](#), [TabBar\\_GetTabCount](#)

**See Also**

[Public Functions](#)

**TabBar\_GetTabCount**

Gets the number of tabs currently displayed.

**Syntax**

TabBar\_GetTabCount(INT *nTabBarAN*)

*nTabBarAN*

The AN of the tab bar.

**Return Value**

The number of displayed tabs.

**Related Functions**

[TabBar\\_AddTab](#)

**See Also**

[Public Functions](#)

**TabBar\_GetOpenItemCount**

Gets the number of open items.

## Syntax

```
TabBar_GetOpenItemsCount(INT nTabBarAN)
```

*nTabBarAN*

The AN of the tab bar.

## Return Value

The number of open items

## Example

```
// Add a Tab Bar control "Tabbar.h" to a page
// The genie is named "Tabbar"
INT hTabBarAN = DspGetANFromName("Tabbar")
INT nCount = TabBar_GetOpenItemsCount(hTabBarAN)
```

## Related Functions

[TabBar\\_AddTab](#), [TabBar\\_GetTabCount](#)

## See Also

[Public Functions](#)

## TabBar\_ShowIcon

Shows/hides the icon of an open item of the tab bar.

## Syntax

```
TabBar_ShowIcon(INT nTabBarAN, INT nTabId [, INT bShow])
```

*nTabBarAN*

The AN of the tab bar.

*nTabId*

The opened item number starting from 1.

*bShow*

Whether to show the icon configured for the tab. Set this to TRUE to show or FALSE to hide. Default value is TRUE.

## Return Value

None.

## See Also

[Public Functions](#)

### **Theme\_Control\_GetColorIndex**

Returns the common control (button) color index for the specific button state. This is different from the header button. The normal state color is always light grey regardless of the theme selected.

## Syntax

`Theme_Control_GetColorIndex(INT nState)`

*nState*

Indicates which state the UI element is in such that correct shade of the color is returned. This can be one of the following values:

CTRL_ITEM_STATE_Normal	0	Normal state - no mouse over
CTRL_ITEM_STATE_NormalHover	2	Mouse is hovering over control
CTRL_ITEM_STATE_NormalPressed	3	Mouse button pressed on control
CTRL_ITEM_STATE_Active	4	Item is in selected state
CTRL_ITEM_STATE_ActiveHover	5	Item is in selected and mouse is hovering
CTRL_ITEM_STATE_ActivePressed	6	Item is selected and mouse button is down
CTRL_ITEM_STATE_Disabled	1	Item is disabled
CTRL_ITEM_STATE_ActiveDisabled	7	Item is in selected AND disabled state\

Typically, this state will be returned by a function such as "Button\_GetState".

## Return Value

Returns an index into the color array configured on the graphics object that called this function.

## Example

```
Theme_Control_GetColorIndex(Button_GetState(DspGetAnCur())))
```

## Related Functions

[Theme\\_Control\\_GetForegroundColorIndex](#), [Theme\\_Header\\_GetBackgroundColorIndex](#),

[Theme\\_SetTheme](#), [Theme\\_ToggleButton\\_GetForegroundColorIndex](#)

## See Also

[Public Functions](#)

### Theme\_Control\_GetForegroundColorIndex

Returns the control highlight foreground color index used for icons and text.

## Syntax

Theme\_Control\_GetForegroundColorIndex(INT *nState*)

*nState*

Indicates which state the UI element is in such that correct shade of the color is returned. This can be one of the following values:

CTRL_ITEM_STATE_Normal	0	Normal state - no mouse over
CTRL_ITEM_STATE_NormalHover	2	Mouse is hovering over control
CTRL_ITEM_STATE_NormalPressed	3	Mouse button pressed on control
CTRL_ITEM_STATE_Active	4	Item is in selected state
CTRL_ITEM_STATE_ActiveHover	5	Item is in selected and mouse is hovering
CTRL_ITEM_STATE_ActivePressed	6	Item is selected and mouse button is down
CTRL_ITEM_STATE_Disabled	1	Item is disabled
CTRL_ITEM_STATE_ActiveDisabled	7	Item is in selected AND disabled state

Typically, this state will be returned by a function such as "Button\_GetState".

## Return Value

Returns an index into the color array configured on the graphics object that called this function.

## Example

```
Theme_Control_GetForegroundColorIndex(Button_GetState(DspGetAnCur())))
```

## Related Functions

[Theme\\_Control\\_GetColorIndex](#), [Theme\\_Header\\_GetBackgroundColorIndex](#), [Theme\\_Header\\_GetColorIndex](#),

## See Also

[Public Functions](#)

### Theme\_Header\_GetBackgroundColorIndex

Returns the background color index for the Header Bar based on the active theme.

## Syntax

```
Theme_Header_GetBackgroundColorIndex()
```

## Return Value

Returns an index into the color array configured on the graphics object that called this function.

## Example

```
Theme_Header_GetBackgroundColorIndex()
```

## Related Functions

## See Also

[Public Functions](#)

### Theme\_Header\_GetColorIndex

Returns the Header toolbar button color index for the specific button state.

## Syntax

```
Theme_Header_GetColorIndex(INT nState)
```

*nState*

Indicates which state the UI element is in such that correct shade of the color is returned. This can be one of the

following values:

CTRL_ITEM_STATE_Normal	0	Normal state - no mouse over
CTRL_ITEM_STATE_NormalHover	2	Mouse is hovering over control
CTRL_ITEM_STATE_NormalPressed	3	Mouse button pressed on control
CTRL_ITEM_STATE_Active	4	Item is in selected state
CTRL_ITEM_STATE_ActiveHover	5	Item is in selected and mouse is hovering
CTRL_ITEM_STATE_ActivePressed	6	Item is selected and mouse button is down
CTRL_ITEM_STATE_Disabled	1	Item is disabled
CTRL_ITEM_STATE_ActiveDisabled	7	Item is in selected AND disabled state

Typically, this state will be returned by a function such as "Button\_GetState".

## Return Value

Returns an index into the color array configured on the graphics object that called this function.

## Example

```
Theme_Header_GetColorIndex(Button_GetState(dspGetAnCur())))
```

## Related Functions

[Public Functions](#)

### Theme\_Header\_GetForegroundColorIndex

Returns the header foreground color index used for icons and text.

## Syntax

```
Theme_Header_GetForegroundColorIndex(INT nState)
```

*nState*

Indicates which state the UI element is in such that correct shade of the color is returned. This can be one of the following values:

CTRL_ITEM_STATE_Normal	0	Normal state - no mouse over
CTRL_ITEM_STATE_NormalHover	2	Mouse is hovering over control
CTRL_ITEM_STATE_NormalPressed	3	Mouse button pressed on control
CTRL_ITEM_STATE_Active	4	Item is in selected state
CTRL_ITEM_STATE_ActiveHover	5	Item is in selected and mouse is hovering
CTRL_ITEM_STATE_ActivePressed	6	Item is selected and mouse button is down
CTRL_ITEM_STATE_Disabled	1	Item is disabled
CTRL_ITEM_STATE_ActiveDisabled	7	Item is in selected AND disabled state

Typically, this state will be returned by a function such as "Button\_GetState".

**Return Value**

Returns an index into the color array configured on the graphics object which called this function.

**Example**

```
Theme_Header_GetForegroundColorIndex(Button_GetState(DspGetAnCur())))
```

**Related Functions**

[Theme\\_Control\\_GetColorIndex](#), [Theme\\_Control\\_GetForegroundColorIndex](#), [Theme\\_Header\\_GetColorIndex](#),  
[Theme\\_Header\\_GetMidColorIndex](#), [Theme\\_SetTheme](#), [Theme\\_ToggleButton\\_GetForegroundColorIndex](#)

**See Also**

[Public Functions](#)

**Theme\_Header\_GetMidColorIndex**

Returns the header mid color index. This color is used for separators and other decorative UI elements in the Header Bar.

## Syntax

```
Theme_Header_GetMidColorIndex()
```

## Return Value

Returns an index into the color array configured on the graphics object that called this function.

## Example

```
Theme_Header_GetMidColorIndex()
```

## Related Functions

## See Also

[Public Functions](#)

## Theme\_SetTheme

Selects the theme to apply to the user interface. This will update dynamically at runtime.

## Syntax

```
Theme_SetTheme(INT nTheme)
```

*nTheme*

The ID of the theme. This can be one of the default themes:

THEME\_Grey - Header is Grey, selection color is SE\_Green

THEME\_Blue - Header is Blue, selection color is Blue

THEME\_SEGreen - Header is SE\_Green, selection color is SE\_Green

THEME\_Indigo - Header is Indigo, selection color is Indigo

THEME\_Orange - Header is Orange, selection color is Orange

THEME\_Dark - Header is Black, selection color is SE\_Green

Or it can be value 5 or 6, which are custom themes which you can configure with [Theme\\_SetHeaderColor](#) and [Theme\\_SetSelectionColor](#).

## Return Value

N/A

## Example

```
Theme_SetTheme(THEME_SEGreen)
```

## Related Functions

[Public Functions](#)

### Theme\_ToggleButton\_GetForegroundColorIndex

Returns the control highlight foreground color for a toggle button used for icons and text.

## Syntax

```
Theme_ToggleButton_GetForegroundColorIndex(INT nState)
```

*nState*

Indicates which state the UI element is in such that correct shade of the color is returned.

## Return Value

Returns an index into the color array configured on the graphics object that called this function.

## Example

```
Theme_ToggleButton_GetForegroundColorIndex(Button_GetState(DspGetAnFromName("../Button3.Background"))))
```

## Related Functions

## **Workspace\_GetContext**

Returns the equipment context of the current window's workspace.

### **Syntax**

```
Workspace_GetContext()
```

### **Return Value**

Returns the fully qualified equipment name. For example, Site1.Level1.Level12.FT001.

### **Related Functions**

[Workspace\\_GetEquipmentCluster](#), [Workspace\\_GetPageNameWithRes](#), [Workspace\\_GetResolution](#),

[Workspace\\_ShowContent](#)

### **See Also**

[Public Functions](#)

## **Workspace\_GetEquipmentCluster**

Returns the given equipment string with its cluster prefix and caching it in the process. The function will attempt to automatically detect the cluster of the equipment in the following order:

1. In a single cluster system, the cluster may be automatically resolved and require no further custom code.
2. Get the cluster from the page cluster context.
3. Check each configured cluster to see if the passed equipment exists.

If the cluster cannot be automatically detected, the original equipment string will be returned.

### **Syntax**

```
Workspace_GetEquipmentCluster(STRING sEquipmentContext [, INT bRefreshCache])
```

*sEquipmentContext*

The equipment context to verify.

*bRefreshCache*

Force the function to ignore any cached value. This is an optional parameter. The default value is FALSE.

## Return Value

The context will be returned with the cluster prefix. If the cluster cannot be automatically detected, the original equipment string will be returned.

## Example

```
STRING sEquipmentNameWithCluster = WWorkspace_GetEquipmentCluster("MyPlant.Mixing.TNK01");  
Result: Cluster1.MyPlant.Mixing.TNK01
```

## Related Functions

[Workspace\\_IsSystem\\_Initialised](#), [Workspace\\_SelectEquipment](#), [Workspace\\_SetSelContext](#),  
[Workspace\\_ShowContent](#)

## See Also

[Public Functions](#)

## Workspace\_GetPageNameWithRes

If you are using multiple resolutions in your project, this function can be used to return an adjusted page name matching your workspace resolution. If a page does exist in your project matching the resolution, then the original name will be returned.

Your pages need to be named "<PageName>\_HD1080" or "<PageName>\_UHD4K".

For example if your project supports HD1080 and UHD4K, and you have designed variations of your page for each resolution: "Test\_HD1080" and "Test\_UHD4K", then call this function with the page name "Test" . .

This is BLOCKING function.

## Syntax

```
Workspace_GetPageNameWithRes(STRING sPage [, STRING sWorkspaceName])
```

*sPage*

Name of the page.

*sWorkspaceName*

Name of the workspace to which the page belongs. This is an optional parameter. The default value is "", which uses the workspace of the current window.

## Return Value

Returns the adjusted page name or the original passed in name if a page is not found matching the workspace

resolution.

## Related Functions

[Workspace\\_ShowContent](#)

## See Also

[Public Functions](#)

### Workspace\_GetResolution

Returns the resolution of a workspace.

## Syntax

`Workspace_GetResolution(STRING sWorkspaceName)`

*sWorkspaceName*

Name of the workspace for which to get the resolution.

## Return Value

Returns the resolution name for the workspace.

## Related Functions

[Workspace\\_ShowContent](#)

## See Also

[Public Functions](#)

### Workspace\_GetSecondaryContext

Returns the secondary equipment context of the workspace to which the current window belongs.

## Syntax

```
Workspace_GetSecondaryContext()
```

## Return Value

Returns the fully qualified name of the secondary equipment. For example, Site1.Level1.Level2.PMP01.

## Example

```
STRING sCurrentSecondaryContext = Workspace_GetSecondaryContext()
```

## Related Functions

[Workspace\\_GetContext](#), [Workspace\\_GetSelContext](#), [Workspace\\_GetWindow](#),  
[Workspace\\_GetWorkspaceFromName](#), [Workspace\\_GetWorkspaceFromWindow](#), [Workspace\\_SetSelContext](#)

## See Also

[Public Functions](#)

## Workspace\_GetSelContext

Gets the selected equipment context of the workspace on the current page.

## Syntax

```
Workspace_GetSelContext()
```

## Return Value

Returns the selected context.

## Example

```
STRING sCurrentContext = Workspace_GetSelContext()
```

## Related Functions

[Workspace\\_SetSelContext](#), [Workspace\\_ShowContent](#)

## See Also

[Public Functions](#)

### Workspace\_GetWindow

Returns the workspace window for the specified workspace.

## Syntax

```
Workspace_GetWindow([STRING sWorkspaceName])
```

*sWorkspaceName*

The workspace name of the window, OR "" to get the window number of the current pinned window. This is an optional parameter.

## Return Value

A Plant SCADA window number OR BAD\_HANDLE if the specified workspace does not exist.

## Example

```
INT nCitectWindow = Workspace_GetWindow("PrimaryScreen");
```

## Related Functions

[Workspace\\_GetContext](#), [Workspace\\_GetEquipmentCluster](#), [Workspace\\_GetPageNameWithRes](#),

[Public Functions](#)

## Workspace\_GetWorkspaceFromName

Returns the workspace ID of the specified workspace name.

## Syntax

Workspace\_GetWorkspaceFromName(STRING *sWorkspaceName* [, INT *nTrace*])

*sWorkspaceName*

Name of the workspace for which you want to get the ID.

*nTrace*

Indicates the trace level to record if an error results. The default value is TRACE\_Error. This is an optional parameter.

## Return Value

Returns the Workspace ID.

## Related Functions

[Workspace\\_GetContext](#), [Workspace\\_GetEquipmentCluster](#), [Workspace\\_GetPageNameWithRes](#),  
[Workspace\\_GetResolution](#), [Workspace\\_GetSelContext](#), [Workspace\\_GetWindow](#),

[Public Functions](#)

### Workspace\_GetWorkspaceFromWindow

Returns the workspace ID to which the current window belongs.

## Syntax

`Workspace_GetWorkspaceFromWindow(INT nWindow [, INT nTrace])`

*nWindow*

Handle of the window.

*nTrace*

Indicates the trace level to record if an error results. The default value is TRACE\_Error. This is an optional parameter.

## Return Value

Returns the workspace ID

## Example

```
Workspace_GetWorkspaceFromWindow(WinNumber())
```

## Related Functions

[Workspace\\_GetContext](#), [Workspace\\_GetEquipmentCluster](#), [Workspace\\_GetPageNameWithRes](#),

[Workspace\\_IsSystem\\_Initialised](#), [Workspace\\_SelectEquipment](#), [Workspace\\_SetSelContext](#),  
[Workspace\\_ShowContent](#)

## See Also

[Public Functions](#)

### Workspace\_Init

Initializes a top level window as a Workspace.

**Note:** This function must only be called from OnPageShown event. Only top level windows are considered to be a Workspace.

## Syntax

```
Workspace_Init()
```

## Return Value

N/A

## Example

```
Workspace_Init()
```

## Related Functions

[Workspace\\_GetContext](#), [Workspace\\_GetEquipmentCluster](#), [Workspace\\_GetPageNameWithRes](#),

[Workspace\\_ShowContent](#)

## See Also

[Public Functions](#)

## Workspace\_IsSelContext

Checks if an equipment name is the selected context of the workspace on the current page.

## Syntax

```
Workspace_IsSelContext(STRING sEquipmentName, STRING sSecondaryEquipmentName)
```

*sEquipmentName*

Name of a piece of equipment.

*sSecondaryEquipmentName*

The value of the equipment name that is set as the secondary context for related equipment. For example, for a Polar Star Composite Genie, this will be the value specified in the **Equipment Name** option in the Presentation Options dialog box. This is used to determine the number of symbols to be displayed for MEOs.

## Return Value

Returns TRUE if equipment is the selected context. Otherwise returns FALSE.

## Example

```
IF Workspace_IsSelContext(DspAnGetMetadata(KeyGetCursor(),"EquipmentName")) THEN
    Workspace_RightClickEquipment(DspAnGetMetadata(KeyGetCursor(),"EquipmentName"))
END
```

## Related Functions

### Workspace\_RightClickEquipment

If you have a specific function that needs to be run when the user right-clicks on the selection adorner, you can set the default '\_CALLBACK\_EquipmentRightClick' label to a custom function of your own. The current default function is "DefaultEquipmentRightClickCallback".

The '\_CALLBACK\_EquipmentRightClick' label is set by default in the SA\_Style\_1\_MultiRes starter project. To view labels, navigate to the **Standards** activity and select **Labels**.

	Label Name	Expression
1	_CALLBACK_EquipmentRightClick(sEquip, sEquipSecondary)	DefaultEquipmentRightClickCallback(sEquip, sEquipSecondary)
2	_CALLBACK_FaceplateHeaderDisabled(sEquip, sEquipSecondary)	DefaultFaceplateHeaderDisabledCallback(sEquip, sEquipSecondary)
3	_CALLBACK_OutOfService(sEquip, sEquipSecondary)	DefaultOutOfServiceCallback(sEquip, sEquipSecondary)
4	_THEME_Default	THEME_Blue

## Syntax

Workspace\_RightClickEquipment()

### Returns

None

### Example

```
IF Workspace_IsSelContext("MyPlant.SkimMilk.TNK02", "", TRUE) THEN
    Workspace_RightClickEquipment()
END
```

## See Also

[Public Functions](#)

## Workspace\_SelectEquipment

Changes the context of the workspace to the piece of equipment selected on the current page. This will trigger the automatic filling of content in your workspace panes according to the [Workspace]contextmode that has been configured. See also .

Any panes in your workspace (or linked workspaces) that have been configured as PANE\_FILLMODE\_Autofill, PANE\_FILLMODE\_AutofillContextMustMatch or PANE\_FILLMODE\_StaticContextMustMatch will be updated with the new context and this is available in your page via two super genie associations \_\_EquipmentName and \_\_EquipmentRef. By default, the page from which this function is called will not be updated. If you need the page to be updated, set the *bIncludeCurrentPane* parameter to TRUE when calling this function.

## Syntax

Workspace\_SelectEquipment([INT *bIncludeCurrentPane*])

*bIncludeCurrentPane*

Allow the current page to be automatically filled and context updated. This may result in the page that you clicked on changing. Default = FALSE. This is an optional parameter.

## Return value

N/A

## Example

```
Workspace_SetSelContext("Cluster1.MyPlant.Mixing.TNK01");
Workspace_SelectEquipment();
```

## Related Functions

[Workspace\\_GetContext](#), [Workspace\\_GetEquipmentCluster](#), [Workspace\\_GetPageNameWithRes](#),

[Public Functions](#)

### Workspace\_SetContext

Sets the context of the current workspace to the specified piece of equipment.

## Syntax

```
Workspace_SetContext(STRING sEquipmentName, INT bIncludeCurrentPane, STRING
sEquipmentSecondaryContext, STRING sWorkspaceName)
```

*sEquipmentName*

Name of a piece of equipment.

*bIncludeCurrentPane*

Allow the current page to be automatically filled and context updated. This may result in the page that you clicked on changing. Default = FALSE. This is an optional parameter.

*sWorkspaceName*

Name of the workspace for which to set the context.

*sEquipmentSecondaryContext*

The value of the equipment name that is set as the secondary context for related equipment. For example, for a Polar Star Composite Genie, this will be the value specified in the **Equipment Name** option in the Presentation Options dialog box. This is used to determine the number of symbols to be displayed for MEOs.

## Return Value

N/A

[Workspace\\_SetSelContext](#), [Workspace\\_ShowContent](#)

## See Also

[Public Functions](#)

### Workspace\_SetSelContext

Sets the selected context of the workspace on the current page to the specified equipment name. This function is only necessary to use when you have excluded a pane configured as PANE\_FILLMODE\_Autofill, PANE\_FILLMODE\_AutofillContextMustMatch or PANE\_FILLMODE\_StaticContextMustMatch from the autofill system.

Typically, this function would be used when building your own custom selection adorner and paired with the [Workspace\\_SelectEquipment\(\)](#) function.

## Syntax

`Workspace_SetSelContext(STRING sEquipmentName, STRING sEquipmentSecondaryContext)`

*sEquipmentName*

Name of a piece of equipment.

*sEquipmentSecondaryContext*

The value of the equipment name that is set as the secondary context for related equipment. For example, for a Polar Star Composite Genie, this will be the value specified in the **Equipment Name** option in the Presentation Options dialog box. This is used to determine the number of symbols to be displayed for MEOs.

## Return Value

N/A

## Example

```
Workspace_SetSelContext(Cluster1.MyPlant.Mixing.TNK01");
Workspace_SelectEquipment();
```

[Workspace\\_IsSelContext](#), [Workspace\\_IsSystem\\_Initialised](#), [Workspace\\_SelectEquipment](#),  
[Workspace\\_ShowContent](#)

## See Also

[Public Functions](#)

### Workspace\_ShowContent

Shows a piece of content (page) in a particular pane of a particular workspace with a specific equipment context.

**Note:** When calling this function in the workspace, any tabs that are added to the tab bar will have the name of the page title and the name of the page itself. For example, If the shelfe form was shown and displayed as content for a tab, the name of the tab would be "Shelve Alarm Form" and not "DefaultShelveForm\_HD1080".

## Syntax

`Workspace_ShowContent(STRING sContentItem [, STRING sPaneRef [, STRING sEquipmentContext [, STRING sEquipmentSecondaryContext [, STRING sWorkspaceName]]]])`

*sContentItem*

The Plant SCADA page to be displayed.

*sPaneRef*

The name of the pane or a pane path reference, in which to display the content. Default is "", which means the pane will be automatically detected based upon the content type of the content and the content types defined on the panes in the workspace(s).

As a Pane may host a page which also has panes, you can use '.' (dot) syntax to refer to them as a pane path reference. For example, Pane.Pane.Pane.

This is an optional parameter.

*sEquipmentContext*

The context to set on the content when it is displayed. Default is "", which will get the context of the workspace. This is an optional parameter.

*sEquipmentSecondaryContext*

The value of the equipment name that is set as the secondary context for related equipment. For example, for a Polar Star Composite Genie, this will be the value specified in the **Equipment Name** option in the Presentation Options dialog box. This is used to determine the number of symbols to be displayed for MEOs. The default value is "".

*sWorkspaceName*

The name of the workspace (a screen name in the active screen profile) in which you want to display your content. Default is "", which is the workspace of the current window and its linked workspaces. This is an optional parameter.

## Return Value

Returns the Plant SCADA Window number (if only one window is updated). Otherwise returns -1.

## Example

```
Workspace_ShowContent("MyPage_HD1080")
```

## Related Functions

## SA\_Include Genie Libraries

The Situational Awareness Include Project (named "SA\_Include") contains the following Genie libraries:

- [Alarm Filter Genie Library](#)
- [Controls Genie Library](#)
- [Common Controls Genie Library](#)
- [Navigation Genie Library](#)
- [Workspace Genie Library](#).

## See Also

[Situational Awareness System Projects](#)

## Alarm Filter Genie Library

The SA\_Include system project includes the "sa\_filter" library. It includes the following Genies:

- [Item Acknowledged Genie \(HD1080\)](#)
- [Item Acknowledged Genie \(UHD4K\)](#)
- [Item Base Genie](#)
- [Item Priority Genie \(HD1080\)](#)
- [Item Priority Genie \(UHD4K\)](#)
- [Item Shelved Genie \(HD1080\)](#)
- [Item Shelved Genie \(UHD4K\)](#)
- [Item State Genie \(HD1080\)](#)
- [Item State Genie \(UHD4K\)](#)

- Item Unacknowledged Genie (HD1080)
- Item Unacknowledged Genie (UHD4K).

These Genie are designed to provide filtering functionality for the Situational Awareness Default Alarm Pages. For more information, see [Add an Alarm Filter Button](#).

## See Also

[Situational Awareness System Projects](#)

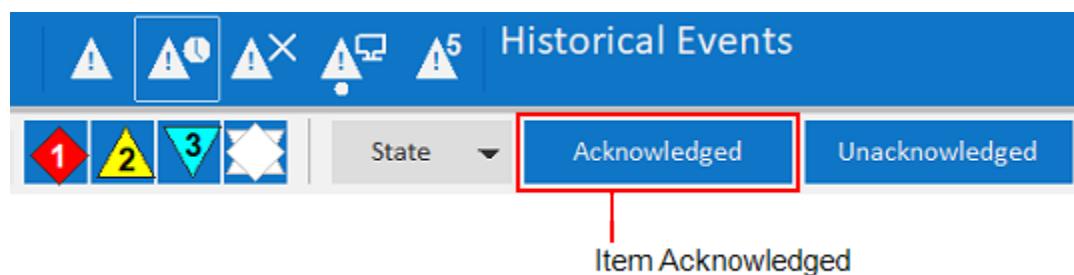

### Item Acknowledged Genie (HD1080)

**Genie Name:** item\_ack\_hd1080

**Genie Library:** sa\_filter

**System Project:** SA\_Include

The HD1080 version of the Item Acknowledged Genie (named "item\_ack\_hd1080") is used to create a button that filters an alarms list so that only acknowledged alarms will appear.

This Genie is designed for use with the Situational Awareness [Default Alarm Pages](#).

For more information, see [Add an Alarm Filter Button](#).

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
FilterName	The name "TopBar" is entered by default. This is the name of the filter used by the Situational Awareness default alarm pages.
Tooltip	An optional description of the Genie that appears when the mouse points at it.

## See also

[Alarm Filter Genie Library](#)

### Item Acknowledged Genie (UHD4K)

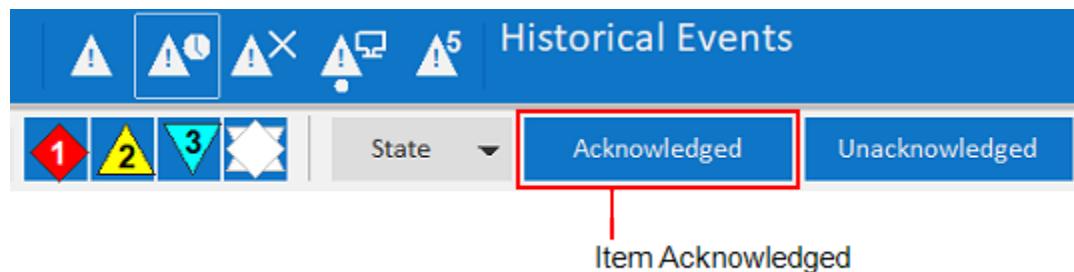

**Genie Name:** item\_ack\_uhd4k

**Genie Library:** sa\_filter

**System Project:** SA\_Include

The UHD4K version of the Item Acknowledged Genie (named "item\_ack\_uhd4k") is used to create a button that filters an alarms list so that only acknowledged alarms will appear.

This Genie is designed for use with the Situational Awareness [Default Alarm Pages](#).

For more information, see [Add an Alarm Filter Button](#).

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
FilterName	The name "TopBar" is entered by default. This is the name of the filter used by the Situational Awareness default alarm pages.
Tooltip	An optional description of the Genie that appears when the mouse points at it.

**Genie Library:** sa\_filter

**System Project:** SA\_Include

The Item Base Genie (named "item\_base") is used to create a customized alarm filter button. This Genie is designed for use with the Situational Awareness [Default Alarm Pages](#).

For more information, see [Add an Alarm Filter Button](#).

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
IsExclusion	Determines if the results of an applied filter are excluded or included in the list that is displayed.  TRUE = Filter results are excluded. For example, if the value of the filter is "CATEGORY <> 3", when the filter is applied category 3 alarms will be excluded.  FALSE = Filter results are included. For example, if the value of the filter is "CATEGORY=3", only category 3

Parameter	Description
	alarms will be included in the list.
FilterExpr	<p>Enter the Cicode expression that returns the name of a filter. To use the default filter name that is applied to Situational Awareness alarm pages, enter the following:</p> <pre>AlarmPage_GetFilter("TopBar")</pre> <p>To use a custom filter, you need to create the required Cicode as on OnPageEntry event. You can then call the filter name.</p>
ValueExpr	Enter the Cicode expression that returns the value of the filter string. For example, "CATEGORY<>3".
Tooltip	An optional description of the Genie that appears when the mouse points at it.
Label	Enter the text that will appear in the header row of the alarms list when the filter is applied. For example, "No Cat 3 Alarms".

## Item Priority Genie (HD1080)

**Genie Name:** item\_priority\_hd1080

**Genie Library:** sa\_filter

**System Project:** SA\_Include

The HD1080 version of the Item Priority Genie (named "item\_priority\_hd1080") is used to create a button that filters an alarms list so that only alarms of a specified priority will appear.

This Genie is designed for use with the Situational Awareness Default Alarm Pages.

For more information, see [Add an Alarm Filter Button](#).

**Note:** You can use this Genie to add a fourth-highest alarm priority filter to alarm pages. See [Add a Fourth Alarm Priority Filter to Alarm Pages.](#)

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
FilterName	The name "TopBar" is entered by default. This is the name of the filter used by the Situational Awareness default alarm pages.
AsmPriority	Enter 1, 2, 3 or 4 to filter an alarms list using one of the four highest Situational Awareness alarm priorities (that is, the alarm priorities with the lowest values).
Tooltip	An optional description of the Genie that appears when the mouse points at it.

### Tab Bar Genie

**Genie Name:** tabbar\_h  
**Genie Library:** sa\_controls  
**System Project:** SA\_Include

The Tab Bar Genie (named "tabbar\_h") forms the basis for the tabs that appear in the [Information Zone](#) on the Situational Awareness Operator Dashboard.

You can also use it to build a set of tabs for a pane on a customized master page (see [Create a Set of Tabs for a Pane](#)).

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
Default Tabs Menu Name	Enter the name of the menu you configured to define the tabs that will display.
OnInit Function Name	If required, specify a Cicode function that is executed

Parameter	Description
	when the tab bar initialization has completed.
Can Tabs be Pinned?	Specify if an operator can pin a tab so that it remains displayed. TRUE = Pinning is enabled FALSE = Pinning is not enabled.
Max Open Items	If required, sets a limit on the number of menu items that are included on the tab bar at runtime.  The menu items are selected according to the value set for <b>Order</b> property. If the Order property is not configured, items are selected according to the order in which they were added to the Menu Configuration database.
Tab Bar Width	Specify the width of the tab bar in pixels.
Max Tab Width	Specify the maximum width for each tab in pixels.
Use for 4K Page?	Specify if the tab bar will appear on a UHD4K master page.  TRUE = The tab bar will be used in a UHD4K project. FALSE = The tab bar will not be used in a UHD4K project.
Allow Duplicate Content?	Determines if multiple tabs can display the same content.  TRUE = Multiple tabs can display the same page. FALSE = Each tab displays a different page (default).  For example, you could set this to TRUE if you need two tabs to display the same page, but with a different filter applied.

## Tree View Genie

**Genie Name:** treeview

**Genie Library:** sa\_controls

**System Project:** SA\_Include

The Tree View Genie (named "treeview") can be used to display a menu structure on a page. For example, you can use it to:

- Display an equipment hierarchy
- Filter an alarm page
- Navigate pages
- Display alarm counts.

The screenshot shows the 'Active Alarms' page interface. At the top, there are navigation icons (New, Open, Search, Close) and a status bar with 'State'. Below the header, a table titled 'Current Filter: Active Alarms of selected equipment' lists alarms by Date, Time, and Name. On the left, a tree view titled 'Alarms Filtered' shows clusters: Cluster1 (selected, checked), Cluster2, and Cluster3. Each cluster has a checkbox and alarm counts (red diamond for severity 2, yellow triangle for severity 1, blue inverted triangle for severity 1). A red box highlights the tree view area. A red arrow points from the caption 'The tree view on the Active Alarms page' to the tree view section.

Date	Time	Name
25/01/2018	10:56:58 AM	Drive1_V_Feedback_H_P3
25/01/2018	10:56:55 AM	Drive1_OP_TRK_H_P2
25/01/2018	10:56:48 AM	Drive1_V_OP_HH_P1
25/01/2018	10:56:52 AM	Drive1_Running_False_P1

The tree view on the Active Alarms page

For an example of how to use the Tree View Genie, see [Add a Tree View to a Page](#).

**Note:** You can use the parameter [\[Workspace\]NumberOfTopPriorities](#) to display alarm counts for the top four alarm priorities (instead of the top three). The Genie "Priority 4 Small Genie" is provided in the SA\_Controls project to represent the fourth-highest priority. To associate this Genie with an alarm priority, see [Configure Display Properties for an Alarm Priority](#).

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

### Basic Setup Parameters

Parameter	Description
Datasource	Specifies the menu on which the tree is based. You can enter the name of a menu you have created using the <b>Menu Configuration</b> view in the <b>Visualization</b> activity (see <a href="#">Prepare the Navigation</a> )

Parameter	Description
	<p><a href="#">Menu</a>).</p> <p>Alternatively, you can use the name of a menu that is created at runtime using the <a href="#">MenuGetPageNode</a> Cicode function.</p> <p>You can also enter "__EquipmentModel" to use the equipment hierarchy defined for the current project.</p>
Use Display Names	<p>Determines if display names are used to label equipment in the tree view.</p> <p>A display name is a meaningful name that can be defined for piece of equipment using the Display Name property (see <a href="#">Define Equipment in Plant SCADA Studio</a>).</p> <p>If the tree view is displaying the equipment model:</p> <p>TRUE = Equipment display names are used</p> <p>FALSE = Equipment names are used.</p> <p>If this is set to TRUE and no Display Name is configured, the equipment name will be used instead.</p> <p>If the tree view is displaying a generic menu structure:</p> <p>TRUE = Menu item comments are used</p> <p>FALSE = Menu item names are used.</p>

#### Search Parameters

Parameter	Description
Search Box Name	<p>This field specifies the name of the ciText.TextBox object that the tree view will use as its input for the search text at runtime. The name to enter is defined in the Text Object Properties dialog on the <b>Access</b> tab.</p> <p>By default, "Search" is used.</p>

#### Display Parameters

Parameter	Description
Treeview Height	<p>The height of the area the tree view will occupy (in pixels).</p> <p>If the length of the expanded tree extends beyond the height specified here, a vertical scroll bar will appear.</p>
Treeview Width	<p>The width of the area the tree view will occupy (in pixels).</p> <p>If the width of the expanded tree extends beyond the left edge of the alarm count list, a horizontal scroll bar</p>

Parameter	Description
	will appear.
Row Height	The amount of space that will be available to each row within the tree view.
Display Checkboxes	<p>Determines if a check box is displayed for each item in the tree.</p> <p>TRUE = Check boxes are displayed.</p> <p>FALSE = Check boxes are not displayed.</p>
Auto-check Children	<p>Determines if the check boxes within the lower levels of a branch are automatically checked when a parent item is checked.</p> <p>TRUE = Children are automatically checked.</p> <p>FALSE = Children are not automatically checked.</p>
Display Alarms	<p>Determines if alarm counts for the top three alarm categories are displayed for each item in the tree.</p> <p>TRUE = Alarm counts for the top three alarm categories are displayed.</p> <p>FALSE = Alarm counts for the top three alarm categories are not displayed.</p> <p>If the branch is collapsed, the values will represent the number of active alarms for each category within the current branch and its lower levels.</p> <p>If a node is expanded, the count will only shows alarms for that node, as the counts for its children will now be visible on the child nodes.</p> <p><b>Note:</b> You can use the parameter <a href="#">[Workspace]NumberOfTopPriorities</a> to display alarm counts for the top four alarm priorities (instead of the top three).</p>
Display Shelved	<p>Determines if an alarm count for shelved alarms is displayed for each item in the tree.</p> <p>If the branch is collapsed, the values will represent the number of shelved alarms for each category within the current branch and its lower levels.</p> <p>If a node is expanded, the count will only shows shelved alarms for that node, as the counts for its children will now be visible on the child nodes.</p> <p>TRUE = Alarm count for shelved alarms is displayed.</p> <p>FALSE = Alarm count for shelved alarms is not displayed.</p>

**Event Parameters**

<b>Parameter</b>	<b>Description</b>
On Init Complete Function	Represents the name of the function that is invoked when the tree view completes initialization.  <code>OnInitCompleteFunction(INT nTreeviewAN)</code> The argument <i>nTreeviewAN</i> is expected, it is the animation number of the tree view that fires the event.
On Check Function	Represents the name of the function that is invoked upon the checked event.  <code>OnCheckFunction(INT hMenuItem)</code> The argument <i>hMenuItem</i> is expected. It is the handle to the menu item that is represented by the tree node on which the check box has just been clicked.
On Left Click Function	Represents the name of the function that is invoked upon the left click event.  <code>OnLeftClickFunction(INT hMenuItem)</code> The argument <i>hMenuItem</i> is expected. It is the handle to the menu item that is represented by the tree node that has just been left-clicked.
On Right Click Function	Represents the name of the function that is invoked upon the right click event.  <code>OnRightClickFunction(INT hMenuItem)</code> The argument <i>hMenuItem</i> is expected. It is the handle to the menu item that is represented by the tree node that has just been right-clicked.

**Customization Parameters**

<b>Parameter</b>	<b>Description</b>
View Genie	Refers to the Genie that is called to display each item in the tree. By default, the <a href="#">Tree View Item Genie</a> in the "sa_controls" library is used ( <code>sa_controls.treeviewitem</code> ).  You can use this parameter to substitute the default Genie with your own. This will allow you to customize the appearance of the tree and the features it supports.
View Init Function	The Cicode function that is called to initialize the <b>View Genie</b> (see above) for each row.  By default, a system function called

Parameter	Description
	" <code>_Treeview_InitViewGenie_&lt;resolution&gt;</code> " is used (for example, " <code>_Treeview_InitViewGenie_HD1080</code> ").
Fill Function	<p>This function is called on each page scan to manage data updates in the tree view when the tree view state changes (for example, when scrolling, expanding, or collapsing occurs).</p> <p>By default, a system function called "<code>_Treeview_Update</code>" is used.</p>
View Model Data Size	<p>Specifies the number of custom fields per tree view item to be allocated for user data. The data in these fields will be updated by the function specified in the parameter <b>Datasource Item Retrieve Function</b> (see below).</p> <p>This parameter is set to zero (0) by default.</p>
View Model Init Function	<p>Custom function to configure the additional columns specified by the parameter 'View Model Data Size'. This function is called once when the tree view is initialized.</p>
Datasource Item Retrieve Function	<p>A custom function that loads additional user data for the tree view. This function is called whenever the tree view data is refreshed (for example, when scrolling, expanding, or collapsing occurs). The number of custom fields to be updated by this function is defined by the parameter <b>View Model Data Size</b> (see above).</p>
Is Source Ready Function	<p>Enter the name a function that is used to determine if the data source is ready.</p> <p>The tree view initialization code will run the function (in addition to the checks for navigation initialized and workspace system initialized) before allowing the tree view to be displayed.</p> <p>If this function does not return TRUE within five seconds of displaying the page, the tree view initialization will time out. This function needs to return an INT (TRUE or FALSE) and takes a single argument, INT nTreeviewAN.</p>
Datasource Watcher Function	<p>Enter a Cicode function that will be used to monitor the tree view's associated data source for any updates. The function will be called when the Tree View Genie is initialized, and needs to be responsible</p>

Parameter	Description
	<p>for triggering a reload if required.</p> <p>The function will run continuously, so it should not return any values. It also needs to accept the arguments <i>sDatasource</i> and <i>hTreeviewAN</i>.</p> <p>If you are using the Tree View Genie to display the entire equipment model (for example, if the <b>Datasource</b> parameter is set to "<code>__EquipmentModel</code>"), you can enter the following function name to trigger a reload of the tree whenever the equipment model changes:</p> <p><code>_Treeview_MonitorEquipmentModel</code></p>
Can Check Items Function	<p>A custom function that is used to determine if tree view item checking is allowed.</p> <p>By default, toggling the checked state of a tree view item is allowed at runtime. This function provides a way to disable the check boxes on all items if required.</p> <p>For example, you may want to disable checking if the data that the tree view will interact with is not ready, or if the current user does not have sufficient privileges.</p> <p>The function needs to return a value of TRUE or FALSE.</p>

#### AN Parameter

Parameter	Description
AN	A unique ID for the Genie object.

#### See Also

- [Configure a Genie](#)

#### Tree View Item Genie

**Genie Name:** treeviewitem / treeviewitem\_uhd4k

**Genie Library:** sa\_controls

**System Project:** SA\_Include

The Tree View Item Genie is used by the [Tree View Genie](#) to build the required number of items displayed in a tree.

Two versions of the Genie exist:

- "treeviewitem" — designed for use with a 1080HD workspace
- "treeviewitem\_uhd4k" — designed for use with a UHD4K workspace.

For more information, see [Add a Tree View to a Page](#).

**Note:** The Tree View Item Genie is displayed dynamically at runtime by the Tree View Genie. There is no need to use this Genie directly on a page.

## Common Controls Genie Library

The SA\_Include system project includes the "sa\_controls\_common" library. It includes the following Genies:

- [Tab Base Genie](#)
- [Tab Genie](#).

**Note:** The **SA\_Controls** system project also contains a library named "sa\_controls\_common". For a list of the Genies it includes, see [Common Controls Genie Library](#).

---

## See Also

[Situational Awareness System Projects](#)

### Tab Base Genie

**Genie Name:** tab\_base

**Genie Library:** sa\_controls\_common

**System Project:** SA\_Include

The Tab Base Genie (named "tab\_base") is a component of the [Tab Bar Genie](#).

See [Create a Set of Tabs for a Pane](#).

## Genie Properties

Complete the following properties for the genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
Left Click Function	Enter a function (no arguments required) that is called when the operator clicks on the tab.
Disabled When	An expression (applied in conjunction with Area and Privilege) that can provide further logic to specify when the tab is disabled.
Tooltip	Text that displays when the operator hovers the mouse over the button at runtime.
Area	Enter the area to which the button belongs. Only users with access to this area can use the button.
Privilege	Enter the privilege level that a user needs to possess to use this button.

[Configure a Genie](#)

[Tab Bar Genie](#)

[SA\\_Include Genie Libraries](#)

## Tab Genie

**Genie Name:** tab\_h

**Genie Library:** sa\_controls\_common

**System Project:** SA\_Include

The Tab Genie (named "tab\_h") is a component of the [Tab Bar Genie](#). It is designed to work with the Workspace.

See [Create a Set of Tabs for a Pane](#).

## Genie Properties

Complete the following properties for the genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
TabID	A unique number identifying this tab. Each tab in your tab bar should have a unique number assigned to it.

## See Also

[Configure a Genie](#)

[Tab Bar Genie](#)

## Navigation Genie Library

The SA\_Include system project includes the "sa\_navigation" library. It includes the following Genies:

- [Link Down Genie](#)
- [Link Left Genie](#)
- [Link Right Genie](#)
- [Link Up Genie](#)
- [Static Link Left Genie](#)
- [Static Link Right Genie](#).

You can use these Genies to direct an operator through a production process that spans multiple graphics pages. For more information, see [Use Navigational Genies on Content Pages](#).

## See Also

[Situational Awareness System Projects](#)

### Link Down Genie

**Genie Name:** link\_d

**Genie Library:** sa\_navigation

**System Project:** SA\_Include

The Link Down Genie (named "link\_d") can be used to direct an operator down a level in a set of hierarchical pages.

For more information, see [Use Navigational Genies on Content Pages](#).

## Genie Properties

Complete the following properties for the genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
Menu Item	The path to the linked item in the project's Menu Configuration. This is specified using the following notation: <Level1>.<Level2>.<Level3>.<Level4>.<Level5>.<Level6> For example, "Plant1.Area1.MyPage" The menu item needs to be included under the "Navigation" menu (defined in the <b>Page</b> field). As "Navigation" is assumed as the top level of the path, it is not necessary to enter it at the start of the menu item path.
Tooltip	An optional description of the Genie that appears when the mouse points at it.
Use for 4K Page?	Determines if the Genie will appear on a page that displays within a UHD_4K workspace. TRUE = The Genie will appear in a UHD4K workspace. FALSE = The Genie will not appear in a UHD4K workspace.

## See Also

[Configure a Genie](#)

## Link Left Genie

**Genie Name:** link\_l  
**Genie Library:** sa\_navigation  
**System Project:** SA\_Include

The Link Left Genie (named "link\_l") can be used to direct an operator to the previous stage of a linear production process that spans multiple pages.

A blue rectangular button with a white arrow pointing left and the text "My Page" in white.

For more information, see [Use Navigational Genies on Content Pages](#).

## Genie Properties

Complete the following properties for the genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
Menu Item	The path to the linked item in the project's Menu Configuration. This is specified using the following notation: <code>&lt;Level1&gt;.&lt;Level2&gt;.&lt;Level3&gt;.&lt;Level4&gt;.&lt;Level5&gt;.&lt;Level6&gt;</code> For example, "Plant1.Area1.MyPage" The menu item needs to be included under the "Navigation" menu (defined in the <b>Page</b> field). As "Navigation" is assumed as the top level of the path, it is not necessary to enter it at the start of the menu item path.
Tooltip	An optional description of the Genie that appears when the mouse points at it.
Use for 4K Page?	Determines if the Genie will appear on a page that displays within a UHD_4K workspace. TRUE = The Genie will appear in a UHD4K workspace. FALSE = The Genie will not appear in a UHD4K workspace.
Links to another console?	Allows you to indicate that a Genie points to a destination on a different console, which is a destination that is not usually monitored by the current client. TRUE = The Genie points to a different console. FALSE = The Genie does not point to a different console. If set to TRUE, the Genie will display a gray background.

Parameter	Description
Use as Control Link?	Determines if the Genie will function as a control link. TRUE = The Genie will use a control link. FALSE = The Genie will not use a control link. If set to TRUE, the Genie will display a purple drop-shadow.
Control Signal Equipment	The piece of equipment that is associated with the left/right Genie. The Genie will only appear when their associated object is selected.
Controlled Equipment	The piece of equipment that the Control Link points to. When you click on the Genie, the page associated with the piece of equipment will display.

## Link Right Genie

**Genie Name:** link\_r

**Genie Library:** sa\_navigation

**System Project:** SA\_Include

The Link Right Genie (named "link\_r") can be used to direct an operator to the next stage of a linear production process that spans multiple pages.

 My Page

For more information, see [Use Navigational Genies on Content Pages](#).

## Genie Properties

Complete the following properties for the genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
Menu Item	<p>The path to the linked item in the project's Menu Configuration. This is specified using the following notation:</p> <p>&lt;Level1&gt;.&lt;Level2&gt;.&lt;Level3&gt;.&lt;Level4&gt;.&lt;Level5&gt;.&lt;Level6&gt;</p> <p>For example, "Plant1.Area1.MyPage"</p> <p>The menu item needs to be included under the "Navigation" menu (defined in the <b>Page</b> field). As "Navigation" is assumed as the top level of the path, it is not necessary to enter it at the start of the menu item path.</p>
Tooltip	<p>An optional description of the Genie that appears when the mouse points at it.</p>
Use for 4K Page?	<p>Determines if the Genie will appear on a page that displays within a UHD_4K workspace.</p> <p>TRUE = The Genie will appear in a UHD4K workspace.</p> <p>FALSE = The Genie will not appear in a UHD4K workspace.</p>
Links to another console?	<p>Allows you to indicate that a Genie points to a destination on a different console, which is a destination that is not usually monitored by the current client.</p> <p>TRUE = The Genie points to a different console.</p> <p>FALSE = The Genie does not point to a different console.</p> <p>If set to TRUE, the Genie will display a gray background.</p>
Use as Control Link?	<p>Determines if the Genie will function as a control link.</p> <p>TRUE = The Genie will use a control link.</p> <p>FALSE = The Genie will not use a control link.</p> <p>If set to TRUE, the Genie will display a purple drop-shadow.</p>
Control Signal Equipment	<p>The piece of equipment that is associated with the left/right Genie. The Genie will only appear when their associated object is selected.</p>
Controlled Equipment	<p>The piece of equipment that the Control Link points to. When you click on the Genie, the page associated with the piece of equipment will display.</p>

## Link Up Genie

**Genie Name:** link\_u  
**Genie Library:** sa\_navigation  
**System Project:** SA\_Include

The Link Up Genie (named "link\_u") can be used to direct an operator up a level in a set of hierarchical pages.

For more information, see [Use Navigational Genies on Content Pages](#).

## Genie Properties

Complete the following properties for the genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
Menu Item	The path to the linked item in the project's Menu Configuration. This is specified using the following notation: <Level1>.<Level2>.<Level3>.<Level4>.<Level5>.<Level6> For example, "Plant1.Area1.MyPage" The menu item needs to be included under the "Navigation" menu (defined in the <b>Page</b> field). As "Navigation" is assumed as the top level of the path, it is not necessary to enter it at the start of the menu item path.
Tooltip	An optional description of the Genie that appears when the mouse points at it.
Use for 4K Page?	Determines if the Genie will appear on a page that displays within a UHD_4K workspace.

Parameter	Description
	TRUE = The Genie will appear in a UHD4K workspace. FALSE = The Genie will not appear in a UHD4K workspace.

### Static Link Left Genie

**Genie Name:** slink\_l  
**Genie Library:** sa\_navigation  
**System Project:** SA\_Include

The Static Link Left Genie (named "slink\_l") can be used to point at the next stage of a linear production process that spans multiple pages.

The Static Link Genies function primarily as a label; they are not designed to provide a direct link to a destination. For more information, see [Use Navigational Genies on Content Pages](#).

## Genie Properties

Complete the following properties for the genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
Label	The label that will appear on the Genie.
Tooltip	An optional description of the Genie that appears when the mouse points at it.
Use for 4K Page?	Determines if the Genie will appear on a page that displays within a UHD_4K workspace. TRUE = The Genie will appear in a UHD4K workspace.

Parameter	Description
	FALSE = The Genie will not appear in a UHD4K workspace.
Links to another console?	Allows you to indicate that a Genie points to a destination on a different console, which is a destination that is not usually monitored by the current client.  TRUE = The Genie points to a different console.  FALSE = The Genie does not point to a different console.  If set to TRUE, the Genie will display a gray background.

### Static Link Right Genie

**Genie Name:** slink\_r

**Genie Library:** sa\_navigation

**System Project:** SA\_Include

The Static Link Left Genie (named "slink\_r") can be used to point at the next stage of a linear production process that spans multiple pages.

The Static Link Genies function primarily as a label; they are not designed to provide a direct link to a destination.

For more information, see [Use Navigational Genies on Content Pages](#).

## Genie Properties

Complete the following properties for the genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
Label	The label that will appear on the Genie.
Tooltip	An optional description of the Genie that appears when the mouse points at it.
Use for 4K Page?	Determines if the Genie will appear on a page that displays within a UHD_4K workspace. TRUE = The Genie will appear in a UHD4K workspace. FALSE = The Genie will not appear in a UHD4K workspace.
Links to another console?	Allows you to indicate that a Genie points to a destination on a different console, which is a destination that is not usually monitored by the current client. TRUE = The Genie points to a different console. FALSE = The Genie does not point to a different console. If set to TRUE, the Genie will display a gray background.

## See Also

## Workspace Genie Library

The SA\_Include system project includes the "sa\_workspace" library. It includes the following Genie:

- [Pane Genie](#).

## See Also

[Situational Awareness System Projects](#)

## Pane Genie

**Genie Name:** pane  
**Genie Library:** sa\_workspace  
**System Project:** SA\_Include

A Pane Genie can be used to add a pane to a master page. See [Create a Master Page for a Customized Workspace](#).

It can also be used for popup windows that support autofill functionality. See [Create a Pop-up Window with Panes](#).

## Genie Properties

Complete the following properties for the genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Pane Properties

Property	Description
Name	The name used to identify the pane. The name needs to be unique; two panes on the same page cannot have the same name. The syslog.dat file for the client will log a message if it detects duplicate panes.
Default Page	The name of the page that the pane will display at startup. If the <b>FillMode</b> for the pane is set to an Autofill option, this page will also display when a context change results in the pane having no content to display.
Display Mode	Determines how the content of a pane will change as the pane is resized. Use one of the following integers to specify a display mode: <ul style="list-style-type: none"><li>• <b>1 = Stretch</b> — the displayed page will continue to fill the pane as it changes size.</li><li>• <b>2 = Maintain aspect ratio</b> — the displayed page will enlarge and reduce in size in proportion with the pane, however it will maintain its aspect ratio.</li><li>• <b>3 = Maintain size</b> — the displayed page will not change in size as the pane is resized. If the page is larger than the pane it will be clipped, or scroll bars will appear if enabled.</li></ul>
Is Default Pane?	Set this property to TRUE if you want the pane to be the default pane within the workspace. This will make the pane the primary point of reference for the workspace. The default pane is used to display pages that have no content type defined.  Each workspace can only contain one default pane. The syslog.dat file for a client will indicate if a default pane is not specified.

Property	Description
	The workspace Header Bar will refer to the page displayed in the default pane to source the active page title and breadcrumbs. This will also determine the current selection in the Navigation Zone.
Display Scrollbars	<p>Determines if the pane will include scrollbars at runtime.</p> <ul style="list-style-type: none"> <li>• FALSE = No scrollbars.</li> <li>• TRUE = Use scrollbars.</li> </ul> <p>Scrollbars will only appear if the pane's <b>DisplayMode</b> property is set to 3 (maintain size), and the page displayed is larger than the pane.</p>
Fill Mode	<p>Determines how the content of a pane is updated as context changes. Use one of the following integers to specify a fill mode:</p> <ul style="list-style-type: none"> <li>• <b>Static</b> — the content and equipment assignments within the pane remain unchanged when equipment context changes.</li> <li>• <b>StaticContextMustMatch</b> — the content does not change, but any associations are updated to match the new equipment context (see below).</li> <li>• <b>Autofill</b> — the pane will check the content specified for the equipment that comes into context. If it matches the pane's <b>ContentTypes</b> setting, the pane will display the content. If there is no valid content for the pane linked to the new equipment context, content may be sourced by traversing up/down the equipment hierarchy.</li> <li>• <b>AutofillContextMustMatch</b> — The same as Autofill, however content directly associated with the new equipment context will be used to fill the pane. The content will only be updated if the equipment is a direct contextual match (see below).</li> </ul> <p>See <a href="#">Autofill</a> for configuration examples.</p>
ContentTypes	Defines the type of content the pane will display. You can specify zero or more types as a comma separated list. Specifying no content type is acceptable for a static pane, but it is recommended that any other type of pane has at least one content type specified.

Property	Description
	<p>The content types you can use are configured in <b>Visualization</b> activity.</p> <p>At runtime, only pages with a content type that matches with the pane will be displayed. See <a href="#">Content Types</a>.</p>
Excluded Autofill Panes	<p>Allows you to specify panes that will not display updated content when an equipment context change is triggered from this pane. When the context changes in the current pane, the content in the excluded panes will remain static. However, the context in excluded panes will still be updated. Any pane in the workspace or a linked workspace can be excluded.</p> <p>Specify the name(s) of one or more panes or nested panes that you want to exclude from autofill. Use a comma to specify more than one pane name.</p> <p>For more information, see <i>Excluding Panes</i> (below).</p>
Tab Header Pane Name	<p>If you want the content of the pane to be controlled via a set of tabs, you can use this property to indicate the pane where the associated tab bar is located.</p> <p>Enter the name of the pane that hosts a page with the tab bar Genie on it.</p>
Tab Control Name	<p>Enter the name of the tab bar Genie that you would like to use to control the content of the pane. The tab control needs to be located on the page of the pane specified in the <b>Tab Header Pane Name</b> property (see above).</p>
Equipment Reference Associations: Categories	<p>This field allows you to associate a pane with an equipment reference category, or a comma-separated list of equipment reference categories (see "Category" in the topic <a href="#">Define Equipment References</a>). When a piece of equipment comes into context, any equipment references within the specified category will be used to create Super Genie associations for a displayed page. For more information, see <a href="#">AssEquipReferences</a>.</p>

## Excluding Panes

As described above, you can use the Pane Properties dialog box to add a list of panes that you wish to exclude from autofill. Excluded panes will show the same content regardless of the context. If the current pane changes context, content in the panes specified in the **Exclude Autofill Panes** box will not be updated.

---

**Note:** The context within excluded panes will be updated when the context of the current page changes.

It is also possible to exclude panes at runtime by using a page environment variable. To do this:

1. Open the page that contains the context that will change.
2. Open the Page Properties dialog box.
3. Select the Environment tab.
4. Click **Add**. The Edit Properties dialog box is displayed.
5. In the **Property** box, type the property name ExcludedAutoFillPanes.
6. In the **Value** box, specify the name(s) of one or more panes that you want to exclude from autofill.
7. Click **OK** to close the Edit Properties dialog box.
8. Click **OK** to close the Page Properties dialog box.

[Situational Awareness System Projects](#)

## Controls Genie Library

The SA\_Controls system project includes the "sa\_controls" library. It includes the following Genies:

- [Alarm List Genie](#)
- [Alarm List Vertical Genie](#)
- [Generic List Genie](#)
- [Generic List Vertical Genie](#)
- [List Row Genie](#).

---

**Note:** The SA\_Inlcude system project also contains a library named "sa\_controls". For a list of the Genies it

---

---

includes, see Controls Genie Library.

---

## See Also

[Situational Awareness System Projects](#)

## Alarm List Genie

**Genie Name:** alarmlist

**Genie Library:** sa\_controls

**System Project:** SA\_Controls

The Alarm List Genie (named "alarmlist") allows you to place a list of alarms on a graphics page in a pre-defined format with a header row and scroll bars. It is a variation of the [Alarm List Vertical Genie](#), which produces a list with no header row and just a vertical scroll bar.

This Genie can be used with the [List Row Genie](#), which facilitates row selection, a row context menu and row background color.

By default, an alarm list Genie displays the fields configured through the [AlarmListCreate](#) Cicode function. You can also use this function to specify the display fonts and alarm indicators.

For further instructions on how to use the Alarm List Genie, see [Add an Alarms List to a Page](#).

---

**Note:** You can also use the Citect.ini parameter [\[Format\]FormatName](#) to set a default format for the fields displayed in an alarms list.

---

## Alarm List Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Alarm List Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
AN	This is automatically populated and matches the AN in the Genie Properties dialog box. This cannot be modified.
OnRightClickFunction	Allows the user to right-click on the alarms list and perform operations displayed on the context menu.
OnColumnSelectedFunction	Allows you to select a column.
OnColumnReorderedFunction	Allows you reorder the columns displayed. For

Parameter	Description
	example, ArrayView_SetFormat().
OnColumnResizedFunction	Allows you to re-size the columns displayed.

## Alarm List Genie Page Properties

For the Genie to work at runtime, they require some arrays to be pre-configured before animation begins. In the Page Properties dialog box, Events tab, select the following event options and specify the required Cicode command.

Parameter	Example	Comments
On Page Entry	<pre>_Array View_Initialize(); AlarmListCreate(DspGetAnFromName("alarmlist"), 0, 700-14, 318, 32, 1, "", "TopActiveAlarms_UHD4K", -1, DspFontHnd("SA_AlarmHeader4K" ))</pre>	This code will create the Alarm list called "alarmlist" based on the parameters specified in the AlarmListCreate function.
On Page Exit	<pre>AlarmListDestroy(DspGetAnFromName("alarmlist"))</pre>	This code will destroy the alarm list array when the user exits the page.

## See Also

[Configure a Genie](#)

[Controls Genie Library](#)

## Alarm List Vertical Genie

**Genie Name:** alarmlist\_v

**Genie Library:** sa\_controls

**System Project:** SA\_Controls

The Alarm List Vertical Genie (named "alarmlist\_v") allows you to place a list of alarms on a graphics page in a pre-defined format. It is a variation of the [Alarm List Genie](#). It differs as it generates a list with no header row and just a vertical scroll bar.

This Genie can be used with the [List Row Genie](#), which facilitates row selection, a row context menu and row background color.

By default, an alarm list Genie displays the fields configured through the [AlarmListCreate](#) Cicode function. You can also use this function to specify the display fonts and alarm indicators.

For further instructions on how to use the List Row Vertical Genie, see [Add an Alarms List to a Page](#).

---

**Note:** You can also use the Citect.ini parameter [\[Format\]FormatName](#) to set a default format for the fields displayed in an alarms list.

## Alarm List Vertical Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- AN:** This is an automatically-generated unique ID for the Genie object.
- Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Alarm List Vertical Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
AN	This is automatically populated and matches the AN in the Genie Properties dialog box. This cannot be modified.

## Alarm List Vertical Genie Page Properties

For the Genie to work at runtime, they require some arrays to be pre-configured before animation begins. In the Page Properties dialog box, Events tab, select the following event options and specify the required Cicode command.

Parameter	Example	Comments
On Page Entry	<pre>_Array View_Initialize(); AlarmListCreate(DspGetAnFromName("alarmlist"), 0, 700-14, 318, 32, 1, "", "TopActiveAlarms_UHD4K", -1, DspFontHnd("SA_AlarmHeader4K")) )</pre>	This code will create the Alarm list called "alarmlist" based on the parameters specified in the AlarmListCreate function.
On Page Exit	<pre>AlarmListDestroy(DspGetAnFromName("alarmlist"))</pre>	This code will destroy the alarm list array when the user exits the page.

## See Also

## Generic List Genie

**Genie Name:** genericlist

**Genie Library:** sa\_controls

**System Project:** SA\_Controls

The Generic List Genie (named "genericlist") allows you to display a custom generated list of information on a page in a pre-defined format with a header row and scroll bars. It is a variation of the [Generic List Vertical Genie](#), which produces a list with no header row and just a vertical scroll bar.

## Generic List Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Generic List Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
AN	This is automatically populated and matches the AN in the Genie Properties dialog box. This cannot be modified.
GenericListFillFunction	Specify the user Cicode function to be called at runtime to populate the list by passing the list's AN to the function. The function needs to retrieve the data to be displayed. For example, <code>AlarmPage_GetReferences</code> .
OnRightClickFunction	Allows the user right-click on a row within the alarms list and perform operations displayed on the right-click menu.
OnColumnSelectedFunction	Allows you to select a column.
OnColumnReorderedFunction	Allows you reorder the columns displayed.
OnColumnResizedFunction	Allows you to resize the columns displayed.

## Generic List Genie Page Properties

For these Genies to work at runtime, they require some arrays to be pre-configured before animation begins. In the Page Properties dialog box, Events tab, select the following event options and specify the required Cicode command.

Parameter	Description	Example
On Page Entry	This code initializes the list array to be populated when the page is displayed.	FUNCTION ListInfo_Init()
On Page Exit	When the user exits the page, clear the information stored in the array.	FUNCTION ListInfo_Exit()

### Example - Clear a list array on exit

```
FUNCTION ListInfo_Exit()
//Clear Equipment List
INT hEquipRefArray = PageGetInt("__EquipRefArray");
ArrayDestroy(hEquipRefArray);
ArrayDestroyByAn(DspGetAnFromName("MyList"));
Debug_Trace("ReferenceInfo", "ListInfo_Exit", "Closing Infoe_Default page.", 
TRACE_Information);
END
```

### Example - Initialize a list array

```
FUNCTION ListInfo_Init()
INT hEquipRefArray;
INT nListAN = DspGetAnFromName("MyList");
INT nListHeight = 160;
INT nListRowHeight = 24;
INT nListWidth = 370;
INT nListCreatedFlag = 0;
STRING sFontPostfix = "";
STRING sResolution = "HD1080";

Debug_Trace("ListInfo", "ListInfo_Init", "Initializing Info_Default page.", 
TRACE_Information);

hEquipRefArray = ArrayCreate("EquipRef_" + nReferencesListAN:#, 5, 1000); // Max of 1000
equip references
PageSetInt("__EquipRefArray", hEquipRefArray); //Cache the array handle

_ArrayView_Initialize(); //Initialize the array

nListCreatedFlag = GenericListCreate(nListAN, nListWidth-14, nListHeight ,
nListRowHeight, 1, "SideEquipRef", DspFontHnd("SA_AlmRow" + sFontPostFix),
DspFontHnd("SA_AlarmHeaderB" + sFontPostFix));
ArraySetIntByAn(nListAN, 5, 1, ARRAY_INFORMATION_ROW, 2);

Debug_Trace("ListInfo", "ListInfo_Init", "List_Default page is initialized with " +
nListCreatedFlag:#, TRACE_Information);
END
```

## Example - Populate list

```
FUNCTION ReferenceInfo_GetData(INT nListAN, STRING sEquipmentContext)
    INT hSession;
    INT nRecords;
    INT nStatus;
    INT nRow;
    INT nLength;
    INT nOffset;
    INT hModel = PageGetInt("__EquipRefArray");
    INT iArrayRow = 1;
    STRING sFilter;
    STRING sFields = "REFCLUST,REFEQUIP,REFITEM,REFCAT"
    STRING sRefCategory;
    STRING sRefCluster;
    STRING sRefEquipment;
    STRING sRefItem;
    STRING sEquipment;
    STRING sRefEquipItem;
    STRING sRefItemValue;
    IF (sEquipmentContext <> "") THEN
        nLength = StrLength(sEquipmentContext);
        nOffset = StrSearch(0, sEquipmentContext, ".");
        sEquipment = StrRight(sEquipmentContext, nLength - nOffset - 1);
        sFilter = "EQUIP=" + sEquipment;
        Debug_Trace("ReferenceInfo", "ReferenceInfo_GetData", "Populating the equipment
reference for " + sEquipment, TRACE_Information);
        hSession = EquipRefBrowseOpen(sFilter, sFields);
        IF (hSession <> BAD_HANDLE) THEN
            nRecords = EquipRefBrowseNumRecords(hSession);
            IF nRecords > 0 THEN
                nStatus = EquipRefBrowseFirst(hSession);
                FOR nRow = 0 TO (nRecords - 1) DO
                    sRefCategory = EquipRefBrowseGetField(hSession, "REFCAT");
                    sRefCluster = EquipRefBrowseGetField(hSession, "REFCLUST");
                    sRefEquipment = EquipRefBrowseGetField(hSession, "REFEQUIP");
                    sRefItem = EquipRefBrowseGetField(hSession, "REFITEM");
                    sRefEquipItem = sRefEquipment + "." + sRefItem;
                    sRefItemValue = TagRead(sRefEquipItem, 0, sRefCluster);
                    SleepMS(10);
                    ArraySetInt(hModel, 0, 0, iArrayRow);
                    ArraySetString(hModel, sRefCluster, 1, iArrayRow);
                    ArraySetString(hModel, sRefEquipItem, 2, iArrayRow);
                    ArraySetString(hModel, sRefItemValue, 3, iArrayRow);
                    ArraySetString(hModel, sRefCategory, 4, iArrayRow);
                    iArrayRow = iArrayRow + 1;
                    EquipRefBrowseNext(hSession);
                END
            END
            EquipRefBrowseClose(hSession);
        END
    END
    IF (nRecords <= 0) THEN
        FOR nRow = 0 TO ArrayGetInfo(hModel, 1) DO
            ArraySetInt(hModel, 0, 0, iArrayRow);
            ArraySetString(hModel, "", 1, iArrayRow);
```

```
        ArraySetString(hModel, "", 2, iArrayRow);
        ArraySetString(hModel, "", 3, iArrayRow);
        ArraySetString(hModel, "", 4, iArrayRow);
        //iArrayRow = iArrayRow + 1;
    END
END
ArraySetInt(hModel, iArrayRow, 0, 0);
END
```

## Generic List Vertical Genie

**Genie Name:** genericlist\_v

**Genie Library:** sa\_controls

**System Project:** SA\_Controls

The Generic List Vertical Genie (named "genericlist\_v") allows you to display a custom generated list of information on a page in a pre-defined format with a header row and scroll bars. It is a variation of the [Generic List Genie](#). It differs as it generates a list with no header row and just a vertical scroll bar.

## Generic List Vertical Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- AN:** This is an automatically-generated unique ID for the Genie object.
- Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Generic List Vertical Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
AN	This is automatically populated and matches the AN in the Genie Properties dialog box. This cannot be modified.
GenericListFillFunction	Specify the user Cicode function to be called at runtime to populate the list by passing the list's AN to the function. The function needs to retrieve the data to be displayed. For example, AlarmPage_FillResponse.

## Generic List Vertical Genie Page Properties

For these Genies to work at runtime, they require some arrays to be pre-configured before animation begins. In the Page Properties dialog box, Events tab, select the following event options and specify the required Cicode command.

Parameter	Description	Example
On Page Entry	This code initializes the list array to be populated when the page is displayed.	FUNCTION ListInfo_Init()
On Page Exit	When the user exits the page, clear the information stored in the array.	FUNCTION ListInfo_Exit()

### Example - Clear a list array on exit

```
FUNCTION ListInfo_Exit()
//Clear Equipment List
INT hEquipRefArray = PageGetInt("__EquipRefArray");
ArrayDestroy(hEquipRefArray);
ArrayDestroyByAn(DspGetAnFromName("MyList"));
Debug_Trace("ReferenceInfo", "ListInfo_Exit", "Closing Infoe_Default page.", 
TRACE_Information);
END
```

### Example - Initialize a list array

```
FUNCTION ListInfo_Init()
INT hEquipRefArray;
INT nListAN = DspGetAnFromName("MyList");
INT nListHeight = 160;
INT nListRowHeight = 24;
INT nListWidth = 370;
INT nListCreatedFlag = 0;
STRING sFontPostfix = "";
STRING sResolution = "HD1080";

Debug_Trace("ListInfo", "ListInfo_Init", "Initializing Info_Default page.", 
TRACE_Information);

hEquipRefArray = ArrayCreate("EquipRef_" + nReferencesListAN:#, 5, 1000); // Max of 1000
equip references
PageSetInt("__EquipRefArray", hEquipRefArray); //Cache the array handle

_ArrayView_Initialize(); //Initialize the array

nListCreatedFlag = GenericListCreate(nListAN, nListWidth-14, nListHeight ,
nListRowHeight, 1, "SideEquipRef", DspFontHnd("SA_AlmRow" + sFontPostFix),
DspFontHnd("SA_AlarmHeaderB" + sFontPostFix));
ArraySetIntByAn(nListAN, 5, 1, ARRAY_INFORMATION_ROW, 2);
```

```
    Debug_Trace("ListInfo", "ListInfo_Init", "List_Default page is initialized with " +
nListCreatedFlag:#, TRACE_Information);
END
```

## Example - Populate list

```
FUNCTION ReferenceInfo_GetData(INT nListAN, STRING sEquipmentContext)
    INT hSession;
    INT nRecords;
    INT nStatus;
    INT nRow;
    INT nLength;

## List Row Genie

**Genie Name:** list\_row\_x<n>

**Genie Library:** sa\_controls

**System Project:** SA\_Controls

The List Row Genie can be used in conjunction with the [Alarm List Genie](#) and [Generic List Genie](#) Genies to facilitate row selection, row context menu and row background color. Several variations of the List Row Genie are available:

- List Row x5 – use this to create a list with up to 5 rows.
- List Row x10 – use this to create a list with up to 10 rows.
- List Row x40 – use this to create a list with up to 40 rows.
- List Row x80 – use this to create a list with up to 80 rows.

---

**Note:** There is no need to adjust the size of the List Row Genie on a graphics page to fill an area. The required space will be determined at runtime by the size of the list with which it is associated.

---

For further instructions on how to use the List Row Genie, see [Add an Alarms List to a Page](#) or [Add a Generic List to a Page](#).

## List Row Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## List Row Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
ArrayAN	Specify the AN of the alarm list to which row formatting will be applied. You can use the Cicode function DspGetAnFromName to retrieve the AN. For example, DspGetAnFromName("AlarmList").
RowOffset	Row number at which to display a list if there are multiple Alarm List Genies on the page. Default is 0. If multiple List Row Genies are inserted on to a page, you need to specify the correct row offset for each List Row Genie. For example, if you insert two List Row_x10 Genies, the row offset for the first Genie will be 0 while the row offset for the second Genie will be 10.
LeftClickCommand	Allows you to call Cicode that performs operations when you click on a row within the list. For example, you can select the row using AlarmPage_SelectAlarmRecord(DspGetAnFromName("AlarmList")).
RightClickCommand	Allows you to call Cicode that performs operations when you right-click on a row within the list. For example, Alarm_TopAlarmsRow_RightClickCommand(DspGetAnFromName("AlarmList")).

### Button Base Genie

**Genie Name:** button\_base

**Genie Library:** sa\_controls\_common

**System Project:** SA\_Controls

The Button Base Genie (named "button\_base") can be used to position a button and enable its basic functionality.

Buttons are theme aware; their color will adjust according to the current theme set for the workspace.

### Genie Properties

Complete the following properties for the genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

### Genie Parameters

Select the genie, then double-click on it. The genie's parameters are displayed. Complete the following parameters:

Parameter	Description
Click Command	The function that is called when the operator clicks on the button. No specific arguments are required.
Disabled When	An expression (applied in conjunction with Area and Privilege) that can provide further logic to specify when the button is disabled.
Tooltip	Text that displays when the operator hovers the mouse over the button at runtime.
Area	Enter the area to which the button belongs. Only users with access to this area can use the button.
Privilege	Enter the privilege level that a user needs to possess to use this button.

Parameter	Description
Equipment Context	<p>Can be used to store an equipment context. This is an optional setting that is only used by navigation buttons.</p> <p><b>Note:</b> If Equipment Context is specified, then the cluster needs to be specified as well.</p>

## Button Label Genie

**Genie Name:** button\_label\_<n>

**Genie Library:** sa\_controls\_common

**System Project:** SA\_Controls

A Button Label Genie can be used to apply text to a [Button Base Genie](#).

There are two variations of the genie:

- button\_label\_12 - uses a 12 point font
- button\_label\_16 - uses a 16 point font

## Genie Properties

Complete the following properties for the genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the genie, then double-click on it. The genie's parameters are displayed. Complete the following parameters:

Parameter	Description
Label	The text that appears on the label.
Background AN	The AN of the background Button Base Genie.

### Scroll Bar Horizontal Genie

**Genie Name:** scrollbar\_h

**Genie Library:** sa\_controls\_common

**System Project:** SA\_Controls

The Scroll Bar Horizontal Genie (named "scrollbar\_h") allows you to add a horizontal scroll bar to a Genie. It is designed to work with the array-enabled Genies such as:

- [Alarm List Genie](#)
- [Alarm List Vertical Genie](#)
- [Generic List Genie](#)
- [Generic List Vertical Genie](#)
- [Tree View Genie](#).

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie, then double-click on it. The Genie's parameters are displayed. Complete the following parameters:

Parameter	Description
pxOffsetX	Reflects the default vertical position of the scroll bar in relation to the Genie it is placed in. For example, if your Genie contains a scroll bar positioned 100 pixels to the right, then pxOffset will be 100.
ArrayAN	Specify the AN of the animation object where an array has been created to store positional and scroll information.

## Priority 2 Normal Genie

**Genie Name:** sa\_p2\_normal

**Genie Library:** sa\_priorities

**System Project:** SA\_Controls

The Priority 2 Normal Genie (named "sa\_p2\_normal") is used to represent priority 2 alarms for a status flag on an alarm indicator (see [Use Alarm Indicators](#)).

It is typically associated with the **Genie Name** property for an Alarm Priority (see [Configure Display Properties for an Alarm Priority](#)).

For information on how to configure a status flag for an alarm indicator, see [Create a Custom Flag for an Alarm Indicator](#).

## See Also

## Priority 2 Small Genie

**Genie Name:** sa\_p2\_small

**Genie Library:** sa\_priorities

**System Project:** SA\_Controls

The Priority 2 Small Genie (named "sa\_p2\_small") can be used as an icon that highlights the occurrence of priority 2 alarms. It is typically associated with the **Small Genie Name** property for an Alarm Priority (see [Configure Display Properties for an Alarm Priority](#)).

It can be used for:

- Priority And State symbols in an alarms list (see [Create Priority and State Symbols for an Alarms List](#)).
- The alarm counts on a tree-view (see [Add a Tree View to a Page](#)).
- The alarm counts in the Navigation Zone (see [Navigation Zone](#)).

## Situational Awareness Library Project

The Situational Awareness Library Project (named "sa\_library") is an include project that contains a set of Genies for common user interface controls as listed in the table below.

In addition, the sa\_library projects contains Genies for meters, drives and valves that can be combined to build **Composite Genies**. Refer to the topic [Insert a Composite Genie](#) to learn how to add a meter, drive or valve object onto your graphics page.

---

**Note:** The sa\_library Include project is a system include project, and only appears in the Project list tree if the **System Projects** filter is applied in the Projects activity. This project is included when you create a project using the Situational Awareness Starter project.

---

## Object Libraries

Library objects are accessible in Graphics Builder from the following object libraries.

Library Name	Description
sa_belt	Contains <a href="#">Belt Objects</a> such as aprons, belts and conveyors.
sa_chart	Contains <a href="#">Additional Objects</a> such as polar star and XY Bar Graph.
sa_common	Contains the selection adorner objects to display borders around objects, output bar, tracker, labels and OOS indicators.
sa_dataobjects	Contains objects such as up/down buttons, numeric and text input that provide additional methods of displaying data and related properties.
sa_deviationmeter	Contains the <a href="#">Deviation Meter</a> object and its components including alarm limits, PV tracker, etc.
sa_drive	Contains <a href="#">Drive Objects</a> such as compressors, brakes, pumps, etc in different sizes and orientations.
sa_dualmeter	Contains the <a href="#">Dual Level Meter</a> object and its components including alarm limits, PV tracker, etc.
sa_faceplates	Contains the components to build a <a href="#">Faceplates</a> .
sa_meter	Contains <a href="#">Meters</a> such as analyzer, pressure,

Library Name	Description
	temperature meters, etc in different sizes and orientations.
sa_mining	Contains <a href="#">Mining Objects</a> such as crushers, cutters, magnets, etc
sa_misc	Contains <a href="#">Additional Objects</a> such as alarm light, handswitch selector, etc.
sa_trend	Contains <a href="#">Trend Objects</a> such as pens, limits, trend tail, etc.
sa_valve	Contains <a href="#">Valves</a> such as simple valves, control valves, damper valves, etc in different sizes and orientations.

## Common Object Elements

The objects within the Situational Awareness library share a set of properties and behaviors that are common across objects.

These include:

- [Use Alarm Indicators](#)
- [Status Indicators](#)
- [Output \(OP\) Bar](#)

- Equipment Running State Indicators.

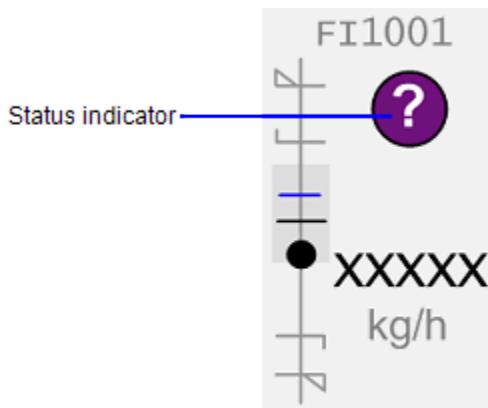

Any exceptions to the properties are noted in the individual object descriptions.

## See Also

[Show/Hide Settings](#)

### Status Indicators

Status indicators are used to represent various non-alarm conditions associated with an object, such as abnormal data quality or control system states. A status indicator will only appear while the triggering condition is true.

The status indicator is a separate genie and is used to represent various states of an object.

The status indicator symbols can be found in the SA\_Library project in a library called sa\_status\_indicator.

### Status Indicator States

Connects to: EquipmentName.EqStatus

A status indicator can represent the following states.

Symbol	State	Name
	Bad data.	d2
	Uncertain data or invalid automation state.	d1
	Simulate mode - forcing a value to a point.	d4
	Offscale.	d12

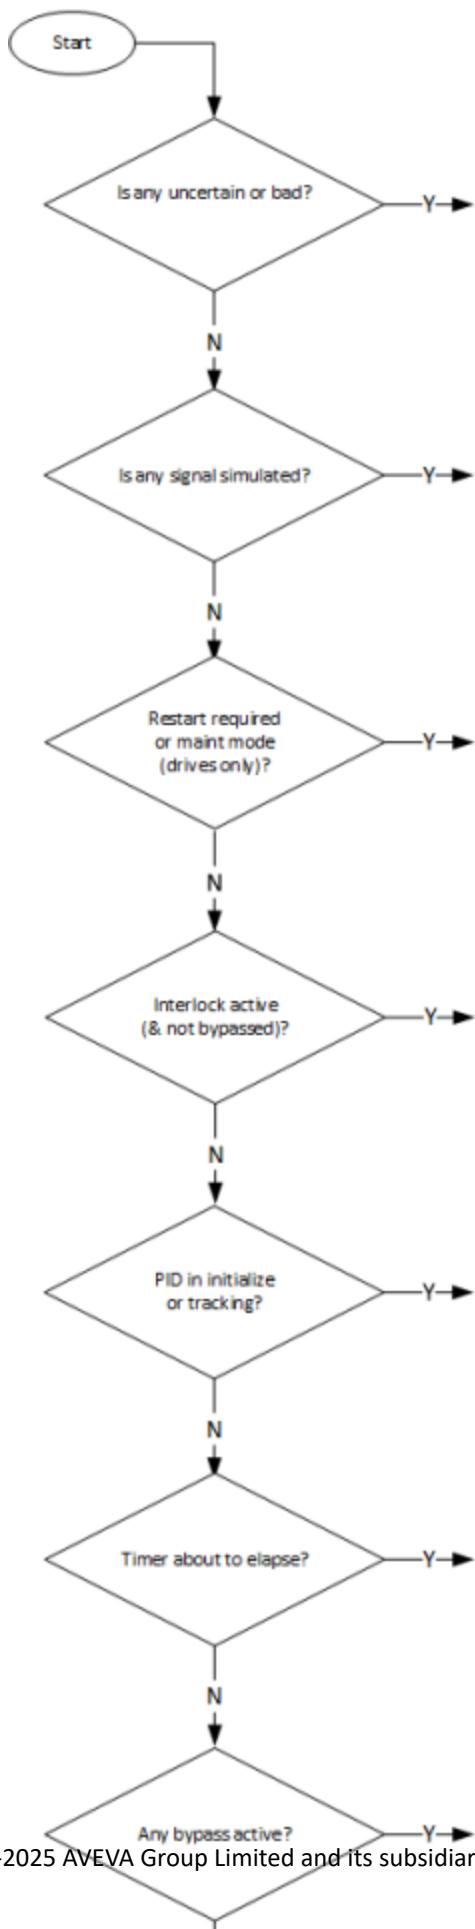

Symbol	State	Name
	Interlocked.	d6
	Interlock bypassed.	d5
	Paused.	d19
	Bad Communication between IO Server and Client	d13
	Tracking	d20
	Clamped	d21
	Off-spec lab data.	d7
	Maintenance.	d8
	Message.	d9
	Restart of the machine is required.	d11
	Initialization manual or index car.	d3
	Timer is active.	d10
	Calibrate mode. Used to calibrate instruments.	d16
	Bad Communication between Gateway and PLC.	d14

Symbol	State	Name
	Deviation	d15
	Reminder to call outside personnel	d17

In scenarios where several states may be active at the same time there is an order of precedence on what indicator will be displayed. For example, a PID controller that is in initialize mode, but also has the PV as simulated would display the "S" indicator, even if there was also an interlock condition active.

## Status Indicator Order of Precedence

The following diagram outlines the order of precedence:

Use this order (first type of failure found) →

Bad comms  
between IO  
Server and  
Client

Bad comms  
between PLC  
and IO  
Client

Bad comms  
between  
Gateway and  
PLC

Bad comms  
between  
Instrument  
and Gateway

Simulate

Calibrate

Restart  
Required

Out to  
Maintenance

Interlocked

If item has Equipment Running State Indicators,  
the lock icon will also be in the Equipment Running  
State Indicator.

Initialize

Tracking

Timer Notice

Interlock  
Bypass Active

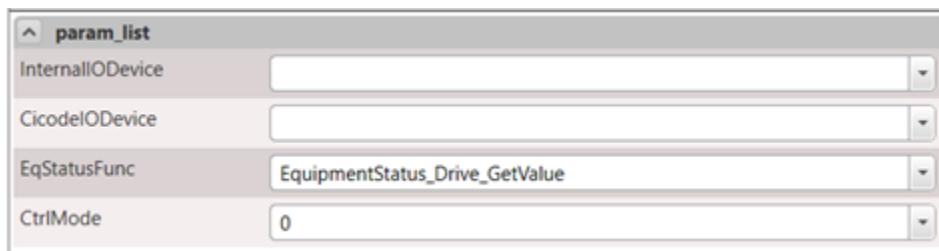

Status Indicators can be configured for most library objects excluding NumericInput and TextInput. Examples have been provided for Drives, Meters and Valves only.

## Customizing Equipment to use Status Indicators

Status Indicators can be used to highlight a non-alarm state of an object or equipment. You can configure equipment to use status indicators one of two ways:

1. Using the Equipment Editor

- Click on the Equipment Tab and from the list of Equipment select the relevant equipment.
- Open the param\_list panel
- Edit the EqStatusFunc field

2. If not using templates, you can configure the status indicator directly using the EqStatus item name of the equipment. Go to System Model -> Variables.

The SA\_Style\_1\_MultiRes starter project includes an example (Indicators.ci) of how to configure equipment using sample functions to call one of the indicators. Variations of the equipment status indicator functions have been provided for Meters, Valves and Drives only.

- [EquipmentStatus\\_Meter\\_GetValue](#)
- [EquipmentStatus\\_Valve\\_GetValue](#)
- [EquipmentStatus\\_Drive\\_GetValue](#)

These functions map the relevant status tags from a PLC's code into the values required by the various indicators. Different pieces of equipment have different relevant states for each of these indicators, so when required, make your own copy of the example Cicode file. You can then create variations or unique versions of the sample functions to use in your project.

Refer to the comments within the Cicode file Indicators.ci for more information on how to customize and use these functions.

## See Also

[Alarm Indicator](#)

## Output (OP) Bar

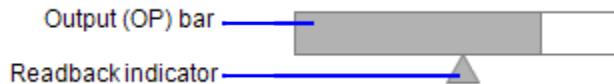

An output (OP) bar provides a visual representation of the current output for a piece of equipment. It can be used with multiple types of objects (control meters, variable speed drives, and control valves).

The information displayed by an OP bar may be presented as two values:

- Output — the value set for the output
- Actual output — the current output value indicated by the readback indicator (also referred to as feedback indicator).

Using a furnace as an example, the output would be the temperature at which the furnace is set to operate. The actual output would be the current temperature of the furnace as it moves towards the specified setting.

The output is represented by the main OP bar, while actual output is represented by a readback indicator.

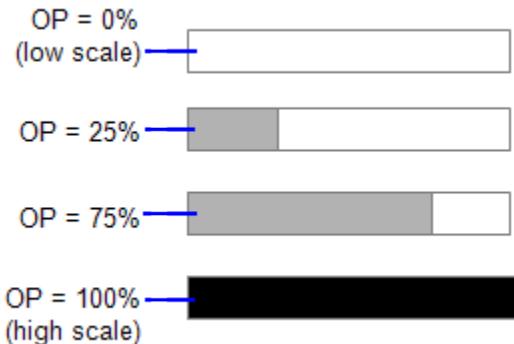

- **Output (OP) bar**

The outer rectangle represents the entire range of the output, from the low scale value to the high scale value (for example, 0—100%).

The following colors are used to represent the OP value:

- White represents 0% (or the low scale value)
- Black represents 100% (or the high scale value)
- Grey represents all output values in between.

---

**Note:** In the case of valves, the valve head will remain grey, but the OP bar will change to black when the OP reaches 100%.

- **Readback Indicator**

The readback indicator (also known as a feedback indicator) is a small filled triangle that is used to show:

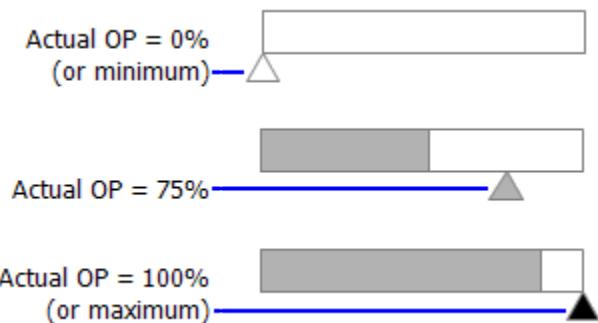

- Actual output (for controllers)
- Speed (for variable speed drives)
- Position (for valves).

If this information is not available from the control system, the readback indicator is not displayed.

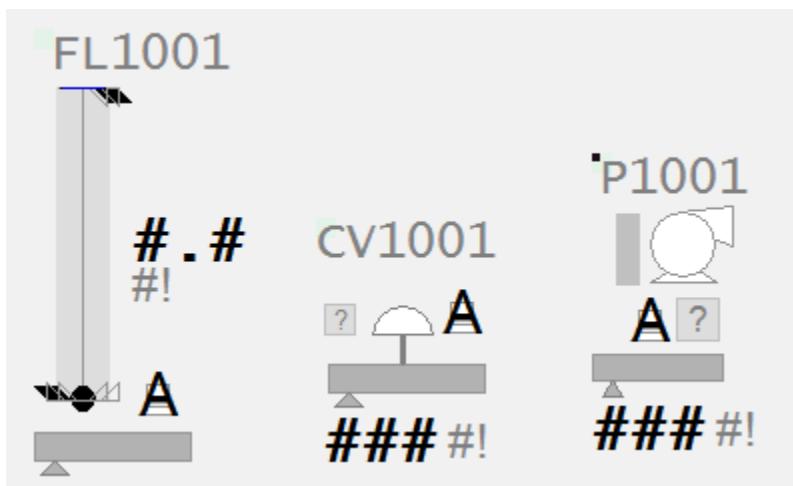

The readback indicator displays the following colors:

- White at 0% (or minimum)
- Black at 100% (or maximum)

- Grey for all values in between.

An OP bar can be specified in the Presentation Options dialog box for meters, drives and valves, but the behavior is the same in all instances. The following examples demonstrate positioning for an OP bar on a control meter, a control valve and a VSD pump.

[Common Object Elements](#)

## Equipment Running State Indicators

An Equipment Running State Indicator is a compact indicator that can be used to represent a variety of states for drive objects and some types of valves. These states can include run status, direction, interlocks, alarms, lockouts, and more.

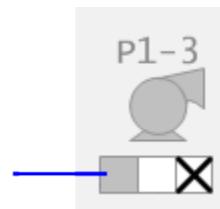

You can use Equipment Running State Indicator in the following ways:

- Represent a group of up to five drives using one symbol.**

A primary reason for using Equipment Running State Indicators is to allow equipment to be displayed on a page as group. For example, it is possible to represent a group of up to five pumps using one pump symbol and four Equipment Running State Indicators.

Equipment Running Status Indicator displaying the current state of three grouped pumps

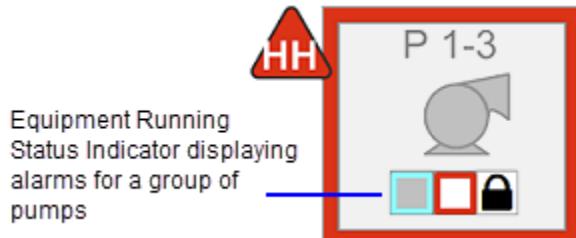

This allows an entire group of drives to be monitored using one compact object.

- Display alarms states for a group of drives.**

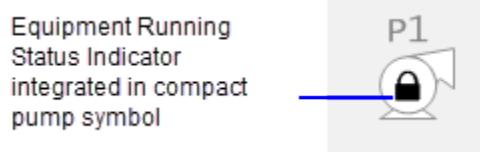

When used with a symbol representing a group of drives, an Equipment Running State Indicator will reflect the occurrence of any alarms on an individual drive within the group. An alarm condition is indicated by a border inside the Equipment Running State Indicator, allowing the status of the drive to remain visible.

The alarm status for the main object will reflect the highest priority alarm on any of the individual drives.

- Integrate an Equipment Running State Indicator into a compact drive symbol.**

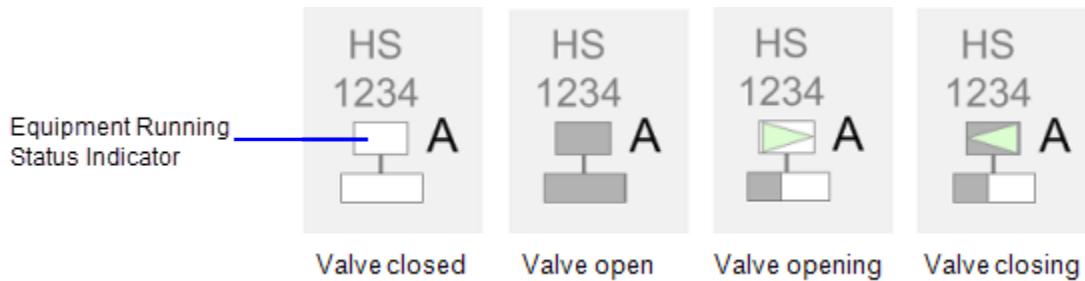

If available space on the screen is limited, compact drives can be used. Instead of showing a square Equipment Running State Indicator box under the symbol, a circular Equipment Running State Indicator is placed inside the symbol.

The Equipment Running State Indicator does not have a border around it. If the commanded and actual states are the same, the Equipment Running State Indicator circle blends into the fill of the symbol.

- **Represent the current state of valves.**

For valves, the Equipment Running State Indicator symbols are shown in the valve head instead of a separate box.

## See Also

[Equipment Running States](#)

### Equipment Running States

Equipment Running State Indicators use the following symbols to indicate the operational state of a piece of equipment. The RunStatus tag is used for indicating out-of-service states with Equipment Running State value of 2, 3 or 4.

OOS and OOSDisabled are digital tags that drive the value of equipment running states.

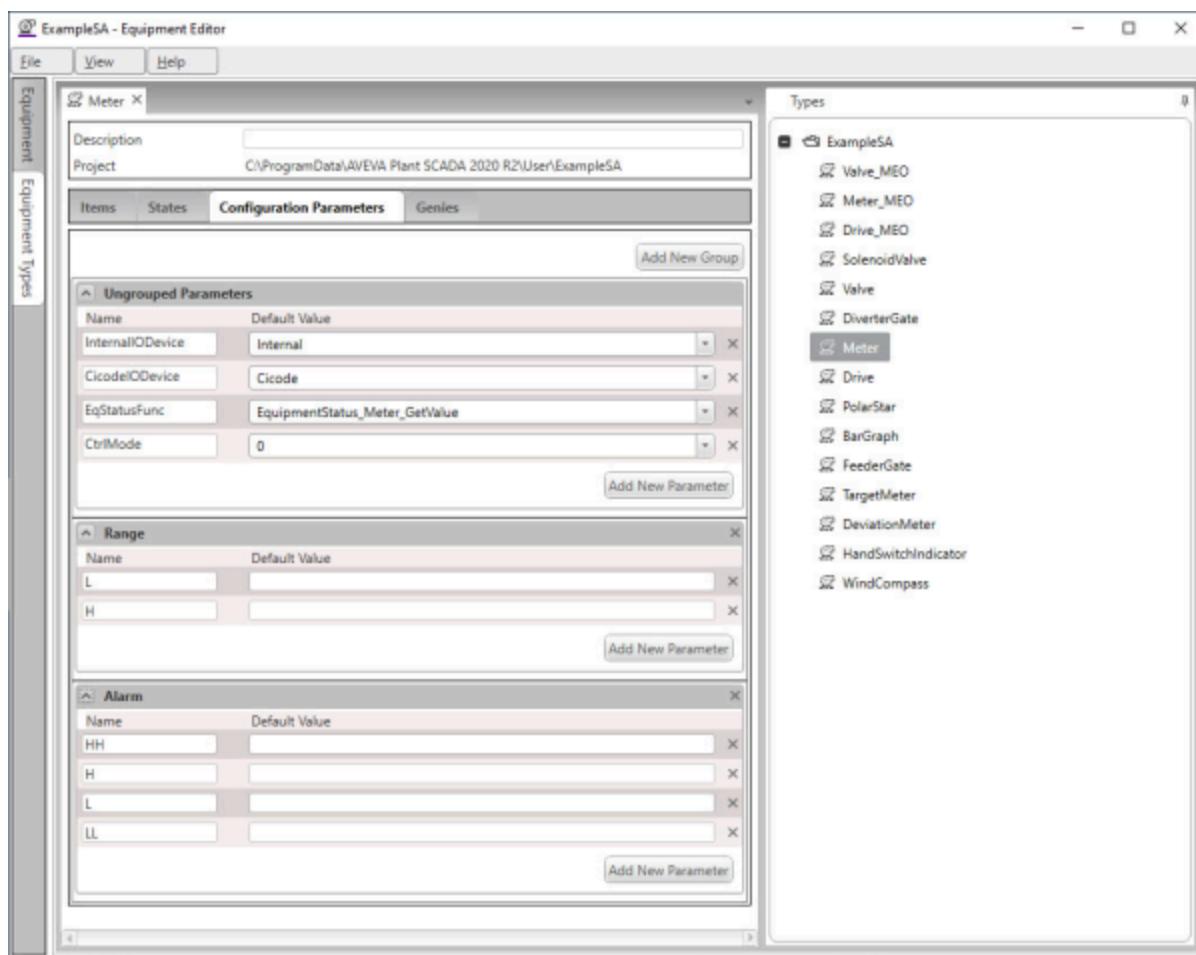

Equipment Running State	Symbol	Description
0	?	Default
1		Mnemonic
2	X	Mnemonic Out of Service - set manually
3	XX	Out To Maintenance / Out Of Service / LOTO (Unavailable)
4	XX	Off / Closed and Selected Out of Service by upstream equipment
5		Off / Stopped and available (Drives) Fully closed (Valves)

Equipment Running State	Symbol	Description
6		Drive running as standby drive in a duty standby arrangement
7		Running Forward (Single Speed Drive) Running Forward Slow Speed (Dual Speed Drive) Valve Open (MOV) Valve stopped midway (complex MOV)
8		Running Reverse (Single Speed Drive) Running Reverse Slow Speed (Dual Speed Drive)
9		Running Forward at Full Speed (Dual Speed Drives) Valve Fully Open
10		Running reverse at Full Speed (Dual Speed Drives)
11		Interlock bypassed and off/ stopped/closed
12		Interlocked and off/stopped/closed
13		Interlock bypassed and on/ running/open
14		Interlocked and on/running/open
15		Running Forward at Full Speed (Dual Speed Drives) with an Interlock Bypass Active.
16		Fully Open and Interlocked (Fail Open Valves).
17		State changing from Stopped to Running (Single speed Drive) State changing from Stopped to Running Slow (Dual speed Drive)

Equipment Running State	Symbol	Description
		Valve requested to open but still at closed limit
18		State changing from Running Slow to Running Fast (Dual Speed Drive) Valve requested to open and has left the closed limit
19		State changing from Running to Stopped (Single Speed Drive) State changing from Running Slow to Stopped (Dual Speed Drive) Valve requested to close and has left the open limit
20		State changing from Running Fast to Running Slow (Dual Speed Drive) Valve requested to close but still at open limit
21		Startup Warning Siren
22		Interlocked by a sequence and not running
23		On / Open and Out to Maintenance / Out of Service
24		Off / Closed and Selected Out of Service by upstream equipment

## Equipment Configuration Parameters

The following equipment configuration parameters defined in the equipment template are applicable to most meters, drives and valves. They are configured on each equipment instance created in the Equipment Editor. Any exception is noted in the parameter description.

- **InternalIODevice**

Name of the persisted memory PLC that stores the value of internal tags to control the value of a library object. For example, the PRHigh, PRLow, ORHigh and ORLow tags may exist in the PLC

- **CicodeIODevice**

Name of the I/O device that is used to store values for calculated variables. For example, EqStatus.

- **EqStatusFunc**

Name of the Cicode function needed to evaluate the value of the status indicator. For example, EquipmentStatus\_Drive\_GetValue.

- **CtrlMode**

Default value for the control mode, which is a value of 0, 1, 2, 3 or 4 (Automatic, Manual, etc). The CtrlDef defines the current control mode of the equipment set at the PLC level. It takes the same values as the CtrlMode.

- **Range**

Used to specify the engineering high and low values for tags that have integer values. For example, PV, PVTrack, SP, PRHigh, PRLow, ORHigh, ORLow.

Note that most tags need to have the same range values.

- **Alarm Limits**

Used to define alarm limits if using analog alarms.

---

**Note:** This parameter is not available for valve objects.

- **Height**

Used only for a Feeder Gate, this is used to specify the engineering range for the height of the gate.

- **WindSpeedRange**

Used only for a Wind Compass, this is used to specify the high and low values for wind speed tags.

- **SwitchPosition**

Used only for a Handswitch Selector, this tag indicates the position of the handswitch - whether it is left (1), right (2) or center (3).

## Show/Hide Settings

Independent controls are provided to show/hide the following elements globally on a workstation. These elements are available from the Header Bar:

Setting	Applies to	Default Setting
Numeric PV/OP and Units 	<ul style="list-style-type: none"><li>• All meters</li><li>• All VSDs and valves with numeric OP and units</li><li>• Trend objects</li></ul>	Visible
Labels 	All instances	Visible
Control Links 	All control links	Visible

## See Also

## Alarm Limits

Alarm limits indicate when a process variable will trigger an alarm in the system. The Situational Awareness support in Plant SCADA allows these limits to be visualized using the Meter Composite Genie library object and its associated faceplates.

The Meter Composite Genie and faceplates that display meters support:

- Analog alarm tag limits (a single analog alarm defining all the limits) and
- PLC tag-based alarm limits (separate I/O tags to define each limit).

Tag-based alarm limits are particularly useful if you want dynamic control of the limits and/or if you want to specify a different category for each limit.

**Note:** Up to 14 limits may be defined, but the Meter object supports display of only 4 limits. However, you can build your own meter object with 6 limits for example.

By default, all analog equipment and your project are configured to use analog alarm limits. In most situations, a meter will be displaying the ".PV" item for your equipment. The meter objects will automatically source your HighHigh, High, Low and LowLow values from a matching PV analog alarm tag.

When using Situational Awareness-based projects, this behavior can be changed in the following ways:

1. Use analog alarm limits for all equipment
2. Use analog alarm limits for most equipment, and override with PLC-based limits on a per equipment basis
3. Use PLC-based alarm limits for all equipment
4. Use PLC-based alarm limits for most equipment, and override with analog alarm limits on a per equipment basis

The default you choose will depend upon:

- The number of analog equipment in your system that will use one or the other method
- The importance of the limits in your system. Analog Alarm Limits in Plant SCADA all share the same category. If you want a different category for HH as opposed to LL, PLC-based alarm limits should be used.

## See Also

[Associate an Alarm with Equipment](#)

[Configure PLC Limits with Equipment](#)

## Configure PLC Limits with Equipment

The steps for setting up and using PLC limits are:

## 1. Choose the default mode for limits (PLC tags or analog alarm limits).

To use PLC limits for all meters, set the INI parameter [\[SA\\_Library.Meter\]UseDefaultPLCLimits](#).

To override the behavior of this parameter per equipment, add an equipment runtime parameter. For more details, see Step 5 below.

## 2. Define the Equipment Items Names that the meter limits will use as the source in [\[SA\\_Library.Meter\]PLCLimitNames](#).

When PLC limits are used, you need to configure a set of custom Equipment Item names representing each of the limits. In the **Setup** activity, **Parameters** view, add the tags (item names) as a comma separated list as shown below.

Section Name	Name	Value
SA_Library.Meter	PLCLimitNames	LLLimit,LLimit,HLimit,HHLimit

The meter library objects will then look for items with these names on your equipment.

As these items will need to exist alongside your equipment's other items (for example, PV), it is recommended to use an identifier which makes it clear that they are limit items (for example, Limit).

**Note:** Up to 14 limits may be defined, but the Meter object supports display of only 4. However, you can build your own meter object with 6 limits for example.

## 3. Define the Analog Limit Labels to display in faceplates

Configure the limit labels for each of your limits (for example, HH). The limit labels are defined at a global level as a comma separated list via the parameter [\[SA\\_Library.Meter\]PLCLimitLabels](#).

Row	Section Name	Name	Value	Comment	Project
55	SA_Library.Meter	PLCLimitLabels	LL,L,H,HH		ExampleSA

**Note:** The limits should be listed in the same order as the item names, and the number of items defined should be the same.

## 4. Define the default Analog Limits

Define the default PLC alarm limits to use for analog equipment. These are defined at a global level as a comma-separated list via the parameter [\[SA\\_Library.Meter\]DefaultPLCLimits](#).

Typically, you would assign 0 = LL, 1 = L, 2 = H and 3 = HH. This matches the order in which the limit labels are specified. If you wanted to define only H and HH as the default, you would set the **Value** to -1, -1, 2, 3.

**Note:** The -1 in the **Value** column means "ignore" the first default limits.

## 5. Configure the "PLCLimits" equipment runtime parameter

When the alarm limits need to differ for a specific piece of equipment, the **PLCLimits** equipment runtime parameter can be configured to override the default.

For example, if only H and HH are required, then this can be configured using Equipment Runtime Parameters as shown below .

▶	5	Cluster1	MyPlant.TS001	PLCLimits	-1,-1,2,3	FALSE	ExampleSA
---	---	----------	---------------	-----------	-----------	-------	-----------

To configure this:

1. In Plant SCADA Studio, navigate to **System Model** activity and select **Equipment**. Select **Runtime Parameters** from the drop-down menu.
2. For each equipment that needs to override the default limits, in the **Name** property, type "PLCLimits".
3. In the **Value** property, specify your comma-separated list of default PLC limits, that is the order in which the defined PLC alarm limits need to be used. Use the value -1 to skip limits that are not required.

**Note:** Setting the **Value** property to \* reverses the setting of the UseDefaultPLCLimits parameter. Therefore, if the UseDefaultPLCLimits parameter is set to TRUE, it will be reversed and applied as if it were set to FALSE. In this case, analog alarm limits will apply. If UseDefaultPLCLimits is FALSE, setting the value of the runtime parameter to \* will cause the associated equipment to use the default PLC limits defined at the project level.

4. Set the **Is Tag** property to FALSE so that the PLC limit labels are displayed on the meter faceplates.
5. Click **Save**.

## 6. Generate variable tag Items for each limit item on your analog equipment.

All analog equipment that will be displayed as meters will then need to be configured to include variable items for these limits. Your PLC code can then set the defaults for those limits, or it could be done via Cicode.

Variables						
Row	Equipment	Item Name	Tag Name	Cluster Name	I/O Device	Data Type
1	Meter1	CHHLimit	Meter1_CHHLimit	Cluster1	PLC	REAL
2	Meter1	CHLimit	Meter1_CHLimit	Cluster1	PLC	REAL
3	Meter1	CLLimit	Meter1_CLLimit	Cluster1	PLC	REAL
4	Meter1	CLLLimit	Meter1 CLLLimit	Cluster1	PLC	REAL

## 7. Generate variable tags representing the condition of the PV against each limit

Once limits are set up, create a digital variable to reflect when the PV signal exceeds the limit.

For the variable, this can either be driven from the PLC itself, or, you can use a [Calculated Variables](#) that will run on the I/O Server as shown below:

Variables						
Row	Equipment	Item Name	Tag Name	Cluster Name	I/O Device	Address
1	Meter1	CHH	Meter1_CHH	Cluster1	Cicode	Meter1_PV >= Meter1_CHHLimit
2	Meter1	CH	Meter1_CH	Cluster1	Cicode	Meter1_PV >= Meter1_CHLimit
3	Meter1	CL	Meter1_CL	Cluster1	Cicode	Meter1_PV <= Meter1_CLLimit
4	Meter1	CLL	Meter1 CLL	Cluster1	Cicode	Meter1_PV <= Meter1 CLLLimit

## 8. Generate digital alarm tags.

Digital Alarms can then be created for each limit item giving you granular control of alarm priority (category).

Each alarm should be bound to their respective digital condition tag defined in Step 7.

[Alarm Limits](#)

[Add Equipment Using Equipment Editor](#)

[Define Equipment Runtime Parameters](#)

## Meters

Meters provide a graphical and a numeric representation of instrument readings. The graphical representation allows you to visually compare the PV with reference values such as alarm limits and/or user-configured reference values (e.g., the "tracker" or optimal range).

Many of the meters have variations that allow them to also be used to represent a controller. These variations include additional elements such as output (OP) and feedback indicator (FB).

You can insert multiple instances of a meter in duplicate or triplicate by using the [Multiple Meter](#).

Meters are associated with equipment, and require the following items to be defined:

Item Name	Description
FB	Feedback Indicator See <a href="#">Control Meters - Common Elements</a> .
OP	Output See <a href="#">Control Meters - Common Elements</a> .
ORDsp	Optimal Range Display See <a href="#">Meter Common Elements</a> .
ORLow	Optimal Range (OR) Low See <a href="#">Meter Common Elements</a> .
ORHigh	Optimal Range (OR) High See <a href="#">Meter Common Elements</a> .
PR	Practical Range specific to Deviation meters See <a href="#">Meter Common Elements</a> .
PRLow	Practical Range (PR) Low See <a href="#">Meter Common Elements</a> .
PRHigh	Practical Range (PR) High See <a href="#">Meter Common Elements</a> .
PV	Process Variable

Item Name	Description
	See <a href="#">Meter Common Elements</a> .
PVTarget	Process Variable specific to Target meters See <a href="#">Meter Common Elements</a> .
PVTrack	Process ValueTracker See <a href="#">Meter Common Elements</a> .
SP	Setpoint See <a href="#">Control Meters - Common Elements</a> .
TrackDsp	Controls whether or not a tracker is displayed See <a href="#">Meter Common Elements</a> .

The Meter objects available in the Situational Awareness library include:

- [Analyzer Meter](#)
- [Deviation Meter](#)
- [Dual Level Meter](#)
- [Flow Meter](#)
- [Level Meter](#)
- [Miscellaneous Meter](#)
- [Pressure Meter](#)
- [Target Meter](#)
- [Temperature Meter](#)

## See Also

[Meter Faceplates](#)

[Multiple Meter](#)

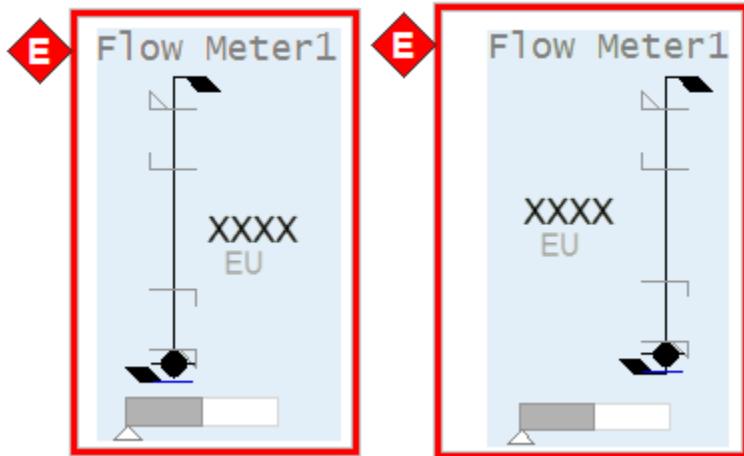

## Meter Orientations

For most meters, several orientations are provided in order to give page designers flexibility in how the graphics are laid out.

## Mirrored

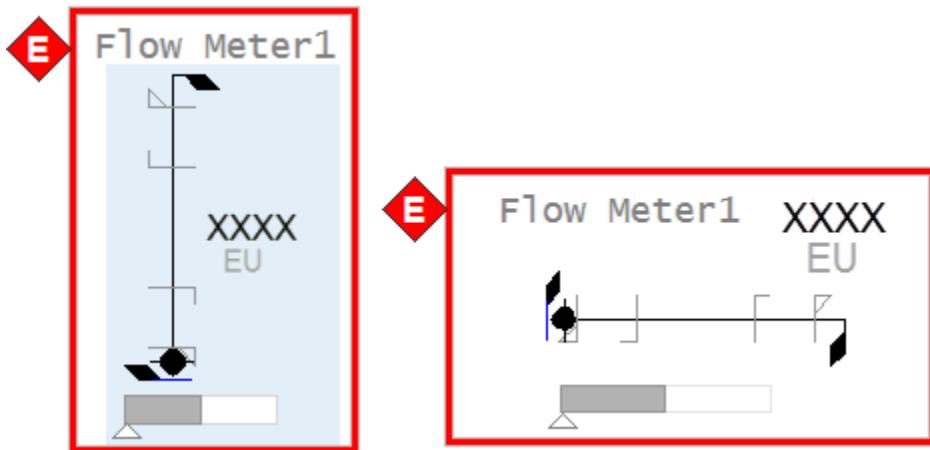

A mirrored meter reverses the left/right position of some meter elements as shown in the example below. The

positions of the running state indicator, rate of change arrow, PV, engineering units, and mode indicator (for control meters) are affected.

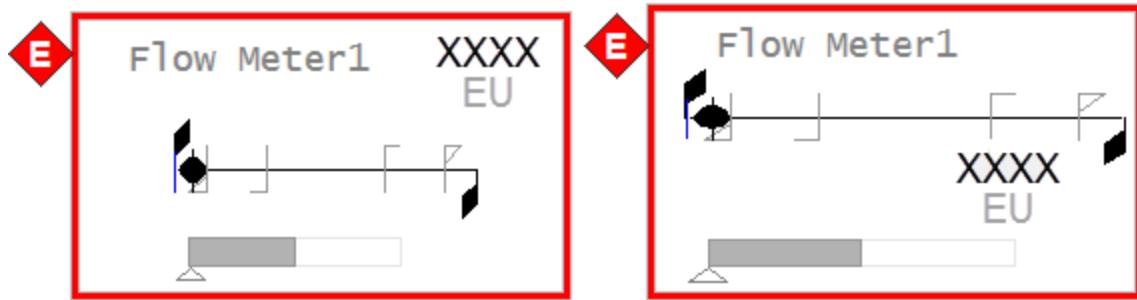

## Horizontal

The orientation of the meter is changed to horizontal as shown in the example below. Note that the proportions of the alarm border, meter symbol and controller output indicator are slightly different for the horizontal version compared to the vertical version.

## Horizontal + Mirrored

Horizontal meters can also be mirrored. Typically, this orientation is used primarily with regular meters rather than control meters.

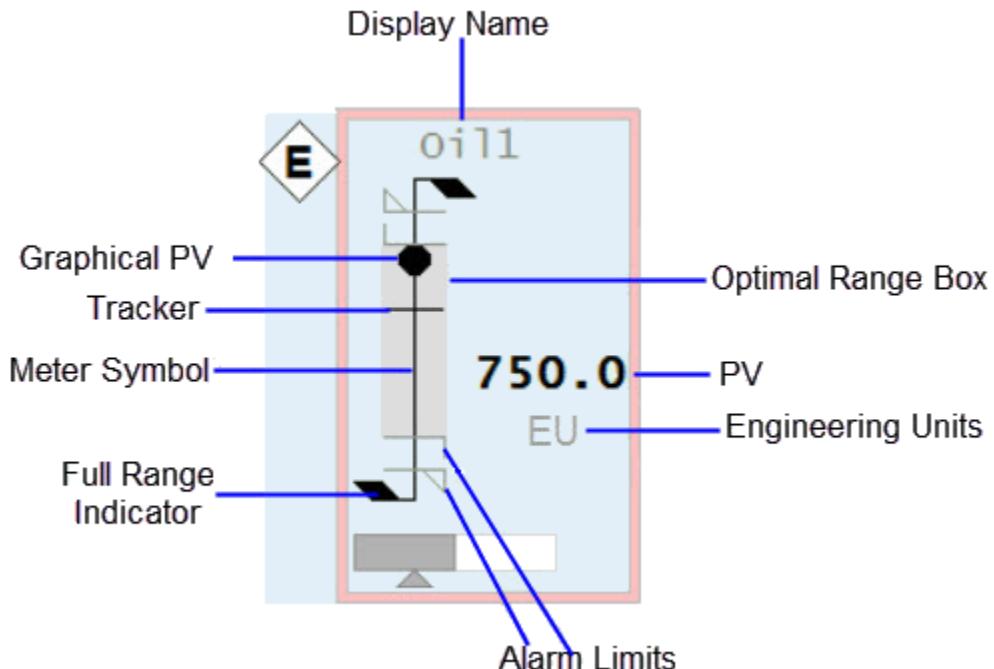

## See Also

[Meters](#)

### Meter Common Elements

The figure below shows an example of the elements that make up a meter.

### Meter Symbol and Graphical PV

Graphical PV connects to: EquipmentName.PV, EquipmentName.PVTarget

The appearance of the meter symbol and graphical PV tells operators what type of reading is being displayed (flow vs. temperature vs. pressure, etc.). For example, flow meters are represented as a basic 'stick' shape, with a black dot as the graphical PV. Temperature meters resemble a thermometer. Level meters resemble a (thin) vessel with a fill that rises and falls to represent the level, and so on. The symbols and PVs for each type of meter are shown in the following image.

Analyzer Meter	Deviation Meter	Flow Meter	Level Meter	Misc Meter	Pressure Meter	Target Meter	Temperature Meter

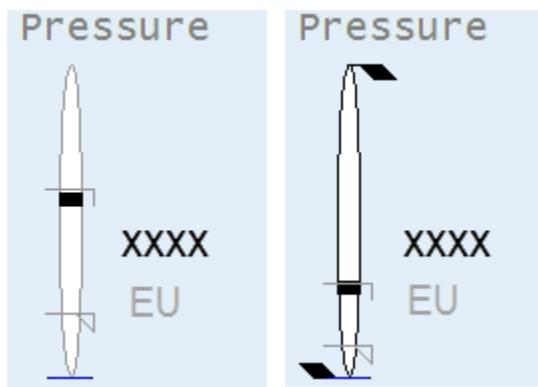

## Full Range Indicators

Connects to: EquipmentName.PRHigh, EquipmentName.PRLow, EquipmentName.PR

Each meter allows you to set a "normal" operating range ("practical" range). During most operating situations, the meter's full range is much bigger than the actual region of interest. By setting the normal operating range you can see meaningful variation in the PV when looking at the meter.

The EquipmentName.PR item is applicable to Deviation meters only. PRHigh and PRLow are not applicable to these meters.

If the PV moves outside the normal operating range, the meter scale will automatically change to show the full range of the instrument. To differentiate a meter that is showing its full range, additional flags appear at the top of the meter and the meter symbol line color changes from grey to black, as in the example below:

## Alarm Limits

Connects to: EquipmentName.PV (analog alarm - current) or (EquipmentName.HHAlm, EquipmentName.HAlm, EquipmentName.LAlm, EquipmentName.LLAlm) or PLC Alarm Limits if configured.

The alarm limit indicators appear on the meter symbol to show the location of any configured alarm limits. This allows operators to see when a PV is approaching an alarm limit. Four types of alarm limits are shown using different symbols.

**Note:** For more information about configuring PLC alarm limits, see [Configure PLC Limits with Equipment](#).

	High high alarm limit
	High alarm limit
	Low alarm limit
	Low Low alarm limit

For more information, see [Alarm Indicator](#).

An alarm limit indicator will not appear if the corresponding alarm limit is not configured for the instrument or if the limit is outside of the range shown by the meter. Note that the precise width of the alarm limit indicators varies somewhat for different meter types in order to accommodate the width of the meter symbol. For example, alarm limit indicators are wider on a level meter than on a flow meter.

## Engineering Units

Connects to: EquipmentName.PV (eng units field).

The engineering units represent the unit of measurement for the instrument.

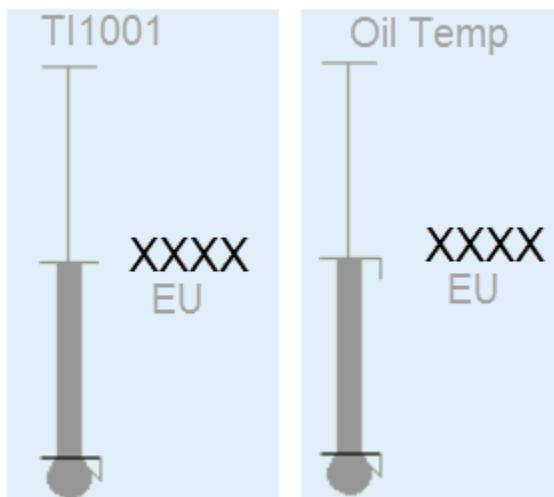

## PV

Connects to: EquipmentName.PV, EquipmentName.PVTarget

The numeric PV provides a text-based representation of the instrument reading. This provides operators with precise values when needed.

## Display Name/Nickname

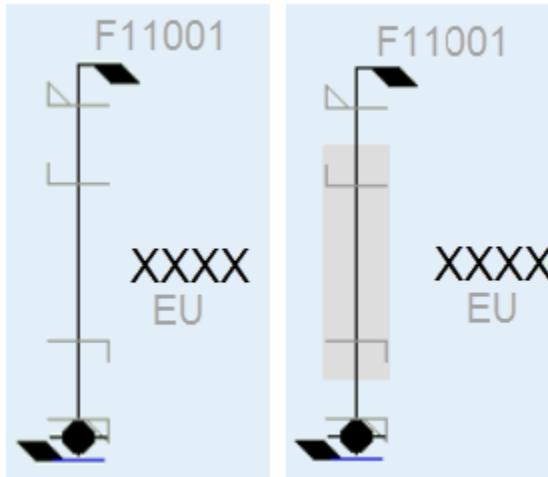

The display name/nickname shows the instrument name (by default), or, if entered by the user, a "display name". The nickname is usually a common name used to help identify the reading (for example, "Oil temp", instead of "TI1001"). The field accommodates up to 79 characters.

## Optimal Range Box

Connects to: EquipmentName.ORHigh, EquipmentName.ORLow, Visibility connected to EquipmentName.ORDsp.

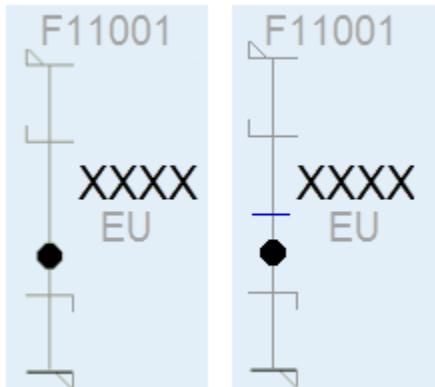

The optimal range box highlights a specific range of the meter. Typically, operators will use this feature to remind themselves of the desired or "optimal" range for the PV, depending on the operating conditions. It should be possible to enable and set the endpoints for the optimal range from the point detail. If the optimal range is not set or enabled, the box is not shown.

## Tracker

Connects to: EquipmentName.PVTrack, EquipmentName.OPTrack, EquipmentName.TrackDsp.

Similar to the optimal range box, the tracker is a user-configured indicator that marks a specific value on the meter. An operator can mark the current value of a PV so that when they look at the reading again later, they can see if it has changed. The tracker can be set and enabled/disabled from the meter faceplate.

## Control Meters - Common Elements

When a meter is used to show readings from a controller, additional information is included. Control meters include all of the [common elements](#) previously described for regular meters, plus the additional elements shown below.

### Setpoint Indicator

Connects to: EquipmentName.SP

The setpoint indicator is an additional mark on the meter symbol (similar to the tracker and alarm limit indicators) which shows the position of the controller setpoint value.

### Output Indicator

Connects to: EquipmentName.OP

The outer rectangle shape with white fill represents the entire range of the [Output \(OP\) Bar](#) (typically 0-100%), while the darker fill represents the output value.

### Feedback Indicator

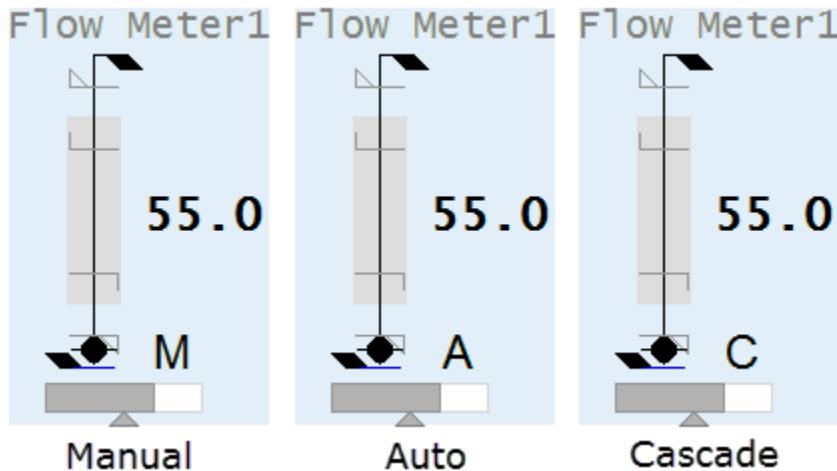

Connects to: EquipmentName.FB

This small triangular indicator represents the actual output for the controller (if available from the control system). It shares the same scale as the controller output indicator (e.g. 0-100%). This allows the operator to quickly see if the output and actual output values match. This can be particularly useful where the controller has a ramping function.

## Mode Indicator

Connects to: EquipmentName.CtrlMode, EquipmentName.CtrlModeDef

This is a single-character code that indicates the mode of the controller. Typically, the set of modes includes Manual (M), Auto (A), and Cascade (C).

**Control Mode Indicator states:**

- 0 – Auto (A)
- 1 – Manual (M)
- 2 – Cascade (C)
- 3 – Local (L)
- 4 – Special control (computer symbol)

---

**Note:** The Mode Indicator is not displayed if the tag is set to CtrlModeDef. To view the control mode at all times, remove the CtrlModeDef tag from the equipment template.

---

## See Also

[Meter Common Elements](#)

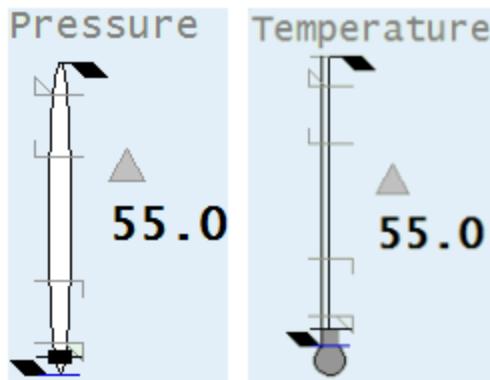

[Meter Special Elements](#)

## Meter Special Elements

Certain meters can have elements in addition to those described in [Meter Common Elements](#). There are three special elements.

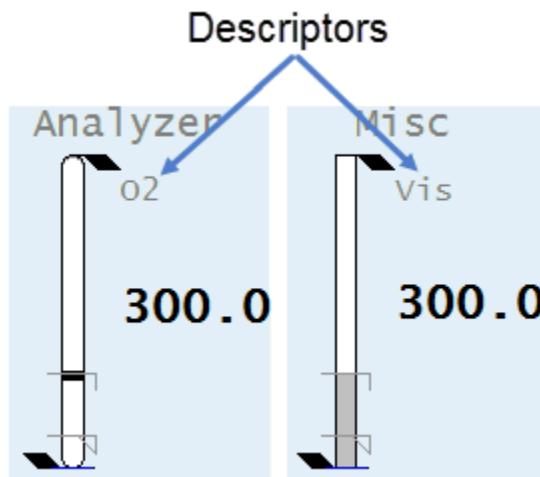

## Differential Indicator

The delta symbol ( $\Delta$ ) is used for temperature and pressure meters to indicate when a differential reading is being displayed. It is a static element which is enabled at configuration and is not connected to the control system. It consists of a simple triangle shape which is placed next to the meter.

## Descriptor

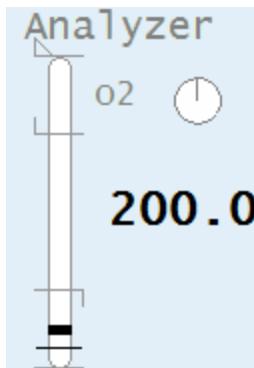

The Miscellaneous, Deviation, and Analyzer meters can all be used to show many different types of readings. Therefore, it is recommended that short text (up to 3 characters) is provided to help identify the reading (e.g., "O2" for Oxygen content, "SG" for density, "Vis" for viscosity, "Trq" for torque, etc.) .

## Clock Timer

Connects to: EquipmentName.Timer, EquipmentName.TimerEXP

The clock timer is an independent object that is integrated with Analyzer meters. It can be used in cases where the analyzer shows an intermittent sample reading. For these types of readings, the Clock Timer provides an indication of how long ago the value was updated. This helps operators to understand how current the value is. If the analyzer reads continuously the clock timer is not shown.

## Configuration Tasks

- [Add Equipment Using Equipment Editor](#): Create equipment instances for the required objects, and organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated

with the equipment you have defined in your project.

- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Meter Type	From the drop-down select one of the following meters: Level, Flow, Temperature, Pressure, Analyzer, Miscellaneous, Target, Deviation and Dual Level
Equipment Name	Enter a name for the equipment associated with the meter. You can enter a maximum of 160 characters for this option.
Equipment Item Prefix	<p>Prefix applied to the equipment item name. This allows for displaying multiple values for a single piece of equipment. For example, you want to create three meters to monitor power, voltage and current for a single pump. You would create three meters on the pump and assign the equipment item prefix "Power", "Voltage" and "Current". So, the PV values for the meters would be PowerPV, VoltagePV and CurrentPV respectively.</p> <p><b>Note:</b> To get a meter with a prefix to work correctly, you need to create tags with the required item names. From the example above, you will need to create the tags PowerPV, PowerOP, VoltagePV, VoltageOP, CurrentPV, CurrentOP and so on.</p> <p>The following equipment item names (where applicable) can be prefixed:</p> <ul style="list-style-type: none"><li>• FB</li><li>• FullScale</li><li>• OP</li><li>• ORDsp</li><li>• ORLow</li><li>• ORHigh</li><li>• PRLow</li><li>• PRHigh</li></ul>

Option	Description
	<ul style="list-style-type: none"> <li>• PV</li> <li>• PVTrack</li> <li>• PVTarget</li> <li>• SP</li> <li>• Timer</li> <li>• TrackDsp</li> </ul>
Size	Size of the meter object image - small or large
Orientation	Select the orientation that is appropriate for the presentation of the object on the graphics page.
Display Label	Use this setting to display a label at the selected position. Select <b>None</b> if you do not want to display a label.
Label	Enter the text that will display at the location specified in <b>Display Label</b> field. You can enter a maximum of 30 characters for this option.
Display Alarm Indicator	Select this option to display an alarm border around the Genie.
Display Alarm Flag	<p>Use this setting to display an alarm flag at the selected position.</p> <p><b>Note:</b> If you select the same position for the alarm flag and <b>Display Status</b> indicator (see below), they will overlap. The alarm flag will not be visible.</p>
Display Status Indicator	<p>Use this setting to display a status indicator at the selected location. Select <b>None</b> if you do not want to display the status indicator. For more information, see <a href="#">Status Indicators</a>.</p>
Display Process Variable	Select to display a process variable (numeric PV) with the meter. This option is selected by default.
Display Control Mode	<p>Select this option to display the Controller <a href="#">Control Meters - Common Elements</a>. On selecting this option the <b>Display Control Readback</b> option box is also displayed.</p> <p>The Display Control <a href="#">Control Meters - Common Elements</a> represents the actual output for the controller.</p>

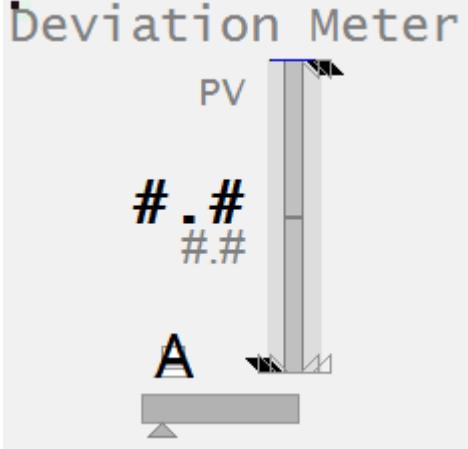

Option	Description
Display Controller Output	Select to display an output indicator with the meter. For more information, see <a href="#">Output (OP) Bar</a> .
Display Setpoint	Select to display a setpoint indicator with the meter.
Display OOS	Select to display Out of Service indicator.
Display Differential Indication	Select to display an indicator when a differential reading is detected. <b>This is visible only on Pressure and Temperature meters.</b> For more information, see <a href="#">Meter Special Elements</a> .
Descriptor	Enter a short 3-character text descriptor to indicate what is being measured. If left blank no descriptor will be displayed. <b>This is visible only on Miscellaneous, Deviation and Analyzer meters.</b>
Display Clock Timer	Select to display a clock timer on the meter. <b>This is visible only on Analyzer meters.</b> For more information, see <a href="#">Meter Special Elements</a> .
Display Control Readback	Select to display a readback indicator (also known as feedback indicator) with the meter.
Display Trend	Select this option to display a <a href="#">Trend Objects</a> object with the meter. On selecting this option, the <b>Trend Type</b> dropdown is displayed. Select either <b>Tail</b> or <b>Full</b> . <b>Note:</b> When the <b>Display Trend</b> option is selected, the Mirrored option is not available.
Trend Type	Select the type of trend to be displayed with the meter: <a href="#">Trend Tail</a> or <a href="#">Full Trend</a> .
Mirrored	Inserts a mirror image of the meter based on the selected presentation options.

## Deviation Meter

The deviation meter is used to represent the difference between two values. A positive difference is shown as a bar extending upwards from the middle of the meter symbol. A negative difference extends downwards. The configured input range for the deviation meter needs to be in equal proportions around a zero (for example -200 to +200 or -50 to +50). The PV will be shown as a deviation from setpoint, where zero=setpoint. If the PV exceeds this range, the color of the bar will change to black.

## Dual Level Meter

This object provides a compact way to monitor two related levels simultaneously. The level indication is presented on a linear scale. For example, you could use a Dual Level meter to indicate the levels of two tanks. One of the tanks is shown in a slightly darker shade of gray than the other. The Dual Level meter is designed to display the values of two levels that share a common set of scales (engineering range, practical range and alarm limits).

**Note:** If you need to display the values of two levels with different scales, use the Multiple Meter.

Property	Description
Name	Dual Level

## Level Meter

The meter symbol for a Level meter is a narrow box shape that resembles a "skinny" vessel. The graphical PV is shown as a darker fill within the vessel. The fill rises and falls to indicate the actual level.

Level meters are provided in both vertical and horizontal orientations, although it is expected they will be used primarily in the vertical orientation.

Property	Description

## Configuration Tasks

- [Add Equipment Using Equipment Editor](#): Create equipment instances for the required objects, and organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

## Configuration Tasks

- [Add Equipment Using Equipment Editor](#): Create equipment instances for the required objects, and organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Meter Type	From the drop-down select one of the following

Option	Description
	meters: Level, Flow, Temperature, Pressure, Analyzer, Miscellaneous, Target, Deviation and Dual Level
Equipment Name	Enter a name for the equipment associated with the meter. You can enter a maximum of 160 characters for this option.
Equipment Item Prefix	<p>Prefix applied to the equipment item name. This allows for displaying multiple values for a single piece of equipment. For example, you want to create three meters to monitor power, voltage and current for a single pump. You would create three meters on the pump and assign the equipment item prefix "Power", "Voltage" and "Current". So, the PV values for the meters would be PowerPV, VoltagePV and CurrentPV respectively.</p> <p><b>Note:</b> To get a meter with a prefix to work correctly, you need to create tags with the required item names. From the example above, you will need to create the tags PowerPV, PowerOP, VoltagePV, VoltageOP, CurrentPV, CurrentOP and so on.</p> <p>The following equipment item names (where applicable) can be prefixed:</p> <ul style="list-style-type: none"> <li>• FB</li> <li>• FullScale</li> <li>• OP</li> <li>• ORDsp</li> <li>• ORLow</li> <li>• ORHigh</li> <li>• PRLow</li> <li>• PRHigh</li> <li>• PV</li> <li>• PVTrack</li> <li>• PVTarget</li> <li>• SP</li> <li>• Timer</li> <li>• TrackDsp</li> </ul>
Size	Size of the meter object image - small or large
Orientation	Select the orientation that is appropriate for the

Option	Description
	presentation of the object on the graphics page.
Display Label	Use this setting to display a label at the selected position. Select <b>None</b> if you do not want to display a label.
Label	Enter the text that will display at the location specified in <b>Display Label</b> field. You can enter a maximum of 30 characters for this option.
Display Alarm Indicator	Select this option to display an alarm border around the Genie.
Display Alarm Flag	Use this setting to display an alarm flag at the selected position.  <b>Note:</b> If you select the same position for the alarm flag and <b>Display Status</b> indicator (see below), they will overlap. The alarm flag will not be visible.
Display Status Indicator	Use this setting to display a status indicator at the selected location. Select <b>None</b> if you do not want to display the status indicator. For more information, see <a href="#">Status Indicators</a> .
Display Process Variable	Select to display a process variable (numeric PV) with the meter. This option is selected by default.
Display Control Mode	Select this option to display the Controller <a href="#">Control Meters - Common Elements</a> . On selecting this option the <b>Display Control Readback</b> option box is also displayed.  The <a href="#">Display Control Control Meters - Common Elements</a> represents the actual output for the controller.
Display Controller Output	Select to display an output indicator with the meter. For more information, see <a href="#">Output (OP) Bar</a> .
Display Setpoint	Select to display a setpoint indicator with the meter.
Display OOS	Select to display Out of Service indicator.
Display Differential Indication	Select to display an indicator when a differential reading is detected. <b>This is visible only on Pressure and Temperature meters</b> . For more information, see <a href="#">Meter Special Elements</a> .
Descriptor	Enter a short 3-character text descriptor to indicate

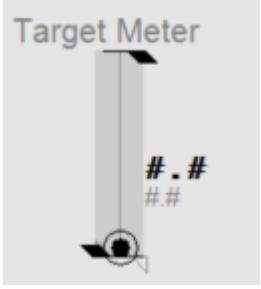

Option	Description
	what is being measured. If left blank no descriptor will be displayed. <b>This is visible only on Miscellaneous, Deviation and Analyzer meters.</b>
Display Clock Timer	Select to display a clock timer on the meter. <b>This is visible only on Analyzer meters.</b> For more information, see <a href="#">Meter Special Elements</a> .
Display Control Readback	Select to display a readback indicator (also known as feedback indicator) with the meter.
Display Trend	Select this option to display a <a href="#">Trend Objects</a> object with the meter. On selecting this option, the <b>Trend Type</b> dropdown is displayed. Select either <b>Tail</b> or <b>Full</b> . <b>Note:</b> When the <b>Display Trend</b> option is selected, the Mirrored option is not available.
Trend Type	Select the type of trend to be displayed with the meter: <a href="#">Trend Tail</a> or <a href="#">Full Trend</a> .
Mirrored	Inserts a mirror image of the meter based on the selected presentation options.

## Configuration Tasks

1. [Add Equipment Using Equipment Editor](#): Create the equipment for the required objects. Organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
2. [Equipment References](#): Create the required relationships (equipment references) between a piece of equipment to items of another piece of equipment. This allows you to refer to equipment.items outside of the equipment hierarchy.
3. [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
4. [Insert a Composite Genie](#): Create graphics pages with instances of Composite Genies that are associated with the equipment you have defined in your project.
5. [Create a New Faceplate](#): Add a faceplate for the equipment to allow operators to engage with the equipment at runtime.
6. Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Equipment Name	Enter a name for the equipment associated with the meter. You can enter a maximum of 160 characters for this option. <b>Note:</b> The Multiple Meter equipment needs to be manually configured to reference the name of each meter to be included.
Meter Count	Number of meters - select from Duplicated for two meters or Triplicated for three meters.
Equipment #1/#2/#3 Name	Enter the name of the equipment object for the first/second/third meter (displayed only if meter count is triplicated). You can enter a maximum of 160 characters for this option.
Equipment #1/#2/#3 Prefix	Prefix applied to the equipment item name for the meters. This allows for displaying multiple values for a single piece of equipment. For example, you want to create three meters to monitor power, voltage and current for a single pump. You would create three meters on the pump and assign the equipment item prefix "Power", "Voltage" and "Current". So, the PV values for the meters would be PowerPV, VoltagePV and CurrentPV respectively.

Option	Description
	<p><b>Note:</b> To get a meter with a prefix to work correctly, you need to create tags with the required item names. From the example above, you will need to create the tags PowerPV, PowerOP, VoltagePV, VoltageOP, CurrentPV, CurrentOP and so on.</p> <p>The following equipment item names (where applicable) can be prefixed:</p> <ul style="list-style-type: none"> <li>• PV</li> <li>• OP</li> <li>• ORDsp</li> <li>• TrackDsp</li> <li>• FB</li> <li>• PRLow</li> <li>• PRHigh</li> <li>• ORLow</li> <li>• ORHigh</li> <li>• SP</li> <li>• PVTrack</li> <li>• FullScale</li> <li>• OPTrack</li> <li>• Timer</li> <li>• PVTtarget</li> </ul>
Meter Type	From a drop-down select one of the following meters: Level, Flow, Temperature, Pressure, Analyzer, Miscellaneous, and Deviation.
Size	Size of the meter object image - small or large
Orientation	Select the orientation that is appropriate for the presentation of the object on the graphics page.
Display Label	Use this setting to display a label at the selected position. Select <b>None</b> if you do not want to display a label.
Label	Enter the text that will display at the location specified in <b>Display Label</b> field. You can enter a maximum of 30 characters for this option.

Option	Description
Display Alarm Indicator	Shows or hides the Alarm Indicator which indicates the highest priority alarm and its state for this group of meters.
Display Setpoint	Select to display a setpoint indicator with the meter.
Display OOS	Select to display Out of Service indicator.
Mirrored	Inserts a mirror image of the meter based on the selected presentation options.

[Meter Faceplates](#)

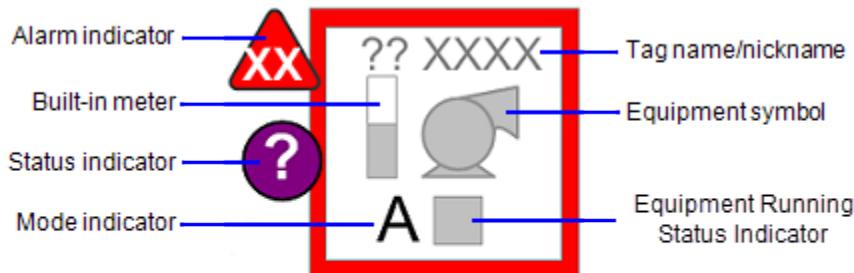

## Drive, Belt and Mining Objects

The drive objects that are available in the Situational Awareness library are classified into the following groups:

- [Drive Objects](#)
- [Belt Objects](#)
- [Rotary Valve](#).

They are all similar in their elements and functionality. The equipment symbol (see below) is the only element that is unique to each drive type.

The image below shows the elements that make up a basic drive object.

---

**Note:** The drive object includes a built-in meter so that you can display a key analog value next to the drive symbol. If you do not want the side meter, you do not need the following item: PV.

If you want your drive to have multiple analog values, you can display those as separate meter objects using meter Composite Genies. When using meters the addresses and tag names need to be unique. Use a prefix on the item name. For more information refer to [Meters](#).

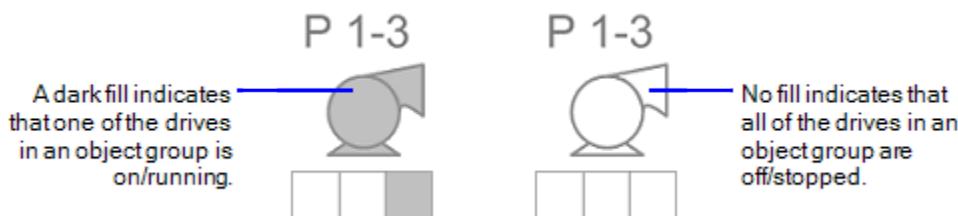

## Equipment symbol

Connects to: Running, Stopped

The equipment symbol indicates the following:

- The type of equipment being represented.
- The run status of the drive.

A dark fill indicates the run status of a drive is 'on' or 'running'. A white fill indicates the drive is 'off' or 'stopped'.

Some equipment symbols are available in variations that point in a particular direction.

## Alarm indicator

An alarm indicator is used to show the occurrence and status of alarms associated with an object. See [Use Alarm Indicators](#) for more information.

## Status indicator

Connects to: EqStatus.

A running state indicator is used to represent various non-alarm conditions associated with an object, such as abnormal data quality or control system states. See Status Indicators in the section on Common Object Properties.

## Equipment Running State Indicator

Connects to: RunStatus.

An Equipment Running State Indicator is a compact indicator that can be used to represent a variety of states for drive objects. They allow an object to represent a group of drives. See [Equipment Running State Indicators](#) in the section on Common Object Properties.

## Built-in meter

Connects to: PV.

This item is available to accommodate drive objects that have an integrated meter for motor amps or kilowatts.

It is built using a small version of the meter symbol and graphical PV from the Miscellaneous meter. To give the graphics designer flexibility to put the relevant information next to the object, the item name that drives this graph has been given a name that describes its use on the genie.

The built-in meter element is only shown if the reading is available. It is only available for single-drive objects, it is not used with groups of multiple drive objects.

For drive objects with a left-facing option, the built-in meter is moved to the right-hand side of the equipment symbol.

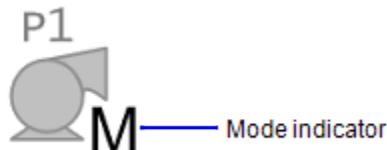

## Tag name or nickname

The tag name/nickname field shows the equipment tag name (by default), or, if entered by the user, a "nickname". The nickname is usually a common name used to help identify the reading (for example, "Oil pump", instead of "P4509").

## Mode indicator

Connects to: CtrlMode, CtrlModeDef

This is a single-character code that indicates the current mode of the drive.

### Control Mode Indicator states:

- 0 – Auto (A)
- 1 – Manual (M)
- 2 – Cascade (C)
- 3 – Local (L)
- 4 – Special control (computer symbol)

---

**Note:** The Mode Indicator is not displayed if the tag is set to CtrlModeDef. To view the control mode at all times, remove the CtrlModeDef tag from the equipment template.

---

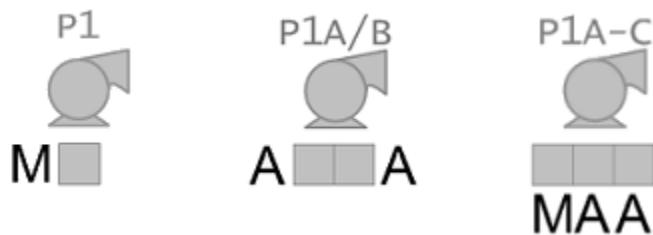

The AutoCmd, ManCmd, CasCmd, FwdCmd, LocalCmd, MaintCmd, RemCmd, RevCmd, StartCmd, StopCmd, OOSCmd tags work in conjunction with the CtrlMode tag. For more information, see [Create a New Faceplate](#).

If a drive object includes Equipment Running State Indicators, the following positioning is used:

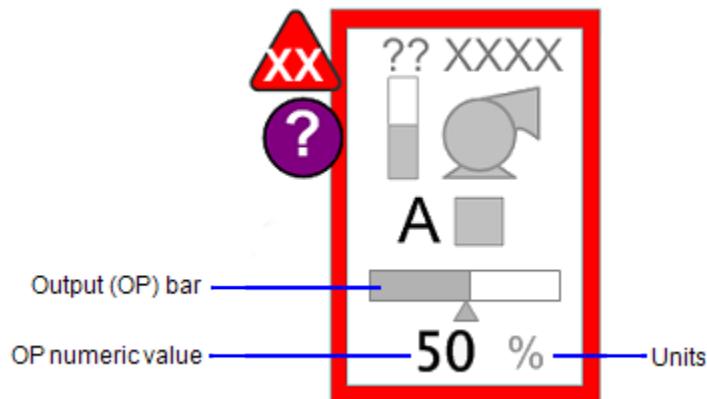

- For a single Equipment Running State Indicator, the mode indicator is positioned to the left of the Equipment Running State Indicator.
- For two Equipment Running State Indicators, the mode indicators are placed on either side of the Equipment

Running State Indicator.

- For groups of three Equipment Running State Indicators, (or more), the mode indicator is shown underneath the Equipment Running State Indicator.

If the object represents a variable speed drive (VSD), it may also include the following additional elements.

## Output (OP) bar

Connects to: OP.

The output (OP) bar provides a graphical representation of the commanded output for a variable speed drive (VSD). See [Output \(OP\) Bar](#) in the section on Common Object Properties.

When dealing with a group of 2 or more drives, the VSD output bar should only be shown if there is only one VSD in the group, or if there is a common controller for all of the drives in the group. If the group includes two or more separate VSDs, either the VSD output indicator should not be shown, or two separate drive objects should be used.

The readback indicator is only shown for drives where readback is available. Generally this will show the actual speed of the drive, measured as a percentage. When a group of drives with a VSD is shown, and readback is available, readback indicators are shown for each drive.

## Numeric OP

Connects to: OP.

For variable speed drives, a numeric representation of the OP can provide operators with precise values when needed. This is measured as a percentage value.

The visibility of the numeric OP is tied to the visibility state for PVs (as specified in the Show/Hide Settings). If the user selects to turn off the visibility for PVs, the numeric OP values is also hidden.

## Units

Represents the unit of measurement for the output. Typically, this will be percentage (%) for VSD output.

## Configuration Tasks

- [Add Equipment Using Equipment Editor](#): Create equipment instances for the required objects, and organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Equipment Name	Enter a name for the piece of equipment. You can enter a maximum of 160 characters for this option.
Drive Type	From the drop down select the type of drive object to be configured.
Size	Select the size that is appropriate for the presentation of the object on the graphics page.
Orientation	Select the orientation that is appropriate for the presentation of the object on the graphics page.
Display Label	Select the location to display a label. Select <b>None</b> if you do not want to display a label.

Option	Description
Label	Enter the text that will display at the location specified in <b>Display Label</b> field. You can enter a maximum of 30 characters for this option.
Display Alarm Indicator	Select this option to display an alarm indicator which indicates the highest priority alarm and its state for this drive.
Display Alarm Flag	<p>Use this setting to display an alarm flag at the selected position.</p> <p><b>Note:</b> If you select the same position for the alarm flag and <b>Display Status</b> indicator (see below), they will overlap. The alarm flag will not be visible.</p>
Display Status Indicator	<p>Select the location to display a status indicator. Select <b>None</b> if you do not want to see the status indicator. For more information, see <a href="#">Status Indicators</a>.</p>
Number of Equipment	<p>If the object represents multiple pieces of equipment, select how many pieces of equipment the object group will include. When the object displays, it will include a corresponding number of <a href="#">Equipment Running State Indicators</a>.</p> <p>If you select 1, the <b>Display Compact Running State</b> option will be displayed.</p> <p>If more than 1 is selected the corresponding Sub Equipment #n Name fields will be displayed and the <b>Display MEO Alarm</b> and <b>Display OOS</b> options will be displayed.</p> <p><b>Note:</b> Multiple pieces of equipment (MEO) are also known as Equipment Running State Indicators.</p>
Display Compact Running State	Select to display a compact <a href="#">Equipment Running State Indicators</a> .
Display Related Equipment Alarm Indicator	Select to display the alarm indicator which indicates the highest priority alarm and its state for every related piece of equipment in this object.
Related Equipment #n Name	Enter a name for each piece of equipment in the group.
Display Control Mode	Select this option to display a mode indicator for the object.
Display OOS	If the number of sub equipment associated with the drive object is more than 1, you can select this option

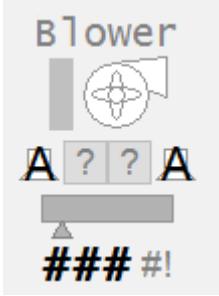

Option	Description
	to display an "Out of Service" indicator for each related equipment.
Display Meter	Select this option to display a built-in meter for the object.
Display Output Bar	Select to display an output indicator with the object. On selecting this option, the "Display Control Readback" and "Display Control Value" options are displayed. The Display Control <a href="#">Control Meters - Common Elements</a> represents the actual output for the controller.
Display Readback	Select this option to display a visual marker for the readback value on the drive's output.
Display Value	Select this option to display the output value of the drive.

- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Equipment Name	Enter a name for the piece of equipment. You can enter a maximum of 160 characters for this option.
Drive Type	From the drop down select the type of drive object to be configured.
Size	Select the size that is appropriate for the presentation of the object on the graphics page.
Orientation	Select the orientation that is appropriate for the presentation of the object on the graphics page.
Display Label	Select the location to display a label. Select <b>None</b> if you do not want to display a label.
Label	Enter the text that will display at the location specified in <b>Display Label</b> field. You can enter a maximum of 30 characters for this option.
Display Alarm Indicator	Select this option to display an alarm indicator which indicates the highest priority alarm and its state for this drive.
Display Alarm Flag	Use this setting to display an alarm flag at the selected position. <b>Note:</b> If you select the same position for the alarm flag and <b>Display Status</b> indicator (see below), they will overlap. The alarm flag will not be visible.
Display Status Indicator	Select the location to display a status indicator. Select <b>None</b> if you do not want to see the status indicator. For more information, see <a href="#">Status Indicators</a> .

Option	Description
Number of Equipment	<p>If the object represents multiple pieces of equipment, select how many pieces of equipment the object group will include. When the object displays, it will include a corresponding number of <a href="#">Equipment Running State Indicators</a>.</p> <p>If you select 1, the <b>Display Compact Running State</b> option will be displayed.</p> <p>If more than 1 is selected the corresponding Sub Equipment #n Name fields will be displayed and the <b>Display MEO Alarm</b> and <b>Display OOS</b> options will be displayed.</p> <p><b>Note:</b> Multiple pieces of equipment (MEO) are also known as Equipment Running State Indicators.</p>
Display Compact Running State	<p>Select to display a compact <a href="#">Equipment Running State Indicators</a>.</p>
Display Related Equipment Alarm Indicator	<p>Select to display the alarm indicator which indicates the highest priority alarm and its state for every related piece of equipment in this object.</p>
Related Equipment #n Name	<p>Enter a name for each piece of equipment in the group.</p>
Display Control Mode	<p>Select this option to display a mode indicator for the object.</p>
Display OOS	<p>If the number of sub equipment associated with the drive object is more than 1, you can select this option to display an "Out of Service" indicator for each related equipment.</p>
Display Meter	<p>Select this option to display a built-in meter for the object.</p>
Display Output Bar	<p>Select to display an output indicator with the object. On selecting this option, the "Display Control Readback" and "Display Control Value" options are displayed.</p> <p>The Display Control <a href="#">Control Meters - Common Elements</a> represents the actual output for the controller.</p>
Display Readback	<p>Select this option to display a visual marker for the readback value on the drive's output.</p>
Display Value	<p>Select this option to display the output value of the</p>

## Configuration Tasks

- [Add Equipment Using Equipment Editor](#): Create equipment instances for the required objects, and organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Equipment Name	Enter a name for the piece of equipment. You can

Option	Description
	enter a maximum of 160 characters for this option.
Drive Type	From the drop down select the type of drive object to be configured.
Size	Select the size that is appropriate for the presentation of the object on the graphics page.
Orientation	Select the orientation that is appropriate for the presentation of the object on the graphics page.
Display Label	Select the location to display a label. Select <b>None</b> if you do not want to display a label.
Label	Enter the text that will display at the location specified in <b>Display Label</b> field. You can enter a maximum of 30 characters for this option.
Display Alarm Indicator	Select this option to display an alarm indicator which indicates the highest priority alarm and its state for this drive.
Display Alarm Flag	Use this setting to display an alarm flag at the selected position. <b>Note:</b> If you select the same position for the alarm flag and <b>Display Status</b> indicator (see below), they will overlap. The alarm flag will not be visible.
Display Status Indicator	Select the location to display a status indicator. Select <b>None</b> if you do not want to see the status indicator. For more information, see <a href="#">Status Indicators</a> .
Number of Equipment	If the object represents multiple pieces of equipment, select how many pieces of equipment the object group will include. When the object displays, it will include a corresponding number of <a href="#">Equipment Running State Indicators</a> . If you select 1, the <b>Display Compact Running State</b> option will be displayed. If more than 1 is selected the corresponding Sub Equipment #n Name fields will be displayed and the <b>Display MEO Alarm</b> and <b>Display OOS</b> options will be displayed. <b>Note:</b> Multiple pieces of equipment (MEO) are also known as Equipment Running State Indicators.
Display Compact Running State	Select to display a compact <a href="#">Equipment Running State</a>

Option	Description
	<a href="#">Indicators</a> .
Display Related Equipment Alarm Indicator	Select to display the alarm indicator which indicates the highest priority alarm and its state for every related piece of equipment in this object.
Related Equipment #n Name	Enter a name for each piece of equipment in the group.
Display Control Mode	Select this option to display a mode indicator for the object.
Display OOS	If the number of sub equipment associated with the drive object is more than 1, you can select this option to display an "Out of Service" indicator for each related equipment.
Display Meter	Select this option to display a built-in meter for the object.
Display Output Bar	Select to display an output indicator with the object. On selecting this option, the "Display Control Readback" and "Display Control Value" options are displayed. The Display Control <a href="#">Control Meters - Common Elements</a> represents the actual output for the controller.
Display Readback	Select this option to display a visual marker for the readback value on the drive's output.
Display Value	Select this option to display the output value of the drive.

## Configuration Tasks

- [Add Equipment Using Equipment Editor](#): Create equipment instances for the required objects, and organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Equipment Name	Enter a name for the piece of equipment. You can enter a maximum of 160 characters for this option.
Drive Type	From the drop down select the type of drive object to be configured.
Size	Select the size that is appropriate for the presentation of the object on the graphics page.
Orientation	Select the orientation that is appropriate for the presentation of the object on the graphics page.
Display Label	Select the location to display a label. Select <b>None</b> if you do not want to display a label.

Option	Description
Label	Enter the text that will display at the location specified in <b>Display Label</b> field. You can enter a maximum of 30 characters for this option.
Display Alarm Indicator	Select this option to display an alarm indicator which indicates the highest priority alarm and its state for this drive.
Display Alarm Flag	<p>Use this setting to display an alarm flag at the selected position.</p> <p><b>Note:</b> If you select the same position for the alarm flag and <b>Display Status</b> indicator (see below), they will overlap. The alarm flag will not be visible.</p>
Display Status Indicator	<p>Select the location to display a status indicator. Select <b>None</b> if you do not want to see the status indicator. For more information, see <a href="#">Status Indicators</a>.</p>
Number of Equipment	<p>If the object represents multiple pieces of equipment, select how many pieces of equipment the object group will include. When the object displays, it will include a corresponding number of <a href="#">Equipment Running State Indicators</a>.</p> <p>If you select 1, the <b>Display Compact Running State</b> option will be displayed.</p> <p>If more than 1 is selected the corresponding Sub Equipment #n Name fields will be displayed and the <b>Display MEO Alarm</b> and <b>Display OOS</b> options will be displayed.</p> <p><b>Note:</b> Multiple pieces of equipment (MEO) are also known as Equipment Running State Indicators.</p>
Display Compact Running State	Select to display a compact <a href="#">Equipment Running State Indicators</a> .
Display Related Equipment Alarm Indicator	Select to display the alarm indicator which indicates the highest priority alarm and its state for every related piece of equipment in this object.
Related Equipment #n Name	Enter a name for each piece of equipment in the group.
Display Control Mode	Select this option to display a mode indicator for the object.
Display OOS	If the number of sub equipment associated with the drive object is more than 1, you can select this option

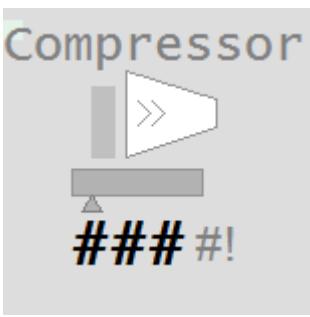

Option	Description
	to display an "Out of Service" indicator for each related equipment.
Display Meter	Select this option to display a built-in meter for the object.
Display Output Bar	Select to display an output indicator with the object. On selecting this option, the "Display Control Readback" and "Display Control Value" options are displayed. The Display Control <a href="#">Control Meters - Common Elements</a> represents the actual output for the controller.
Display Readback	Select this option to display a visual marker for the readback value on the drive's output.
Display Value	Select this option to display the output value of the drive.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Equipment Name	Enter a name for the piece of equipment. You can enter a maximum of 160 characters for this option.
Belt Drive Type	From the drop down select the type of drive object to be configured.
Size	Select the size that is appropriate for the presentation of the object on the graphics page.
Orientation	Select the orientation that is appropriate for the presentation of the object on the graphics page.
Display Label	Select the location to display a label. Select <b>None</b> if you do not want to display a label.

Option	Description
Label	Enter the text that will display at the location specified in <b>Display Label</b> field. You can enter a maximum of 30 characters for this option.
Display Alarm Indicator	Select this option to display an alarm indicator which indicates the highest priority alarm and its state for this drive.
Display Alarm Flag	<p>Use this setting to display an alarm flag at the selected position.</p> <p><b>Note:</b> If you select the same position for the alarm flag and <b>Display Status</b> indicator (see below), they will overlap. The alarm flag will not be visible.</p>
Display Status Indicator	Select the location to display a status indicator. Select <b>None</b> if you do not want to see the status indicator. For more information, see <a href="#">Status Indicators</a> .
Number of Equipment	<p>If the object represents multiple pieces of equipment, select how many pieces of equipment the object group will include. When the object displays, it will include a corresponding number of <a href="#">Equipment Running State Indicators</a>.</p> <p>If you select 1, the <b>Display Compact Running State</b> option will be displayed.</p> <p>If more than 1 is selected the corresponding Sub Equipment #n Name fields will be displayed and the <b>Display MEO Alarm</b> and <b>Display OOS</b> options will be displayed.</p> <p><b>Note:</b> Multiple pieces of equipment (MEO) are also known as Equipment Running State Indicators.</p>
Display Compact Running State	Select to display a compact <a href="#">Equipment Running State Indicators</a> .
Display Related Equipment Alarm Indicator	Select to display the alarm indicator which indicates the highest priority alarm and its state for every related piece of equipment in this object.
Related Equipment #n Name	Enter a name for each piece of equipment in the group.
Display Control Mode	Select this option to display a <a href="#">mode indicator</a> for the object.
Display OOS	If the number of sub equipment associated with the drive object is more than 1, you can select this option

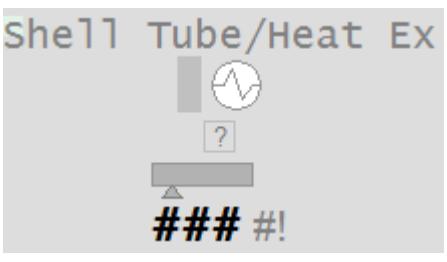

Option	Description
	to display an "Out of Service" indicator for each related equipment.
Display Meter	Select this option to display a <a href="#">built-in meter</a> for the object.
Display Output Bar	Select to display an output indicator with the object. On selecting this option, the "Display Control Readback" and "Display Control Value" options are displayed. The <a href="#">Control Meters - Common Elements</a> represents the actual output for the controller.
Display Readback	Select this option to display a visual marker for the readback value on the drive's output.
Display Value	Select this option to display the output value of the drive.

## Configuration Tasks

- [Add Equipment Using Equipment Editor](#): Create equipment instances for the required objects, and organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Equipment Name	Enter a name for the piece of equipment. You can enter a maximum of 160 characters for this option.
Mining Drive Type	From the drop down select the type of drive object to be configured.
Size	Select the size that is appropriate for the presentation of the object on the graphics page.
Orientation	Select the orientation that is appropriate for the presentation of the object on the graphics page.

Option	Description
Display Label	<p>Select the location to display a label.</p> <p>Select <b>None</b> if you do not want to display a label.</p>
Label	<p>Enter the text that will display at the location specified in <b>Display Label</b> field. You can enter a maximum of 30 characters for this option.</p>
Display Alarm Indicator	<p>Select this option to display an alarm indicator which indicates the highest priority alarm and its state for this drive.</p>
Display Alarm Flag	<p>Use this setting to display an alarm flag at the selected position.</p> <p><b>Note:</b> If you select the same position for the alarm flag and <b>Display Status</b> indicator (see below), they will overlap. The alarm flag will not be visible.</p>
Display Status Indicator	<p>Select the location to display a status indicator. Select <b>None</b> if you do not want to see the status indicator.</p> <p>For more information, see <a href="#">Status Indicators</a>.</p>
Number of Equipment	<p>If the object represents multiple pieces of equipment, select how many pieces of equipment the object group will include. When the object displays, it will include a corresponding number of Running State Indicators.</p> <p>If you select 1, the <b>Display Compact Running State</b> option will be displayed.</p> <p>If more than 1 is selected the corresponding Sub Equipment #n Name fields will be displayed and the <b>Display MEO Alarm</b> and <b>Display OOS</b> options will be displayed.</p> <p><b>Note:</b> Multiple pieces of equipment (MEO) are also known as Equipment Running State Indicators.</p>
Display Compact Running State	<p>Select to display a compact <a href="#">Equipment Running State Indicators</a>.</p>
Display Related Equipment Alarm Indicator	<p>Select to display the alarm indicator which indicates the highest priority alarm and its state for every related piece of equipment in this object.</p>
Related Equipment #n Name	<p>Enter a name for each piece of equipment in the group.</p>
Display Control Mode	<p>Select this option to display a <a href="#">mode indicator</a> for the object.</p>

Option	Description
Display OOS	If the number of sub equipment associated with the drive object is more than 1, you can select this option to display an "Out of Service" indicator for each related equipment.
Display Meter	Select this option to display a <a href="#">built-in meter</a> for the object.
Display Output Bar	Select to display an output indicator with the object. On selecting this option, the "Display Control Readback" and "Display Control Value" options are displayed. The <a href="#">Control Meters - Common Elements</a> represents the actual output for the controller.
Display Readback	Select this option to display a visual marker for the readback value on the drive's output.
Display Value	Select this option to display the output value of the drive.

## Configuration Tasks

- [Add Equipment Using Equipment Editor](#): Create equipment instances for the required objects, and organize

the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.

- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Equipment Name	Enter a name for the piece of equipment. You can enter a maximum of 160 characters for this option.
Mining Drive Type	From the drop down select the type of drive object to be configured.
Size	Select the size that is appropriate for the presentation of the object on the graphics page.
Orientation	Select the orientation that is appropriate for the presentation of the object on the graphics page.
Display Label	Select the location to display a label. Select <b>None</b> if you do not want to display a label.
Label	Enter the text that will display at the location specified in <b>Display Label</b> field. You can enter a maximum of 30 characters for this option.
Display Alarm Indicator	Select this option to display an alarm indicator which indicates the highest priority alarm and its state for this drive.
Display Alarm Flag	Use this setting to display an alarm flag at the selected position. <b>Note:</b> If you select the same position for the alarm flag and <b>Display Status</b> indicator (see below), they will overlap. The alarm flag will not be visible.
Display Status Indicator	Select the location to display a status indicator. Select <b>None</b> if you do not want to see the status indicator. For more information, see <a href="#">Status Indicators</a> .

Option	Description
Number of Equipment	<p>If the object represents multiple pieces of equipment, select how many pieces of equipment the object group will include. When the object displays, it will include a corresponding number of Running State Indicators.</p> <p>If you select 1, the <b>Display Compact Running State</b> option will be displayed.</p> <p>If more than 1 is selected the corresponding Sub Equipment #n Name fields will be displayed and the <b>Display MEO Alarm</b> and <b>Display OOS</b> options will be displayed.</p> <p><b>Note:</b> Multiple pieces of equipment (MEO) are also known as Equipment Running State Indicators.</p>
Display Compact Running State	Select to display a compact <a href="#">Equipment Running State Indicators</a> .
Display Related Equipment Alarm Indicator	Select to display the alarm indicator which indicates the highest priority alarm and its state for every related piece of equipment in this object.
Related Equipment #n Name	Enter a name for each piece of equipment in the group.
Display Control Mode	Select this option to display a <a href="#">mode indicator</a> for the object.
Display OOS	If the number of sub equipment associated with the drive object is more than 1, you can select this option to display an "Out of Service" indicator for each related equipment.
Display Meter	Select this option to display a <a href="#">built-in meter</a> for the object.
Display Output Bar	<p>Select to display an output indicator with the object. On selecting this option, the "Display Control Readback" and "Display Control Value" options are displayed.</p> <p>The <a href="#">Control Meters - Common Elements</a> represents the actual output for the controller.</p>
Display Readback	Select this option to display a visual marker for the readback value on the drive's output.
Display Value	Select this option to display the output value of the drive.

Property	Description
	<p><b>RunStatus</b> (see <a href="#">Equipment Running States</a>)</p> <p><b>OP</b> (see <a href="#">Drive,Belt and Mining Objects</a>)</p> <p><b>PV</b> (see <a href="#">Drive,Belt and Mining Objects</a>)</p> <p><b>EqStatus</b> (see <a href="#">Drive,Belt and Mining Objects</a>)</p> <p><b>Note:</b> The drive object includes a built-in meter so that you can display a key analog value next to the drive symbol. If you do not want the side meter, you do not need the PV item. If you want your drive to have multiple analog values, you can display those as separate meter objects that have a set of items associated with them. Refer to the <a href="#">Meters</a> topics for more information about these items.</p>
Equipment Parameters the Equipment Items Expect	InternalIODevice CicodeIODevice EqStatusFunc CtrlMode Range Alarm Limits See <a href="#">Equipment Configuration Parameters</a> .
Associated Faceplate(s)	Single and Multiple DOL Drive Single and Multiple VSD Drive - Single Direction Single DOL Drive with Forward/Reverse Capability Single VSD Drive with Forward/Reverse Capability
Equipment.Items that the Faceplate expects	<b>OPTrack</b> (see <a href="#">Drive,Belt and Mining Objects</a> ) <b>CtrlMode, CtrlModeDef</b> (see <a href="#">Drive,Belt and Mining Objects</a> ) <b>AutoCmd, ManCmd, CasCmd, FwdCmd, LocalCmd, MaintCmd, RemCmd, RevCmd, StartCmd, StopCmd, OOSCmd</b> (see <a href="#">Drive,Belt and Mining Objects</a> ) <b>OOS, OOSDisabled</b> (see <a href="#">Equipment Running States</a> ) <b>Fwd, Rev, Maint</b> <b>Stopped</b>

## Configuration Tasks

- **Add Equipment Using Equipment Editor:** Create equipment instances for the required objects, and organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.

- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Equipment Name	Enter a name for the piece of equipment. You can enter a maximum of 160 characters for this option.
Mining Drive Type	From the drop down select the type of drive object to be configured.
Size	Select the size that is appropriate for the presentation of the object on the graphics page.
Orientation	Select the orientation that is appropriate for the presentation of the object on the graphics page.
Display Label	Select the location to display a label. Select <b>None</b> if you do not want to display a label.
Label	Enter the text that will display at the location specified in <b>Display Label</b> field. You can enter a maximum of 30 characters for this option.
Display Alarm Indicator	Select this option to display an alarm indicator which indicates the highest priority alarm and its state for this drive.
Display Alarm Flag	Use this setting to display an alarm flag at the selected position. <b>Note:</b> If you select the same position for the alarm flag and <b>Display Status</b> indicator (see below), they will overlap. The alarm flag will not be visible.
Display Status Indicator	Select the location to display a status indicator. Select <b>None</b> if you do not want to see the status indicator. For more information, see <a href="#">Status Indicators</a> .
Number of Equipment	If the object represents multiple pieces of equipment,

Option	Description
	<p>select how many pieces of equipment the object group will include. When the object displays, it will include a corresponding number of Running State Indicators.</p> <p>If you select 1, the <b>Display Compact Running State</b> option will be displayed.</p> <p>If more than 1 is selected the corresponding Sub Equipment #n Name fields will be displayed and the <b>Display MEO Alarm</b> and Display OOS options will be displayed.</p> <p><b>Note:</b> Multiple pieces of equipment (MEO) are also known as Equipment Running State Indicators.</p>
Display Compact Running State	Select to display a compact <a href="#">Equipment Running State Indicators</a> .
Display Related Equipment Alarm Indicator	Select to display the alarm indicator which indicates the highest priority alarm and its state for every related piece of equipment in this object.
Related Equipment #n Name	Enter a name for each piece of equipment in the group.
Display Control Mode	Select this option to display a <a href="#">mode indicator</a> for the object.
Display OOS	If the number of sub equipment associated with the drive object is more than 1, you can select this option to display an "Out of Service" indicator for each related equipment.
Display Meter	Select this option to display a <a href="#">built-in meter</a> for the object.
Display Output Bar	Select to display an output indicator with the object. On selecting this option, the "Display Control Readback" and "Display Control Value" options are displayed. The <a href="#">Control Meters - Common Elements</a> represents the actual output for the controller.
Display Readback	Select this option to display a visual marker for the readback value on the drive's output.
Display Value	Select this option to display the output value of the drive.

[Drive Faceplates](#)

## Valves

The Valve objects that are available in the Situational Awareness library include:

- [Block Valve](#)
- [Control Valve](#)
- [Damper](#)
- [Hand Valve](#)

The figure below shows an example of the elements that may make up a control valve object.

## Alarm indicator

An alarm indicator is used to show the occurrence and status of alarms associated with an object. See [Alarm Indicators](#) in the section on [Common Object Elements](#).

## Status indicator

Connects to: EquipmentName.EqStatus

A status indicator is used to represent various non-alarm conditions associated with an object, such as abnormal data quality or control system states. See [Status Indicators](#) in the section on [Common Object Elements](#).

**Note:** Status Indicator is not part of the basic genie composite.

## Valve Objects - Tagname/Nickname

The tagname/nickname field shows the valve tagname (by default), or, if entered by the user, a "nickname". The nickname is usually a common name used to help identify the reading (e.g., "Fuel Gas", instead of "CV1001").

Visibility of the tagname/nickname field shall be tied to the settings for visibility of Tagnames in the "Show/Hide Settings" controls.

## OP Bar (for valves with continuous position control)

Connects to: EquipmentName.OP

For control valves and other valves that can be positioned between 0-100% open, this bar shows the commanded OP for the valve (see section 0 for a description of functionality).

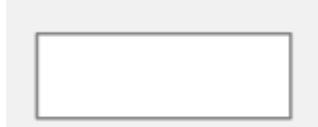

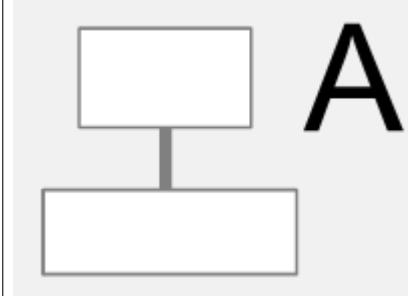

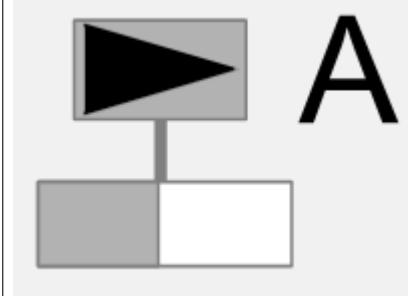

Note that the OP bar does not turn black when the valve is fully open.

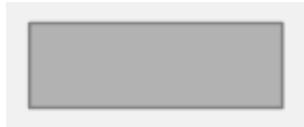

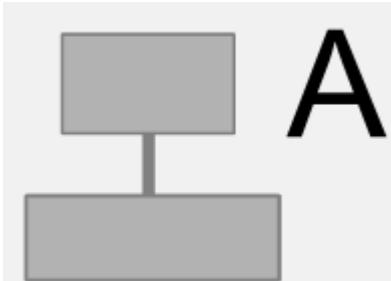

## OP Bar (for valves with discrete position control)

Connects to: EquipmentName.OP

For two-position valves (open/closed), such as block valves or simple MOVs, the OP bar is used to distinguish between closed, opening/closing, and closed (as available). When opening or closing, the bar is shown with the fill at the half-way point of the bar.

Note that the OP bar does not turn black in the open state.

State	OP Bar	Example (Block Valve)
Fully closed		
Opening or closing		

State	OP Bar	Example (Block Valve)
Fully open		

## Position Readback Indicator

Connects to: EquipmentName.FB

This triangle is used to show the actual (readback) valve position (0-100%), if available (see section 0 for a description of functionality).

---

**Note:** Should only be used on complex valves that have OP and FB items; otherwise it will not compile.

---

## Valve Objects - Numeric OP

Connects to: EquipmentName.OP

This is a numeric field used to show the commanded OP (0-100%), if applicable. It is always shown as a % value. This provides operators with precise values when needed.

The visibility of the numeric OP should be tied to the visibility state for PVs as selected in the "Show/Hide Settings" controls. If the user selects to turn off the visibility for PVs, the numeric OP values should also be hidden. The visibility should be forced to "on" if the valve goes into an alarm state.

## OP Tracker

Connects to: EquipmentName.OPTacker

The tracker is a user-configured indicator that marks a specific output value on the OP bar. A typical use case is where an operator wants to mark the current position so that when they look at the position again (some time later) they can see if it has changed. The tracker position is set and enabled/disabled from the valve faceplate (see APG dashboard specification). The tracker is only available on valves with continuous position control (control valves, dampers, and complex MOV/EOVs).

## Mode Indicator

Connects to: EquipmentName.CtrlMode, EquipmentName.CtrlModeDef

This is a single-character code that indicates the mode of the valve. It is shown next to the valve head. Typically, the set of modes includes Manual (M), Auto (A), Cascade (C) and Local (L) and special control (a computer symbol) but others may be added as required for the Control System platform.

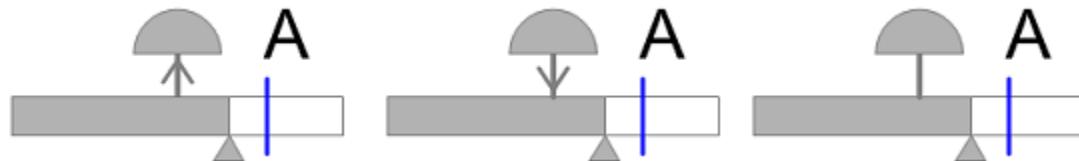

---

**Note:** The Mode Indicator is not displayed if the tag is set to CtrlModeDef. To view the control mode at all times, remove the CtrlModeDef tag from the equipment template.

---

## Valve Stem

Where applicable, the valve stem is used to show the fail action for the valve (fail open, fail closed, or fail last). These states are shown as follows:

## Valve Head (control valves and dampers)

Connects to: EquipmentName.Open, EquipmentName.POS, EquipmentName.Closed, EquipmentName.Opening, EquipmentName.Closing

For [Control Valve](#) and [Damper](#), the fill color of the valve head is used to indicate whether the valve is fully closed, partially open, or fully open. This is similar to the way fill color is used for the OP bar and readback indicators. When fully closed the fill is white. When partially open the fill is grey, and when fully open the fill turns black.

If readback is available the valve head fill should indicate the readback position. Otherwise it should indicate the commanded position.

State	Control Valve	Damper
Fully closed		
Partially Open		
Fully open		

## Valve Head (MOV/EOVs and block valves)

Connects to: EquipmentName.Open, EquipmentName.POS, EquipmentName.Closed, EquipmentName.Opening, EquipmentName.Closing

For MOV/EOVs and block valves, the valve head fill color follows the same scheme as for control valves and dampers.

In addition to the position however, the valve heads for MOV/EOVs and block valves are also used to indicate transition states. That is, the valve head uses symbols from the Equipment Running State Indicator symbol set to show when the valve is opening or closing. Opening or closing is indicated with a triangle in the valve head. See examples below:

Fully closed, commanded to open

Partially open, opening further

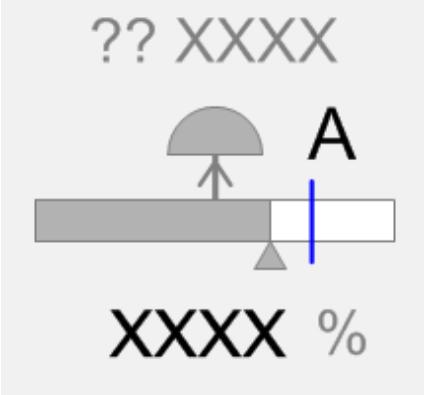

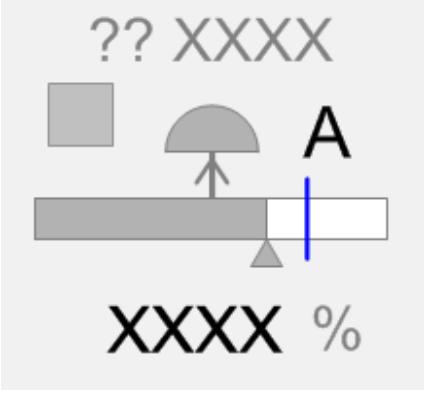

Partially open, and closing

Fully open, commanded to close

## Special Control Indicator

The special control indicator can be used to indicate either of two special states: field control and computer control. No symbol appears for valves that are under normal control via the SCADA system.

State	Appearance	
Normal		The valve is being controlled normally via the control system (no symbol shown)
Handswitch control		The handswitch control indicator appears when the valve is being controlled from the field via a local handswitch.

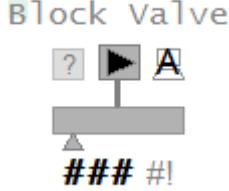

**Note:** Check that the address configured for a valve in the PLC is the same as the tag address specified in Plant SCADA. If this is not configured correctly, the state and output value of the valve will not be accurate.

[Valve Faceplates](#)

## Valve Orientations

All valves can be oriented horizontally or vertically. Block valves have additional orientation options to provide extra flexibility. Refer to the individual object specifications for details.

## See Also

[Valve Versions](#)

## Valve Versions

Most valves appear in several versions, which differ in the amount of information shown surrounding the valve. The different versions correspond roughly to the types of display pages they are typically expected to be used on. Alarm borders are re-sized as needed for the different versions.

## Level 3 Valves

Level 3 valves are the baseline version for every valve. They contain all of the information elements available. All of the examples described above show Level 3 valves. These objects are expected to be used heavily on detailed operating graphics ("Level 3" operating graphics) where showing a full complement of information is most important.

## Level 2 Valves

Level 2 valves are expected to be used on "Level 2" operating graphics, which provide overviews of major areas or units. Level 2 valves are identical to their Level 3 counterparts with the exception that the visibility of some of the elements can be "switched off" (i.e., hidden from view) by operators (during run time). The intent is to allow operators some flexibility in the amount of detail shown on their Level 2 operating graphics.

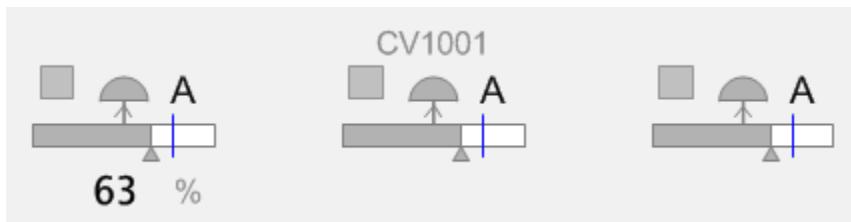

**Note:** Whether this feature is implemented using visibility properties for a single object or by creating separate objects is at the discretion of the implementation team.

The "Show/Hide Settings" controls are used by the operator to select which elements are shown for Level 2 valves. The intent is to provide this functionality globally on a workstation via a button on the toolbar and/or via a right click menu.

Elements which can be (independently) hidden are:

- Tagname / nickname
- Numeric OP and Units

All of the other common elements for valves remain unchanged.

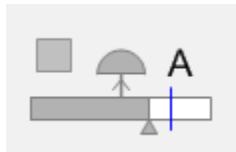

For Level 2 valves the visibility of the numeric OP will be forced on if the valve goes into an alarm state.

## Level 1 Valves

Level 1 valves can be used on the overview displays covering an operators entire span of control ("Level 1" operating graphics). These displays tend to focus more on visual presentation of process status, and less on details. Level 1 objects therefore have the visibility of tagnames/nicknames and the numeric OP elements set to "off". Unlike Level 2 valves, these elements cannot be re-enabled by operators using the Show/Hide Settings selections.

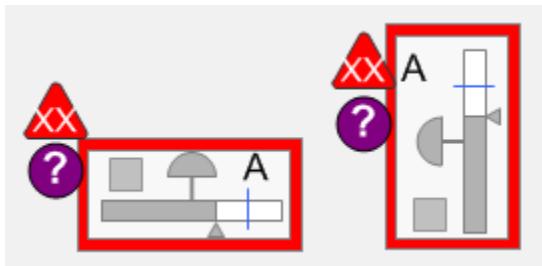

On Level 1 valves, the visibility of the numeric OP will be forced on if the valve goes into an alarm state.

All of the other common elements for valves remain unchanged.

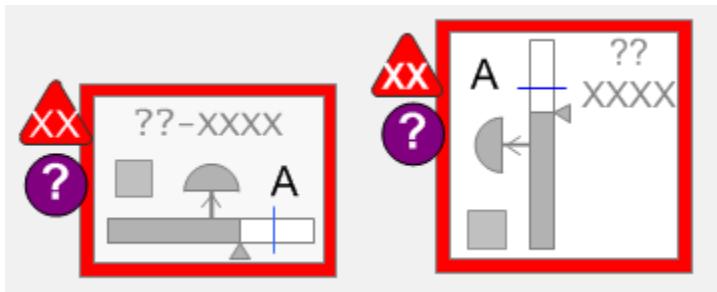

## Basic Valves

Basic valves provide page designers with a small-footprint option for special situations requiring only a basic set of information for a given valve. Basic valves do not show the tagname/nickname field, or the numeric OP and units (if applicable). Basic valves can be vertical or horizontal. Basic valves can also be mirrored in either orientation.

## Basic Valves (with Tags)

Basic valves with tags are identical to basic valves except that they retain space for a tagname/nickname field. This makes the footprint slightly larger. Basic (with tag) valves can be vertical or horizontal as shown below. They can also be mirrored in either orientation.

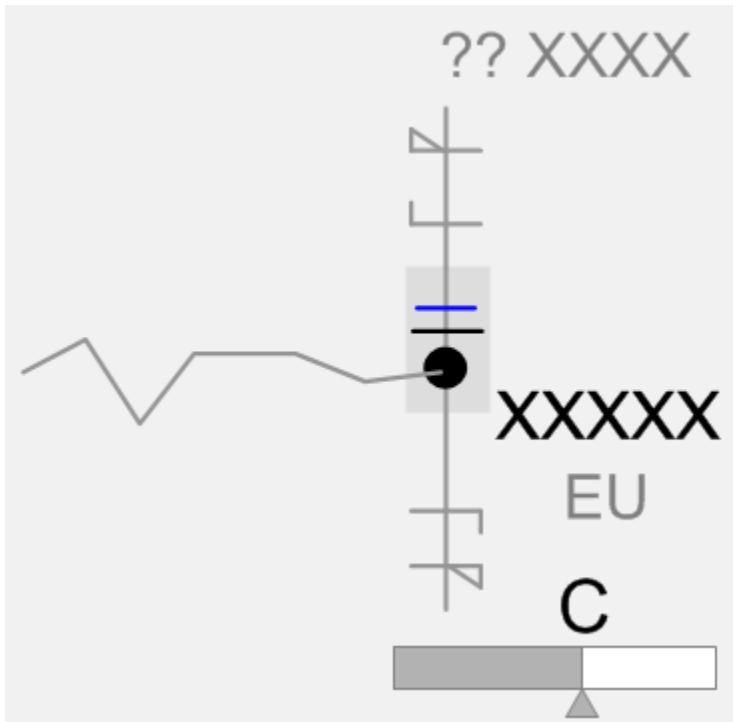

**Note:** All valve versions should include orientation options as per the individual object specifications.

## Trend Objects

The trend objects provide the ability to embed trend information in display pages. The following trend objects are available in the Situational Awareness Library:

- [Trend Tail](#)
- [Full Trend](#)
- [Four-Pen Trend](#)

## Trend Tail

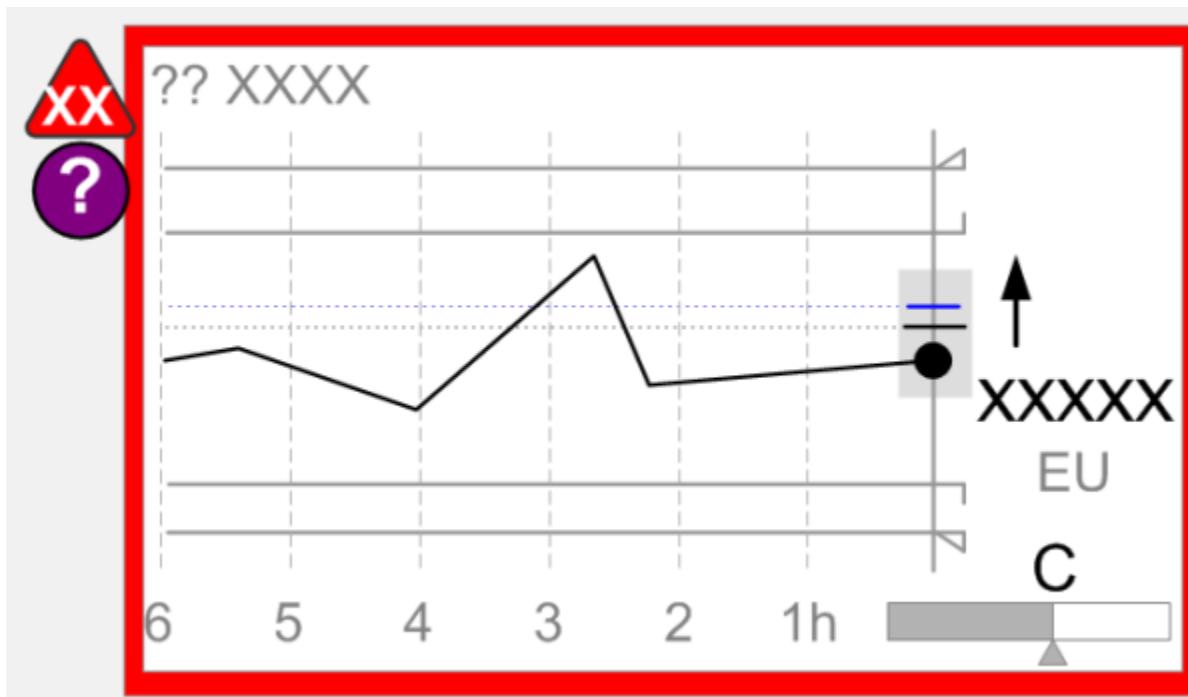

**Note:** Trend Tails are included in Meters and are not separate objects.

The Trend Tail object provides the operator with information about the historical behavior of a point. It is always used together with a meter object, and provides a relatively simple and compact method for showing trend information directly on the display.

The vertical scale of trend tail needs to be tied to the meter it is connected to. If the meter has auto-scaling turned on, or if the PV exceeds the practical range and the meter goes into "full-range" mode, then the scale of the trend must change accordingly. There is no alarming associated with the trend tail, however, the meter to which the trend tail is connected will display alarms as configured.

There are no orientation options for the trend tail. Therefore, it can only be used with meters that are in their vertical orientation.

## Full Trend

**Note:** Full Trends are included in Meters and are not separate objects.

This trend object provides basic trending capability for any instrument. This can be created by setting the **Trend Type** option to **Full** on any meter composite. The alarm limits are projected leftward onto the trend to provide reference lines for the PV. The tracker is also displayed as a time-varying value.

**Note:** The High and High High alarm limit indicators are 'flipped', so that the flags are shown on the right hand side of the meter.

## Four-Pen Trend

The Four-Pen Trend object shows between 1 and 4 Equipment Trend Items trended on the same set of axes.

The tag names corresponding to each displayed Equipment Trend Item are shown across the top of the graph. The box surrounding each tagname matches the line style and color of the trend line for that Equipment Trend Item. At runtime when you hover the mouse cursor over the boxes, the full Equipment Name is displayed. Above each box, flags are displayed to indicate the full range.

The number of vertical gridlines and the corresponding text indicating the time intervals (i.e., 1h, 2h, 3h, etc.) depends upon the **Time Span** selected in the Presentation Options for the trend.

If the trend has fewer than 4 displayed Equipment Trend Items, the objects associated with the remaining items are not displayed.

Alarming is based on the referenced equipment.

Property	Description
Name	Four-Pen Trend
Graphical Representation	
Associated Composite Genie	Trend.xml
Equipment.Item Names Associated with the Genie	PV

## Presentation Options

The following presentation options are available for this object.

Option	Description
Equipment Name	Enter the name of the equipment for which you want to view the trend. You can enter a maximum of 160 characters for this option.
Size	Size of the Trend object image - small or large
Display Label	Use this setting to display a label at the selected position. Select <b>None</b> if you do not want to display a label.
Label	Enter the text that will display at the location specified in <b>Display Label</b> field. You can enter a maximum of 30 characters for this option.
Display Status Indicator	Select the location to display a status indicator. Select <b>None</b> if you do not want to see the status indicator. For more information, see Status Indicators.
Time Span	Select the time span to be used for the trend. The minimum is 30 seconds and the maximum is 12 hours.

## Additional Objects

This category includes a variety of objects with various functions and features. All are described with individual specifications.

- [Polar Star](#)
- [Dump Light Genie](#)
- [Polar Star](#)
- [Numeric Input](#)
- [Polar Star](#)
- [Status Light Genie](#)
- [Text Input](#)
- [Wind Compass](#)
- [XY Bar Graph](#)

### Alarm Light

The alarm light object is a text object used to draw the operator's attention to an alarm that may not have a numerical equivalent (for example, LOW FIRE CHECK).

When the alarm is inactive, the text is barely visible so as to not draw the operator's attention to the text, but still makes the operator aware that there is an alarm associated with a piece of equipment. If the alarm is triggered, the visibility will be forced to "on".

Property	Description
Name	Alarm Light
Graphical Representation	
Associated Composite Genie	AlarmLight.xml

## Configuration Tasks

- [Add Equipment Using Equipment Editor](#): Create equipment instances for the required objects, and organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the

equipment at runtime.

- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Equipment Name	Enter the name of the equipment associated with the object. You can enter a maximum of 160 characters for this option.
Item Name	Item Name of the alarm for which to display the status. You can enter a maximum of 63 characters for this option.
Size	Size of the alarm light object image - small or large
Label	Text that describes the alarm condition. You can enter a maximum of 30 characters for this option.
Display Alarm Indicator	Select this option to display an alarm indicator that indicates the highest priority alarm and its state for this Alarm Light equipment object.
Display Alarm Flag	Select this option to display an alarm flag. This option is available for selection only if the <b>Display Alarm Border</b> option is selected.
Display Status Indicator	Select the location to display a status indicator. Select None if you do not wish to see the status indicator. For more information, see Status Indicators.

## Dump Light Genie

**Genie Name:** dumplight\_32 / dumplight\_48

**Genie Library:** sa\_misc

**System Project:** SA\_Library

The Dump Light Genie allows you to add a stop/go indicator to a page or faceplate. The "proceed" indication is a green triangle in a white circle. The "stop" indication is a large black X.

The Genie is available in two sizes:

- dumplight\_32
- dumplight\_48

The Genie binds to the following equipment item:

- **Running** (see [Drive, Belt and Mining Objects](#))

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

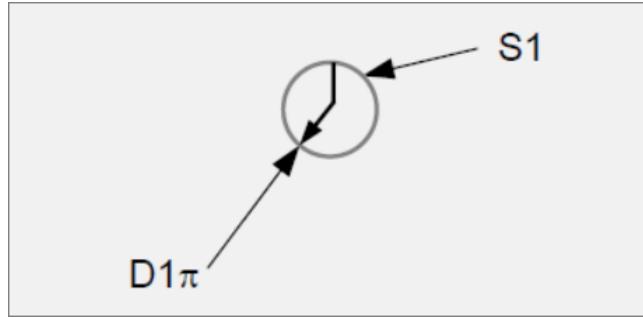

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.

## Handswitch Selector

The Handswitch Selector object can be used to show which of two pieces of equipment is selected "on" through the use of handswitching. The solid line connects the output indicator line from the selected controller to the active piece of equipment.

Property	Description
Name	Handswitch Selector
Graphical Representation	
Example Equipment Template	HandSwitchIndicator
Associated Composite Genie	Handswitch.xml
Equipment.Item that the Genie Expects	<b>SwitchPosition</b> (see <a href="#">Equipment Configuration Parameters</a> )

## Presentation Options

Option	Description
Equipment Name	Enter a name for the equipment associated with the handswitch selector. You can enter a maximum of 160 characters for this option.
Size	Size of the Handswitch Selector object image - small or large

## Numeric Input

The numerical input object can be used when you need to input data that might be measured remotely, or may be manually entered for use within a Genie. There is no alarming associated with this object.

Property	Description
Name	Numeric Display
Graphical Representation	
Associated Composite Genie	NumericInput.xml

## Configuration Tasks

- [Add Equipment Using Equipment Editor](#): Create equipment instances for the required objects, and organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

Option	Description
Equipment Name	Enter a name for the equipment associated with numeric display. You can enter a maximum of 160 characters for this option.
Item Name	Enter the item name of the value to be displayed. You

Option	Description
	can enter a maximum of 63 characters for this option.
Display Label	Use this setting to display a label
Label	Enter the text that will display. This is displayed only if the <b>Display Label</b> option is selected. You can enter a maximum of 30 characters for this option.
Size	Size of the Numeric Display object image - small or large
Is Editable	Select this option make the displayed value editable.
Disabled When	Enter a Boolean condition for disabling the input functionality. This option is displayed only if the <b>Disabled When</b> option is selected.
Privilege	Privilege required to change the value at runtime. For more information, see <a href="#">Privileges</a> .
Area	Area access required to change the value at runtime. Area 0 includes every privilege a role may be assigned. For more information, see <a href="#">Areas</a> .
Separate Read/Write Items	Select whether changing the value writes to a different item. This option is displayed only if the <b>Disabled When</b> option is selected.
Write Item Name	Enter the item name that is written to when the value is changed. This option is displayed only if the <b>Separate Read/Write Items</b> option is selected. You can enter a maximum of 63 characters for this option.
Display Adjustment Controls	<p>Select to add controls to increase or decrease the value.</p> <p><b>Note:</b> In a multi-cluster system, any instance of Numeric Input with "Show Adjustment Controls" enabled needs to specify the cluster on the Equipment Name parameter.</p>
Use Absolute Step Value	<p>Select whether to increase and decrease by a fixed value or by a value defined by a runtime parameter on the equipment.</p> <p>If this is not selected, it will display a field in which you need to enter the name of the <a href="#">Define Equipment Runtime Parameters</a> that holds the step value.</p>

Option	Description
Step Value	Enter the value to increment/decrement value. This option is displayed only if the <b>Use Absolute Step Value</b> option is selected.
Step Equipment Parameter	Enter the name of the equipment runtime parameter that defines the increment/decrement value. This option is displayed only if the <b>Use Absolute Step Value</b> option is not selected.
Display Units	Select this option to display the engineering units for the equipment item.

## Polar Star

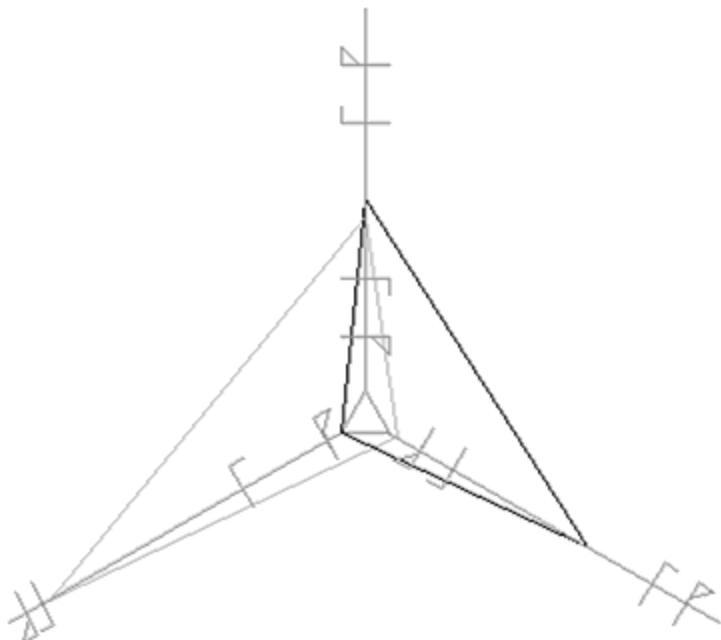

The Polar Star can be used for monitoring purposes. However, its use is limited to a few applications where information is for the most part static yet needs to be monitored. With Plant SCADA, you can create a 3-spoke Polar Star. Each spoke can be used to measure one parameter of an equipment and the 3 parameters are represented by a triangle. For example, you can compare three meters or three drives.

**Note:** The equipment that you select to compare needs to have a PV equipment.item.

Whenever one of the parameters records a deviation from its SP, the shape of the triangle will be disfigured and the operator will be able identify the abnormal parameter. When an alarm is triggered by an alarm flag, the spoke that triggered the alarm will be highlighted in the same color as the alarm border. When a spoke is selected, it displays the faceplate associated with it.

At runtime, the triangle is displayed in gray when the SP changes and in black when the PV changes (as shown below).

Meter1

Meter3

Meter2

Property	Description
Name	Polar Star
Graphical Representation	
Example Equipment Template	PolarStar
Associated Composite Genie	PolarStar.xml
Equipment.Item Names Associated with the Genie	<b>EqStatus</b> (see <a href="#">Equipment Configuration Parameters</a> ) <b>RunStatus</b> (see <a href="#">Equipment Running States</a> )

## Configuration Tasks

1. [Add Equipment Using Equipment Editor](#): Create the equipment for the required objects. Organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
2. [Equipment References](#): Create the required relationships (equipment references) between a piece of equipment to items of another piece of equipment. This allows you to refer to equipment.items outside of the equipment hierarchy.
3. [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
4. [Insert a Composite Genie](#): Create graphics pages with instances of Composite Genies that are associated with the equipment you have defined in your project.
5. [Create a New Faceplate](#): Add a faceplate for the equipment to allow operators to engage with the equipment at runtime.
6. Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Polar Star Equipment	Enter a name for the equipment associated with the Polar Star. You can enter a maximum of 160 characters for this option. <b>Note:</b> The Polar Star equipment needs to be manually configured to reference each equipment to be monitored.
Spoke #1/#2/#3 Equipment Name	Enter the name of the first/second/third equipment that you want to measure. You can enter a maximum of 160 characters for this option.
Spoke #1/#2/#3 Equipment Item Prefix	Prefix applied to the equipment item name on each spoke. This allows for displaying multiple values for a single piece of equipment.
Size	Size of the Polar Star object image - small or large
Display Label	Use this setting to display a label at the selected position. Select <b>None</b> if you do not want to display a label.
Label / Spoke#2 Label/Spoke #3 Label	Enter the text that will display for each spoke of the Polar Star. You can enter a maximum of 30 characters for this option.

Option	Description
Display Alarm Limits	Select this option to display alarm limits on the selected equipment.
Display Alarm Indicator	Select this option to display an alarm indicator which indicates the highest priority alarm and its state for this Polar Star's equipment. The Polar Star will also include the alarms for each equipment specified for each spoke if you create an equipment reference between the Polar Star and each equipment specified for the spokes.
Display Alarm Flag	Select this option to display an alarm flag. This option is available for selection only if the <b>Display Alarm Border</b> option is selected.
Display Status Indicator	Select the location to display a status indicator. Select <b>None</b> if you do not want to see the status indicator. For more information, see Status Indicators.
Display OOS	Select to display Out of Service indicator.

## Status Light Genie

**Genie Name:** statuslight\_20 / statuslight\_30

**Genie Library:** sa\_misc

**System Project:** SA\_Library

The Status Light Genie allows you to add a status indicator to a page or faceplate. It can be used to show basic status information (on/off/alarm) for equipment. It is based on the multiple equipment object, but with a limited range of states.

The Genie is available in two sizes:

- statuslight\_20
- statuslight\_30

This Genie binds to the following equipment item:

- Running

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.

## Text Input

The text input-output object can be used for entry and/or display of text (non-numeric) data. There is no alarming associated with this object.

Property	Description
Name	Text Input
Graphical Representation	
Associated Composite Genie	TextInput.xml

## Configuration Tasks

- [Add Equipment Using Equipment Editor](#): Create equipment instances for the required objects, and organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

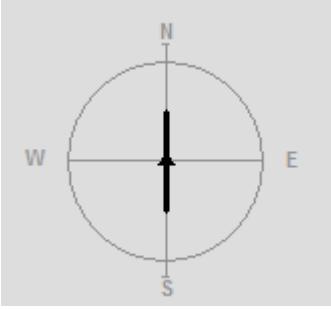

## Presentation Options

Option	Description
Equipment Name	Enter a name for the equipment associated with numeric display. You can enter a maximum of 160 characters for this option.
Item Name	Enter the item name of the value to be displayed. You can enter a maximum of 63 characters for this option.
Show Label	Use this setting to display a label
Label	Enter the text that will display. This is displayed only if the <b>Display Label</b> option is selected. You can enter a maximum of 30 characters for this option.
Size	Size of the Text Input object image - small or large
Width	Select the length of text display - Normal or Wide
Is Editable	Select this option make the displayed value editable.
Disabled When	Enter a Boolean condition for disabling the input functionality.
Privilege	Privilege required to change the value at runtime. For more information, see <a href="#">Privileges</a> .
Area	Area access required to change the value at runtime. Area 0 includes every privilege a role may be assigned. For more information, see <a href="#">Areas</a> .
Separate Read/Write Items	Select whether changing the value writes to a different item. This option is displayed only if the <b>Disabled When</b> option is selected.
Write Item Name	Enter the item name that is written to when the value is changed. This option is displayed only if the <b>Separate Read/Write Items</b> option is selected. You can enter a maximum of 63 characters for this option.

## Wind Compass

This object shows both current and average wind speed and direction. A black arrow points in the direction in which the wind is blowing, and a dark grey arrow points in the average direction in which the wind is blowing. The lengths of the arrows are proportional to the wind speeds, with a dot representing zero. The arrows are anchored in the middle and rotate around the middle of the compass. For light winds, the arrowhead is not drawn.

All the spokes have the same scale (operating range), which is configured at design time and can be changed during runtime. If the wind speed exceeds this range, the spokes change to full scale and the black full scale indicators are shown.

Property	Description
Name	Wind Compass
Graphical Representation	
Example Equipment Template	WindCompass
Associated Composite Genie	WindCompass.xml
Equipment.Item Names Associated with the Genie	<b>WindSpeed, WindSpeedAvg, WindSpeedThreshold</b> <b>PRHigh, PRLow</b> <b>WindPV, WindPVAvg</b> See <a href="#">Wind Compass Elements</a>
Equipment Parameters the Equipment Items Expect	<b>WindSpeedRange</b> (see <a href="#">Equipment Configuration Parameters</a> )

## Configuration Tasks

- [Add Equipment Using Equipment Editor](#): Create equipment instances for the required objects, and organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
- [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
- [Insert a Composite Genie](#): Create graphics pages with instances of [Composite Genies](#) that are associated with the equipment you have defined in your project.
- [Create a New Faceplate](#): Add a [Faceplates](#) for the equipment to allow operators to engage with the equipment at runtime.
- Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

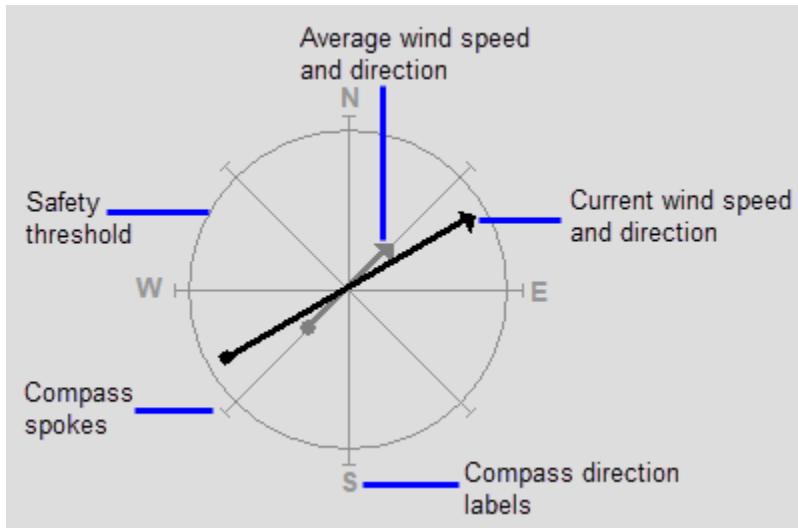

## Presentation Options

Option	Description
Equipment Name	Enter a name for the equipment associated with the wind compass.

Option	Description
	You can enter a maximum of 160 characters for this option.
Size	Size of the Wind Compass object image - small or large

## Wind Compass Elements

The image below shows the elements that make up the wind compass object.

## Wind Speed and Direction

Connects to: Equipment.WindSpeed, Equipment.WindSpeedAvg, Equipment.WindSpeedThreshold

Current and average speed and direction of the wind. A black arrow points in the direction in which the wind is blowing. A dark grey arrow points in the average direction in which the wind is blowing. The lengths of the arrows are proportional to the wind speed, with a dot representing zero. The radius of the compass measures the wind speed.

The WindSpeedThreshold represents the safety threshold circle. This item controls the size of the circle.

## Range Indicators

Connects to: Equipment.PRHigh, Equipment.PRLow,

Allows you to set a "normal" operating range ( "practical" range) with maximum (high) and minimum (low) values.

## Compass Direction

Connects to: Equipment.WindPV, Equipment.WindPVAvg

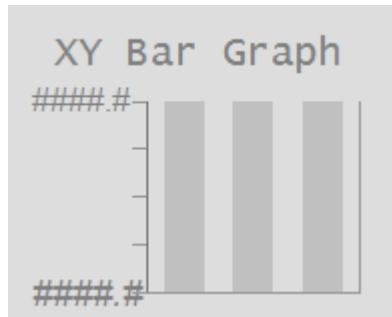

This is the angle between 0 and 360 degrees which denotes the direction in which the wind is blowing.

## Compass Spokes

All the spokes have the same scale (operating range). If the wind speed exceeds this range, the spokes change to full scale and black full scale indicators are shown.

## XY Bar Graph

The XY Bar Graph object can be used to compare sets of related PV values from similar equipment.

Property	Description
Name	XY Bar Graph
Graphical Representation	
Example Equipment Template	BarGraph
Associated Composite Genie	XY Bar Graph.XML
Equipment.Item Names Associated with the Genie	<b>PRHigh</b> , <b>PRLow</b> (see <a href="#">Meter Common Elements</a> ) <b>ORHigh</b> , <b>ORLow</b> , <b>ORDsp</b> (see <a href="#">Meter Common Elements</a> ) <b>EqStatus</b> (see <a href="#">Status Indicators</a> )
Equipment Parameters the Equipment Items Expect	<b>EqStatusFunc</b> <b>Range</b> See <a href="#">Equipment Configuration Parameters</a>

## Configuration Tasks

1. [Add Equipment Using Equipment Editor](#): Create the equipment for the required objects. Organize the equipment in a hierarchy. Objects can be referred to by their name when you add Composite Genies to a graphics page. You can add one or more instances of an equipment to a page.
2. [Equipment References](#): Create the required relationships (equipment references) between a piece of equipment to items of another piece of equipment. This allows you to refer to equipment.items outside of the equipment hierarchy.
3. [Configure PLC Limits with Equipment](#): This is an optional task that is required if you want to use PLC alarm limits instead of the standard analog alarm limits.
4. [Insert a Composite Genie](#): Create graphics pages with instances of Composite Genies that are associated

with the equipment you have defined in your project.

5. [Create a New Faceplate](#): Add a faceplate for the equipment to allow operators to engage with the equipment at runtime.
6. Write Cicode functions to initialize PR and OR values. Refer to the [Cicode Reference](#) documentation for more information.

## Presentation Options

The following presentation options are available for this object.

Option	Description
Main Equipment Name	<p>Enter a name for the equipment associated with the XY Bar Graph. You can enter a maximum of 160 characters for this option.</p> <p><b>Note:</b> The XY Bar Graph equipment needs to be <a href="#">Define Equipment References</a> each equipment to be monitored.</p>
Main Equipment Item Prefix	<p>Prefix applied to the main equipment item name. This allows for displaying multiple values for a single piece of equipment.</p>
Number of Bars	<p>Select the number of bars to be displayed in the graph. You can select a minimum of 1 and a maximum of 5 bars</p>
Bar #n Equipment Name	<p>Enter the name of each equipment to measure. The number of <b>Bar #n Equipment Name</b> options displayed depends on the <b>Number of Bars</b> selected for display. A maximum of 5 pieces of equipment can be selected for monitoring.</p> <p>You can enter a maximum of 160 characters for this option.</p>
Bar #n Equipment Item Prefix	<p>Prefix applied to the equipment item name on each bar of the XY Bar Graph. This allows for displaying multiple values for a single piece of equipment.</p>
Size	<p>Size of the XY Bar Graph object image - small or large</p>

Option	Description
Label	Enter the text that will display for the XY Bar Graph. You can enter a maximum of 30 characters for this option.
Display Alarm Indicator	Select this option to display an alarm indicator, which indicates the highest priority alarm and its state for this XY Bar Graph. The XY Bar Graph will also include alarms from each equipment included for comparison if you create an equipment reference between the XY bar Graph and each equipment specified for the bars.
Display Alarm Flag	Select this option to display an alarm flag. This option is available for selection only if the <b>Display Alarm Border</b> option is selected.
Display Status Indicator	Select the location to display a status indicator. Select <b>None</b> if you do not wish to see the status indicator. For more information, see <a href="#">Status Indicators</a> .

## Faceplates

A faceplate is a page that is associated with a piece of equipment. It typically contains a graphical representation of the equipment, measurements and controls that allow an operator to engage with the equipment at runtime. When the piece of equipment comes into context at runtime, the faceplate will be displayed. To support this, the default layout for a Situational Awareness project includes a Faceplate Zone in the Information Zone.

**Note:** When the equipment is out of service, all controls (buttons and numeric inputs) on the faceplate are disabled.

Plant SCADA provides a set of sample faceplates for meters, drives and valves. Note that the sample faceplates are fully configured and ready to use. However, you can [Create a New Faceplate](#) if it is required.

Faceplates are made up Genies and/or Composite Genies. User interaction with faceplates is achieved through items (tags) associated with the various components of a faceplate. The items associated with each faceplate are listed in the Associated Tags column of the faceplate table.

## See Also

- [Meter Faceplates](#)
- [Drive Faceplates](#)
- [Valve Faceplates](#)

## Create a New Faceplate

You can use one of the sample faceplates in the required resolution (HD1080 or 4K) to create your own faceplate. Sample faceplates are located in the SA\_Style\_1\_MultiRes project.

### To create a new faceplate, follow these steps:

1. Modify an existing sample faceplate.

Or:

Create a copy of an existing faceplate.

Or:

Create a new page in Graphics Builder using the "faceplate" template in the required resolution.

**Note:** The sample faceplates use a specific set of items to display controls at runtime. You can build your [Faceplates](#) using these items, which are listed in the topics that describe the faceplates for [Meter Faceplates](#), [Drive Faceplates](#) and [Valve Faceplates](#).

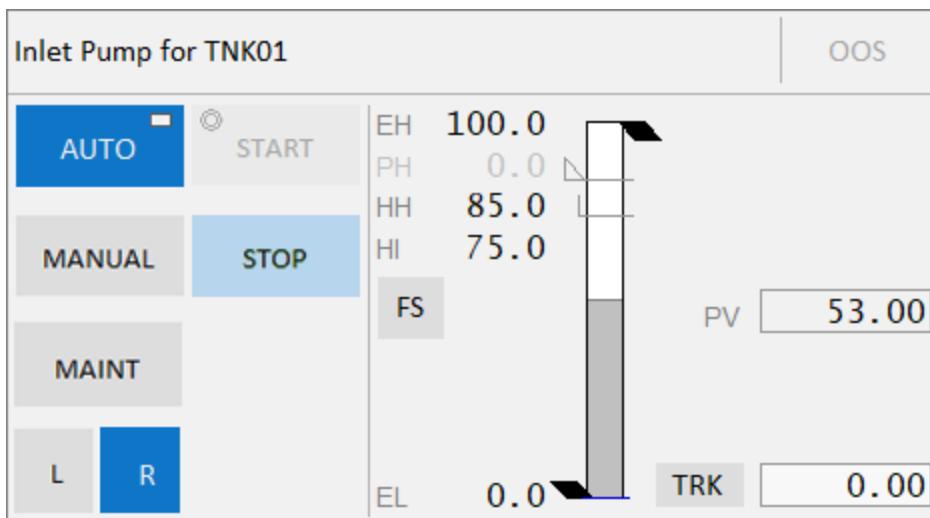

2. Save your page.
3. Go to Plant SCADA Studio.
4. In the **Visualization activity | Pages**, set the **Content Type** for the above page to "FP". Content of this type will automatically display in the [Faceplate Zone](#) of the workspace.
5. Click **Save**.
6. In Plant SCADA Studio, **System Model activity | Equipment**, locate the equipment for which you are creating the faceplate.
7. Add the name of the page you created earlier to the **Content** field for the equipment. It can include a comma separated list.
8. Click **Save**.

**Note:** User interaction with faceplates is achieved through command tags (items) associated with the various components of a faceplate. Items are listed in the individual faceplate topic. Buttons on a faceplate are designed to support this interaction. However, tags in Plant SCADA need to be mapped to the tags that you have configured on your PLCs. For example, tags for starting a drive (StartCmd) and displaying its status (CtrlMode) available in Plant SCADA. Similarly, tags for starting the drive and displaying its status would exist on your PLC. These two sets of tags need to be mapped to each other for the buttons on the drive faceplate to work. If the mapping is not created, buttons on the faceplates will not function. Refer to the example below to understand how this works.

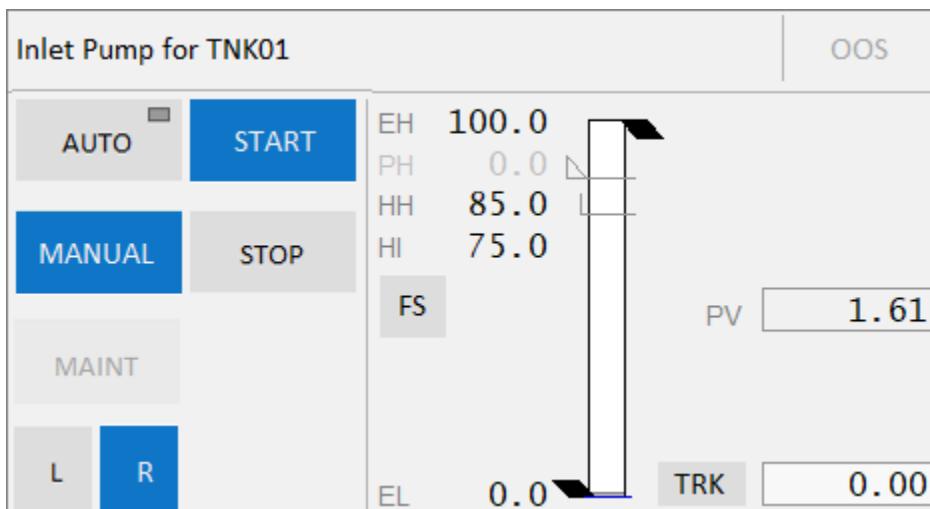

## Example

This example illustrates how tags are used to achieve interaction with faceplates.

The CtrlModeDef tag sets the default mode of operation for a piece of equipment. If you set this tag to 0 for a pump, the default mode of a pump will be Auto. That is indicated on the faceplate by a rectangle in the top-right corner of the **Auto** button on the faceplate as shown below.

The CtrlMode tag represents the current mode for a piece of equipment. If the CtrlModeDef (default) and CtrlMode (current) have different values, the current mode will be displayed in green. For example, the CtrlModeDef = 0 (Auto) and the CtrlMode = 1 (Manual), the **Manual** button will be displayed in green. Clicking the **Manual** button will set the ManCmd tag to 1.

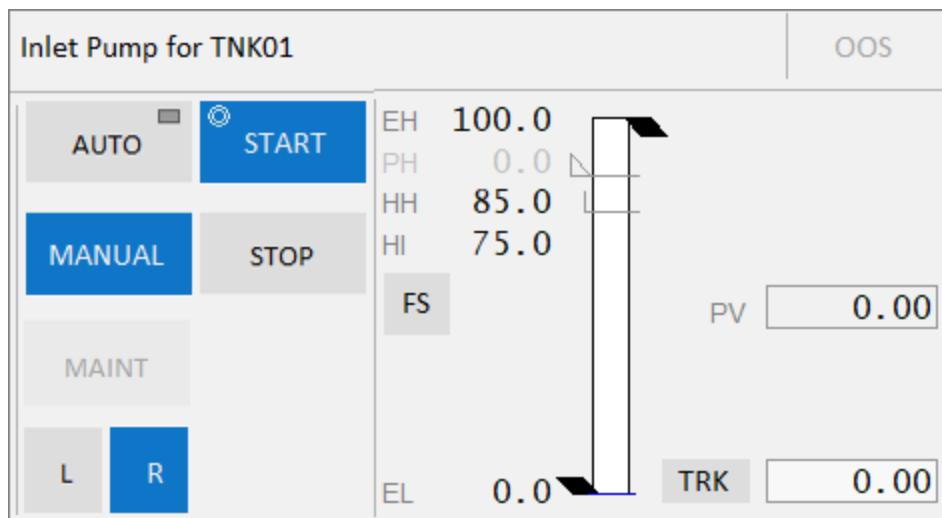

If the pump is not running, the **Start** button will also be displayed in green to allow you to manually start the pump. If the pump is running, the **Stop** button will be green allowing you to manually stop the pump. The **Auto** button will continue to display the rectangle to indicate that it is the default mode. Note that the **Start** and **Stop** buttons are available only when the mode is Manual.

---

**Note:** Clicking any button will set its <name>Cmd tag to 1. For example, clicking the **Manual** button will set ManCmd to 1.

---

When you click one of the buttons, a circle will appear in the top-left corner to indicate that a command (**Start** in the above image) has been sent to the PLC mapped to the corresponding tags. Once the Start command is completed, the circle will disappear as the PLC sets StartCmd to 0 (or StopCmd to 0 in case you clicked the **Stop** button). In addition, the PLC sets the value of the Running tag to 1 (Stopped tag if you clicked the **Stop** button). When you click Stop, the value of the Stopped tag is 1.

## See Also

- [Faceplates](#)
- [Faceplate Zone](#)
- [Meter Faceplates](#)
- [Drive Faceplates](#)
- [Valve Faceplates](#)

## Meter Faceplates

Meters can be associated with one the following faceplates:

- [Analog Controller](#)
- [Analog Indicator](#)

The following sample meter faceplates are available for use:

- FP\_AI\_HD1080
- FP\_AI\_UHD4K
- FP\_CTRL\_HD1080
- FP\_CTRL\_UHD4K

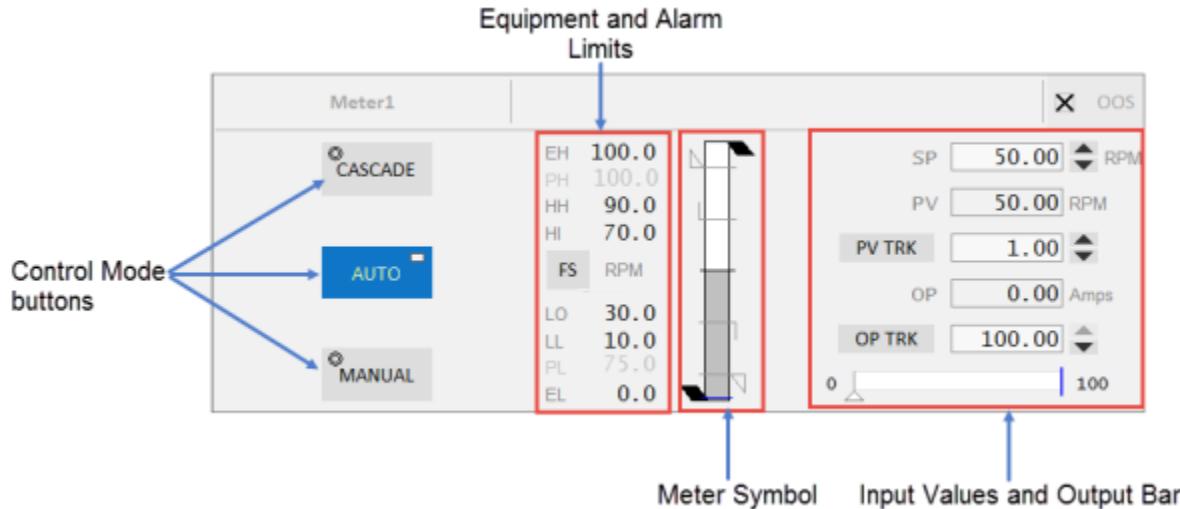

These faceplates are pages in the sa\_style\_1\_multires project, and are fully configured. You can use them directly in your projects.

## See Also

[Faceplates](#)

### Analog Controller

The Analog Controller faceplate can be associated with control meters such as a Flow meter.

The Analog Controller faceplate comprises the following components:

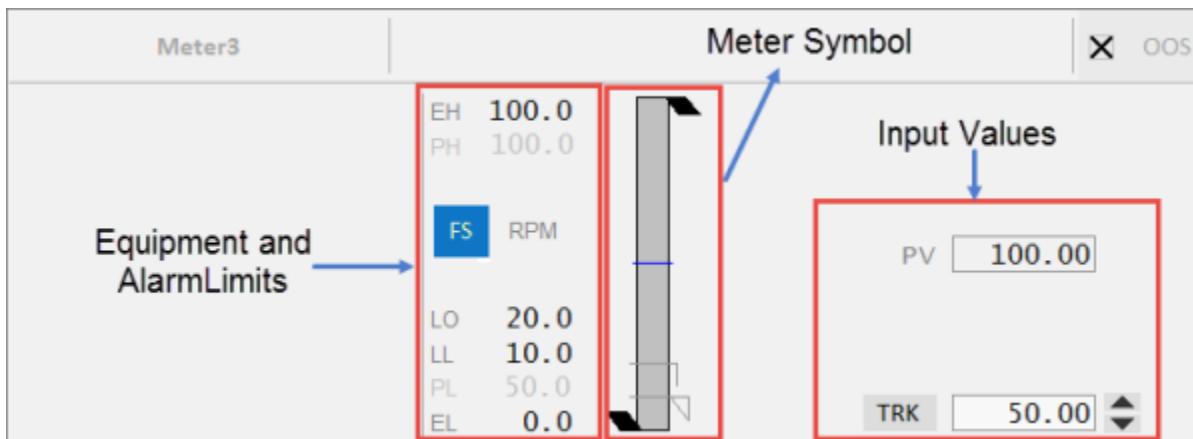

Component	Description	Associated Tags
Control Mode buttons	<p>Auto, Manual and Cascade buttons are displayed on this faceplate. The button is green when a mode is active. When the tag associated with the equipment is 0, the mode is Auto. When the tag is 1, the mode is Manual and when the tag is 2, the mode is Cascade.</p> <p>Clicking a mode button sends a command to the linked PLC.</p> <p>The Mode button displays two symbols:</p> <ul style="list-style-type: none"> <li>The circle in the top-left corner indicates that a command has been sent to the linked PLC. This indicator is not visible otherwise.</li> </ul>	<p><b>CtrlMode, CtrlDef</b> (see <a href="#">Control Meters - Common Elements</a>)</p> <p>AutoCmd, CasCmd, ManCmd</p>

Component	Description	Associated Tags
	<ul style="list-style-type: none"> <li>The rectangle in the top-right corner indicates that the current mode is the normal(default) mode of operation for the equipment.</li> </ul>	
Equipment Limits	<p>The following limits are displayed on the left-hand side of the meter symbol:</p> <ul style="list-style-type: none"> <li>Engineering High and Low values</li> <li>Practical Value High and Low values</li> </ul> <p>If the values lie outside the practical values, additional indicators are displayed. The color of the equipment limits changes as the meter values change.</p> <p>If the practical range is the same as the engineering range, the practical range will be hidden.</p>	<b>PRHigh, PRLow</b> (see <a href="#">Meter Common Elements</a> ) <b>PV</b> (see <a href="#">Meter Common Elements</a> )
Alarm Limits	<p>Displays the following alarm limits on the left-hand side of the meter symbol:</p> <ul style="list-style-type: none"> <li>HiHi</li> <li>Hi</li> <li>Lo</li> <li>LoLo</li> </ul> <p>These are the standard analog alarm limits. If these alarm limits are not configured, they will not be displayed.</p> <p><b>Note:</b> You can now configure custom digital alarm limits based on the PLC alarm limits.</p> <p>The <b>FS</b> (Full scale) button can be used to toggle the meter into full scale even when the PV is within the practical range. The units of</p>	<b>HHAlm, HAlm, LAlm, LLAlm</b> (see <a href="#">Meter Common Elements</a> ) <b>Note:</b> These tags are used if the UsePLCLimits parameter is "true" unless the PLCLimits parameter has been changed from the default. If the UsePLCLimits parameter is "false", values come from the alarm limit configuration of the PV tag.

Component	Description	Associated Tags
	measurement of the PV are displayed to the right of the <b>FS</b> button.	
Meter Symbol	Symbol for the currently selected meter.	
Faceplate Inputs	<p>Shown on the right-hand side of the meter symbol. Most of these are selected in the Composite Genie presentation options. These include:</p> <ul style="list-style-type: none"> <li>• Setpoint (SP) - this is editable only in Auto mode.</li> <li>• PV (comes from the equipment)</li> <li>• PV tracker</li> <li>• OP - this is editable only in Manual mode.</li> <li>• OP tracker</li> </ul> <p><b>Note:</b> You can configure the Setpoint increment by using an Equipment Runtime Parameter on your equipment. This is not supported on the default faceplates, but you can modify the faceplate to achieve this. Specify a name for the parameter (for example, SPStep) on the Composite Genie of the faceplate. Also, the <b>IsTag</b> property needs to be set to FALSE.</p>	<a href="#">SP</a> (see <a href="#">Control Meters - Common Elements</a> ) <a href="#">PV, PVTrack</a> (see <a href="#">Meter Common Elements</a> ) <a href="#">OP, OPTrack</a> (see <a href="#">Control Meters - Common Elements</a> )
Output Bar	Displayed below the input values. This shows the expected output along the bar and the actual output indicated by a triangle below the bar. The output indicator is visible only when the controller is in Auto or Cascade mode. It is not visible in Manual mode.	<a href="#">OP, OPTrack</a> (see <a href="#">Control Meters - Common Elements</a> ) <a href="#">FB</a> (see <a href="#">Control Meters - Common Elements</a> )

## Analog Indicator

The Analog Indicator faceplate can be associated with regular meters such as an Analyzer meter.

The Analog Indicator faceplate comprises the following components:

Component	Description	Associated Tags
Equipment Limits	<p>The following limits are displayed for this faceplate:</p> <ul style="list-style-type: none"> <li>Engineering High and Low values</li> <li>Practical Value High and Low values</li> </ul> <p>If the values lie outside the practical values, additional indicators are displayed. The color of the equipment limits changes as the meter values change.</p> <p>If the practical range is the same as the engineering range, the practical range will be hidden.</p>	<a href="#">PRHigh</a> , <a href="#">PRLow</a> <a href="#">PV</a>

## Drive Faceplates

Drive objects can call different faceplates depending on their specific properties as outlined below:

- [Single and Multiple DOL Drive](#)
- [Single and Multiple VSD Drive - Single Direction](#)
- [Single DOL Drive with Forward/Reverse Capability](#)
- [Single VSD Drive with Forward/Reverse Capability.](#)

The following sample drive faceplates are available for use:

- FP\_DOL\_HD1080
- FP\_DOL\_UHD4K
- FP\_VSD\_HD1080
- FP\_VSD\_UHD4K
- FP\_DOL\_FR\_HD1080
- FP\_DOL\_FR\_UHD4K
- FP\_VSD\_FR\_HD1080
- FP\_VSD\_FR\_UHD4K

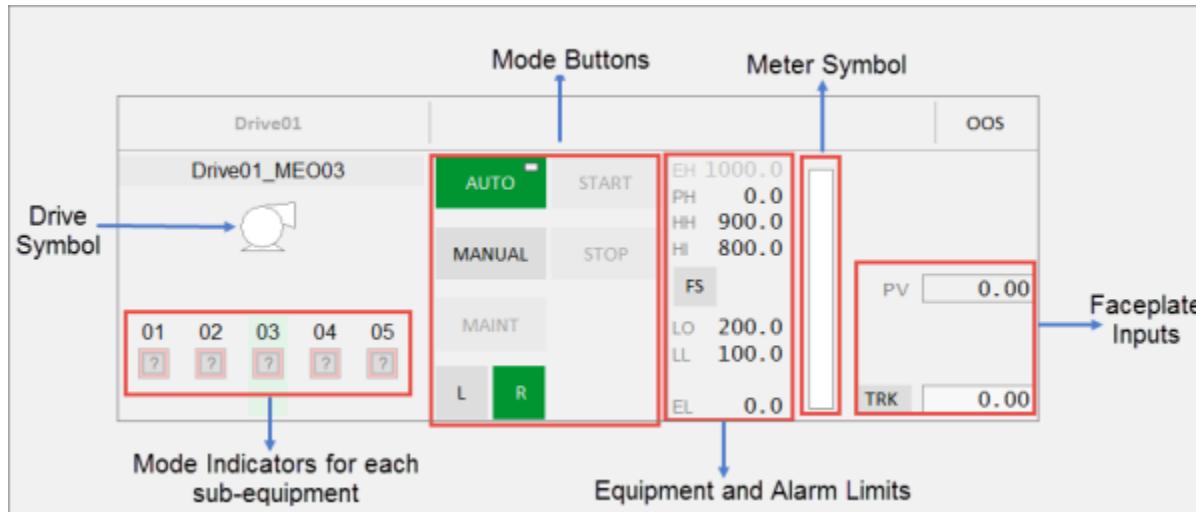

These faceplates are pages in the sa\_style\_1\_multires project, and are fully configured. You can use them directly in your projects.

### Single and Multiple DOL Drive

This faceplate is used for all single and multiple Direct Online (DOL) drives.

The Single or Multiple DOL Drive faceplate comprises the following components:

Component	Description	Associated Tags
Drive Symbol	Symbol for the drive associated with the selected equipment. Clicking on the multiple equipment object selects that particular drive. The buttons, meter and readings are then populated for that drive.	
Mode Indicators for each related equipment	Status Indicator and control modes for each related equipment displayed below the drive symbol. The last two characters of the tagname for each drive are shown over each multiple equipment indicator to distinguish between the drives.  <b>Note:</b> If the drive does not have any MEOs, a Running Status indicator and control mode will be displayed for the drive itself in the	<a href="#">RunStatus</a> (see <a href="#">Equipment Running States</a> )  <b>CtrlMode, CtrlModeDef</b> (see <a href="#">Drive,Belt and Mining Objects</a> )

Component	Description	Associated Tags
	<p>center position. The last two characters' label and the label above the drive are not shown. The mode indicator is not selectable.</p> <p>Indicators for up to 5 DOL drives can be displayed here.</p>	
<b>Mode Buttons</b>	<p>Mode buttons are green when a mode is active, and grey when inactive. When the CtrlMode tag associated with the equipment is 0, the mode is Auto. When the tag is 1, the mode is Manual. This tag applies to Auto and Manual buttons.</p> <p>The Mode button displays two symbols:</p> <ul style="list-style-type: none"> <li>• The circle in the top-left corner indicates that a command has been sent to the linked PLC. This indicator is not visible otherwise.</li> <li>• The rectangle in the top-right corner indicates that the current mode is the normal mode of operation for the equipment.</li> </ul> <p>The following mode buttons are displayed:</p>	
	<ul style="list-style-type: none"> <li>• Auto: Automatic mode</li> </ul>	<b>CtrlMode</b> , <b>CtrlModeDef</b> (see <a href="#">Drive,Belt and Mining Objects</a> ) <b>AutoCmd</b>
	<ul style="list-style-type: none"> <li>• Manual: Manual mode</li> </ul>	<b>CtrlMode</b> , <b>CtrlModeDef</b> (see <a href="#">Drive,Belt and Mining Objects</a> ) <b>ManCmd</b>
	<ul style="list-style-type: none"> <li>• Maint: Maintenance mode - This is a toggle button that toggles the "MaintCmd" item from 0 to 1 or vice versa. It is green (active) when the</li> </ul>	<b>Maint</b> , <b>MaintCmd</b>

### Single and Multiple VSD Drive - Single Direction

This faceplate is used for single and multiple Variable Speed Drive (VSD) control. It is used for variable drives and groups of variable speed drives. This faceplate functions similar to the multiple DOL drive faceplate. The Equipment Running State Indicators are positioned like the multiple DOL drive faceplate based upon the number of drives.

Component	Description	Associated Tags
Drive Symbol	Symbol for the drive associated with the selected equipment. Clicking on the multiple equipment object selects that particular drive. The buttons, meter and readings are then populated for that drive.

If UsePLCLimits parameter is "false", values come from the alarm limit configuration of the PV tag.
Meter	Meter displayed for the PV of the equipment.	
Faceplate Inputs	<p>Shown on the right-hand side of the meter. These include:</p> <ul style="list-style-type: none"> <li>• PV (comes from the equipment)</li> <li>• PV tracker</li> </ul>	<a href="#">PV</a> , <a href="#">PVTrack</a> (see <a href="#">Meter Common Elements</a> )

## Valve Faceplates

Valves can be associated with one of the following faceplates:

- [Simple Valve Faceplate](#)
- [Complex Valve](#)

The following sample valve faceplates are available for use:

- FP\_COMPLX\_VLV\_HD1080
- FP\_COMPLX\_VLV\_UHD4K
- FP\_VLV\_HD1080

- FP\_VLV\_UHD4K

These faceplates are pages in the sa\_style\_1\_multires project, and are fully configured. You can use them directly in your projects.

### Simple Valve Faceplate

The Simple Valve faceplate example can be associated with a Block Valve as it has the square valve head.

**Note:** To use for other valve types, create a copy of the faceplate and update the valve type in the composite genie.

The Simple Valve faceplate comprises the following components:

Component	Description	Associated Tags
Valve Head	Valve Symbol associated with the selected equipment.	
Mode buttons	Mode buttons are green when a mode is active, and grey when inactive. When the CtrlMode tag associated with the equipment is 0, the mode is Auto. When the tag is 1, the mode is Manual. This tag	<b>CtrlMode, CtrlModeDef (see Valves)</b> <b>AutoCmd</b> <b>ManCmd</b>

Component	Description	Associated Tags
	<p>applies to Auto and Manual buttons.</p> <p>The Mode button displays two symbols:</p> <ul style="list-style-type: none"> <li>• The circle in the top-left corner indicates that a command has been sent to the linked PLC. This indicator is not visible otherwise.</li> <li>• The rectangle in the top-right corner indicates that the current mode is the normal mode of operation for the equipment. Displayed on the Auto/Manual buttons, the rectangle depends on 'CtrlModeDef'</li> </ul> <p>The following Mode Buttons are available:</p>	
	<ul style="list-style-type: none"> <li>• Auto: Automatic mode</li> </ul>	<b>CtrlMode, CtrlModeDef</b> (see <a href="#">Valves</a> ) <b>AutoCmd</b>
	<ul style="list-style-type: none"> <li>• Manual: Manual mode</li> </ul>	<b>CtrlMode, CtrlModeDef</b> (see <a href="#">Valves</a> ) <b>ManCmd</b>
	<ul style="list-style-type: none"> <li>• Open: Open mode - This is a toggle button that toggles the "OpenCmd". The Open button is active (green) when 'OpenCmd' tag is 1. The button is disabled when the valve is in AUTO mode or the valve has an interlock/shutdown condition preventing the valve from being operated.</li> </ul>	<b>OpenCmd</b>
	<ul style="list-style-type: none"> <li>• Close: Close mode - This is a toggle button that toggles the "CloseCmd". The Close button</li> </ul>	<b>CloseCmd</b>

Component	Description	Associated Tags
	is active (green) when 'Closedmd' tag is 1. The button is disabled when the valve is in AUTO mode or the valve has an interlock/shutdown condition preventing the valve from being closed.	
Mode Indicators	<p>Local, Manual, Auto and Cascade Mode.</p> <p>Local - Local Mode – field or MCC control only.</p> <p>Manual - Manual Mode - start/stop or valve position set by control room operator</p> <p>Auto Mode - start/stop and valve position set by control system, control operator sets Setpoint target.</p> <p>Cascade mode – control system sets setpoint target from another loop/logic.</p>	<b>CtrlMode, CtrlModeDef</b> (see <a href="#">Valves</a> )
Equipment Status Indicator	Displays if there is an abnormal status condition e.g. bad comms (stop IO server).	<b>EqStatus</b> (see <a href="#">Status Indicators</a> )
Output Tracker	Blue line on output bar. The position of the output tracker is based on the 'OPTrack' tag and visible when 'TrackDsp' tag is 1.	<b>OPTrack</b> (see <a href="#">Valves</a> ) TrackDsp

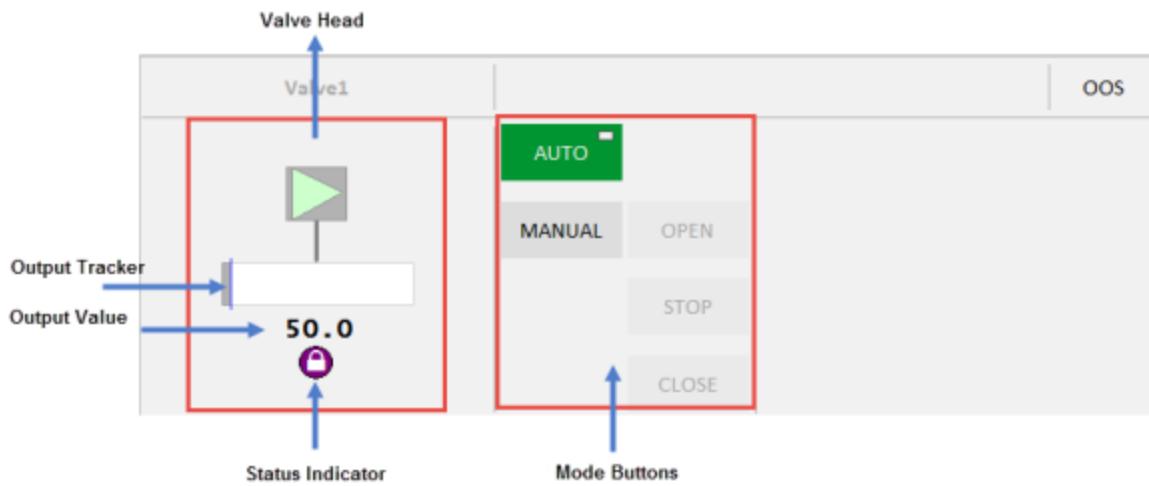

## Complex Valve

The Complex Valve faceplate can be associated with the Block Valve.

---

**Note:** To use for other valve types, create a copy of the faceplate and update the valve type in the composite genie.

---

The Complex Valve faceplate comprises the following components:

Component	Description	Associated Tags
Valve Head	Valve Symbol associated with the selected equipment.	
Mode buttons	<p>Auto, Manual, Open, Close and Stop buttons are displayed on this faceplate. The button is green when a mode is active. When the tag associated with the equipment is 0, the mode is Auto. When the tag is 1, the mode is Manual.</p> <p>The Control Mode button displays two symbols:</p> <ul style="list-style-type: none"> <li>The circle in the top-left corner indicates that a command has been sent to the linked PLC. This indicator is not visible otherwise.</li> <li>The rectangle in the top-right corner indicates that the current mode is the normal mode of operation for the equipment. Displayed on the Auto/Manual buttons, the rectangle depends on 'CtrlModeDef'</li> </ul>	<b>CtrlMode, CtrlModeDef</b> (see <a href="#">Valves</a> ) <b>AutoCmd</b> <b>ManCmd</b>

Component	Description	Associated Tags
	<ul style="list-style-type: none"> <li>• Auto: Automatic mode</li> </ul>	<b>CtrlMode, CtrlModeDef</b> (see <a href="#">Valves</a> ) <b>AutoCmd</b>
	<ul style="list-style-type: none"> <li>• Manual: Manual mode</li> </ul>	<b>CtrlMode, CtrlModeDef</b> (see <a href="#">Valves</a> ) <b>ManCmd</b>
	<ul style="list-style-type: none"> <li>• Open: Open mode - This is a toggle button that toggles the "OpenCmd". The Open button is active (green) when 'OpenCmd' tag is 1. The button is disabled when the valve is in AUTO mode or the valve has an interlock/shutdown condition preventing the valve from being operated.</li> </ul>	<b>OpenCmd</b>
	<ul style="list-style-type: none"> <li>• Close: Close mode - This is a toggle button that toggles the "CloseCmd". The Close button is active (green) when 'Closedmd' tag is 1. The button is disabled when the valve is in AUTO mode or the valve has an interlock/shutdown condition preventing the valve from being closed.</li> </ul>	<b>CloseCmd</b>
	<ul style="list-style-type: none"> <li>• Stop: Stop mode - This is a toggle button that toggles the .The Stop button is active (green )when 'Stopped' is 1. The button shall be disabled when the valve is in AUTO mode.</li> </ul>	<b>StopCmd</b>
Mode Indicators	Local, Manual, Auto and Cascade Mode. Local - Local Mode – field or MCC control only. Manual - Manual Mode - start/stop	<b>CtrlMode, CtrlModeDef</b> (see <a href="#">Valves</a> )

Component	Description	Associated Tags
	or valve position set by control room operator Auto Mode - start/stop and valve position set by control system, control operator sets Setpoint target. Cascade mode – control system sets setpoint target from another loop/logic.	
Equipment Status Indicator	Displays if there is an abnormal status condition e.g. bad comms (stop IO server).	<b>EqStatus</b> (see <a href="#">Status Indicators</a> )
Output Tracker	Blue line on output bar. The position of the output tracker is based on the 'OPTrack' tag and visible when 'TrackDsp' tag is 1.	<b>OPTrack</b> (see <a href="#">Valves</a> ) TrackDsp
Output Value	Number below the output bar. This uses the 'OP' tag which is the same for the output bar. The units of the OP will be displayed to the right of the number if configured.	

## Core Component Genie Libraries

This section of the help describes the components that are used to build the Composite Genies and faceplates provided with a Situational Awareness project.

These components are located in the following libraries:

### Common Components Genie Library

The Common Components Library (named "sa\_common") includes the following components:

- [Clock Timer Genie](#)
- [Control Mode Genie](#)
- [Label Genie](#)
- [MEO Genie](#)
- [Meter Value Genie](#)
- [Out Of Service \(OOS\) Genie](#)
- [Output Bar Genie](#)
- [Output Value Genie](#)

- PV Value Genie
- Selection Adorner Genie
- Selection Adorner Auto Genie
- Status Indicator Genie.

## Miscellaneous Components Genie Library

The Miscellaneous Library (named "sa\_misc") includes the following component:

- Direction Arrow Genie

## Faceplate Components Library

The Faceplate Library (named "sa\_faceplates") includes Genies that can be used as components for equipment faceplates.

- Faceplate Button Genie
- Faceplate Command Button Genie
- Limit Label Genie
- Local/Remote Indicator Genie
- MEO Selector Genie
- Output Tracker Genie
- Faceplate Output Value Genie
- Faceplate Selection Adorner Genie

## See Also

[Create a New Faceplate](#)

## Common Components Genie Library

This Common Components Genie Library (named "sa\_common") includes the following Genies that are used to build the Composite Genies and faceplates provided with a Situational Awareness project.

- Clock Timer Genie
- Control Mode Genie
- Label Genie
- MEO Genie
- Meter Value Genie
- Out Of Service (OOS) Genie
- Output Bar Genie
- Output Value Genie
- PV Value Genie

- Selection Adorner Genie
- Selection Adorner Auto Genie
- Status Indicator Genie.

## See Also

[Create a New Faceplate](#)  
[Core Component Genie Libraries](#)

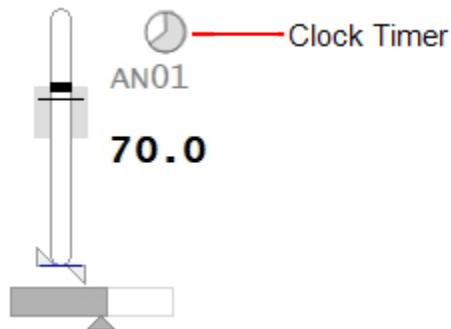

### Clock Timer Genie

**Genie Name:** clocktimer\_24

**Genie Library:** sa\_common

**System Project:** SA\_Library

The Clock Timer Genie (named "clocktimer\_24") allows you to add an indicator to a page or faceplate that uses a grey fill to show how much time has passed since the PV last changed.

If the clock reaches 100% and no new sample has been received, the clock continues to fill but the grey segments are replaced with black. If a second cycle passes without an updated sample reading, the clock will remain solid black.

This Genie binds to the following equipment items:

- **PV** (see [Drive, Belt and Mining Objects](#))
- **Timer** (see [Meter Special Elements](#))

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.
Prefix	If the piece of equipment has a prefix specified for the PV or Timer items (enabling support for multiple values), enter the prefix you want the Genie to access.

## See Also

[Configure a Genie](#)

[Core Component Genie Libraries](#)

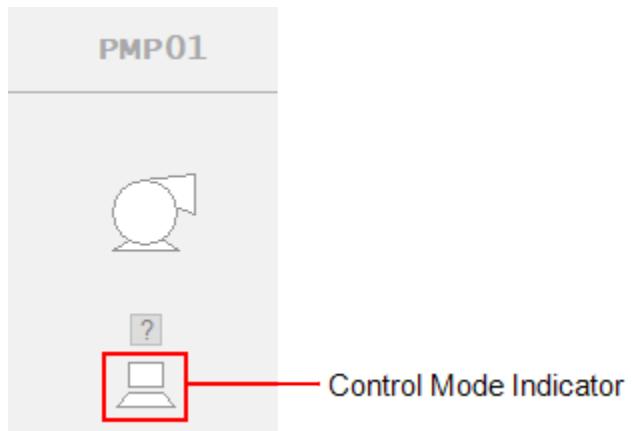

## Control Mode Genie

**Genie Name:** control\_mode\_<n>

**Genie Library:** sa\_common

**System Project:** SA\_Library

The Control Mode Genie allows you to add a control mode indicator to a faceplate.

It indicates the following modes:

- 0 – Automatic (A)
- 1 – Manual (M)
- 2 – Cascade (C)
- 3 – Local (L)
- 4 – Special control (computer symbol).

The Genie is available in three sizes:

- control\_mode\_14
- control\_mode\_18
- control\_mode\_24

This Genie binds to the following equipment items:

- **CtrlMode** (see [Drive, Belt and Mining Objects](#))
- **CtrlModeDef** (see [Drive, Belt and Mining Objects](#))

See [Create a New Faceplate](#) for an example of how this Genie is activated.

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.

## See Also

[Configure a Genie](#)

[Core Component Genie Libraries](#)

## Label Genie

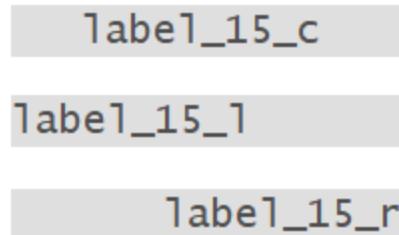

**Genie Name:** label\_<n>\_c / label\_<n>\_l / label\_<n>\_r

**Genie Library:** sa\_common

**System Project:** SA\_Library

The Label Genie allows you to add a label to a page or faceplate. Six variations of the Genie are included in the SA\_Library project:

- label\_12\_c — a 12 pixel center label
- label\_12\_l — a 12 pixel left label
- label\_12\_r — a 12 pixel right label
- label\_15\_c — a 15 pixel center label
- label\_15\_l — a 15 pixel left label
- label\_15\_r — a 15 pixel right label

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Label	Enter the text that you would like to appear on the label.

## See Also

[Configure a Genie](#)

[Core Component Genie Libraries](#)

## MEO Genie

**Genie Name:** meo\_<n> / meo\_<n>\_r

**Genie Library:** sa\_common

**System Project:** SA\_Library

The MEO Genie is used to create a Multiple Equipment Object (MEO). It is called by the [MEO Selector Genie](#), which is the Genie you should use to add an MEO to a faceplate.

Four variations of the Genie are included in the SA\_Library project:

- meo\_16 — a small square MEO
- meo\_17\_r — a small round MEO
- meo\_22 — a larger square MEO
- meo\_25\_r — a larger round MEO

The Genie binds to the following equipment item:

- **RunStatus** (see [Drive, Belt and Mining Objects](#))

For more information, see [Configure Equipment Selection for Group Objects](#).

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.

## See Also

[Configure a Genie](#)

[Core Component Genie Libraries](#)

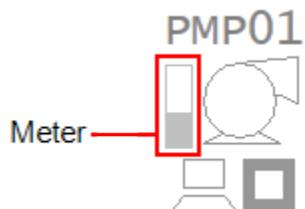

## Meter Value Genie

**Genie Name:** meter\_value\_<n>

**Genie Library:** sa\_common

**System Project:** SA\_Library

The Meter Value Genie allows you to add a meter value indicator to a page or faceplate.

Two variations of the Genie are included in the SA\_Library project:

- meter\_value\_28
- meter\_value\_35

This Genie binds to the following equipment item:

- **PV** (see [Drive, Belt and Mining Objects](#))

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.
Prefix	If the piece of equipment has a prefix specified for the PV item (enabling support for multiple values), enter the prefix you want the Genie to access.

## See Also

[Configure a Genie](#)

[Core Component Genie Libraries](#)

## Out Of Service (OOS) Genie

**Genie Name:** oos\_<n>

**Genie Library:** sa\_misc

**System Project:** SA\_Library

The Out Of Service (OOS) Genie allows you to add an OOS button to a page or faceplate. Four variations of the Genie are included in the SA\_Library project:

- oos\_16
- oos\_22
- oos\_25
- oos\_33

This Genie binds to the following equipment item:

- **RunStatus** (see [Drive, Belt and Mining Objects](#))

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.

## See Also

[Configure a Genie](#)

[Core Component Genie Libraries](#)

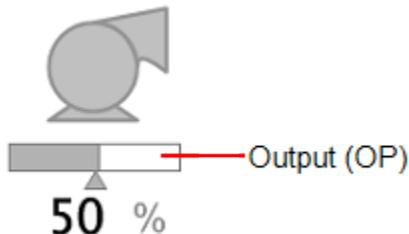

## Output Bar Genie

**Genie Name:** output\_<n> / output\_<n>\_rb / output\_<n>\_rb\_v / output\_<n>\_v

**Genie Library:** sa\_misc

**System Project:** SA\_Library

The Output Bar Genie allows you to add an Output (OP) Bar to a faceplate.

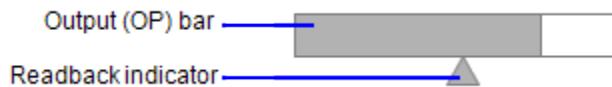

Fourteen variations of the Genie are included in the SA\_Library project:

- output\_110
- output\_110\_rb
- output\_50
- output\_50\_rb
- output\_50\_rb\_v
- output\_50\_v
- output\_65
- output\_65\_rb
- output\_65\_rb\_v
- output\_65\_v
- output\_80

- output\_80\_rb
- output\_80\_rb\_v
- output\_80\_v

The "\_rb" variations will include a readback indicator.

The "\_v" variations are a vertical version of the OP bar.

This Genie binds to the following equipment items:

- **FB** (see [Control Meters - Common Elements](#))
- **OP** (see [Control Meters - Common Elements](#))

---

**Note:** The 'output\_50\_rb\_v' and 'output\_65\_rb\_v' variations of this Genie can show the feedback position for a set of sub-equipment. They can be used in conjunction with the MEO Genie.

---

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.
Prefix	If the piece of equipment has a prefix specified for the FB or OP items (enabling support for multiple values), enter the prefix you want the Genie to access.
Equipment1 — Equipment5	Applies to the 'output_50_rb_v' and 'output_65_rb_v' variations of the Genie. To access a set of sub-equipment, enter up to five equipment names.

## See Also

[Configure a Genie](#)

[Core Component Genie Libraries](#)

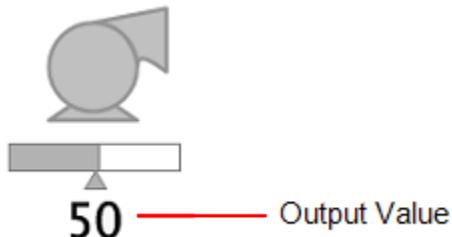

## Output Value Genie

**Genie Name:** output\_value\_<n>\_r

**Genie Library:** sa\_misc

**System Project:** SA\_Library

The Output Value Genie allows you to add a value label to an output bar on a page.

Three variations of the Genie are included in the SA\_Library project:

- output\_value\_11\_r
- output\_value\_14\_r
- output\_value\_18\_r

The Genie binds to the following equipment item:

- **OP** (see [Control Meters - Common Elements](#))

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.
Prefix	If the piece of equipment has a prefix specified for the OP item (enabling support for multiple values), enter the prefix you want the Genie to access.

## See Also

- [Configure a Genie](#)
- [Core Component Genie Libraries](#)

### PV Value Genie

**Genie Name:** pv\_value\_<n>\_l / pv\_value\_<n>\_r

**Genie Library:** sa\_misc

**System Project:** SA\_Library

The PV Value Genie allows you to add a value label for a process variable (PV) on a faceplate. Four variations of the Genie are included in the SA\_Library project:

- pv\_value\_14\_l
- pv\_value\_14\_r
- pv\_value\_18\_l
- pv\_value\_18\_r

The Genie binds to the following equipment item:

- **PV** (see [Drive, Belt and Mining Objects](#))

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.
Prefix	If the piece of equipment has a prefix specified for the PV item (enabling support for multiple values), enter the prefix you want the Genie to access.

## See Also

- [Configure a Genie](#)

## Selection Adorner Genie

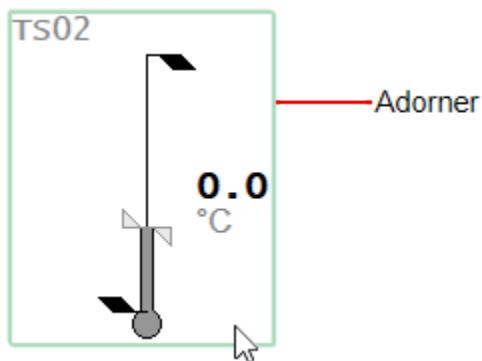

**Genie Name:** selection\_adorner

**Genie Library:** sa\_misc

**System Project:** SA\_Library

The Selection Adorner Genie (named "selection\_adorner") is a Genie that enables you to set the context of the workspace by clicking in an area that surrounds a piece of equipment. This Genie is useful with existing pages that do not include the Situational Awareness library objects. It allows legacy objects to be selected.

The border of the adorner is hidden at runtime until an operator points the mouse at the associated piece of equipment.

Clicking within the adorner will set the context for the workspace.

**Note:** A variation of this Genie is available that will automatically adjust to the size of the associated piece of equipment. See [Selection Adorner Auto Genie](#).

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- AN:** This is an automatically-generated unique ID for the Genie object.
- Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
OnClickFunction	A Cicode function that is executed when an operator clicks on the adorner around a piece of equipment with which the adorner is associated.
OnRightClickFunction	A Cicode function that is executed when an operator right-clicks on the adorner around a piece of equipment with which the adorner is associated..
Equipment	The name of the associated piece of equipment that

Parameter	Description
	you want use to set the context of the workspace.
EquipmentSecondary	The name of the piece of equipment that references any sub-equipment.

## See Also

[Configure a Genie](#)

### Selection Adorner Auto Genie

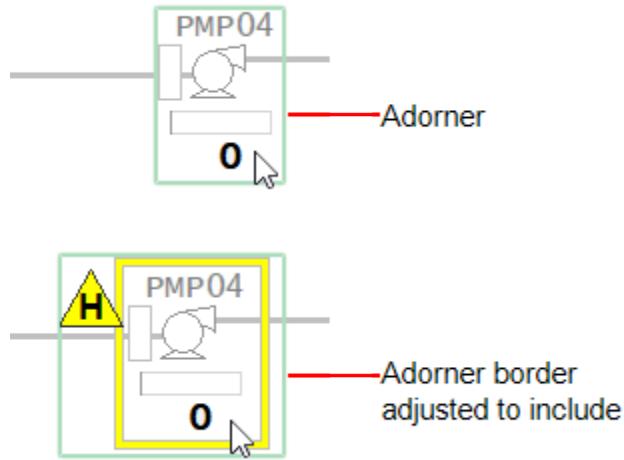

**Genie Name:** selection\_adorner\_auto

**Genie Library:** sa\_misc

**System Project:** SA\_Library

The Selection Adorner Auto Genie (named "selection\_adorner\_auto") is a Genie that enables you to set the context of the workspace by clicking in an area that surrounds a piece of equipment. The border of the adorner is hidden at runtime until an operator points the mouse at the associated piece of equipment. Clicking within the adorner will set the context for the workspace.

The size of the Adorner Auto Genie will automatically adjust to the size of the associated piece of equipment. For example, it will adjust to include an alarm indicator when it appears.

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
RefAN	The AN number of the object you want the adorner to surround.  By default, the following function is specified: Adorner_GetAnFromName("..\\..\\Composite")  This will retrieve the AN of an assumed sibling object named "Composite".  If required, delete this function and enter the AN for the object you would like to use the adorner with.
Padding	If you want to add padding to the adorner, enter the required padding size in pixels.
IsParentRefAN	Specifies if the parent AN is used.  TRUE = Parent AN is used.  FALSE = Parent AN is not used.
OnClickFunction	A Cicode function that is executed when an operator clicks on the adorner around a piece of equipment with which the adorner is associated.
OnRightClickFunction	A Cicode function that is executed when an operator right-clicks on the adorner around a piece of equipment with which the adorner is associated..
Equipment	The name of the associated piece of equipment that you want use to set the context of the workspace.
EquipmentSecondary	The name of the piece of equipment that references any sub-equipment.

## See Also

[Configure a Genie](#)

[Core Component Genie Libraries](#)

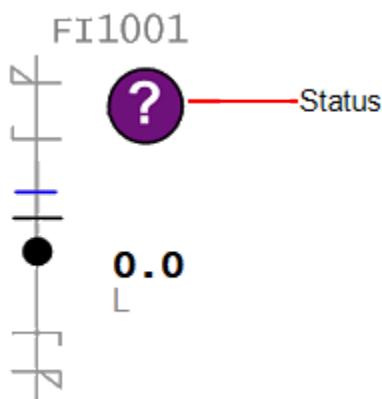

## Status Indicator Genie

**Genie Name:** status\_<n>

**Genie Library:** sa\_misc

**System Project:** SA\_Library

The Status Indicator Genie allows you to add a status indicator to a page or faceplate. See Status Indicators.

Two variations of the Genie are included in the SA\_Library project:

- status\_24
- status\_35

This Genie binds to the following equipment items:

- **EQStatus** (see [Drive, Belt and Mining Objects](#))

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.

## See Also

[Configure a Genie](#)

[Core Component Genie Libraries](#)

## Miscellaneous Components Genie Library

The Miscellaneous Components Library (named "sa\_misc") includes the following Genie:

- Direction Arrow Genie

## See Also

[Create a New Faceplate](#)  
[Core Component Genie Libraries](#)

### Direction Arrow Genie

**Genie Name:** directionarrow\_31 / directionarrow\_45

**Genie Library:** sa\_misc

**System Project:** SA\_Library

The Direction Arrow Genie allows you to add a direction indicator to a page or faceplate. The Genie will indicate forward and reverse states.

Forward

Reverse

The Genie is available in two sizes:

- directionarrow\_31
- directionarrow\_45

The Genie binds to the following equipment item:

- Left
- Right

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.

## See Also

- [Configure a Genie](#)
- [Core Component Genie Libraries](#)
- [Miscellaneous Components Genie Library](#)

## Faceplate Components Genie Library

The Faceplate Library (named "sa\_faceplates") includes Genies that can be used as components for equipment faceplates.

- [Faceplate Button Genie](#)
- [Faceplate Command Button Genie](#)
- [Limit Label Genie](#)
- [Local/Remote Indicator Genie](#)
- [MEO Selector Genie](#)
- [Output Tracker Genie](#)
- [Faceplate Output Value Genie](#)
- [Faceplate Selection Adorner Genie](#)

## See Also

- [Create a New Faceplate](#)
- [Core Component Genie Libraries](#)

## Faceplate Button Genie

**Genie Name:** button\_fp\_<n>\_<n>

**Genie Library:** sa\_faceplate

**System Project:** SA\_Library

The Faceplate Button Genie allows you to add a button to a faceplate.

---

**Note:** If you need a button that binds directly to an item, use the [Faceplate Command Button Genie](#).

---

The button features two indicators.

- Targeted indicator - indicates that a command has been issued, but has not completed.
- Normal mode indicator - indicates that the associated piece of equipment is in its normal operational state. For example, if the button represents Auto/Manual, then Auto maybe the normal operational state and is therefore indicated as such.

Two variations of the Genie are included in the SA\_Library project:

- button\_fp\_112\_44
- button\_fp\_84\_40

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment Context	An equipment name that is used to define equipment context, or a Super Genie association that defines equipment context.  By default, the following is used: <code>?__EquipmentRef?</code>  This specifies that the current workspace context is used.
Label	The text label that appears on the button.
Tooltip	Additional text that appears when the mouse hovers over the button.
Click Command	An expression that is called when the button is clicked on.
Active When	An expression (applied in conjunction with Area and Privilege) that can provide further logic to specify when the button is active.
Normal When	An expression that determines when the normal mode indicator displays.
Targeted When	An expression that determines when the targeted indicator displays.
Disabled When	An expression (applied in conjunction with Area and Privilege) that can provide further logic to specify when the button is disabled.
Hidden When	An expression that determines when the button is hidden.

Parameter	Description
Security: Area	Enter the area to which the button belongs. Only users with access to this area can use the button.
Security: Privilege	Enter the privilege level that a user needs to possess to use this button.

### Faceplate Command Button Genie

**Genie Name:** button\_fp\_cmd\_<n>\_<n>

**Genie Library:** sa\_faceplate

**System Project:** SA\_Library

The Faceplate Command Button Genie allows you to add a button to a faceplate that binds directly to an item. The button features two indicators.

- Targeted indicator - indicates that a command has been issued, but has not completed.
- Normal mode indicator - indicates that the associated piece of equipment is in its normal operational state.

Two variations of the Genie are included in the SA\_Library project:

- button\_fp\_cmd\_112\_44
- button\_fp\_cmd\_84\_40

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table

below:

Parameter	Description
Equipment Context	An equipment name that is used to define equipment context, or a Super Genie association that defines equipment context.  By default, the following is used: <code>?__EquipmentRef?</code> This specifies that the current workspace context is used.
Label	The text label that appears on the button.
Tooltip	Additional text that appears when the mouse hovers over the button.
Command Item	The name of the command tag that, when written to, will update the status item.
Status Item	The name of the item that sets the button to its active state.
Normal Mode Item	The name of the item that controls the appearance of the normal mode indicator.
Status Value	The value of the normal mode item that controls the normal mode indicator.
Disabled When	An expression (applied in conjunction with Area and Privilege) that can provide further logic to specify when the button is disabled.
Hidden When	An expression that determines when the button is hidden.
Security: Area	Enter the area to which the button belongs. Only users with access to this area can use the button.
Security: Privilege	Enter the privilege level that a user needs to possess to use this button.

## See Also

- [Create a New Faceplate](#)

- [Faceplate Components Genie Library](#)
- [Core Component Genie Libraries](#)

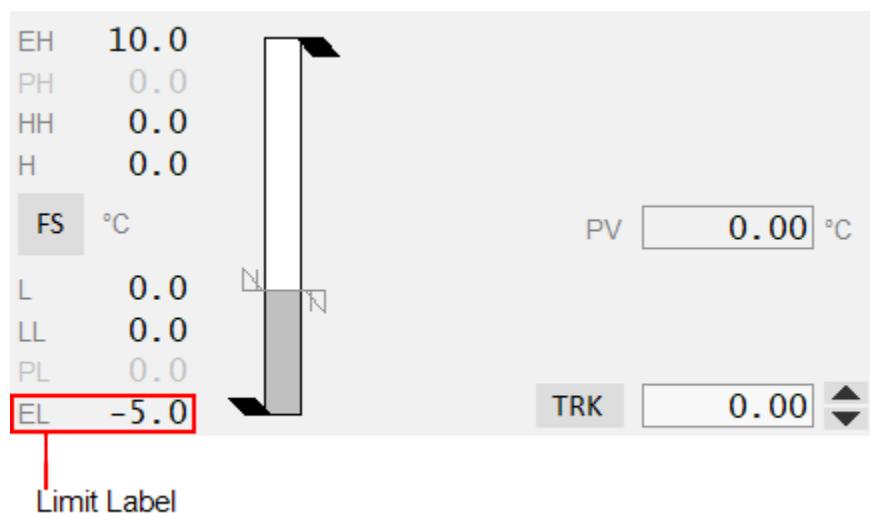

## Limit Label Genie

**Genie Name:**limitlabel\_<n>

**Genie Library:** sa\_faceplate

**System Project:** SA\_Library

The Limit Label Genie allows you to add a label to a limit indicator on a faceplate.

It can display alarming limits, or the practical engineering range.

Practical engineering range:

- EH = engineering high.
- PH = practical high.
- PL = practical low.
- EL = engineering low.

Alarming limits:

- HH = high high alarm.
- HI = high alarm.
- LO = low alarm.
- LL = low low alarm.

Two variations of the Genie are included in the SA\_Library project:

- limitlabel\_12
- limitlabel\_15

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment Context	An equipment name that is used to define equipment context, or a Super Genie association that defines equipment context. By default, the following is used: ?__EquipmentRef? This specifies that the current workspace context is used.
Item Prefix	Enter the equipment item prefix you want the Genie to access.
Limit Index	Enter the value that indicates the limit index you would like the label to use. You can enter one of the following values, or one of the pre-defined labels included in the SA_Library system project. <ul style="list-style-type: none"><li>• HH = 3 (METER_LIMIT_HH)</li><li>• HI = 2 (METER_LIMIT_H)</li><li>• LO = 1 (METER_LIMIT_L)</li><li>• LL = 0 (METER_LIMIT_LL)</li><li>• PH = -1 (METER_LIMIT_PH)</li><li>• PL = -2 (METER_LIMIT_PL)</li><li>• EH = -3 (METER_LIMIT_EH)</li><li>• EL = -4 (METER_LIMIT_EL)</li></ul> <b>Note:</b> If you want to use PLC limits, you can add additional labels that correspond to those configured by the [SA_Library.Meter]PLCLimitNames parameter. See Associate PLC Limits with Equipment.

## Local/Remote Indicator Genie

**Genie Name:**localremote\_indicator\_<n>**Genie Library:** sa\_faceplate**System Project:** SA\_Library

The Local/Remote Indicator Genie allows you to add a local/remote indicator to a faceplate.

If the control mode for a piece of equipment is set to "Local" (mode 3), the indicator will highlight "L". For all other control modes, the indicator will highlight "R".

Two variations of the Genie are included in the SA\_Library project:

- localremote\_indicator\_12
- localremote\_indicator\_16

The Genie binds to the following equipment item:

- **CtrlMode** (see [Drive, Belt and Mining Objects](#))

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.

## MEO Selector Genie

**Genie Name:** meo\_selector\_<n>  
**Genie Library:** sa\_faceplate  
**System Project:** SA\_Library

The MEO Selector Genie allows you to add an MEO selector to a faceplate, allowing you to switch between the objects within the Multiple Equipment Object. Two variations of the Genie are included in the SA\_Library project:

- meo\_selector\_18
- meo\_selector\_22

The Genie binds to the following equipment item:

- **RunStatus** (see [Drive, Belt and Mining Objects](#))

For more information, see [Configure Equipment Selection for Group Objects](#).

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.
Equipment Secondary	The name of the piece of equipment that references any sub-equipment.

## Output Tracker Genie

**Genie Name:** optrack\_<n>  
**Genie Library:** sa\_faceplate  
**System Project:** SA\_Library

The Output Tracker Genie allows you to add an [output tracker](#) to a faceplate. Two variations of the Genie are included in the SA\_Library project:

- optrack\_135
- optrack\_169

This Genie binds to the following equipment items:

- **OPTTrack** (see [Meter Common Elements](#))
- **TrackDsp** (see [Meter Common Elements](#))

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.

## Output Indicator Genie

**Genie Name:** output\_<n>\_fp

**Genie Library:** sa\_faceplate

**System Project:** SA\_Library

The Output Indicator Genie allows you to add an output indicator to a faceplate. Two variations of the Genie are included in the SA\_Library project:

- output\_160\_fp
- output\_170\_fp

This Genie binds to the following equipment items:

- **OP** (see [Control Meters - Common Elements](#))
- **FB** (see [Control Meters - Common Elements](#))

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Show Readback	Determines if the readback indicator is displayed. TRUE = Readback indicator is displayed (default). FALSE = Readback indicator is not displayed.
Equipment	The name of the piece of equipment with which the Genie is associated.

### Faceplate Output Value Genie

**Genie Name:** output\_value\_<n>\_r

**Genie Library:** sa\_faceplate

**System Project:** SA\_Library

The Faceplate Output Value Genie allows you to add an output value indicator to a faceplate.

Two variations of the Genie are included in the SA\_Library project:

- output\_value\_12\_r
- output\_value\_15\_r

This Genie binds to the following equipment item:

- **OP** (see [Control Meters - Common Elements](#))

### Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

### Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
Equipment	The name of the piece of equipment with which the Genie is associated.

### Faceplate Selection Adorner Genie

**Genie Name:** selection\_adorner\_fp

**Genie Library:** sa\_faceplate

**System Project:** SA\_Library

The Faceplate Selection Adorner Genie (named "selection\_adorner\_fp") allows you to set the context of the workspace by clicking in the area surrounding a highlighted piece of equipment on a faceplate. The border of the adorner is hidden at runtime until an operator points the mouse at the associated piece of equipment.

Clicking within the adorner will set the context for the workspace.

## Genie Properties

Complete the following properties for the Genie in the Genie Properties dialog box.

- **AN:** This is an automatically-generated unique ID for the Genie object.
- **Name:** Optional. If you need to reference the Genie at runtime using Cicode, specify a unique name.

## Genie Parameters

Select the Genie and double-click on it to view its parameters. The parameters are used as described in the table below:

Parameter	Description
OnClickFunction	A Cicode function that is executed when an operator clicks on the adorner around a piece of equipment with which the adorner is associated. By default, the following function is used: <code>Workspace_SelectEquipment(TRUE)</code>
Equipment	The name of the associated piece of equipment that you want use to set the context of the workspace.
EquipmentSecondary	The name of the piece of equipment that references any sub-equipment.

## StruxureWare (SxW) Templates Project

The SxW Template project (named "SxW\_Style\_Include") is a system project that includes a set of templates designed for use with StruxureWare systems.

---

**Note:** These templates are not designed for direct upgrade from existing Tab Style templates. If you want to use these templates you will need to manipulate the page objects so that the objects are rendered correctly on screen.

When a new Plant SCADA project is created to use SxW\_Style\_1 as the default template style, the SxW Template (SxW\_Style\_Include) project is automatically incorporated as an included project. This means the project's templates are available for implementation when creating your graphics pages in Graphics Builder.

As well as including a standard graphics page template for creating plant mimics, the project also includes predefined alarm templates, a set of file templates for displaying text, Rich Text Format and HTML files. They have identical page navigation, alarm banners and menus for consistent "look and feel", and usability across an entire project.

---

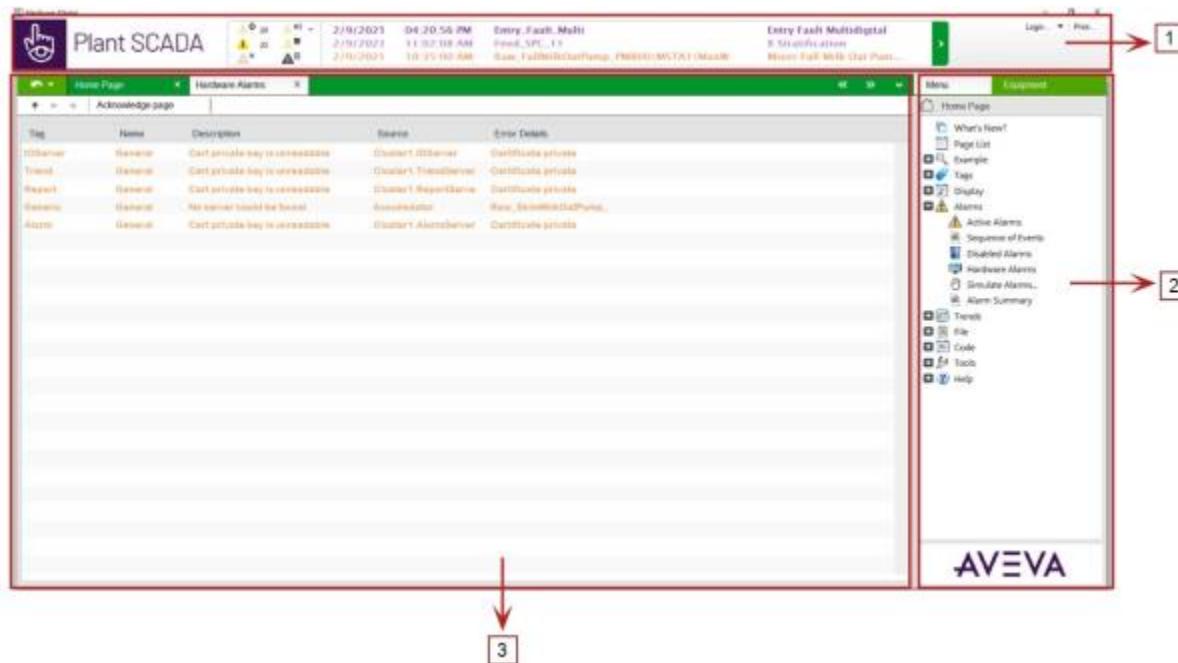

**Note:** Avoid making changes to the SxW Template project for use as a runtime project. A Plant SCADA upgrade will install a new version of the project, which will overwrite any changes you make.

## See Also

- [The SxW Interface](#)
- [Use SxW Pages and Templates](#)
- [Creating a New Project](#)

## The SxW Interface

The SxW template is divided into 3 parts:

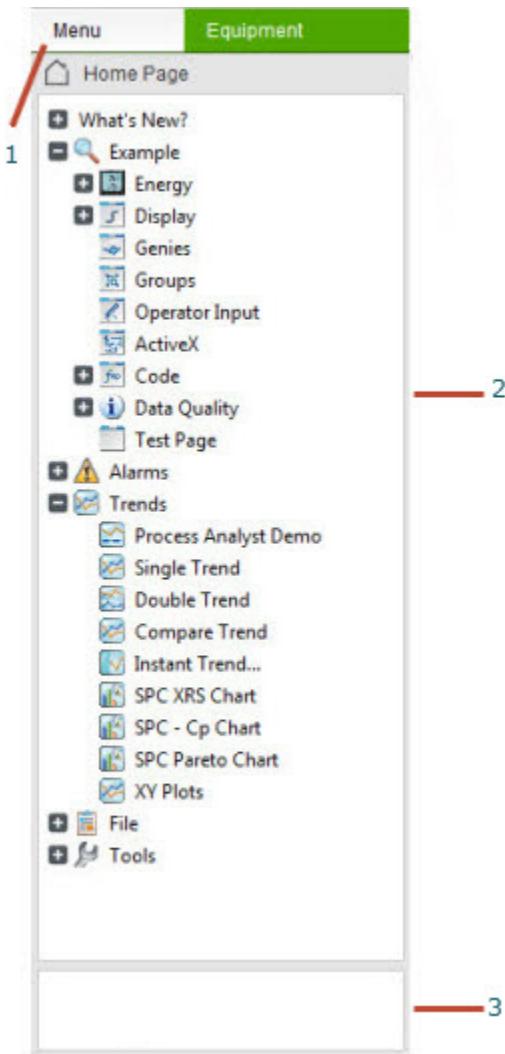

### 1. The Header

<b>1</b>	The icon and name of the product. They are always visible, and cannot be re-sized.
<b>2</b>	The Alarm panel. It displays status (and counts) for various types of alarms, including active, unacknowledged, disabled and hardware alarms, shortcuts to relevant alarm and events page, and controls to silence alarm (sound).
<b>3</b>	The Alarm banner. It lists recent alarms. Click on the white arrow in the side tab to expand/reduce the alarm banner.
<b>4</b>	Currently logged in user name. click on the drop-down arrow for more login related options, and print commands. The options for the login drop-down menu are user configurable via the Menu Configuration form. The items for this menu should be assigned with page name of "Template" and Level 1

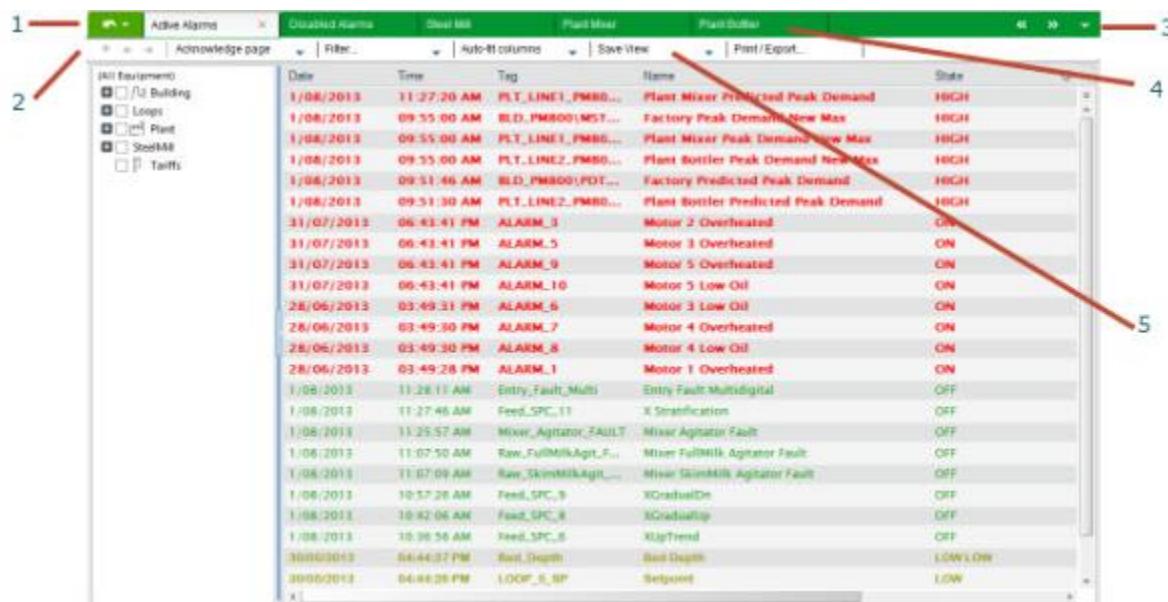

name of "Login". When the alarm banner is expanded, this section will collapse to a single drop-down arrow. The information shown here will be automatically incorporated to the drop-down menu.

## 2. The Right Panel

1	<p>Option to switch between navigation tree representing your Menu Configuration or Equipment hierarchy. Click on the Menu option to view common menu configuration for all pages in your project. On selecting a page it will open in the main window. The icon dimensions for optimal display in the menu and equipment tree are 16x16.</p> <p>To view the Equipment tree (lists all equipment defined in your project) click on the <b>Equipment</b> option.</p>
2	<p>Click on the plus and minus signs next to the nodes to expand and collapse items.</p>
3	<p>User configurable logo. To display your logo in the allocated space, define your logo as bitmap symbol in your project. The dimension of the bitmap should be 230 x 50. Assign the name of your symbol (in format of library.symbol) to project / INI parameter [Page]Logo.</p>

### 3. The Main Window

1	<p>History button. Move back through the tabs that have been opened.</p>
2	<p>Page specific navigation commands.</p> <ul style="list-style-type: none"> <li>Up navigation command changes the display to the "parent" page. You can assign a parent page by setting an environment variable in Graphics Builder. To do so,</li> </ul>

	open the page properties dialog of a page (via File   Properties menu command), click the Environment tab, and add a variable called "ParentPage". Assign the name of the parent page to the value of this variable <ul style="list-style-type: none"> <li>• Left / Right navigation commands display the previous / next page relative to the current page. To configure previous / next page, open the page properties dialog in Graphics Builder (via File   Properties menu command), click the General tab, and set page name to the Previous page / Next page fields.</li> </ul>
<b>3</b>	Forward and back navigation command buttons and the Display list button. Use to scroll and display the list of opened pages.
<b>4</b>	Tabs of opened pages. Allows you to access and navigate between pages that have been selected from the right-panel or launched from other pages.
<b>5</b>	Page specific menu commands. Menu configuration defined specified for this page appears here. (Menu configuration that is common to all pages appears on the navigation tree on the right panel).

**Note:** The Alarm templates include a left-hand panel that enables you to filter using the Equipment hierarchy.

[Use SxW Pages and Templates](#)

## Use SxW Pages and Templates

When you create a new project based on the SxW templates starter project, the following templates are available for you to use as you create your graphics pages. The templates are divided into three parts with each part sharing common functionality, including page navigation, menus and tools. Options available may vary according to the type of page.

The SxW template starter project has the following templates:

Template Type	Description
Normal	Standard graphics page. See <a href="#">Normal Page Template</a> .
Blank	For users who want to create their pages from scratch. See <a href="#">Blank Page Template</a> .
Data Browse	For users who want to display a table of data retrieved from built-in data browse functions on a page. See <a href="#">Data Browse Page Template</a> .

Template Type	Description
Alarm	Includes Alarm, Disabled, Hardware, Sequence of events and Summary for displaying different types of alarm list. See <a href="#">Alarm Page Templates</a> .
Process Analyst	Includes SinglePA, DoublePA, PopPA. See <a href="#">Process Analyst Page Templates</a> .
SPC	Includes SpcPareto, SpcCpk, SpcXRSChart, EventSPCXRS, MeanMeanChart, RangeChart and StandardChart. See <a href="#">SPC Trend Page Templates</a> .
File	Includes File, File_RTF and File_HTML for displaying a plain text file, rich text format file and HTML file / URL respectively. See <a href="#">File Page Templates</a> .

## See Also

[Creating a New Project](#)

[Creating New Pages](#)

## Normal Page Template

A template designed for creating user-necessary content and plant mimics. This page contains the navigation and alarm panels featured on SxW templates. If you are creating a project based on the SxW style templates, use this template for your standard graphics pages.

The Normal template creates a page in display format to be shown with a title bar. Two wide-screen sizes are available: HD768 (1388x768,16:9) and HD1080 (1920x1080,16:9).

## See Also

[Create Pages](#)

[Secure the Window Titlebar](#)

## Blank Page Template

The blank template is included for users who want to create their pages from scratch. There are no differences between the SxW blank template and the template in the include project.

## See Also

[Create Pages](#)

## Data Browse Page Template

The data browse template is included for users who want to create a page that displays a table of data retrieved from built-in data browse functions. The template includes the Equipment tree view on the left side of the main window. This is used to filter the display list based on the selected equipment node .

When using this template to create a new page within your project, configure the Data Browse pop up form. When configured the new page will display the appropriate data session at runtime.

Field	Description
Equipment Symbol Library (Optional)	The symbol library for displaying equipment symbol for each item in the equipment tree. The symbol is displayed based on the type of the equipment. It should have the same name as the equipment type assigned to an equipment record. If not specified, it defaults to a symbol library named "Equipment".
Equipment Default Symbol (Optional)	The default symbol to be displayed next to the item in the equipment tree if symbol corresponding to the equipment type of the item cannot be found from the supplied Equipment Symbol Library. The symbol should be specified in format of <library name>.<symbol name>
Browse Type	The type of project configuration to be browsed and displayed, including: AccumBrowse – for listing accumulators AlmBrowse – for listing alarm tags EquipBrowse - for listing equipment ServerBrowse – for listing servers TagBrowse – for listing variable tags TrnBrowse – for listing trend tags
Clusters (Optional)	A comma delimited string specifying only items from a subset of clusters to be included in the display. If not specified, items from all clusters will be included.
Filter (Optional)	A filter expression specifying the records to return during the browse If not specified, all records will be returned. Please see the browse open Cicode function of the selected browse type for the details of filter expression supported.
Fields (Optional)	A comma delimited string specifying the fields (columns) to be returned during the browse. If it is not specified, all fields of the selected browse type will be displayed: Tag, Tag Item, Value, Comment, Cluster, Equipment, Item, Type, IODev, Addr, Arr_Size, Eng_Zero, Eng_Full, Eng_Units, Format, Deadband,

Field	Description
	Raw_Zero,Raw_Full,Scaled_Type,Ovr_Mode,Ctrl_Mode,Override,Valid,Status,Field,Num_Subs.
Sort By (Optional)	A comma delimited string specifying the order of sorting preferences. This is only applicable to TagBrowse. Please see the Sort parameter of the built-in Cicode function <a href="#">TagBrowseOpen</a> for details.
View Name (Optional)	<p>A name to represent a view setting about the placement and width of the columns displayed on the browse table. The view name works with the Save view and Restored saved view options at runtime. You can assign a unique view on different data browse pages or share the same view among multiple pages. When user selects the Save view command from the Action tab, the current column settings will be saved under the view name. Once a view is saved, when user re-enters the page, previous saved view settings will be retrieved automatically. The saved view can also be restored on demand by selecting the Restored saved view from the Action tab. User can reset (forget) the view to the default as how it was pre-configured by selecting the Restore view to default command under the Action tab.</p> <p>For system engineers, the information associated with a view name is saved under INI parameters:</p> <pre>[BrowseTableView] &lt;BrowseType&gt;.&lt;ViewName&gt;.Fields &lt;BrowseType&gt;.&lt;ViewName&gt;.ColWidths</pre> <p>in comma delimited format. You can pre-configure these parameters in your project as the defaults.</p>
Privilege (Optional)	Only applicable to Browse Type of "TagBrowse", this specifies the privilege required by the logged on user to change the values / operating mode of variable tags displayed on the table. If no privilege is defined, no modification will be allowed.

Use the equipment tree to filter the data browse table at runtime. Items belonging to selected parent and child branches will be displayed with the exception of 'ServerBrowse' which is not associated with equipment.

Refer to Interactive Data Browse List for list display options available at runtime.

## See Also

[Create Pages](#)

## Interactive Data Browse List

The Data Browse template features an interactive list that supports the following functionality:

### Adjustable Columns

The user can adjust the columns displayed on the data browse list. Options include:

- Reposition a column by drag-and-drop its column heading to the new position.
- Adjust the size of a column by dragging the column separator that appears at the right edge of a column heading.

### Selection of data rows

The user can select single or multiple rows on the display list so that the same operation can be applied to multiple selected rows in one go. Row selection works as follows:

- To select a single data browse row: Left-click a row that is not already selected to select it.
- To select a continuous range of data browse rows: Select a single row to mark the start of the selection. Then hold the SHIFT key and left-click another row to extend the selection. Alternatively, you can select rows by dragging the mouse cursor from the starting to the ending row. Once rows are selected, you can extend its range by SHIFT left-clicking another row of alarm.
- To select disjointed rows, hold the CTRL key while selecting a row.
- To deselect alarm(s): Left-click any alarm within a selection range to deselect the whole range. Only the row that you have clicked will remain selected. Click the selected row again to deselect it.

### Context Menu

If the page is set to display tag browse data, right-click on any row will bring up the context menu for operations. Options available in the context menu will vary depending on whether single or multiple items are selected:

The commands will only work if:

- Tag field is included in the table display
- For system with multiple clusters, the cluster field will also need to be included

The items available on the menu are selection sensitive depending on whether single or multiple items are selected at the time. The following options are available only when single row is selected:

- Set Value

---

**Note:** To disable the Set Value command leave the privilege field empty. See [Data Browse Page Template](#) topic for more information.

---

The following options are available:

- Set Override Mode
- Set Control Mode

## Alarm Page Templates

Alarm page templates are included for the following types of alarm displays:

- **Active Alarm Page:** Used to create a page displaying active alarms that are unacknowledged or acknowledged and still in alarm state. The template has the equipment tree-view panel displayed on the left hand side of the page for filtering of the display list. The tree-view will display a hierarchy of equipment available to the currently logged on user. The template also includes vertical and horizontal scroll bars to allow users to view columns and rows off screen. To create a default active alarm page for your project, create a new page based on the **alarm** template. By default, the name of the page is expected to be "Alarm". However, you can change the name of the page by adjusting the setting for the INI parameter [\[Page\]AlarmPage](#).
- **Disabled Alarm Page :** Used to create a page displaying alarms that are presently disabled in the system. The alarms will appear on this page when they have been disabled from the normal alarm system due to a maintenance shutdown, nuisance tripping etc. The template has the equipment tree-view panel displayed on the left hand side of the page for filtering of the display list. The tree-view will display a hierarchy of equipment available to the currently logged on user. To create a default disabled alarm page for your project, create a new page based on the **disabled** template. By default, the name of the page is expected to be "Disabled". However, you can change the name of the page by adjusting the setting for the INI parameter [\[Page\]DisabledPage](#).
- **Sequence of Events Page:** Used to create a page displaying a snapshot of every state transition of an alarm instance that have occurred. The template has the equipment tree-view panel displayed on the left hand side of the page for filtering of the display list. When configured the tree-view will display a hierarchy of equipment available to the currently logged on user. To create a default SOE alarm page for your project, create a new page based on the **soe** template. By default, the name of the page is expected to be "SOE". However, you can change the name of the page by adjusting the setting for the INI parameter, [\[Page\]SOEPage](#). Unlike the active, hardware, and disabled alarm pages, that are refreshed automatically at runtime to display real time data, the SOE and summary pages display a snapshot of events that have occurred, therefore is not updated automatically. To retrieve the latest events you can manually refresh the page.
- **Alarm Summary Page :** Used to create a page displaying a historical log of alarms that have occurred. This page can be used for troubleshooting purposes. The template has the equipment tree-view panel displayed on the left hand side of the page for filtering of the display list. When configured the tree-view will display a hierarchy of equipment available to the currently logged on user. To create a default summary alarm page for your project, create a new page based on the **summary** template. By default, the name of the page is expected to be "Summary". However, you can change the name of the page by adjusting the setting for the INI parameter [\[Page\]SummaryPage](#).

### SUMMARY DATA NOT AUTOMATICALLY REFRESHED

Summary data is not automatically refreshed at runtime. Manually refresh the Summary and SOE page before using its data for analysis of plant state.

**Failure to follow these instructions can result in injury or equipment damage.**

The alarm templates display alarm lists using a "no draw" mode. The display of alarm fields is handled by a new set of template specific Cicode functions and genies to control each of the alarm fields' position and size. The

alarm list is installed with a callback event function to redraw the alarm list upon data change. The "no draw" mode and data change callback event are supported by a modified form of the existing Cicode function [AlarmDsp\(\)](#).

## Alarm Page-specific Menus

If your project is created using SxW starter project, a set of menus are already pre-configured for each of the alarm pages. When the user displays an alarm page, its page specific menu items will be automatically displayed. Options available on the page specific menu vary according to the type of Alarm page.

Name	Description
Acknowledge Page	Acknowledge all alarms on the current page. Available on Active Alarm page.
Disable Page	Disable all alarms on the current page. Available on Active Alarm page.
Enable Page	Enables all alarms on Page. Available on Disabled Alarm Page.
Filter...	Opens the alarm filter form. Filter form varies according to alarm page open.
Reset Filter	Clears the effect of the filter criteria specified through the filter form.
Auto size columns	Auto size column widths in the alarm display list.
Add column...	Add column to the alarm display list.
Save View	Save the column settings of the alarm display. The same settings will then be used for this alarm page.
Restore Saved View	Restore the column settings according to the alarm format set in parameter <a href="#">[Format]FormatName</a> .
Reset view to default	Reset the column settings of alarm display to default. Define your own default by setting parameters <a href="#">[Format]FormatName</a> as project parameters.
Print/Export	Print or Export the current page

## Interactive Alarm List

The alarm page templates feature an interactive alarm list that supports the following functionality:

## Adjustable Columns

The user can adjust the columns displayed on the alarm list. Options include:

- Reposition a column by drag-and-drop its column heading to the new position.
- Delete a column by drag-and-drop its column heading (vertically) beyond the column heading row.
- Insert or delete a column via a pop-up menu by right-clicking a column heading
- Adjust the size of a column by dragging the column separator that appears at the right edge of a column heading.

## Dockable Equipment tree-view

- Adjust the width of the equipment tree-view by dragging the column separator that appears at the right edge of the column. When selected the column separator will change from blue to gray.
- To hide the equipment tree-view click the arrow icon on the column separator. On clicking it the equipment tree-view will collapse and be hidden from view. Click the arrow icon at the edge of the page to show the equipment tree-view on screen.

## Selection of Alarms

The user can select single or multiple alarms on the alarm list so that the same operation can be applied to multiple selected alarms in one go. If some of the selected alarms are off-screen, before the required operation is completed, a message dialog will popup, reminding the user that some of the selected records are not viewable. On clicking Continue or the Enter key the selected records on and off the screen will be acted on. On clicking Cancel or the ESC key the command is canceled. If the selected records are viewable on-screen the message dialog will not open.

Alarm selection works as follows:

- To select a single alarm: Left-click an alarm that is not already selected to select it.
- To select a continuous range of alarms: Select a single alarm to mark the start of the selection. Then hold the SHIFT key and left-click another alarm to extend the selection. Alternatively, you can select rows by dragging the mouse cursor from the starting to the ending row. Once rows are selected, you can extend the range of the selection by SHIFT left-clicking another row of alarm.
- To select disjointed rows, hold the CTRL key while selecting a row.
- To deselect alarm(s): Left-click any alarm within a selection range to deselect the whole range. Only the row that you have clicked will remain selected. Click the selected row again to deselect it.

## Sorting the Alarm List

Users can sort the alarm list display using most fields except for 'State' and 'Type'. To sort click on the header of the relevant column.

**Note:** Alarms on the Alarm Summary Page can be sorted on only on date and time.

The default order of alarms is dependent on the [\[Alarm\]SummarySortMode](#) parameter and the type of alarm page.

Refer to the topic [Alarm List Default Sort Order](#) for more information.

## Context Menu

Right-click on any alarm row to bring up the context menu for alarm operations. Options available in the context menu will vary depending on whether single or multiple items are selected. If you right-click on an alarm that is not already selected, this will select it. Subsequent commands (selected from the context menu) will then only operate on this single alarm. On the other hand, if you right-click on any alarm within a selection range, this will not change the selection. Subsequent commands selected will operate on each alarm within the selection range. Several operation options are available in the context menu:

- Acknowledge: acknowledges selected alarms. This option is restricted by the privilege set by the parameter [\[Privilege\]AckAlarms](#). This is not available on the Alarm Summary page.
- Disable: disables selected alarms. This option is restricted by the privilege set by the parameter [\[Privilege\]DisableAlarms](#). It is not available on the Disabled Alarms page.
- Enable: enables selected alarms. This option is restricted by the privilege set by the parameter [\[Privilege\]DisableAlarms](#). It is not available on the Active Alarms page.
- Comment: Add a comment to an event. This option is only available when a single row is selected. This option is restricted by the privilege set by the parameter [\[Privilege\]AckAlarms](#). This option is available to Alarm Summary and SOE pages only.
- Information: displays the detailed information of a single alarm.
- Help: displays the Help page of a single alarm.

---

**Note:** The Hardware Alarms template only allows a single alarm to be selected. Its context menu has only the Acknowledge option which is also restricted by the privilege set by parameter [\[Privilege\]AckAlarms](#).

---

## Filtering Alarms using the Equipment Panel

You can filter the alarm display list to show alarms belonging to selected parent and child equipment branches. If no equipment is selected in the tree-view then all alarms are displayed.

To select equipment, check the box to the left of the relevant branches. If you select equipment with child branches, then the child equipment will be automatically selected, with their check boxes grayed out.

---

**Note:** If the parent equipment branch is checked, child equipment cannot be deselected.

---

If the parent is not selected you can change the checked states of the child equipment.

Next to each item in the tree, an alarm count is displayed. The count includes the total number of alarms belonging to the equipment and its child hierarchy. The type of alarms that are counted vary according to the type of alarms that are displayed on the list. For example, on the active alarms page, the count represents the active alarms associated to that equipment, while on the disabled alarms page, the count represents the disabled alarms associated to that equipment. Other points to consider with the equipment count include:

1. The count on the tree node represents the total number of alarms that are associated with that equipment hierarchy branch.
2. For alarms that are not associated to equipment, the count is not available due to the nature of the equipment tree view.
3. The counts are not affected by the filter applied to the alarm list.
4. Due to point 2 and 3, the total sum of the counts from the equipment tree does not equal to the alarm count on the alarm banner, and they never mean to be comparable. The alarm count on the banner represents the

total number of (unfiltered) unacknowledged alarms in the system (subjected to the viewable areas of the currently logged on user).

## Process Analyst Page Templates

The Process Analyst template is the default template for you to create trend pages. The SxW Style project includes templates for the three following types of trend display:

- **SinglePA** - A template that displays a single Process Analyst chart on the page. To create a default trend page for your project, please create a new page based on this template and name it "ProcessAnalyst". You can change the default page name by setting parameter [\[Page\]ProcessAnalystPage](#)
- **DoublePA** - A template that displays two Process Analyst charts on the page.
- **PopPA** - A template that displays a single Process Analyst chart on the page. The size of the page is reduced to make it suitable for pop-up pages. To create a default trend pop-up page for your project, please create a new page based on this template and name it "!ProcessAnalystPopup". You can change the default page name by setting parameter [\[Page\]ProcessAnalystPopupPage](#).

The functionality of traditional trends, double trends, and popup trends are largely incorporated into the Process Analyst on the new templates.

There is a key difference between the new PA templates and the existing trend templates, which is pen assignment. The trend templates can get pens assigned to the page at both design time and runtime, but every PA template needs the pens assigned at runtime only. This can be done by calling the [Process Analyst Functions](#) and pass the PAV file or individual trend pens to those functions.

There are two new items on the PA templates:

- The Show/Hide Trend Statistics button shows and hides trend statistics columns in the Process Analyst.
- The Std Deviation column works out the sample standard deviation value of the samples within the display area.

## See Also

[Process Analyst](#)

## SPC Trend Page Templates

The following trend templates are provided for charting different types of statistical process control:

- **SPCPareto**: Displays a Pareto chart for multiple variable tags
- **SPCCpk**: Displays an SPC mean chart and a Capability chart
- **SPCXRSChart**: Displays SPC mean, range and standard deviation charts
- **EventSPCXRS**: Displays SPC mean, range and standard deviation charts for Event SPC trend tag
- **MeanMeanChart**: Displays SPC mean charts for two SPC trend tags
- **RangeChart**: Displays SPC mean and range charts for an SPC trend tag
- **StandardChart**: Displays SPC mean and standard deviation charts for an SPC trend tag

## File Page Templates

The following templates have been included for displaying different types of files:

- File: Displays a plain text file on the page. This template replicates the functionality of the original file template found in the standard Include project. The new template is compatible with any existing `PageFile()` or `DspFile()` Cicode functions. It can display up to 24 lines of text from a file at a time. Buttons are provided for the user to browse to different rows and columns of the file.
- File\_RTF: Displays a rich text format (RTF) file on the page using the CiTextBox ActiveX control. It can also display plain text file.
- File\_HTML: Displays a hypertext markup language (HTML) file or an universal resource locator (URL) link on the page. It needs Microsoft Internet Explorer to be installed on the machine.

Several common features are presented on the templates:

The new file template replicates the functionality of the original file template in the Include project. The new template is compatible with any existing `PageFile()` or `DspFile()` Cicode functions. The HD768 version of the template can display up to 23 lines of text from a file on screen, while the HD1080 version of the template can display up to 33 lines of text on screen. Buttons are provided for the user to browse to different rows and columns of the file.

Several new features are added to the templates:

- When you create a page based on any of these templates in Graphics Builder, you can predefine the file for display at runtime. Clicking anywhere on the page will show a genie style dialog to allow you to enter a file path to assign a file to the page. A Plant SCADA path substitution string can be used in the file path. When the page is recalled at runtime, for example via `PageDisplay()`, the specified file will be automatically displayed.
- The "Open File" button displays an Open File dialog to select a different file to display.
- The "Refresh" button reopens the already opened file to get the latest contents.
- The full path name of the currently opened file is displayed.

## Creating a New Project

Creating a project based on the SxW templates project is simple; by default, it is incorporated as an included project in new projects. This means whenever you start a new project, the SxW templates are ready to use as necessary.

There are two ways to create a project based on the SxW templates:

- Use the predefined starter project
- Create a project from scratch

---

**Note:** It is recommended when creating a project, you base it on one of the starter projects. Offering a basic level of functionality, the project can be modified and extended to suit your needs.

---

## Using the pre-defined Starter Project

### To base a project on an existing starter project:

#### 1. Create a Project Using a Starter Project.

Two pre-defined starter projects with page resolutions HD1080 and HD768 for wide screens only are provided as part of the product installation. Each of the starter projects will be based on project "SxW\_Style\_1" and contain:

- A cluster named "Cluster1".
- A server of each server types: "IOServer1", "AlarmServer1", "ReportServer1" and "TrendServer1".
- A memory I/O devices named "Internal".
- Equipment type "Motor" and its associated template file, graphical genie and super-genie pop-up pages.
- A role named "Administrators" which is linked to the "BUILTIN\Administrators" Windows group and have global privilege of 1 to 8. This allows a user to log in Plant SCADA at runtime using a Windows user account who belongs to the Administrators group of the local machine.
- Pages of Alarm, Summary, Disabled, Hardware, ProcessAnalyst and !ProcessAnalystPopup, Data Browse -Control Inhibit, and Manual Override, based on the relevant templates found in the SxW\_Style\_Include project.
- Page specific menu items. For example, the active alarm page will have page specific menu items such as Simulate, History, Acknowledge and Disable, and Filter options.

The newly created project will be immediately compilable, and will contain a basic level of built-in functions such as viewing alarms and trends, and a menu displayed in the right-panel to easily access and navigate the included pages.

## Create a project from scratch

### To configure a project based on the SxW templates from scratch:

1. Create a privileged user; see [Create a Privileged User](#).
2. Run the Setup Wizard; see [Run the Setup Wizard](#).
3. Set up instant trending; see [Use Instant Trending](#).
4. Implement audible alarms; see [Implement Audible Alarms](#).
5. Add Pages; see [Creating New Pages](#).
6. Create/define custom menu; see [Creating Custom Menus for SxW Templates](#).

Avoid modifications to the SxW template project for use as a runtime project; set it aside for use as a template for new projects.

If creating a project based on the SxW templates, it is not recommended to include pages based on templates that use a different style, including the earlier Include project. Doing so might affect functionality.

## See Also

[Create Pages](#)

## Create a Privileged User

Some SxW template project content is restricted via a user login. Without a valid login, some project functionality will be disabled. For example, the Close window (the cross) button on the title bar will not work if you log in as a user with restricted privileges.

By default, the following elements within the SxW templates project are restricted by global privileges.

Element	Global Privilege	Associated Parameter
Editing users	8	[Privilege]EditUser
Project shutdown	8	[Privilege]Shutdown
Acknowledge alarms	1	[Privilege]AckAlarms
Disable alarms	8	[Privilege]DisableAlarms
Silence alarms	0	[Privilege]SilenceAlarms

When configuring a SxW template project, check that your users have appropriate access to the available functionality. Verify that your users can acknowledge alarms if necessary.

To adjust the global privileges for the elements previously listed for a more complex security architecture, adjust the [Privilege] parameters in the Citect.ini file. Click the relevant link in the previous table above for details.

## See Also

[Run the Setup Wizard](#)

[Privilege Parameters](#)

## Run the Setup Wizard

As with any Plant SCADA project, you need to run the Setup Wizard on any machine where a SxW template project will be run. See [Run the Setup Wizard](#) for more information.

## Use Instant Trending

Instant trending is natively supported by the Process Analyst. The steps to implement instant trending are as follows:

1. **Create a Process Analyst page.** Create a page that has a Process Analyst object on it. You may create these pages based on the provided tab style templates. For a fullscreen page, create the page based on the SinglePA template. For a pop-up page, create the page based on the PopPA template.
2. **Set the sample cache duration.** Samples collected for Instant Trends are kept in the cache up to a default number of samples and time period. You can adjust these settings using the parameters [Trend]InstantTrendSamples and [Trend]InstantTrendIdleTime.
3. **Call the Process Analyst Display.** At runtime, call your process analyst page either as a fullscreen page or

pop-up page using the Cicode function PageDisplay(pagename) or PagePopup(pagename) respectively.

4. **Add Variable Tags / Local Variables for Trending.** Use the Add Pens dialog provided with the Process Analyst to add pens to the process analyst chart as normal. In the dialog, you can now select any variable tags or local variables for trending.

## See Also

[Process Analyst Page Templates](#)

## Implement Audible Alarms

The SxW template project offers support for audible alarms. You can configure a project so that a selected wav file is sounded whenever an alarm of a particular priority is triggered. You can even assign different sounds to different alarm priorities, allowing the urgency of an alarm to be determined from its sound.

### **WARNING**

#### **LOSS OF CONTROL**

- Do not use Plant SCADA's alarming system as the primary alert mechanism for safety-related alarms or notifications (that is, those classified as critical to process safety, the protection of the plant and equipment, or the protection of human life).
- Do not use Plant SCADA's audible alarm functionality as a replacement for safety-related warning systems critical to process safety, the protection of the plant and equipment or the protection of human life.
- Safety-related alarms and notifications should be independent and separate from the process control system. They should be implemented in the form of a stand-alone physical alarm system driving individual discrete alarm annunciators.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

#### **To implement audible alarms in your project:**

Verify that the alarms you want to trigger an audible alert are assigned to a category and given a particular priority.

1. Adjust the parameter **[Alarm]Sound<n>**. This parameter determines the wav file used when an alarm sounds, based on the priority of the alarm (n). For example, [Alarm]Sound1 identifies the .wav file that will be sounded whenever a priority 1 alarm is triggered.
2. If necessary, adjust the parameter **[Alarm]Sound<n>Interval**. This parameter determines how long the selected wav file sounds, based on the priority of the alarm (n). For example, [Alarm]Sound1Interval sets the length of time a priority 1 alarm is sounded for.
3. Verify that your users have appropriate privileges associated with their login to silence alarms, otherwise they will not be able to silence an alarm. See [Creating a Privileged User](#) and the parameter **[Privilege]SilenceAlarms**.

## See Also

[Alarm Page Templates](#)

## Create Pages

If you created your project by selecting the **Create project based on starter project** check box in the **New Project** dialog, pages of Alarm, Summary, SOE, Disabled, Hardware, ProcessAnalyst and !ProcessAnalystPopup will already be created in your new project. You can accept those pages or modify them as you develop your project. See [Creating a New Project](#).

If you created your project from scratch, there are no predefined pages in your project. The navigation controls at runtime on the SxW template expect several default pages to exist in your project for basic functionality such as alarm and trend displays. You are recommended to add the following pages to your project based on the provided templates of your chosen size:

Template	Description
SinglePA or DoublePA	Process Analyst page for displaying trends.
!PopPA	Process Analyst pop-up page.
Data Browse Template	Tag Browse page.
Alarm	Active Alarms page, called from the Alarms toolbar.
Hardware	Hardware Alarms page, called from the Alarms toolbar.
Disabled	Disabled Alarms page, called from the Alarms toolbar.
Summary	Alarms Summary page, called from the Alarms toolbar using the Historical events icon.
SOE (Sequence of Events)	Sequence of events page, called from the Alarms toolbar using the Historical events icon.

The links between the pages listed and the controls that call them are defined by the [Page] parameter settings within the Citect.ini file. The relevant parameters are [\[Page\]ProcessAnalystPage](#), [\[Page\]ProcessAnalystPopupPage](#), [\[Page\]AlarmPage](#) and [\[Page\]HardwarePage](#), etc. If you want a button to call a page with a different name, adjust these parameter settings. For details see [Page Parameters](#).

## Creating New Pages

The normal template in the SxW template library is designed with minimal content to enable the presentation of customer-necessary information and plant mimics.

Pages are created based on this template within Graphics Builder by choosing the necessary template from the Use Template dialog (**File | New Page**). You can access the SxW templates by selecting **SxW\_style\_1** from the **Style** field.

## Creating Custom Menus for SxW Templates

The content of the menus on pages based on the SxW templates are configured using the **Visualization** activity in Plant SCADA Studio (see [Menu Configuration](#)).

**Note:** If your project is based on a SxW starter project, a basic pre-configured menu exists. The menu allows you to access the page templates included in the starter project and is displayed in the right-panel. Page specific menu items are displayed under the active page list. Options available vary according to the type of page.

The following examples demonstrate how you can add additional pages to the SxW menus.

### Example 1

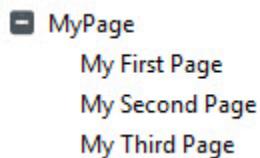

In this example, the pages MyFirstPage, MySecondPage and MyThirdPage will be added to the menu so they will be listed in the right-hand panel.

**To configure this custom menu:**

1. In the **Visualization** activity, select **Menu Configuration**.
2. Add a row to the Grid Editor.
3. In the row complete the fields in the table below.
4. Click **Save**
5. Repeat steps 1 to 4 for the remaining pages MySecondPage, and MyThirdPage.
6. When finished compile and run your project.

Field	Value
Level 1	MyPage
Level 2	MyFirstPage
Menu Command	PageDisplay("Name of Page") e.g PageDisplay("MyFirstPage")

The right-panel should look like the one below.

### Example 2

To separate the alarm pages from the other graphic pages, this example demonstrates how to create a new node, MyAlarm Pages, with MyActiveAlarmPage, MyDisabledPage, and MySOEPage.

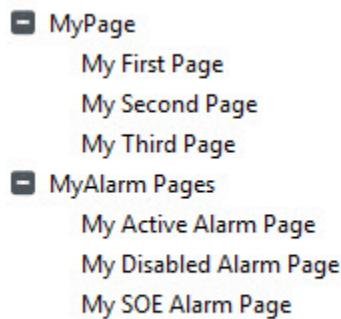

**To configure this custom menu:**

1. In the **Visualization** activity, select **Menu Configuration**.

2. Add a row to the Grid Editor.
3. In the row complete the fields in the table below.
4. Click **Save**.
5. Repeat steps 1 to 4 for the remaining pages MyDisabledPage, and MySOEPage.
6. When finished compile and run your project.

Field	Value
Level 1	MyAlarm Pages
Level 2	My Active Alarm Page
Menu Command	PageDisplay("Name of Page") e.g PageDisplay("MyActiveAlarmPage")

The right-panel should look like the one below:

### Example 3

In the next example, an icon will be added to appear next to the Active Alarm Page. The icon used is a standard symbol in the Include project.

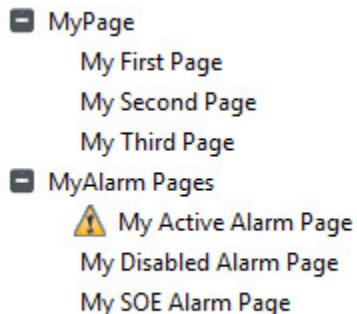

#### To configure this custom menu:

1. In the **Visualization** activity, select **Menu Configuration**.
2. Add a row to the Grid Editor.
3. In the row complete the fields in the table below.
4. When finished compile and run your project.

Field	Value
Level 1	MyAlarm Pages
Level 2	My Active Alarm Page
Menu Command	PageDisplay("Name of Page") e.g

Field	Value
	PageDisplay("MyActiveAlarmPage")
Symbol	icons_16x16.alam_act

The right-panel should look like the one below:

---

**Note:** The above examples are for basic illustration only. It is recommended you refer to the example project and the menu configuration properties prior to configuring your own menus.

---

## See Also

[Menu Configuration](#)

## Using Environment Variables in SxW Templates

Whereas parameters apply specified rules to every template page, environment variables apply rules to *specific* pages. In this way, you can use environment variables to specify functionality for specific pages.

For example, to display a specific page, specify the page name as the environment variable. To call a specific Cicode function, specify the function name (with a "?" prefix), space, then a list of comma separated arguments, like this: ?WinPrint LPT1,0,0,Trend.pa1. (The "?" indicates that the variable is to be interpreted as a function call rather than a page to display.)

Let's look at a more detailed example. Usually the standard **Print** button is used for printing a graphics page in WYSIWYG format. If you have a text/html file displayed on the page, or perhaps a trend, you can create your own print function (for example, PrintTrend) and specify it in the environment variable, as ?PrintTrend. To reduce the amount of ink used, specify the WinPrint function with a user-defined palette. In this case you would specify it as a parameter rather than as an environment variable so that it applies to every page.

---

**Note:** For pages created based on the Process Analyst templates, you can print the screen using the standard Print button, or print the chart using the Print button on the toolbar of the Process Analyst object. Give the user both alternatives as they both serve different purposes.

---

## Tab Style Templates Project

The Tab Style Templates project (named "Tab\_Style\_Include") is a system project that includes a set of templates

that use a tabbed ribbon menu.

When a new Plant SCADA project is created, the Tab\_Style\_Include project is automatically incorporated as an included project. This means the project's templates are available for implementation when creating your graphics pages in Graphics Builder.

As well as including a graphics page template for creating plant mimics, the project includes predefined Process Analyst and alarm templates (with or without the equipment tree-view panel), a set of file templates for displaying text, Rich Text Format and HTML files.

Each type of page type has the same tab-styled navigation and alarm menus, providing a consistent "look and feel" across an entire project. The project also supports multi-monitor displays, allowing you to simultaneously display several graphics pages across several computer screens.

---

**Note:** Avoid making modifications to the Tab Style Template project for use as a runtime project. A Plant SCADA upgrade will install a new version of the project, which will overwrite any changes you make to the project.

---

Use the following links for details about the pre-configured content included in the Tab Style Template project:

- Predefined templates (see [Use Pages and Templates](#)).
- Common toolbars (see [Common Navigation Functionality](#)).

Use the following links for details about the processes used to create a project based on Tab Style templates:

- Creating a new project (see [Create a New Project](#)).
- Creating pages (see [Create Pages](#)).
- Creating custom menus (see [Create Custom Tab Style Menus](#)).

Reference material is also included, describing the Citect.ini parameters and Cicode functions available to customize a project. See [Tab Style Template Reference](#).

## Use Pages and Templates

When you create a new project based on the Tab Style templates, the following templates are available for you to use as you create your graphics pages. These templates share [Common Navigation Functionality](#), such as a customizable tabbed menu, a navigation toolbar and an alarm toolbar. This section describes the templates and their buttons, menus and tools.

The Tab Style template project has the following templates:

### Normal

A template designed for creating user-necessary content and plant mimics. This page contains the custom tabbed menus, the standard navigation and alarm toolbars featured on tab style templates. If you are creating a project based on the tab style templates, use this template for your standard graphics pages.

The Normal template creates a page in display format to be shown with a title bar. Several sizes of templates are available including XGA (1024 x 768), SXGA (1280 x 1024), HD1080 (1920 x 1080) and WUXGA (1920 x 1200).

---

**Note:** Starting in version 7.20, you can customize the behavior of the standard window titlebar to lock down its functions to achieve the same result that used to be only possible by hiding it in the previous versions. This is achieved by [overriding the titlebar events](#) or setting the startup mode of the window.

---

## Blank

The blank template is included for users who want to create their pages from scratch. There are no differences between the Tab Style blank template and the template in the include project.

## Data Browse

The data browse template is included for users who want to create a page that displays a table of data retrieved from built-in data browse functions. The template includes the Equipment tree library control.

When using this template to create a new page within your project, configure the Data Browse pop up form. When configured the new page will display the appropriate data session at runtime.

Field	Description
Equipment Symbol Library (Optional)	The symbol library for displaying equipment symbol for each item in the equipment tree. The symbol is displayed based on the type of the equipment. It should have the same name as the equipment type assigned to an equipment record. If not specified, it defaults to a symbol library named "Equipment".
Equipment Default Symbol (Optional)	The default symbol to be displayed next to the item in the equipment tree if symbol corresponding to the equipment type of the item cannot be found from the supplied Equipment Symbol Library. The symbol should be specified in format of <library name>.<symbol name>
Browse Type	The type of project configuration to be browsed and displayed, including: AccumBrowse – for listing accumulators AlmBrowse – for listing alarm tags EquipBrowse - for listing equipment ServerBrowse – for listing servers TagBrowse – for listing variable tags TrnBrowse – for listing trend tags
Clusters (Optional)	A comma delimited string specifying only items from a subset of clusters to be included in the display. If not specified, items from all clusters will be included.
Filter (Optional)	A filter expression specifying the records to return during the browse. If not specified, all records will be returned. Please see the browse open Cicode function of the selected browse type for the details of filter expression supported.
Fields (Optional)	A comma delimited string specifying the fields (columns) to be returned during the browse. If it is not

Field	Description
	specified, all fields of the selected browse type will be displayed: Tag, Tag Item, Value, Comment, Cluster, Equipment, Item, Type, IODev, Addr, Arr_Size, Eng_Zero, Eng_Full, Eng_Units, Format, Deadband, Raw_Zero, Raw_Full, Scaled_Type, Ovr_Mode, Ctrl_Mode, Override, Valid, Status, Field, Num_Subs.
Sort By (Optional)	A comma delimited string specifying the order of sorting preferences. This is only applicable to TagBrowse. Please see the <i>Sort</i> parameter of the built-in Cicode function <a href="#">TagBrowseOpen</a> for details.
View Name (Optional)	<p>A name to represent a view setting about the placement and width of the columns displayed on the browse table. The view name works with the Save view and Restored saved view options at runtime. You can assign a unique view on different data browse pages or share the same view among multiple pages. When user selects the Save view command from the Action tab, the current column settings will be saved under the view name. Once a view is saved, when user re-enters the page, previous saved view settings will be retrieved automatically. The saved view can also be restored on demand by selecting the Restored saved view from the Action tab. User can reset (forget) the view to the default as how it was pre-configured by selecting the Restore view to default command under the Action tab.</p> <p>For system engineers, the information associated with a view name is saved under INI parameters:  [BrowseTableView] &lt;BrowseType&gt;.&lt;ViewName&gt;.Fields  &lt;BrowseType&gt;.&lt;ViewName&gt;.ColWidths  in comma delimited format. You can pre-configure these parameters in your project as the defaults.</p>
Privilege (Optional)	Only applicable to Browse Type of "TagBrowse", this specifies the privilege required by the logged on user to change the values / operating mode of variable tags displayed on the table. If no privilege is defined, no modification will be allowed.

Use the equipment tree to filter the data browse table at runtime. Items belonging to selected parent and child branches will be displayed with the exception of 'ServerBrowse' which is not associated with equipment.

Refer to Interactive Data Browse List for list display options available at runtime.

## Alarm

Templates are included for the following types of alarm displays:

- **Active Alarm Page (Alarm):** Used to create a page displaying active alarms that are unacknowledged or acknowledged and still in alarm state. To create a default active alarm page for your project, create a new page based on this template. By default, the name of the page is expected to be "Alarm". However, you can change the name of the page by adjusting the setting for the INI parameter [\[Page\]AlarmPage](#).
- **Hardware Alarm Page (Hardware):** Used to create a page displaying details of any system errors that are unacknowledged or acknowledged and still in alarm state, for example, if communications are lost, if Cicode can't execute, if a graphics page is not updating correctly, or if a server becomes inoperative, this page will alert you. To create a default hardware alarm page for your project, create a new page based on this template. By default, the name of the page is expected to be "Hardware". However, you can change the name of the page by adjusting the setting for the INI parameter [\[Page\]HardwarePage](#).
- **Disabled Alarm Page (Disabled):** Used to create a page displaying alarms that are presently disabled in the system. The alarms will appear on this page when they have been disabled from the normal alarm system due to a maintenance shutdown, nuisance tripping etc. To create a default disabled alarm page for your project, create a new page based on this template. By default, the name of the page is expected to be "Disabled". However, you can change the name of the page by adjusting the setting for the INI parameter [\[Page\]DisabledPage](#).
- **Sequence of Events Page (SOE):** Used to create a page displaying a snapshot of all state transitions of an alarm instance that have occurred. To create a default SOE page for your project, create a new page based on this template. By default, the name of the page is expected to be "SOE". However, you can change the name of the page by adjusting the setting for the INI parameter [\[Page\]SOEPage](#). Unlike the active, hardware, disabled pages that are refreshed automatically at runtime to display real time data, the SOE and Summary pages display a snapshot of events that have occurred, therefore is not updated automatically. To retrieve the latest events you can manually refresh the page.
- **Alarm Summary Page (Summary):** Used to create a page displaying a historical log of alarms that have occurred. This page can be used for troubleshooting purposes. To create a default alarm summary page for your project, create a new page based on this template. By default, the name of the page is expected to be "Summary". However, you can change the name of the page by adjusting the setting for the INI parameter [\[Page\]SummaryPage](#).

### CAUTION

#### CAUTION

Summary data is not automatically refreshed at runtime. Manually refresh the Summary page before using its data for analysis of plant state.

The alarm templates (except the hardware alarm template) display alarm lists using a "no draw" mode. The display of alarm fields is handled by a new set of template specific Cicode functions and genies to control each of the alarm fields' position and size. The alarm list is installed with a callback event function to redraw the alarm list upon data change. The "no draw" mode and data change callback event are supported by a modified form of the existing Cicode function [AlarmDsp\(\)](#).

## Process Analyst

The Process Analyst template is the default template for you to create trend pages. The Tab Style project includes templates for the three following types of trend display:

- **SinglePA** - A template that displays a single Process Analyst chart on the page. To create a default trend page for your project, please create a new page based on this template and name it "ProcessAnalyst". You can change the default page name by setting parameter [\[Page\]ProcessAnalystPage](#).
- **DoublePA** - A template that displays two Process Analyst charts on the page.
- **PopPA** - A template that displays a single Process Analyst chart on the page. The size of the page is reduced to make it suitable for pop-up pages. To create a default trend pop-up page for your project, please create a new page based on this template and name it "!ProcessAnalystPopup". You can change the default page name by setting parameter [\[Page\]ProcessAnalystPopupPage](#).

The functionality of traditional trends, double trends, and popup trends are largely incorporated into the Process Analyst on the new templates.

There is a key difference between the new PA templates and the existing trend templates, which is pen assignment. The trend templates can get pens assigned to the page at both design time and runtime, but every PA template needs the pens assigned at runtime only. This can be done by calling the Process Analyst Cicode Functions and pass the PAV file or individual trend pens to those functions.

There are two new items on the PA templates:

- The Show/Hide Trend Statistics button shows and hides trend statistics columns in the Process Analyst.
- The Std Deviation column works out the sample standard deviation value of the samples within the display area.

## SPC

The Tab Style project includes the following trend templates for different types of statistical process control:

- **SPCPareto**: Displays a Pareto chart for multiple variable tags
- **SPCCpk**: Displays an SPC mean chart and a Capability chart
- **SPCXRSChart**: Displays SPC mean, range and standard deviation charts
- **EventSPCXRS**: Displays SPC mean, range and standard deviation charts for Event SPC trend tag
- **MeanMeanChart**: Displays SPC mean charts for two SPC trend tags
- **RangeChart**: Displays SPC mean and range charts for an SPC trend tag
- **StandardChart**: Displays SPC mean and standard deviation charts for an SPC trend tag

## File

The tab style project includes the following templates for displaying different types of file:

- File: Displays a plain text file on the page. This template replicates the functionality of the original file template found in the standard Include project. The new template is compatible with any existing PageFile() or DspFile() Cicode functions. It can display up to 24 lines of text from a file at a time. Buttons are provided

for the user to browse to different rows and columns of the file.

- File\_RTF: Displays a rich text format (RTF) file on the page using the CiTextBox ActiveX control. It can also display plain text file.
- File\_HTML: Displays a hypertext markup language (HTML) file or an universal resource locator (URL) link on the page. It needs Microsoft Edge to be installed on the machine.

Several common features are presented on the templates:

The new file templates replicate the functionality of the original file template in the Include project. The new templates are compatible with any existing PageFile() or DspFile() Cicode functions. They can display up to 24 lines of text from a file at a time. Buttons are provided for the user to browse to different rows and columns of the file.

Several new features are added to the templates:

- When you create a page based on any of these templates in Graphics Builder, you can predefine the file for display at runtime. Clicking anywhere on the page will show a genie style dialog to allow you to enter a file path to assign a file to the page. A Plant SCADA path substitution string can be used in the file path. When the page is recalled at runtime, for example via PageDisplay(), the specified file will be automatically displayed.
- The "Open File" button displays an Open File dialog to select a different file to display.
- The "Refresh" button reopens the already opened file to get the latest contents.
- The full path name of the currently opened file is displayed.

## Common Navigation Functionality

The tab style page templates include common toolbars for easy navigation and feature access, as well as a consistent appearance. This helps ensure pages that are created based on these templates will look and operate in the same style.

The following three toolbars remain on screen during operation:

### Custom tabbed menus toolbar

The tab style templates provide a tabbed toolbar to present the custom menus defined in the menu configuration database. The tabbed menu toolbar consists of following components:

- **Tab Buttons**

Tab buttons are equivalent of selecting a menu option in a traditional menu system. Each tab contains a list of menu items (represented as icons) relating to that tab.

- **Menu Icons (Buttons)**

Each tab contains a row of menu icons, each of which either performs a function such as calling up a page or

running a Cicode expression.

- **Sub-menu Drop Down Lists**

Optionally, a drop-down list may be provided next to the menu icon for further options. You can also view it as a sub-menu to the top-level tab. In this case, the menu icon serves as a collection point for related sub-menu items.

- **Hidden Menu Items**

Where there are too many menu items to fit comfortably within the menu bar (either for the tabs or the menu icons), a pair of drop-down list buttons are supplied at either end of the menu bar which provide access to the menu items. The horizontal arrow buttons on the menu bar displays only those items not visible on either side of the screen. The vertical arrow button on the left side of the menu bar displays menu items (either tabs or the menu icons for the currently selected tab).

## Navigation toolbar

The Navigation toolbar includes clickable text and icons to quickly access the common pages and functions from every page in the project.

The following items are available from the toolbar:

Icon	Name	Description
	Goes back one page in the page history	Goes back to the page displayed before the current page.
	Goes forward one page in the page history	Goes forward to the page that was displayed prior to the back button being pressed. The arrow to the right of the button allows you to select from menu of recently visited pages.
	Displays the parent page	Changes the display to the "parent page" of the current page. You can assign a parent page to a graphics page by setting an environment variable in Graphics Builder. To do this, open the page you want to assign a parent to. Go to the properties dialog for the page ( <b>File   Properties</b> ), and click the <b>Environment</b> tab. Add a new variable called "ParentPage" with a value of the page name of the parent page.
	Displays the previous page	Moves backwards through pages in a browse sequence if a sequence is configured. To configure a browse sequence, go to the Page

Icon	Name	Description
		Properties dialog ( <b>File   Properties</b> ) for each page in the sequence and set the <b>Previous</b> field on the <b>General</b> tab accordingly.
	Displays the next page	Moves forwards through pages in a browse sequence if a sequence is configured. To configure a browse sequence, go to the Page Properties dialog ( <b>File   Properties</b> ) for each page in the sequence and set the <b>Next</b> field on the <b>General</b> tab accordingly.
	Displays the home page	Displays the "home" page. A home page act as a default page for the project. To set a home page, use the [Page]HomePage parameter.
	Displays the Page Select dialog	Displays a dialog box with a list of graphics pages defined in the project. The user can select a page name for display.
	Prints the current page	Prints the current graphic page to the selected printer using the built-in WinPrint() Cicode function. You can specify your own printing function for the page by setting an environment variable in Graphics Builder. To do this, open the page you want to assign a printer function to. Go to the properties dialog for the page ( <b>File   Properties</b> ), and click the Environment tab. Add a new variable called "PrintPage" with a value of Cicode command in the syntax of "?" followed by a valid Cicode function name and comma separated arguments, for example, ?MyPrintFunction "arg1","arg2".
	Login / Logout	Displays the standard Plant SCADA login prompt. The menu to the right offers extra options. The default options are Login, Logout,

Icon	Name	Description
		Change Password, Edit User (restricted by login) and Create User (restricted by login). Logged in user is indicated to the right of the button. You can override the default options by defining your own login menu in the Visualization activityCommand Bar option <b>menu configuration</b> . The Page field and Level 1 field of these menu items needs to be set to "Template" and "Login" respectively.

## Alarm toolbar

The alarms toolbar provides access to current alarm information and navigation buttons for single-click access to alarm pages. It also includes standard Plant SCADA prompt and current date and time.

The alarms toolbar contains the following features:

Icon	Name	Description
n/a	<b>Last Alarms</b>	The center panel of the toolbar displays the last alarms triggered within the system, providing the operator with an immediate visual cue to alarm occurrences.  You can modify the format of this list and control which alarms appear. For example, you can set the list to only display alarms of a particular type, category or priority.  For details, see the alarm parameters LastAlarmFmt, LastAlarmCategories, LastAlarmPriorities, and LastAlarmType .
	<b>Active Alarms</b>	Changes the display to the active alarms page. This button is animated and shows the count of unacknowledged alarms in the system. The page displayed by this button is determined by the parameter [Page]AlarmPage.

Icon	Name	Description
	<b>Historical Events</b>	<p>The arrow to the right allows you to change the display to the sequence of events or alarm summary page. When clicking on the historical events button again the sequence of events page will display by default. However, if there is no SOE page configured in the project, the alarm summary page will be displayed.</p> <p><b>Sequence of events</b> - Select the option Sequence of Events. The SOE page displays each state transition of an alarm instance as a separate row.</p> <p>This page is determined by the <a href="#">[Page]SOEPAGE</a>.</p> <p><b>Alarm Summary</b> - The alarm summary page provides an historical log of alarm occurrences.</p> <p>This page is determined by the <a href="#">[Page]SummaryPage</a>.</p>
	<b>Hardware Alarms</b>	Changes the display to the hardware alarms page. This is an animated button which will blink when an unacknowledged hardware alarm occurs. The page displayed by this button is determined by the parameter <a href="#">[Page]HardwarePage</a> .
	<b>Disabled Alarms</b>	Changes the display to the disabled alarms page. This button shows the count of disabled alarms in the system. The page displayed by this button is determined by the parameter <a href="#">[Page]DisabledPage</a> .
	<b>Alarm Silence</b>	Silences the audible alarm buzzer that sounds when there are pending unacknowledged alarms. See <a href="#">Implement Audible Alarms</a> .

## Common Alarm Page Template Functionality

The alarm page templates offered as part of the tab style page templates include common graphical user interface (GUI) features for easy operation and consistent appearance.

These include:

### Task Panels

The alarm page templates share panels to the left of the alarms list that support the following functionality:

- **Page Tasks**

Allows the user to navigate through the list of alarms a page at a time. The Print / Export hyperlink (not available in the hardware alarm page) allows the user to send the alarms on the list to a printer or a file. The output will be presented in a HTML table, and reflects the columns, filter and sort settings that are currently used on the display. There are options to output available alarms (starting from page 1) or specific pages of alarms starting from the current page of the alarm list. The blue box indicates the current page number of the alarm list.

- **Filter Tasks**

Allows the user to filter the current list based on date time, alarm name, plant area, alarm category and other criteria. The Reset filter hyperlink clears the effect of the filter criteria specified through the filter form. The blue box indicates the current filter setting. It may display one of the following states:

- No Filter - no filter is applied
- Filter Applied - filter criteria specified in the filter form is applied
- Custom Filter - filter criteria is applied via Cicode function AlarmSetInfo by the user.

- **Control Tasks**

Offers the option to:

- Acknowledge alarms on the current page (only available on Active Alarms and Hardware Alarms page)
- Disable alarms on the current page (only available on Active Alarms page)
- Enable alarms on the current page (only available on Disabled Alarms page)
- Silence alarm sound (not available on Hardware Alarms page)

This panel is not featured on the Alarm Summary page.

- **View Tasks**

Offers the option to:

- Add new column to the alarm list.
- Automatically fit the width of columns to show the most content.
- Reload the column settings according to the alarm format set in parameter [Format]FormatName.
- Save the current column settings to parameter [Format]FormatName, so that the same settings are used when this page is displayed in the future.

This panel is not featured on the Hardware Alarm page.

## Interactive Alarm List

The alarm and alarm equipment tree view page templates (except the Hardware Alarms template) feature an interactive alarm list that supports the following functionality:

- **Adjustable Columns**

The user can adjust the columns displayed on the alarm list. Options include:

- Reposition a column by drag-and-drop its column heading to the new position.
- Delete a column by drag-and-drop its column heading (vertically) beyond the column heading row.
- Insert or delete a column via a pop-up menu by right-clicking a column heading
- Adjust the size of a column by dragging the column separator that appears at the right edge of a column heading.

- **Selection of Alarms**

The user can select single or range of alarms on the alarm list so that the same operation can be applied to multiple selected alarms in one go. Alarm selection works as follows:

- To select a single alarm: Left-click an alarm that is not already selected to select it.
- To select a range of alarms: Select a single alarm to mark the start of the selection. Then hold the SHIFT key and left-click another alarm to extend the selection. You can adjust the range of the selection by SHIFT left-clicking another row of alarm.
- To deselect alarm(s): Left-click any alarm within a selection range to deselect the whole range.

- **Context Menu**

Right-click on any alarm row to bring up the context menu for alarm operations. Options available in the context menu will vary depending on whether single or multiple items are selected. If you right-click on an alarm that is not already selected, this will select it. Subsequent commands (selected from the context menu) will then only operate on this single alarm. On the other hand, if you right-click on any alarm within a selection range, this will not change the selection. Subsequent commands selected will operate on each alarm within the selection range. Several operation options are available in the context menu:

- Information: displays the detailed information of a single alarm that has the cursor focus (indicated by surrounded by a white box).
- Help: displays the Help page of a single alarm that has the cursor focus.
- Acknowledge: acknowledges selected alarms. This option is restricted by the privilege set by the parameter [\[Privilege\]AckAlarms](#). This is not available on the Alarm Summary page.
- Disable: disables selected alarms. This option is restricted by the privilege set by the parameter [\[Privilege\]DisableAlarms](#). It is not available on the Disabled Alarms page.
- Enable: enables selected alarms. This option is restricted by the privilege set by the parameter [\[Privilege\]DisableAlarms](#) It is not available on the Active Alarms page.
- Comment: Add a comment to an event. This option is only available when a single row is selected. This option is restricted by the privilege set by the parameter [\[Privilege\]AckAlarms](#). This option is available to Alarm Summary and SOE pages only.

**Note:** The Hardware Alarms template only allows a single alarm to be selected. Its context menu has only the Acknowledge option which is also restricted by the privilege set by parameter [\[Privilege\]AckAlarms](#).

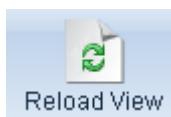

## Common Data Browse Template Functionality

The data browse page template offered as part of the tab style page templates include common graphical user interface (GUI) features for easy operation and consistent appearance.

These include:

### Data Browse Action Tab

When the user displays a Data Browse page based on the Data Browse template, an Action tab will be automatically added to the menu bar. The following options are available on the Action tab:

Icon	Name	Description
 Reload View	Refresh	Reload the column settings.
 Auto-f...	Auto-Fit Columns	Auto size column widths in the data browse list.
 Save View	Save View	Has the following options: Save View - Current column settings will be saved. When you re-enter the page, previous saved view settings will be retrieved automatically. Restore Saved View - Restores the saved view on demand. Reset View to Default - Reset the view to the default value.

### Interactive Data Browse List

The Data Browse template features an interactive list that supports the following functionality:

#### Adjustable Columns

The user can adjust the columns displayed on the data browse list. Options include:

- Reposition a column by drag-and-drop its column heading to the new position.
- Adjust the size of a column by dragging the column separator that appears at the right edge of a column heading.

#### Selection of data rows

The user can select single or multiple rows on the display list so that the same operation can be applied to multiple selected rows in one go. Row selection works as follows:

- To select a single data browse row: Left-click a row that is not already selected to select it.
- To select a continuous range of data browse rows: Select a single row to mark the start of the selection. Then hold the SHIFT key and left-click another row to extend the selection. Alternatively, you can select rows by dragging the mouse cursor from the starting to the ending row. Once rows are selected, you can extend its range by SHIFT left-clicking another row of alarm.
- To select disjointed rows, hold the CTRL key while selecting a row.
- To deselect alarm(s): Left-click any alarm within a selection range to deselect the whole range. Only the row that you have clicked will remain selected. Click the selected row again to deselect it.

### Context Menu

If the page is set to display tag browse data, right-click on any row will bring up the context menu for operations. Options available in the context menu will vary depending on whether single or multiple items are selected:

The commands will only work if:

- Tag field is included in the table display
- For system with multiple clusters, the cluster field will also need to be included

The items available on the menu are selection sensitive depending on whether single or multiple items are selected at the time. The following options are available only when single row is selected:

- Set Value

The following options are available:

- Set Override Mode
- Set Control Mode

## Alarm Equipment Tree-view Page Templates

Alarm page templates are included for the following types of alarm displays:

- **Active Alarm Page (`alarm_equip`):** Used to create a page displaying active alarms that are unacknowledged or acknowledged and still in alarm state. The template has the equipment tree-view panel displayed on the left hand side of the page. When configured the tree-view will display a hierarchy of equipment available to the currently logged on user. The template also includes vertical and horizontal scroll bars to allow users to view columns and rows off screen. To create a default active alarm page for your project, create a new page based on the `alarm_equip` template. By default, the name of the page is expected to be "Alarm". However, you can change the name of the page by adjusting the setting for the INI parameter [\[Page\]AlarmPage](#).
- **Disabled Alarm Page (`disabled_equip`):** Used to create a page displaying alarms that are presently disabled in the system. The alarms will appear on this page when they have been disabled from the normal alarm system due to a maintenance shutdown, nuisance tripping etc. The template has the equipment tree-view panel displayed on the left hand side of the page. When configured the tree-view will display a hierarchy of equipment available to the currently logged on user. To create a default disabled alarm page for your project, create a new page based on the `disabled_equip` template. By default, the name of the page is expected to be "Disabled". However, you can change the name of the page by adjusting the setting for the INI parameter [\[Page\]DisabledPage](#).

- **Sequence of Events Page (soe\_equip):** Used to create a page displaying a snapshot of every state transition of an alarm instance that have occurred. The template has the equipment tree-view panel displayed on the left hand side of the page. When configured the tree-view will display a hierarchy of equipment available to the currently logged on user. To create a default SOE alarm page for your project, create a new page based on the **soe\_equip** template. By default, the name of the page is expected to be "SOE". However, you can change the name of the page by adjusting the setting for the INI parameter [\[Page\]SOEPage](#). Unlike the active, hardware, and disabled alarm pages, that are refreshed automatically at runtime to display real time data, the SOE and summary pages display a snapshot of events that have occurred, therefore is not updated automatically. To retrieve the latest events you can manually refresh the page.
- **Alarm Summary Page (summary\_equip):** Used to create a page displaying a historical log of alarms that have occurred. This page can be used for troubleshooting purposes. The template has the equipment tree-view panel displayed on the left hand side of the page. When configured the tree-view will display a hierarchy of equipment available to the currently logged on user. To create a default summary alarm page for your project, create a new page based on the **summary\_equip** template. By default, the name of the page is expected to be "Summary". However, you can change the name of the page by adjusting the setting for the INI parameter [\[Page\]SummaryPage](#).

## CAUTION

### SUMMARY DATA NOT AUTOMATICALLY REFRESHED

Summary data is not automatically refreshed at runtime. Manually refresh the Summary page before using its data for analysis of plant state.

**Failure to follow these instructions can result in injury or equipment damage.**

The alarm equipment tree-view templates display alarm lists using a "no draw" mode. The display of alarm fields is handled by a new set of template specific Cicode functions and genies to control each of the alarm fields' position and size. The alarm list is installed with a callback event function to redraw the alarm list upon data change. The "no draw" mode and data change callback event are supported by a modified form of the existing Cicode function [AlarmDsp\(\)](#).

## Common Functionality

The alarm equipment tree-view page templates offered as part of the tab style page templates include common graphical user interface (GUI) features for easy operation and consistent appearance.

These include:

- Action Tab - Provides controls to carry out common tasks that apply to the whole of the alarm list.
- Interactive Alarm List - Provides controls to manipulate the columns displayed on the alarm list and select alarms.
- Equipment Tree-view filter - The tree-view can be used to filter the results of the list of alarms displayed.
- Column Sorting and Filtering Status Indicator - Sorting and filtering status indicator shown in header of column.

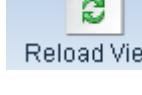

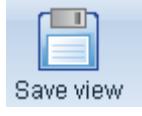

## See Also

[Action Tab](#)

[Interactive Alarm List](#)[Filtering Alarms Using the Equipment Tree-view](#)[Column Sorting and Filter Status Indicator](#)

## Action Tab

When the user displays an alarm page based on the alarm equipment tree-view templates, an Action tab will be automatically added to the menu bar. Options available on the Action tab vary according to the type of Alarm page.

Icon	Name	Description
 Ackn...	Acknowledge Page	Acknowledge all alarms on the current page. Available on Active Alarm page.
 Disab...	Disable Page	Disable all alarms on the current page. Available on Active Alarm page.
 Silence	Silence Alarm	Silence alarm sound. Available on Active Alarm page.
 Enable page	Enable Page	Enables all alarms on Page. Available on Disabled Alarm Page.
 Filter...	Set Filter	Opens the alarm filter form. Filter form varies according to alarm page open.
 Reset ...	Reset filter	Clears the effect of the filter criteria specified through the filter form.
 Reload View	Reload View	Reload the column settings according to the alarm format set in parameter [Format]FormatName.
 Save view	Save View	Save changes to the alarm display

Icon	Name	Description
	Add column	Add column to the alarm display list.
	Auto size columns	Auto size column widths in the alarm display list.
	Print/Export	Print or Export the current page

### Interactive Alarm List

The alarm equipment tree view page templates feature an interactive alarm list that supports the following functionality:

### Adjustable Columns

The user can adjust the columns displayed on the alarm list. Options include:

- Reposition a column by drag-and-drop its column heading to the new position.
- Delete a column by drag-and-drop its column heading (vertically) beyond the column heading row.
- Insert or delete a column via a pop-up menu by right-clicking a column heading
- Adjust the size of a column by dragging the column separator that appears at the right edge of a column heading.

### Dockable Equipment tree-view

- Adjust the width of the equipment tree-view by dragging the column separator that appears at the right edge of the column. When selected the column separator will change from blue to gray.
- To hide the equipment tree-view click the arrow icon on the column separator. On clicking it the equipment tree-view will collapse and be hidden from view. Click the arrow icon at the edge of the page to show the equipment tree-view on screen.

### Selection of Alarms

The user can select single or multiple alarms on the alarm list so that the same operation can be applied to multiple selected alarms in one go. If some of the selected alarms are off-screen, before the required operation is completed, a message dialog will popup, reminding the user that some of the selected records are not viewable. On clicking Continue or the Enter key the selected records on and off the screen will be acted on. On clicking Cancel or the ESC key the command is canceled. If the selected records are viewable on-screen the message dialog will not open.

Alarm selection works as follows:

- To select a single alarm: Left-click an alarm that is not already selected to select it.
- To select a continuous range of alarms: Select a single alarm to mark the start of the selection. Then hold the SHIFT key and left-click another alarm to extend the selection. Alternatively, you can select rows by dragging the mouse cursor from the starting to the ending row. Once rows are selected, you can extend the range of the selection by SHIFT left-clicking another row of alarm.
- To select disjointed rows, hold the CTRL key while selecting a row.
- To deselect alarm(s): Left-click any alarm within a selection range to deselect the whole range. Only the row that you have clicked will remain selected. Click the selected row again to deselect it.

## Sorting the Alarm List

Users can sort the alarm list display using most fields except for 'State' and 'Type'. To sort click on the header of the relevant column.

The default order of alarms is dependent on the [\[Alarm\]SummarySortMode](#) parameter and the type of alarm page.

Refer to the topic [Default Sort Order](#) for more information.

## Context Menu

Right-click on any alarm row to bring up the context menu for alarm operations. Options available in the context menu will vary depending on whether single or multiple items are selected. If you right-click on an alarm that is not already selected, this will select it. Subsequent commands (selected from the context menu) will then only operate on this single alarm. On the other hand, if you right-click on any alarm within a selection range, this will not change the selection. Subsequent commands selected will operate on each alarm within the selection range. Several operation options are available in the context menu:

- Information: displays the detailed information of a single alarm that has the cursor focus (indicated by surrounded by a white box).
- Help: displays the Help page of a single alarm that has the cursor focus.
- Acknowledge: acknowledges selected alarms. This option is restricted by the privilege set by the parameter [\[Privilege\]AckAlarms](#). This is not available on the Alarm Summary page.
- Disable: disables selected alarms. This option is restricted by the privilege set by the parameter [\[Privilege\]DisableAlarms](#). It is not available on the Disabled Alarms page.
- Enable: enables selected alarms. This option is restricted by the privilege set by the parameter [\[Privilege\]DisableAlarms](#). It is not available on the Active Alarms page.
- Comment: Add a comment to an event. This option is only available when a single row is selected. This option is restricted by the privilege set by the parameter [\[Privilege\]AckAlarms](#). This option is available to Alarm Summary and SOE pages only.

**Note:** The Hardware Alarms template only allows a single alarm to be selected. Its context menu has only the Acknowledge option which is also restricted by the privilege set by the parameter [\[Privilege\]AckAlarms](#).

## Column Sorting and Filter Status Indicator

When you specify a filter or sort columns via the provided UI the status is shown in the header of the columns. Whether you select equipment in the tree view panel, specify filters via the filter form or click on the column header to sort a column, one of the following symbols will appear on the filtered/sorted column(s).

Symbol	Description
	No sorting or filtering is applied
	Sorted in ascending order
	Sorted in descending order
	Filtered without explicit sorting order
	Filtered and sorted in ascending order
	Filtered and sorted in descending order

If an equivalent field to the column is being filtered the appropriate filter symbol will appear in the heading of the column. For example, date and time should be filtered together, thus when the date field is specified in the alarm filter form, the filter symbol will appear in the time column.

## Filtering Alarms Using the Equipment Tree-view

For alarm pages with the equipment tree view pane, you can filter the alarm display list to show alarms belonging to selected parent and child equipment branches. If no equipment is selected in the tree-view then all alarms are displayed.

To select equipment, check the box to the left of the relevant branches. If you select equipment with child branches, then the child equipment will be selected and grayed out.

**Note:** If the parent equipment branch is checked, child equipment cannot be deselected.

If the parent is not selected, you can change the checked states of the child equipment.

Next to each item in the tree, an alarm count is displayed. The count includes the total number of alarms belonging to the equipment and its child hierarchy. The type of alarms that are counted vary according to the type of alarms that are displayed on the list. For example, on the active alarms page, the count represents the active alarms associated to that equipment, while on the disabled alarms page, the count represents the disabled alarms associated to that equipment. Other points to consider with the equipment count include:

1. The count on the tree node represents the total number of alarms that are associated with that equipment.
2. For alarms that are not associated to equipment, the count is not available due to the nature of the equipment tree view.
3. The counts are not affected by the filter applied to the alarm list.
4. Due to point 2 and 3, the total sum of the counts from the equipment tree does not equal to the alarm count

on the alarm banner, and they never mean to be comparable. The alarm count on the banner represents the total number of (unfiltered) unacknowledged alarms in the system (subjected to the viewable areas of the currently logged on user).

## Create a New Project

Creating a project based on the Tab Style templates project is simple; by default, it is incorporated as an included project in new projects. This means whenever you start a new project, the tab style templates are ready to use as necessary.

There are two ways to create a project based on the tab style templates:

- Use the pre-defined starter project.
- Create a project from scratch.

### Using the Pre-defined Starter Project

**To base a project on an existing starter project:**

1. Choose **New Project** from the **File** menu, or click the **New Project** button.
2. Type a name for your project and choose a location for the files. Using spaces in the project name is not recommended. Although Plant SCADA does not stop you from using spaces, it can cause unpredictable results.
3. Click the **Create project based on starter project** check box.
4. Choose the project on which you want to base your new project.
5. Click **OK**.

Four pre-defined starter projects with page resolutions of XGA, SXGA, WUXGA and HD1080 (Full HD) are provided as part of the product installation. Each of the starter projects will be based on project "Tab\_Style\_1" and contain:

- A cluster named "Cluster1".
- A role named "Administrators" which is linked to the "BUILTIN\Administrators" Windows group and have global privilege of 8. This allow a user to log in Plant SCADA at runtime using a Windows user account who belongs to the Administrators group of the local machine.
- Pages of Alarm, Summary, Disabled, Hardware, ProcessAnalyst and !ProcessAnalystPopup based on the relevant templates found in the Tab\_Style\_Include project.

The newly created project will be immediately compilable, and will contain a basic level of built-in functions such as viewing alarms and trends.

## Create a Project from Scratch

**To configure a project based on the tab style templates from scratch:**

1. Create a privileged user; see [Create a Privileged User](#).

2. Run the Setup Wizard; see [Run the Setup Wizard](#).
3. Set up instant trending; see [Use Instant Trending](#).
4. Set up multiple monitor display; see [Display a Project on Multiple Monitors](#).
5. Implement audible alarms; see [Implement Audible Alarms](#).

Don't modify the tab style templates project for use as a runtime project; set it aside for use as a template for new projects.

If creating a project based on the tab style templates, it is not recommended to include pages based on templates that use a different style, including the earlier Include project. Doing so might affect functionality.

## See Also

[Create Pages](#)

## Create a Privileged User

Some tab style templates project content is restricted via a user login. Without a valid login, some project functionality will be disabled. For example, the Close window (the cross) button on title bar will not work if you log in as a user with restricted privileges.

By default, the following elements within the tab style templates project are restricted by global privileges.

Element	Global Privilege	Associated Parameter
Editing users	8	<a href="#">[Privilege]EditUser</a>
Project shutdown	8	<a href="#">[Privilege]Shutdown</a>
Acknowledge alarms	1	<a href="#">[Privilege]AckAlarms</a>
Disable alarms	8	<a href="#">[Privilege]DisableAlarms</a>
Silence alarms	0	<a href="#">[Privilege]SilenceAlarms</a>

When configuring a tab style templates project, check that your users have appropriate access to the available functionality. Verify that your users can acknowledge alarms if necessary.

To adjust the global privileges for the elements previously listed for a more complex security architecture, adjust the [Privilege] parameters in the Citect.ini file. Click the relevant link in the previous table above for details.

## See Also

[Run the Setup Wizard](#)

[Privilege Parameters](#)

## Run the Setup Wizard

As with any Plant SCADA project, you need to fill in the Setup Wizard on any machine where a tab style

templates project will be run. See [Run the Setup Wizard](#) for more information.

How you set up a computer using the Wizard is mostly up to you; however, due to some necessary settings, you need to run the Setup Wizard as a custom setup. The Wizard page you need to pay attention to is the Control Menu Page.

## Security Setup - Control Menu Page

All tab templates are designed to be displayed with the title bar. You need to select the "Show Title Bar" option when you select to display the page in fullscreen mode.

Window title bar controls can be secured from unauthorized access. See [Secure the Windows Title Bar](#).

## See Also

[Create a Privileged User](#)

[Use Instant Trending](#)

[Implement Audible Alarms](#)

## Use Instant Trending

Instant trending is natively supported by the Process Analyst. The steps to implement instant trending are as follows:

1. **Create a Process Analyst page.** Create a page that has a Process Analyst object on it. You may create these pages based on the provided tab style templates. For a fullscreen page, create the page based on the SinglePA template. For a pop-up page, create the page based on the PopPA template.
2. **Set the sample cache duration.** Samples collected for Instant Trends are kept in the cache up to a default number of samples and time period. You can adjust these settings using the parameters [Trend]InstantTrendSamples and [Trend]InstantTrendIdleTime.
3. **Call the Process Analyst Display.** At runtime, call your process analyst page either as a fullscreen page or pop-up page using the Cicode function PageDisplay(pagename) or PagePopup(pagename) respectively.
4. **Add Variable Tags / Local Variables for Trending.** Use the Add Pens dialog provided with the Process Analyst to add pens to the process analyst chart as normal. In the dialog, you can now select any variable tags or local variables for trending.

## See Also

[Use Pages and Templates](#)

## Display a Project on Multiple Monitors

For projects based on the tab style templates, multiple monitors will be supported through the core product. You can display a Plant SCADA window on each of the monitors on the machine by adjusting the following parameters:

- [\[MultiMonitors\]Monitors](#) - Adjust this parameter to indicate how many monitors your project will be running

on.

- [\[MultiMonitors\]StartupPage<n>](#) - This parameter determines which page will appear on each monitor at startup. You have to duplicate this parameter for each monitor. For example, StartupPage1 determines the page that appears on the first monitor at startup, StartupPage2 determines what appears on the second monitor, and so on. If a startup page is not defined for a particular monitor, the page specified in parameter [\[Page\]Startup](#) will be displayed.

## See Also

[MultiMonitors Parameters](#)

## Implement Audible Alarms

The tab style templates project offers support for audible alarms. You can configure a project so that a selected wav file is sounded whenever an alarm of a particular priority is triggered. You can even assign different sounds to different alarm priorities, allowing the urgency of an alarm to be determined from its sound.

### LOSS OF CONTROL

- Do not use Plant SCADA's alarming system as the primary alert mechanism for safety-related alarms or notifications (that is, those classified as critical to process safety, the protection of the plant and equipment, or the protection of human life).
- Do not use Plant SCADA's audible alarm functionality as a replacement for safety-related warning systems critical to process safety, the protection of the plant and equipment or the protection of human life.
- Safety-related alarms and notifications should be independent and separate from the process control system. They should be implemented in the form of a stand-alone physical alarm system driving individual discrete alarm annunciators.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

### To implement audible alarms in your project:

1. Verify that the alarms you want to trigger an audible alert are assigned to a category and given a particular priority.
2. Adjust the parameter [\[Alarm\]Soundn](#). This parameter determines the wav file used when an alarm sounds, based on the priority of the alarm (n). For example, [Alarm]Sound1 identifies the .wav file that will be sounded whenever a priority 1 alarm is triggered.
3. If necessary, adjust the parameter [\[Alarm\]SoundnInterval](#). This parameter determines how long the selected wav file sounds, based on the priority of the alarm (n). For example, [Alarm]Sound1Interval sets the length of time a priority 1 alarm is sounded for.
4. Verify that your users have appropriate privileges associated with their login to silence alarms, otherwise they will not be able to silence an alarm. See [Create a Privileged User](#) and the parameter [\[Privilege\]SilenceAlarms](#).

## See Also

[Use Pages and Templates](#)

## Create Pages

If you created your project by selecting the **Create project based on starter project** check box in the **New Project** dialog, Alarm, SOE, Disabled, Hardware, ProcessAnalyst, !ProcessAnalystPopup, ControllInhibit, ManualOverride, VariableTags and generic equipment pop-up pages would already have been created in your new project. You can accept those pages or modify them as you develop your project. See [Create a New Project](#).

If you created your project from scratch, there are no predefined pages in your project. The navigation controls on the tab template expect several default pages to exist in your project for basic functionality such as alarm and trend displays. You are recommended to add the following pages to your project based on the provided templates of your chosen size:

Template	Description
SinglePA or DoublePA	Process Analyst page for displaying trends.
!PopPA	Process Analyst pop-up page.
Alarm	Active Alarms page, called from the Alarms toolbar.
Hardware	Hardware Alarms page, called from the Alarms toolbar.
Disabled	Disabled Alarms page, called from the Alarms toolbar.
Summary	Alarms Summary page, called from the Alarms toolbar using the Historical events icon.
SOE (Sequence of Events)	Sequence of events page, called from the Alarms toolbar using the Historical events icon.

The links between the pages listed and the controls that call them are defined by the [Page] parameter settings within the Citect.ini file. The relevant parameters are [Page]ProcessAnalystPage, [Page]ProcessAnalystPopupPage, [Page]AlarmPage and [Page]HardwarePage, etc. If you want a button to call a page with a different name, adjust these parameter settings. For details see [Page Parameters](#).

## Creating new tab pages using the normal template

The normal template in the tab style template library is designed with minimal content to enable the presentation of customer-necessary information and plant mimics.

Pages are created based on this template within Graphics Builder by choosing the necessary template from the Use Template dialog (**File | New Page**). You can access the tab style templates by selecting **tab\_style\_1** from the **Style** field.

## Create Custom Tab Style Menus

The tabbed menus that appear on pages created by the Tab Style Starter Project are configured using the **Visualization** activity in Plant SCADA Studio (see [Menu Configuration](#)).

You can choose to use the default menus offered by the Tab Style templates; they can be turned on or off via the parameter [\[Page\]AddDefaultMenu](#).

Items in the default menus are assigned a sorting order of 100. When you configure to show the default menus and your own defined menus at the same time, the two will be merged and ordered accordingly.

The default menus contain the following items:

Tabs	Buttons
Pages	Automatically populate the non-system pages configured in the project and included project(s)
Alarms	Active Alarms
	Historical events (Alarm summary and SOE pages)
	Disabled Alarms
	Hardware Alarms
Trends	Process Analyst Calls Cicode function: PageProcessAnalyst("", "")
	Process Analyst Popup Calls Cicode function: ProcessAnalystPopup("", "")

**Note:** If you need to migrate from CSV\_Include project to the tab style templates, you can use the Project Migration Tool to migrate the CSV\_Include menu definition to the Menu Configuration database.

## See Also

[Configure Tab Style Popup Menus](#)

## Configure Tab Style Popup Menus

The Tab style templates menu bar features two pop up menus:

- **Login** dropdown - displays a drop-down menu with login options.

You can override the default menu by specifying your own menu item in the [Menu Configuration](#) view of the Visualization activity. The override menu item needs the **Page** field set to "Template". It also needs to have the **Level 1** field set to "Login".

- **Alarm silence** option button - clicking this button displays a context menu for selecting different silence options.

This button is only enabled if you have sufficient privileges (as specified in the parameter [\[Privilege\]SilenceAlarms](#)).

You can override the default menu by specifying your own menu item in the [Menu Configuration](#) view of the Visualization activity. The override menu item needs the **Page** field set to "Template". It also needs to have the **Level 1** field set to "Alarm Sound".

## See Also

[Create Custom Tab Style Menus](#)

## Using Environment Variables in Tab Style Templates

Whereas parameters apply specified rules to every template page, environment variables apply rules to *specific* pages. In this way, you can use environment variables to specify functionality for specific pages.

For example, to display a specific page, you'd specify the page name as the environment variable. To call a specific Cicode function, you'd specify the function name (with a "?" prefix), space, then a list of comma separated arguments, like this: ?WinPrint LPT1,0,0,Trend.pal. (The "?" indicates that the variable is to be interpreted as a function call rather than a page to display.)

Let's look at a more detailed example: usually the standard **Print** button is used for printing a graphics page in WYSIWYG format. If you have a text/html file displayed on the page, or perhaps a trend, you can create your own print function (for example, PrintTrend) and specify it in the environment variable, as ?PrintTrend. To reduce the amount of ink used, specify the WinPrint function with a user-defined palette. In this case you would specify it as a parameter rather than as an environment variable so that it applies to every page.

---

**Note:** For pages created based on the Process Analyst templates, you can print the screen using the standard Print button, or print the chart using the Print button on the toolbar of the Process Analyst object. Give the user both alternatives as they both serve different purposes.

---

## Tab Style Template Reference

Plant SCADA includes a set of parameters that support the Tab Style Templates. These include:

- Alarm parameters
- Alarm heading parameters
- Format parameters
- Page parameters
- Privilege parameters
- Custom alarm parameters
- Custom menu parameters.

For a full list of these parameters, see [Tab\\_Style Template Parameters](#) in the Parameters documentation.

There is also a set of Cicode functions that only apply to the Tab Style Templates. See [Tab Style Template Functions](#).

## Tab Style Template Functions

The list below contains Cicode functions that only apply to the Tab Style Templates:

### Alarm Functions

- [TabAlarm\\_GetAn](#)
- [TabAlarm\\_GetAckPriv](#)
- [TabAlarm\\_GetDisablePriv](#)

### Alarm Sound Functions

- [TabAlarmSnd\\_GetPriv](#)
- [TabAlarmSnd\\_SoundState](#)
- [TabAlarmSnd\\_Silence](#)
- [TabAlarmSnd\\_SilenceOnAck](#)
- [TabAlarmSnd\\_ShowContextMenu](#)

### Display Functions

- [DspFileGetAn](#)
- [DspRtfFileGetAn](#)
- [DspRtfFileGetName](#)
- [DspRtfFileSetName](#)

### Page Functions

- [PageDspConfigMenu](#)
  - [PageDspLoginMenu](#)
  - [PageGetConfigMenuHnd](#)
  - [PageHomeGetName](#)
  - [PageParent](#)
  - [PageParentGetName](#)
1. [PagePrint](#)
  2. [PagePrintGetName](#)

### **TabAlarm\_GetAn**

Gets the Animation Number (AN) of the alarm list on the provided alarm templates. The returned AN can be passed to the alarm family of Cicode functions such as `AlarmSetInfo()`, `AlarmGetInfo()` etc. to further manipulate the alarm list.

---

**Note:** The alarm list displayed by the alarm templates is instantiated using the new noDraw mode. This helps eliminate the need to have consecutive ANs for each row of the alarm records displayed on screen. Therefore, this alarm list is not compatible with any alarm Cicode functions that operates on current cursor position, such as

---

mode 0 of AlarmGetInfo(), AlarmSetInfo(), etc.

---

## Syntax

**TabAlarm\_GetAn(*iListID*)**

*iListID*

The list number of the alarm list used by the alarm templates:

0 - last alarm list (at alarm banner)

1 - main alarm list (only exist on alarm templates)

## Return Value

The AN of the alarm list, otherwise -1 is returned.

## See Also

[Tab Style Template Functions](#)

## TabAlarm\_GetAckPriv

Checks if currently logged on user has privilege to acknowledge alarms from the controls on the provided alarm templates.

---

**Note:** The privilege to acknowledge alarms is defined under INI / project parameter [\[Privilege\]AckAlarms](#).

---

## Syntax

**TabAlarm\_GetAckPriv()**

## Return Value

1 if the logged on user has privilege, otherwise 0 is returned.

## See Also

[Tab Style Template Functions](#)

## TabAlarm\_GetDisablePriv

Checks if currently logged on user has privilege to disable / enable alarms from the controls on the provided alarm templates.

---

**Note:** The privilege to disable / enable alarms is defined under INI / project parameter [\[Privilege\]DisableAlarms](#).

---

## Syntax

`TabAlarm_GetDisablePriv()`

## Return Value

1 if the logged on user has privilege, otherwise 0 is returned.

## See Also

[Tab Style Template Functions](#)

## TabAlarmSnd\_GetPriv

Checks if currently logged on user has privilege to change alarm sound settings.

**Note:** The privilege to change alarm sound settings is defined under INI / project parameter [\[Privilege\]SilenceAlarms](#).

## Syntax

`TabAlarmSnd_GetPriv()`

## Return Value

1 if the logged on user has privilege and alarm sound is available, otherwise 0 is returned.

## See Also

[Tab Style Template Functions](#)

## TabAlarmSnd\_SoundState

Gets the state of alarm sound.

## Syntax

`TabAlarmSnd_SoundState()`

## Return Value

A number that represents the state of alarm sound: 0 - No audible alarms exist; 1 - Audible alarms exist; 2 - Alarm sound is being silenced.

## See Also

[Tab Style Template Functions](#)

### TabAlarmSnd\_Silence

Silences audible alarms for a specified time period in seconds.

## Syntax

**TabAlarmSnd\_Silence([iSilenceTime])**

*iSilenceTime*

Number of seconds to silence audible alarms. If not specified, defaults to -1

-1 - silence audible alarms until every alarm has been acknowledged

0 - re-enable audible alarms

>0 - silence alarms for the specified number of seconds

## Return Value

Zero (0) if function is executed successfully, otherwise error code is returned.

## See Also

[Tab Style Template Functions](#)

### TabAlarmSnd\_SilenceOnAck

Silences alarm sound upon alarm acknowledgement. Call this function when you wish to integrate your alarm acknowledgement Cicode with the alarm sound.

---

**Note:** The silence period can be adjusted by INI / project parameter [\[Alarm\]SoundSilenceTimeoutOnAck](#).

Because the alarm silence is a result of alarm acknowledgment, the privilege to perform this function is controlled by the INI / project parameter [\[Privilege\]AckAlarms](#) instead of [\[Privilege\]SilenceAlarms](#).

---

## Syntax

**TabAlarmSnd\_SilenceOnAck()**

## Return Value

Zero (0) if function is executed successfully, otherwise error code is returned.

## See Also

[Tab Style Template Functions](#)

## **TabAlarmSnd\_ShowContextMenu**

Pops up the alarm sound context menu. The menu is expected to be defined in the Menu Configuration database under the page name of "Template" and Level 1 field of "Alarm Sound". If no menu is defined, a default menu will be shown.

## **Syntax**

**TabAlarmSnd\_ShowContextMenu()**

## **Return Value**

Zero (0) if function is executed successfully, otherwise error code is returned.

## **See Also**

[Tab Style Template Functions](#)

## **DspFileGetAn**

Gets the Animation Number (AN) on the provided file template where the text file is displayed. The returned AN can be passed to the DspFile family of Cicode functions such as DspFileGetInfo(), DspFileGetName(), DspFileSetName etc. to further manipulate the text file.

## **Syntax**

**DspFileGetAn([iAN])**

*iAN*

The AN where text file is displayed. Only specify this argument if you would like to override the value maintained by the template. Default value -1.

## **Return Value**

The AN where the text file is displayed, otherwise -1 is returned.

## **See Also**

[Tab Style Template Functions](#)

## **DspRtfFileGetAn**

Gets the Animation Number (AN) of the CiTextBox ActiveX control that displays rich text file / text file on the page based on the file\_rtf template.

## Syntax

**DspRtfFileGetAn([iAN])**

*iAN*

The AN where the CiTextBox ActiveX control is located. Only specify this argument if you would like to override the value maintained by the template. Default value -1.

## Return Value

The AN where the CiTextBox ActiveX control is located, otherwise -1 is returned.

## Related Functions

[DspRtfFileGetName](#), [DspRtfFileSetName](#)

## See Also

[Tab Style Template Functions](#)

## DspRtfFileGetName

Returns the name of the rich text / text file that is being displayed on the page based on the file\_rtf template.

## Syntax

**DspRtfFileGetName([iAN])**

*iAN*

The AN where the CiTextBox ActiveX control is located. Only specify this argument if you would like to override the value maintained by the template. Default value -1.

## Return Value

The full path file name of the file is being displayed, otherwise an empty string is returned.

## Related Functions

[DspRtfFileGetAn](#), [DspRtfFileSetName](#)

## See Also

[Tab Style Template Functions](#)

0 - no scrollbars

1 - horizontal scroll bar only

2 - vertical scroll bar only

You can use the combination of the above modes by adding the modes together.

## Return Value

Zero (0) if run successfully, otherwise error code is returned.

## Related Functions

[DspRtfFileGetAn](#), [DspRtfFileGetName](#)

## See Also

[Tab Style Template Functions](#)

## PageDspConfigMenu

Displays a pop-up menu. The contents of the menu are defined in the Menu configuration under the specified page name and menu name (Level 1) field.

---

**Note:** If localization syntax, that is, @ (<Name>) is used in the page name or menu name field of your menu configuration record. You need to pass the exact string to this function to retrieve the menu.

---

## Syntax

**PageDspConfigMenu(*sPageName*, *sMenuName* [, *iXPos* [, *iYPos*]])**

*sPageName*

The page name of the menu to be found in the menu configuration database

*sMenuName*

The menu name (Level 1) to be found in the menu configuration database

*iXPos*

The x position (relative to origin of the page) when the menu pops up. Do not specify or set this argument to -1 to show menu at mouse pointer.

*iYPos*

The y position (relative to origin of the page) when the menu pops up. Do not specify or set this argument to -1 to show menu at mouse pointer.

## Return Value

Zero (0) if function is executed successfully, otherwise error code is returned.

## See Also

[Tab Style Template Functions](#)

### PageDspLoginMenu

This Cicode function is associated with the Normal template. Pops up the login context menu. The menu is expected to be defined in the Menu Configuration database under the page name of "Template" and menu name (Level 1) field of Login. If no menu is defined, a default menu will be shown.

## Syntax

**PageDspLoginMenu()**

## Return Value

Zero (0) if function is executed successfully, otherwise error code is returned.

## See Also

[Tab Style Template Functions](#)

### PageGetConfigMenuHnd

Gets the menu configuration node handle for the specified page name and menu (Level 1) name. The returned handle can be passed to the menu family of Cicode functions such as MenuGetFirstChild(), MenuGetNextChild(), MenuNodeGetProperty(), etc. to browse the contents of the menu.

## Syntax

**PageGetConfigMenuHnd(*sPageName*, *sMenuName* [, *iIgnoreEmpty*])**

*sPageName*

The page name of the menu to be found in the menu configuration database

*sMenuName*

The menu name (Level 1) to be found in the menu configuration database

*iIgnoreEmpty*

Indicates whether to treat empty menu node as invalid (1), default is false (0)

## Return Value

The menu handle of the specified menu (Level 1) node, otherwise -1 is returned.

## Related Functions

[PageDspConfigMenu](#)

## See Also

[Tab Style Template Functions](#)

### PageHomeGetName

Returns the name of the home page of the running project.

## Syntax

`PageHomeGetName()`

## Return Value

Page name of the home page.

## See Also

[Tab Style Template Functions](#)

### PageParent

Displays the parent page of the currently displayed page based on page environment variable "ParentPage".

## Syntax

`PageParent()`

## Return Value

Zero (0) if function is executed successfully, otherwise error code is returned.

## Related Functions

[PageParentGetName](#)

## See Also

[Tab Style Template Functions](#)

## PageParentGetName

Returns the name of the parent page of the currently displayed page based on page environment variable "ParentPage".

### Syntax

**PageParentGetName()**

### Return Value

Page name of the parent page.

### Related Functions

[PageParent](#)

### See Also

[Tab Style Template Functions](#)

## PagePrint

Execute a custom Cicode function to print the currently displayed page. The custom Cicode function is either defined in page environment variable "PrintPage" or Citect.INI / project parameter [\[Page\]PrintPage](#). If custom Cicode function is not defined, a Select Printer dialog will pop-up and a screenshot of the currently displayed page will be sent to the selected printer. The print command is defined in the format of: ?Cicode\_fn comma\_separated\_argument\_list e.g. ?WinPrint LPT1;,0,0

### Syntax

**PagePrint()**

### Return Value

Zero (0) if function is executed successfully, otherwise error code is returned.

### Related Functions

[PagePrintGetName](#)

### See Also

[Tab Style Template Functions](#)

## PagePrintGetName

This Cicode function is associated with the Normal template. Returns the page name / Cicode command for printing the currently displayed page based on page environment variable PrintPage. If the environment variable is not defined, it returns the value of INI / project parameter [\[Page\]PrintPage](#).

## Syntax

**PagePrintGetName()**

## Return Value

Page name / Cicode command for printing the currently displayed page.

## Related Functions

[PagePrint](#)

## See Also

[Tab Style Template Functions](#)

# Library Controls Include Project

The Library Control Include project contains a set of Genies for common user interface controls such as an equipment tree view, data table, and vertical and horizontal scroll bars.

**Note:** The Library Control Include project is a system include project, and only appears in the Project list tree if the **System Projects** filter is applied in the Projects activity.

## Library Control Genies

Genie	Description	When to use
<a href="#">Alarm Table Library Control</a>	A version of the Table genie for displaying an alarm list.	Place on page to display an alarm list.
<a href="#">Calendar Library Control</a>	Displays a monthly calendar view.	Place on page to show calendar information or allow user to select a particular date for input.
<a href="#">Data Browse Table Library Control</a>	A version of the Table genie to display snapshot information retrieved via the built-in data browse family of Cicode functions, such as AlmBrowse, TagBrowse and	Place on page to display a snapshot of data retrieved from the built-in data browse functions.

Genie	Description	When to use
	TrnBrowse or other data browse-like data by providing custom initialization callback function to the genie.	
Equipment Tree Library Control	<p>A version of the Tree genie for displaying a hierarchy of equipment configured in the project. The EquipTree genie automatically loads the equipment defined in the project.</p> <p>For advanced usage, such as doing custom actions upon different events, you will need to write your own Cicode functions and assign them to the callback functions part of the genie form.</p>	Place on page to display an equipment tree.
Scroll Bar Horizontal Library Control	Displays a horizontal scroll bar for panning the displayed content horizontally to reveal the off-screen portion of the content. This genie can be used with any content by hooking up the call-back events of the genies with the appropriate Cicode functions (written by the users).	Place on page to view the off screen content
Scroll Bar Vertical Library Control	Displays a vertical scroll bar for panning the displayed content vertically to reveal the off-screen portion of the content. This genie can be used with any content by hooking up the call-back events of the genies with the appropriate Cicode functions (written by the users).	Place on page to view the off screen content
Slider Library Control	Displays a Slider for hiding and displaying the equipment tree-view panel on screen.	Place on page to hide the equipment tree-view panel
SQL Table Library Control	A version of the BrowseTable genie to display information retrieved using the built-in SQL functions as a disconnected recordset.	Place on page to display data retrieved from an SQL data source.

Genie	Description	When to use
Tab	<p>Displays a list of opened pages uniquely in the Activity Bar.</p> <p>See <a href="#">Use the Tabs Genie</a> for examples in how the control can be used.</p>	Place on page to display a list of opened pages that will allow users to navigate between pages easily.
Table Row Library Control	<p>Displays background highlight for a particular row when it is selected. This genie is to be used in conjunction with the Table genies. However, its use is optional.</p> <p>The position and size of the highlight is not automatically calculated at runtime. Locate and re-size the instance of this genie in the Graphics Builder at design time.</p>	Use when want to highlight the selected row with a blue background color.
Table Library Control	<p>Displays multiple rows of data on the screen in tabular layout. The genie is designed to display only a certain number of rows and columns of data on screen. You can view the off-screen portion of the table by using it with the scroll bar genies or via specific Cicode functions. This genie does not include the row highlight animation for row selection. However, you can find out which rows are selected via a set of specific Cicode functions.</p>	Place on page to display table like data such as alarms, or database records.
Tag Table Library Control	<p>A version of the Table genie for displaying a table of variable tags added to the genie using the LibTagTable_AddTag() Cicode function.</p> <p>See <a href="#">Using the Tag Table Genie</a> for examples in how the control can be used.</p>	Place on page to display a table of variable tags.
Tree Library Control	<p>Displays a collection of items in a parent-child hierarchical relationship. Displays only a certain number of items on screen. You can view the off-screen rows and</p>	Place on page to display hierarchical data, such as an equipment menu.

Genie	Description	When to use
	<p>columns of the table by associating it with the scroll bar genies or via specific Cicode functions.</p> <p>See <a href="#">Use the Tree Genie</a> for examples in how the control can be used.</p>	

## See Also

[Use the Library Controls](#)

## Use the Library Controls

### To use a Genie from the Library\_Controls include project:

1. In Graphics Builder, open the page to which you would like to add a Genie.
2. Click the Paste Genie button in the objects toolbox, or select **Paste Genie** from the **Edit** menu.
3. In the Paste Genie dialog, select the "lib\_controls" library.
4. Select the required Genie from the **Genie** list and click **OK**. You can also double-click the thumbnail of the Genie.

The Genie is pasted on the graphics page. A dialog will open prompting you to configure the properties of the Genie.

5. Click **Save**.

At runtime, the dialog values you entered into the prompt will replace each substitution in the Genie.

[Genies](#)

## Alarm Table Library Control

Alarm table genie has the following parameters:

Parameter	Description
<b>Alarm Table Name</b>	Name of table (max characters). Used to identify the genie when on a graphics page.
<b>Width</b>	Pixel width of the table at runtime. <b>Note:</b> Leave the size of the genie at design time as 100

Parameter	Description
	pixels, as it will be automatically calculated at runtime.
<b>Number Of Rows</b>	Number of rows displayed on the page.
<b>Header Height</b>	Pixel Height of header row in table display.
<b>Row Height</b>	Pixel height of row in the table display.
<b>Header Padding</b>	The pixel padding between the bottom of the header text (column name) and the bottom of the header row.
<b>Row Padding</b>	The pixel padding between the bottom of the cell text and the bottom of each row.
<b>Column Padding</b>	The pixel padding on the left-hand-side and right-hand-side of the cell text relative to the width of each column.
<b>Refresh Rate</b>	The minimum (quickest possible) rate that the control will be redrawn.  The control is only redrawn as required upon changes to the layout, scrolling or other user initiated events.
<b>Scan Delay (Optional)</b>	The number of page scan delay before the genie is initialized at runtime. this can be set to different number on different control genies to stagger the initialization order. If not set defaults to 1.
<b>Last Alarm List</b>	True/False drop down box. Determines whether the alarm list is a normal list (which will be instantiated via the function AlarmDsp) or a last alarm list (which will be instantiated via AlarmDspLast).
<b>Horizontal Scrollbar (Optional)</b>	The name of the horizontal scroll bar genie on the page that allows the user to horizontally scroll the content displayed on the control genie If you do not require horizontal scrolling, leave this field blank.
<b>Vertical Scrollbar (Optional)</b>	The name of the horizontal scroll bar genie on the page that allows the user to vertically scroll the content displayed on the control genie If you do not require vertical scrolling, leave this field blank.
<b>Header Font</b>	The pre-configured font for header text .
<b>Auto Width</b>	True/False drop down box. False is selected by default.
<b>Format Category</b>	The alarm category that is used to determine the

Parameter	Description
	fields (columns) displayed. If this is not specified, the columns displayed on the table will be determined by the field format defined in alarm category 0.
<b>Cluster</b>	The cluster of the alarm list If this is not specified, alarms from all clusters configured in the project will be displayed.
<b>Allow Selection</b>	True/False drop down. True is selected by default.
<b>Alarm Type</b>	<p>The display type of the alarm list. See the <b>Type</b> parameter for the Cicode function <b>AlarmDsp</b> for details of the values you can use and what each represents.</p> <p><b>Note:</b> If you set the alarm type to a hardware alarm (types 5 - 9), the following limitations will apply:</p> <ul style="list-style-type: none"> <li>• The format used to display the hardware alarms will be defined by the <b>Alarm Format</b> property for alarm category 255.</li> <li>• The <b>Cluster</b> field is not used for hardware alarms.</li> <li>• You may need to specify off-screen animation numbers (ANs) for each table row. If you are using a Plant SCADA template project (SxW or Tab Style templates), a set of ANs starting at 21 is already reserved for this purpose. If you are not using a template project, you will need to manually add these ANs.</li> </ul>
<b>AN</b>	The Animation Number (AN) of a user created Cicode / Animation Number object where the alarm list will be instantiated (displayed). If this is less than 1, the alarm list will be displayed at a random AN. The AN allows the user to interact with the alarm list at runtime using built-in Cicode functions such as <b>AlarmSetInfo()</b> , <b>AlarmDspPrev()</b> and <b>AlarmDspNext()</b> .
<b>Initialize (Optional)</b>	<p>Callback function that is called when the control initializes. The callback function should return either TRUE (1) for success or FALSE (0) if unsuccessful. By default, if the user specified function does not initialize, the control genie will retry the function a few times before giving up. This callback only supports the #Name keyword which represents the name assigned to the control genie.</p> <p><b>Note:</b> The initialization callback function may be called</p>

Parameter	Description
	multiple times whenever the table is re-initialized.
<b>Left Mouse (Optional)</b>	<p>Callback function that is called when the user clicks the left mouse button No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <p>#Name = name assigned to the genie</p> <p>#Row = row number of the cell (with respect to the underlying data) that is clicked</p> <p>#Col = column number of the cell that is clicked</p> <p>#RowDsp = row number of the cell relative to the display that is clicked</p> <p>#ColDsp = column number of the cell relative to the display that is clicked</p> <p>#AN= the animation number where the alarm is displayed</p>
<b>Right Mouse (Optional)</b>	Callback function that is called when the user clicks the right mouse button It uses the same specification as that of the Left mouse callback .
<b>Double Click (Optional)</b>	Callback function that is called when the user double-click the left mouse button It uses the same specification as that of the Left mouse callback.
<b>Table Reload (Optional)</b>	<p>Callback function that is called when the control is redrawn No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <p>#Name = name assigned to the genie</p>

**Note:** The table can be up to 62 columns (although the latter columns may not have the column separators). For tables that return more columns than the limit, the first 62 columns will be displayed.

You can filter the alarm list at runtime by using the [Alarm Filter Functions](#).

## See Also

[Use the Library Controls](#)

## Use the Alarm Table Genie

In the example below, a simple initialization function is used to set the columns (fields) and then filter the display list when the alarm table initializes.

## Example

The Cicode sample below will be used in the following example.

```
INT FUNCTION MyAlmTable_Init(STRING sTable, STRING sEquipment)
    // Set up columns
    LibTable_AddColumn(sTable, "Name", 150);
    LibTable_AddColumn(sTable, "Description", 150, "Desc");
    LibTable_AddColumn(sTable, "State", 150);
    // Set up filter
    INT nAN = LibAlmTable_GetAN(sTable);
    INT hEdit = AlarmFilterEditOpen(nAN);
    AlarmFilterEditSet(hEdit, "Equipment=" + sEquipment);
    AlarmFilterEditCommit(hEdit);
    AlarmFilterEditClose(hEdit);
    RETURN TRUE;
END
```

### To set columns and filter via table initialization callback event:

1. Open the Cicode Editor and create a new Cicode file (for example, \_MyAlmTable\_Ex.ci).
2. From the Graphics Builder create a new page (for example, the Normal Tab Style Page).
3. When created, from the **Object toolbox** select the **Paste Genie** icon.
4. In the **Paste Genie** window select the **lib\_controls** library
5. Select the Alarm Table genie. The Alarm Table genie is pasted onto the graphics page.
6. In the Alarm Table Genie property dialog, configure the fields according to the table below. Click **OK** to save the changes.
7. Save the graphics page and compile and run the project.

Parameter	Description
Table Name	Table 1
Width	400 ( all columns within the table are displayed. If left at 100 some columns may not be displayed)
Number of rows	10
Header Height	18
Row Height	15
Header Padding	5
Row Padding	4
Column Padding	5
Horizontal Scrollbar	
Vertical Scrollbar	

Parameter	Description
Initialize	MyAlmTable_Init("#Name","Plant*")

At runtime the table will look like the following:

Alarm Table		
Name	Description	State
Plant Mixer Pe...	HIGH	HIGH
Plant Bottler Pe...	HIGH	HIGH
Plant Bottler Pre...	HIGH	HIGH
Plant Mixer Predict...	HIGH	HIGH
Mixer Chocolate F...	FAULT	OFF
Mixer Malt Feeder ...	FAULT	OFF
Mixer Full Milk Out...		OFF

## Calendar Library Control

The following parameters are available for the Calendar library control:

Parameter	Description
<b>Calendar Name</b>	A unique name used to identify the Genie within a page.
<b>Width</b>	The pixel width of the control at runtime. <b>Note:</b> Please do not re-size the Genie at design time, as its width will be automatically calculated at runtime.
<b>Height</b>	The pixel height of the control at runtime. <b>Note:</b> Please do not re-size the Genie at design time, as its height will be automatically calculated at runtime.
<b>Header Height</b>	Pixel height of header row (that shows the week day initials) in calendar display.
<b>Label Height</b>	Pixel height of the label row (that shows the month).
<b>Header Padding</b>	The pixel padding between the bottom of the header text and the bottom of the header row.
<b>Label Padding</b>	The pixel padding between the bottom of the label text and the bottom of the label row.

Parameter	Description
<b>Top Padding</b>	The pixel padding on top of the calendar display.
<b>Left Padding</b>	The pixel padding on left of the calendar display.
<b>Side Padding</b>	The pixel padding on both sides of the calendar display.
<b>Header Font</b>	The pre-configured font for header text.
<b>Date Font</b>	The pre-configured font for the month text.
<b>Day Font</b>	The pre-configured font for the day displays.
<b>Next Month Font</b>	The pre-configured font for the next month text.
<b>Selection Font</b>	The pre-configured font for the selected day.
<b>Single selection</b>	Whether allow single day or multiple days to be selected.
<b>Refresh Rate</b>	The minimum (quickest possible) rate that the control will be drawn. The control is only redrawn as required upon changes to the layout or other user initiated events.
<b>Initialize (Optional)</b>	<p>Callback function that is called when the control initializes. The callback function should return either TRUE (1) for success or FALSE (0) if unsuccessful. By default, if the user specified function does not initialize, the control Genie will retry the function a few time before giving up. This callback only supports the #Name keyword which represents the name assigned to the control Genie.</p> <p><b>Note:</b> The initialization callback function may be called multiple times whenever the table is re-initialized.</p>
<b>Left Mouse (Optional)</b>	<p>Callback function that is called when the user clicks the left mouse button. No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <ul style="list-style-type: none"> <li>#Name = name assigned to the Genie</li> <li>#Date = the date selected as a timestamp value. Users may wish to convert the result using TimestampToStr to the desired format and locale.</li> </ul>
<b>Right Mouse (Optional)</b>	Callback function that is called when the user clicks the right mouse button. It uses the same specification as that of the Left mouse callback.

Parameter	Description
<b>Double Click (Optional)</b>	Callback function that is called when the user double-click the left mouse button. It uses the same specification as that of the Left mouse callback.
<b>Table Reload (Optional)</b>	Callback function that is called when the control is redrawn. No particular return value is expected from this function, and it supports the following keywords in its argument list: #Name = name assigned to the Genie.

## Data Browse Table Library Control

Browse table genie has the following parameters:

Parameter	Description
<b>Browse Table Name</b>	Name of table. Used to identify the genie when on a graphics page
<b>Width</b>	Pixel width of the table at runtime. <b>Note:</b> Leave the size of the genie at design time as 100 pixels, as it will be automatically calculated at runtime.
<b>Number of rows</b>	Number of rows displayed on the page.
<b>Header Height</b>	Pixel Height of header row in table display.
<b>Row Height</b>	Pixel height of row in the table display.
<b>Header Padding</b>	The pixel padding between the bottom of the header text (column name) and the bottom of the header row
<b>Row Padding</b>	The pixel padding between the bottom of the cell text and the bottom of each row.
<b>Column Padding</b>	The pixel padding on the left-hand-side and right-hand-side of the cell text relative to the width of each column.
<b>Refresh Rate</b>	The minimum (quickest possible) rate that the control will be redrawn. The control is only redrawn as required upon changes

Parameter	Description
	to the layout, scrolling or other user initiated events.
<b>Scan Delay (Optional)</b>	The number of page scan delay before the genie is initialized at runtime. this can be set to different number on different control genies to stagger the initialization order. If not set defaults to 1.
<b>Browse Type</b>	<p>The type of project configuration to be browsed and displayed, including:</p> <ul style="list-style-type: none"> <li>AccumBrowse – for listing accumulators</li> <li>AlmBrowse – for listing alarm tags</li> <li>EquipBrowse – for listing equipment</li> <li>ServerBrowse – for listing servers</li> <li>TagBrowse – for listing variable tags</li> <li>TrnBrowse – for listing trend tags</li> </ul>
<b>Filter (Optional)</b>	A filter expression specifying the records to return during the browse If it is not specified, all records will be returned. Please see the browse open Cicode function of the selected browse type for the details of filter expression supported.
<b>Fields (Optional)</b>	A comma delimited string specifying the fields (columns) to be returned during the browse. If it is not specified, all fields of the selected browse type will be displayed: Tag, Tag Item, Value, Comment, Cluster, Equipment, Item, Type, IODev, Addr, Arr_Size, Eng_Zero, Eng_Full, Eng_Units, Format, Deadband, Raw_Zero, Raw_Full, Scaled_Type, Ovr_Mode, Ctrl_Mode, Override, Valid, Status, Field, Num_Subs.
<b>Sort By(Optional)</b>	A comma delimited string specifying the order of sorting preferences. This is only applicable to TagBrowse. Please see the Sort parameter of the built-in Cicode function TagBrowseOpen for details.
<b>Horizontal Scrollbar (Optional)</b>	The name of the horizontal scroll bar genie on the page that allows the user to horizontally scroll the content displayed on the control genie If you will not require horizontal scrolling, leave this field blank.
<b>Vertical Scrollbar (Optional)</b>	The name of the horizontal scroll bar genie on the page that allows the user to vertically scroll the content displayed on the control genie If you will not require vertical scrolling, leave this field blank.

Parameter	Description
<b>Header Font</b>	The pre-configured font for header text .
<b>Cell Font</b>	The pre-configured font for cell text.
<b>Selection Font</b>	The pre-configured font for cell text when it is selected .
<b>Auto Width</b>	True/False drop down box. False is selected by default. Determines whether the column width will be automatically adjusted to show the entire cell content when the control is redrawn.
<b>Allow Selection</b>	True/False drop down. True is selected by default. Determines whether allow the rows displayed on the control are selectable .
<b>Clusters (Optional)</b>	A comma delimited string specifying only items from a subset of clusters to be included in the display. If it is not specified, items from all clusters will be included.
<b>Initialize (Optional)</b>	<p>Callback function that is called when the control initializes. The callback function should return either TRUE (1) for success or FALSE (0) if unsuccessful. By default, if the user specified function does not initialize, the control genie will retry the function a few times before giving up. This callback only supports the #Name keyword which represents the name assigned to the control genie.</p> <p><b>Note:</b> The initialization callback function may be called multiple times whenever the table is re-initialized.</p>
<b>Left Mouse (Optional)</b>	<p>Callback function that is called when the user clicks the left mouse button. No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <ul style="list-style-type: none"> <li>#Name = name assigned to the genie</li> <li>#Row = row number of the cell (w.r.t. the underlying data) that is clicked</li> <li>#Col = column number of the cell that is clicked</li> <li>#RowDsp = row number of the cell relative to the display that is clicked</li> <li>#ColDsp = column number of the cell relative to the display that is clicked</li> </ul>
<b>Right Mouse (Optional)</b>	Callback function that is called when the user clicks the right mouse button. It uses the same specification

Parameter	Description
	as that of the Left mouse callback .
<b>Double Click (Optional)</b>	Callback function that is called when the user double-click the left mouse button. It uses the same specification as that of the Left mouse callback.
<b>Table Reload (Optional)</b>	Callback function that is called when the control is redrawn No particular return value is expected from this function, and it supports the following keywords in its argument list: <code>#Name = name assigned to the genie</code>

**Note:** The Table can be up to 62 columns (although the latter columns may not have the column separators). For tables that return more columns than the limit, the first 62 columns will be displayed.

## Equipment Tree Library Control

The Equipment Tree Genie (named "equiptree") allows you to create an in-memory menu hierarchy. It has the following parameters:

**Note:** For the Genie to work, a report server needs to be defined in your project and accessible at runtime.

Parameter	Description
<b>Tree Name</b>	Name of the tree. Used to identify the Genie when on a graphics page. Each tree on a page must have a unique name.
<b>Width</b>	Pixel width of the table at runtime. <b>Note:</b> Leave the size of the Genie at design time as 100 pixels, as it will be automatically calculated at runtime.
<b>Menu Name</b>	Name of the menu that stores the content that will be used by the tree. By default, "_Equip" is used. This specifies that all of the equipment hierarchy will be used (based on what is available to the current user). If you apply a filter expression to the tree using the <b>Filter</b> parameter (see below), you need to enter a unique menu name, as all EquipTree controls share the same equipment tree if they are assigned to the same menu name.

Parameter	Description
<b>Number of items</b>	Number of items displayed on the page.
<b>Item Height</b>	Pixel height of item in the tree display.
<b>Show CheckBox</b>	True/False drop down box. False is selected by default. Determines whether to show the checkboxes next to each of the tree items.
<b>Force Child</b>	True/False drop down box. False is selected by default. Determines whether to force all children tree items to follow the checked status of their parent when the latter is checked / unchecked.
<b>Window Inst</b>	True/False drop down box. True is selected by default. Determines whether create a new instance of the equipment hierarchy on each window where the equipment tree is displayed.
<b>Refresh Rate</b>	The minimum (quickest possible) rate that the control will be redrawn.  The control is only redrawn as required upon changes to the layout, scrolling or other user initiated events.
<b>Expand Level</b>	The minimum expand level of the tree hierarchy. Set to 0 to allow the tree be collapsed to its root items.
<b>Horizontal Scrollbar (Optional)</b>	The name of the horizontal scroll bar Genie on the page that allows the user to horizontally scroll the content displayed on the control Genie If you will not require horizontal scrolling, leave this field blank.
<b>Vertical Scrollbar (Optional)</b>	The name of the horizontal scroll bar Genie on the page that allows the user to vertically scroll the content displayed on the control Genie If you will not require vertical scrolling, leave this field blank.
<b>Label Font</b>	The font used for displaying the tree item label.
<b>Item Font</b>	The font used for displaying the optional dynamic text next to the tree item.
<b>Symbol Library (Optional)</b>	The name of the symbol library that contains the symbols for displayed next to the tree items.
<b>Refresh Rate</b>	The minimum rate that the control will be redrawn.  <b>Note:</b> The control is only redrawn as required upon changes to the layout, scrolling or other user initialized events.

Parameter	Description
<b>Scan Delay</b>	The number of page scan delay before the Genie is initialized at runtime. This can be set to different number on different control Genies to stagger the initialization order.
<b>Expand Level</b>	The minimum expand level of the tree hierarchy. Set this to 0 to allow the tree to be collapsed to its root items.
<b>Filter (Optional)</b>	<p>A filter expression specifying the equipment records that will be available to the tree. If it is not specified, all equipment available to the currently logged on user will be returned.</p> <p>If you apply a filter, you need to enter a unique name in the <b>Menu Name</b> parameter (see above). A unique menu name will allow you to determine which filter settings apply to a particular menu.</p>
<b>Initialize</b>	Callback function that is called when the control initializes. The callback function should return either TRUE (1) for success or FALSE (0) for unsuccessful. By default, if the user specified function does not initialize, the control Genie will retry the function a few times before giving up. This callback only supports the #Name keyword which represents the name assigned to the control Genie.
<b>Row Item</b>	<p>Callback function that is called when the table initializes. The callback function should return a string value. The value returned will be displayed next to the tree item label. It supports the following keyword in its argument list:</p> <ul style="list-style-type: none"> <li>#Name - name assigned to the Genie.</li> <li>#Ref – the complete path of the tree item.</li> <li>#Label – the label of the tree item.</li> <li>#ItemDsp- the position of the item as displayed on screen.</li> <li>#IsChecked - the checked status of the tree item.</li> <li>#IsParent - whether the item is expanded/collapsed.</li> <li>#ItemDsp - the position of the item as displayed on screen.</li> <li>#Node - the handle to the internal menu node object that represents the tree item.</li> <li>#Level - the level of the tree item.</li> </ul>

Parameter	Description
<b>Selected</b>	Callback function that is called when a tree item is selected. No particular return value is expected from this function, and it supports the same set of keywords as that of the Row Item function in its argument list. Callback function that is called when the check box of a tree item is clicked. No particular return value is expected from this function, and it supports the same set of keywords as that of the Row Item function in its argument list.
<b>Checked</b>	Callback function that is called when a tree item is selected. No particular return value is expected from this function, and it supports the same set of keywords as that of the Row Item function in its argument list. Callback function that is called when the check box of a tree item is clicked. No particular return value is expected from this function, and it supports the same set of keywords as that of the Row Item function in its argument list.
<b>Left Mouse</b>	Callback function that is called when the user clicks the left mouse button. No particular return value is expected from this function, and it supports the following keywords in its argument list:  #Node - the handle to the internal menu node object that represents the tree item.  #Level - the level of the tree item.
<b>Right Mouse</b>	Callback function that is called when the user clicks the right mouse button. It uses the same specification as that of the Left mouse callback .
<b>Double Click</b>	Callback function that is called when the user double-click the left mouse button. It uses the same specification as that of the Left mouse callback.
<b>Tree Reload</b>	Callback function that is called when the control is redrawn. No particular return value is expected from this function, and it supports the following keywords in its argument list:  #Name = name assigned to the Genie.
<b>Tree Name</b>	Name of table (max characters). Used to identify the Genie when on a graphics page.
<b>Width</b>	Pixel width of the table at runtime.  <b>Note:</b> Leave the size of the Genie at design time as

Parameter	Description
	100 pixels, as it will be automatically calculated at runtime.

**Note:** The project will compile and run when configured with longer equipment names, a runtime error may occur when you attempt to interact with the tree display based on the 'EquipTree' Genie. When this happens, an alarm icon will appear on the tree view, and a "Too few arguments for function or argument string too long" hardware alarm will be reported. This usually indicates either the equipment name is too long or the name of the tree Genie is too long.

## See Also

[Use the Library Controls](#)

## PageTabs Library Control

PageTabs genie has the following parameters:

**Note:** The PageTabs genie is specifically designed for displaying page data. The genie internally binds page data to the tab display. You should not add tabs directly. Manipulating the tab data using the LibTabs Cicode function may result in unexpected behavior.

Parameter	Description
<b>Page Tabs Name</b>	Name of page tabs control (max characters 254). Used to identify the genie when on a graphics page.
<b>Width</b>	Pixel width of the tabs control at runtime. Note: Leave the size of the genie at design time as 100 pixels, as it will be automatically calculated at runtime.
<b>Tab height</b>	Pixel height of the tabs control at runtime.
<b>Vertical Padding</b>	The vertical distance (in pixels) between the tab elements and the bottom of the tabs control.
<b>Tab Padding</b>	The horizontal distance (in pixels) between the edges and elements of a tab
<b>Tab Min Width</b>	The minimum width allowed for a tab
<b>Tab Max Width</b>	The maximum width allowed for a tab
<b>Auto Width</b>	True/False drop down box. False is selected by default. Determines whether the column width will be automatically adjusted to show full cell content when the control is redrawn.
<b>Icon Add Padding</b>	Additional vertical padding for the display of icon

Parameter	Description
	relative to the text. Positive padding will move the icon further upward, and vice versa.
<b>Refresh Rate</b>	<p>The minimum (quickest possible) rate that the control will be redrawn.</p> <p>The control is only redrawn as required upon changes to the layout, scrolling or other user initiated events.</p>
<b>Scan Delay (Optional)</b>	The number of page scan delay before the genie is initialized at runtime. this can be set to different number on different control genies to stagger the initialization order. If not set defaults to 1
<b>Page Type</b>	The type of page data to be displayed in the tabs: PageList GenericMenu PageMenu WindowMenu
<b>Menu (Page) Name</b>	Name of page with menu items to display. this is only applicable when Page type is set to "PageMenu"
<b>Default Font</b>	The pre-configured font for tab text.
<b>Selection Font</b>	The pre-configured font for a tab when it is selected.
<b>Tab Line Style</b>	<p>The display style of the separator between tabs, options are:</p> <p>Dark Light None</p>
<b>Tab Select Style</b>	<p>The display style for highlighting of selected tab:</p> <p>Dark Light None</p>
<b>Allow Drag Sort</b>	Indicates whether to allow individual tabs to be repositioned by drag and drop.
<b>Allow Drag Delete</b>	Indicates whether to allow individual tabs to be deleted by dragging it vertically away from the tabs control.
<b>Tab Select Icon</b>	The icon to be displayed when a tab is selected. An icon needs to be pre-configured as a symbol in your project. It is specified by the syntax of <symbol library>.<symbol>.

Parameter	Description
<b>Initialize (Optional)</b>	<p>Callback function that is called when the control initializes. The callback function should return either TRUE (1) for success or FALSE (0) if unsuccessful. By default, if the user specified function does not initialize, the control genie will retry the function a few times before giving up. This callback only supports the #Name keyword which represents the name assigned to the control genie.</p> <p><b>Note:</b> The initialization callback function may be called multiple times whenever the tab is re-initialized.</p>
<b>Right Mouse (Optional)</b>	<p>Callback function that is called when the user clicks the right mouse button. No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <ul style="list-style-type: none"> <li>#Name = name assigned to the genie</li> <li>#Ref = reference (assigned when tab is added) of the cell that is clicked</li> <li>#TabDsp = tab number of the cell relative to the display that is clicked</li> <li>#Icon = icon number indicating the different areas with a tab is clicked: <ul style="list-style-type: none"> <li>&lt;=0 - text on tab is clicked</li> <li>1 - icon to left hand side of text is clicked</li> <li>2 - icon to right hand side of text is clicked</li> <li>3 - selection icon (only shows up when a tab selected) is clicked</li> </ul> </li> </ul>
<b>Double Click (Optional)</b>	<p>Callback function that is called when the user double-click the left mouse button. It uses the same specification as that of the Left mouse callback.</p>
<b>Tabs Reload (Optional)</b>	<p>Callback function that is called when the control is redrawn. No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <ul style="list-style-type: none"> <li>#Name = name assigned to the genie</li> </ul>

## Scroll Bar Horizontal Library Control

The horizontal scroll bar genie has the following parameters:

Parameter	Description
<b>Scrollbar Name</b>	A unique name used to identify the genie within a page.
<b>Width</b>	The pixel width of the control at runtime. Leave the size of the genie at design time as 100 pixels, as it will be automatically calculated at runtime.
<b>Update on Drag</b>	True/False (True selected by default). Determines whether the position of the scroll bar and the contents of the associated control genie is updated while the thumb is being dragged
<b>Auto Hide</b>	Determines whether the scroll bar will be automatically hidden when the contents of the associated control are fully displayed on screen
<b>Allow Double Click</b>	Determines whether the scroll bar will response to mouse double-click event
<b>Hidden When</b>	A user specified expression to explicitly hide the scroll bar If this is not specified, it is defaulted to FALSE (not hidden).
<b>Initialize</b>	Callback function that is called when the control initializes. The callback function should return either TRUE (1) for success or FALSE (0) if unsuccessful. By default, if the user specified function does not initialize, the control genie will retry the function a few time before giving up. This callback only supports the #Name keyword which represents the name assigned to the control genie.
<b>Callback</b>	Callback function to be called when the position of the scroll bar is updated. No particular return value is expected from this function, and it supports the following keywords in its argument list: #Name = name assigned to the genie #Pos = position of the scroll bar #View = number of items for the scroll bar view (that constitutes one page of items) #Max = maximum (total) number of items for the scroll bar

Parameter	Description
<b>Right Mouse</b>	Callback function to be called when the user clicks the right mouse button on the scroll bar. Supports the same set of substitutions as Callback.

## See Also

[Use the Library Controls](#)

## Scroll Bar Vertical Library Control

The vertical scroll bar genie has the following parameters:

Parameter	Description
<b>Scrollbar Name</b>	A unique name used to identify the genie within a page.
<b>Height</b>	The pixel height of the control at runtime. Leave the height of the genie at design time as 100 pixels, as it will be automatically calculated at runtime.
<b>Update on Drag</b>	True/False (True selected by default). Determines whether the position of the scroll bar and the contents of the associated control genie is updated while the thumb is being dragged
<b>Auto Hide</b>	Determines whether the scroll bar will be automatically hidden when the contents of the associated control are fully displayed on screen
<b>Allow Double Click</b>	Determines whether the scroll bar will response to mouse double-click event
<b>Hidden When</b>	A user specified expression to explicitly hide the scroll bar If this is not specified, it is defaulted to FALSE (not hidden).
<b>Initialize</b>	Callback function that is called when the control initializes. The callback function should return either TRUE (1) for success or FALSE (0) if unsuccessful. By default, if the user specified function does not initialize, the control genie will retry the function a few time before giving up. This callback only supports the #Name keyword which represents the name assigned to the control genie.
<b>Callback</b>	Callback function to be called when the position of the

Parameter	Description
	scroll bar is updated. No particular return value is expected from this function, and it supports the following keywords in its argument list: <code>#Name</code> = name assigned to the genie <code>#Pos</code> = position of the scroll bar <code>#View</code> = number of items for the scroll bar view (that constitutes one page of items) <code>#Max</code> = maximum (total) number of items for the scroll bar
<b>Right Mouse</b>	Callback function to be called when the user click the right mouse button on the scroll bar. Supports the same set of substitutions as Callback.

## See Also

[Use the Library Controls](#)

## Slider Library Control

The Slider genie has the following parameters:

Parameter	Description
<b>Slider Name</b>	A unique name used to identify the control genie within a page.
<b>Length</b>	The pixel height of the control at runtime. Leave the size of the genie at design time as 100 pixels, as it will be automatically calculated at runtime.
<b>Minimum Offset</b>	The min. offset (in pixels) the slider can be dragged to. The acceptable range is -4000 to 4000.
<b>Maximum Offset</b>	The max. offset (in pixels) the slider can be dragged to. The acceptable range is -4000 to 4000.
<b>Docked Offset (Optional)</b>	The offset (in pixels) the slider is moved to when it is docked. If this is not set, it is defaulted to -4000. The acceptable range is -4000 to 4000.
<b>Dockable</b>	Whether the middle thumb button will appear at runtime, so that the user can click on it to move the slider to the docked offset.

Parameter	Description
<b>Update on Drag</b>	Whether the position of the scroll bar and the contents of the associated control genie is updated while the thumb is being dragged.
<b>Hidden</b>	Determines whether to hide the genie
<b>Scan Delay (Optional)</b>	The number of page scan delay before the genie is initialized at runtime. This can be set to different number on different control genies to stacker their initialization order. If this is not set, it defaults to 0.
<b>Initialize</b>	Callback function that is called when the control initializes. The callback function should return either TRUE (1) for success or FALSE (0) for unsuccessful. By default, if the user specified function can not initialize successfully, the control genie will retry the function a few times before giving up. This callback only supports the #Name keyword which represents the name assigned to the control genie.
<b>Callback</b>	Callback function to be called when the position of the slider is updated. No particular return value is expected from this function, and it supports the following keywords in its argument list:  #Name = name assigned to the genie #Offset = Offset of the slider position relative to its initial position
<b>Right Mouse</b>	Callback function to be called when the user click the right mouse button on the scroll bar

## SQL Table Library Control

Tag table genie has the following parameters:

Parameter	Description
<b>SQL Table Name</b>	Name of table (max characters). Used to identify the genie when on a graphics page
<b>Width</b>	Pixel width of the table at runtime. <b>Note:</b> Leave the size of the genie at design time as 100

Parameter	Description
	pixels, as it will be automatically calculated at runtime.
<b>Number of rows</b>	Number of rows displayed on the page.
<b>Header Height</b>	Pixel Height of header row in table display.
<b>Row Height</b>	Pixel height of row in the table display.
<b>Header Padding</b>	The pixel padding between the bottom of the header text (column name) and the bottom of the header row
<b>Row Padding</b>	The pixel padding between the bottom of the cell text and the bottom of each row.
<b>Column Padding</b>	The pixel padding on the left-hand-side and right-hand-side of the cell text relative to the width of each column.
<b>Refresh Rate</b>	The minimum (quickest possible) rate that the control will be redrawn.  The control is only redrawn as required upon changes to the layout, scrolling or other user initiated events.
<b>Scan Delay (Optional)</b>	The number of page scan delay before the genie is initialized at runtime. this can be set to different number on different control genies to stagger the initialization order. If not set defaults to 1.
<b>Connection Str</b>	The ADO connection string to the database source. See the sConnect parameter of the built-in Cicode function SQLCreate for details.
<b>SQL Selection Query</b>	The SQL query statement to return a table of records (recordset)
<b>Horizontal Scrollbar (Optional)</b>	The name of the horizontal scroll bar genie on the page that allows the user to horizontally scroll the content displayed on the control genie If you will not require horizontal scrolling, leave this field blank.
<b>Vertical Scrollbar (Optional)</b>	The name of the horizontal scroll bar genie on the page that allows the user to vertically scroll the content displayed on the control genie If you will not require vertical scrolling, leave this field blank.
<b>Header Font</b>	The pre-configured font for header text.
<b>Cell Font</b>	The pre-configured font for cell text.

Parameter	Description
<b>Selection Font</b>	The pre-configured font for cell text when it is selected.
<b>Auto Width</b>	True/False drop down box. False is selected by default. Determines whether the column width will be automatically adjusted to show full cell content when the control is redrawn.
<b>Allow Selection</b>	True/False drop down. True is selected by default. Determines whether allow the rows displayed on the control are selectable .
<b>Initialize (Optional)</b>	<p>Callback function that is called when the control initializes. The callback function should return either TRUE (1) for success or FALSE (0) if unsuccessful. By default, if the user specified function does not initialize, the control genie will retry the function a few times before giving up.</p> <p>This callback only supports the #Name keyword which represents the name assigned to the control genie.</p> <p><b>Note:</b> The initialization callback function may be called multiple times whenever the table is re-initialized.</p>
<b>Left Mouse (Optional)</b>	<p>Callback function that is called when the user clicks the left mouse button. No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <ul style="list-style-type: none"> <li>#Name = name assigned to the genie</li> <li>#Row = row number of the cell (w.r.t. the underlying data) that is clicked</li> <li>#Col = column number of the cell that is clicked</li> <li>#RowDsp = row number of the cell relative to the display that is clicked</li> <li>#ColDsp = column number of the cell relative to the display that is clicked</li> </ul>
<b>Right Mouse (Optional)</b>	Callback function that is called when the user clicks the right mouse button. It uses the same specification as that of the Left mouse callback.
<b>Double Click (Optional)</b>	Callback function that is called when the user double-click the left mouse button. It uses the same specification as that of the Left mouse callback.
<b>Table Reload (Optional)</b>	Callback function that is called when the control is redrawn. No particular return value is expected from

Parameter	Description
	this function, and it supports the following keywords in its argument list: #Name = name assigned to the genie

**Note:** The Table can be up to 62 columns (although the latter columns may not have the column separators). For tables that return more columns than the limit, the first 62 columns will be displayed.

## Tabs Library Control

Tabs genie has the following parameters:

**Note:** All fields are mandatory unless specified otherwise.

Parameter	Description
<b>Tabs Name</b>	Name of tabs control (max characters). Used to identify the genie when on a graphics page.
<b>Width</b>	Pixel width of the tabs control at runtime. Note: Leave the size of the genie at design time as 100 pixels, as it will be automatically calculated at runtime.
<b>Tab height</b>	Pixel height of the tabs control at runtime.
<b>Vertical Padding</b>	The vertical distance (in pixels) between the tab elements and the bottom of the tabs control.
<b>Tab Padding</b>	The horizontal distance (in pixels) between the edges and elements of a tab
<b>Tab Min Width</b>	The minimum width allowed for a tab
<b>Tab Max Width</b>	The maximum width allowed for a tab
<b>Auto Width</b>	True/False drop down box. False is selected by default. Determines whether the column width will be automatically adjusted to show full cell content when the control is redrawn.
<b>Icon Add Padding</b>	Additional vertical padding for the display of icon relative to the text. Positive padding will move the icon further upward, and vice versa.
<b>Refresh Rate</b>	The minimum (quickest possible) rate that the control

Parameter	Description
	<p>will be redrawn.</p> <p>The control is only redrawn as required upon changes to the layout, scrolling or other user initiated events.</p>
<b>Scan Delay (Optional)</b>	<p>The number of page scan delay before the genie is initialized at runtime. this can be set to different number on different control genies to stagger the initialization order. If not set defaults to 1</p>
<b>Default Font</b>	<p>The pre-configured font for tab text.</p>
<b>Selection Font</b>	<p>The pre-configured font for a tab when it is selected.</p>
<b>Tab Line Style</b>	<p>The display style of the separator between tabs, options are:</p> <ul style="list-style-type: none"> <li>Dark</li> <li>Light</li> <li>None</li> </ul>
<b>Tab Select Style</b>	<p>The display style for highlighting of selected tab:</p> <ul style="list-style-type: none"> <li>Dark</li> <li>Light</li> <li>None</li> </ul>
<b>Allow Drag Sort</b>	<p>Indicates whether to allow individual tabs to be repositioned by drag and drop.</p>
<b>Allow Drag Delete</b>	<p>Indicates whether to allow individual tabs to be deleted by dragging it vertically away from the tabs control.</p>
<b>Tab Select Icon</b>	<p>The icon to be displayed when a tab is selected. An icon needs to be pre-configured as a symbol in your project. It is specified by the syntax of &lt;symbol library&gt;.&lt;symbol&gt;.</p>
<b>Initialize (Optional)</b>	<p>Callback function that is called when the control initializes The callback function should return either TRUE (1) for success or FALSE (0) if unsuccessful. By default, if the user specified function does not initialize, the control genie will retry the function a few time before giving up. This callback only supports the #Name keyword which represents the name assigned to the control genie.</p> <p><b>Note:</b> The initialization callback function may be called multiple times whenever the tab is re-initialized.</p>
<b>Left Mouse (Optional)</b>	<p>Callback function that is called when the user clicks</p>

Parameter	Description
	<p>the left mouse button No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <ul style="list-style-type: none"> <li>#Tab= tab ordinal number of the cell that is clicked</li> <li>#Name = name assigned to the genie</li> <li>#Ref = reference (assigned when tab is added) of the cell that is clicked</li> <li>#TabDsp = tab number of the cell relative to the display that is clicked</li> <li>#Icon =Icon number indicating the different areas within a tab when clicked:           <ul style="list-style-type: none"> <li>&lt;=0 - text on tab is clicked</li> <li>1- icon to left hand side of text is clicked</li> <li>2- icon to right hand side of text is clicked</li> <li>3- selection icon (only shows up when a tab selected) is clicked</li> </ul> </li> </ul>
<b>Right Mouse (Optional)</b>	Callback function that is called when the user clicks the right mouse button. It uses the same specification as that of the Left mouse callback.
<b>Double Click (Optional)</b>	Callback function that is called when the user double-click the left mouse button. It uses the same specification as that of the Left mouse callback.
<b>Tabs Reload (Optional)</b>	<p>Callback function that is called when the control is redrawn. No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <ul style="list-style-type: none"> <li>#Name = name assigned to the genie</li> </ul>

## Use the Tabs Genie

There are two ways to populate data to the tabs:

1. Set cell value directly to the table.
2. Binding a Cicode function to return the value for the individual tabs.

## Example 1

### Set create tabs statically on initialization

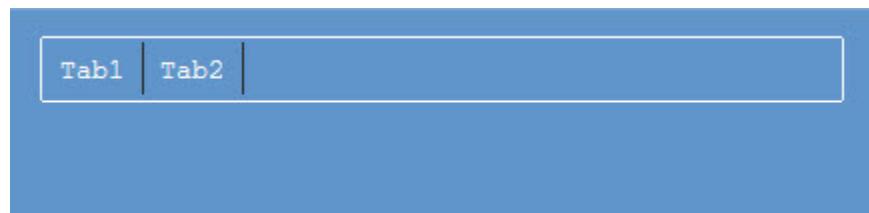

The Cicode sample below will be used in the following example. Open the Cicode Editor and create a new Cicode file, for example: \_MyTab\_Ex1.ci

```
//Callback function to respond to the initialization event of the tab genie
INT FUNCTION MyTabs_Init(STRING sTabs)
// Pre-populate with 2 auto-width tabs
LibTabs_AddTab(sTabs, "Tab1", 0);
LibTabs_AddTab(sTabs, "Tab2", 0);
RETURN TRUE;
END
```

1. From Graphics Builder create a new page (for example, a Normal Tab Style Page).
2. When created, from the **Object Toolbox** select the **Paste Genie** icon.
3. In the **Paste Genie** window, select the **lib\_controls library**.
4. Select the **Tabs** genie. The genie is pasted onto the graphics page.
5. In the Tab Genie dialog, configure the fields according to the table below. Click **OK** to save the changes.
6. Save the graphics page, and compile and run the project.

Parameter	Description
Tab BarName	MyTabs1
Width	400
Height	30
Initialize	MyTabs_Init("#Name")

At runtime the tab layout should look like the following:

## Example 2

### Binding a Cicode function to return the value for the individual tabs

This is similar to setting a formula in Excel. With binding, cell values are not stored in the tabs control. the control will call the provided Cicode function when it needs the data.

Using the Cicode sample below, open the Cicode Editor and create a new Cicode file. For example: 'MyTabs\_Ex2.ci'

```
INT FUNCTION MyTabs_InitDyn(STRING sTabs)
// Bind callback function for data display
```

```
LibTabs_SetDataTask(sTabs, "Value", "MyTabs_GetCellValue", "^#Name^", #Tab");

// Set the number of tabs for the control
LibTabs_SetCount(sTabs, 3);

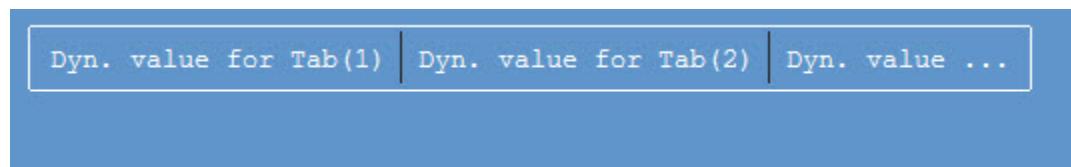

RETURN TRUE;
END

//Function to return the value for a data cell
STRING FUNCTION MyTabs_GetCellValue(STRING sTabs, INT nTab)
RETURN "Dyn. value for Tab(" + nTab:# + ")";
END
```

1. As in example 1, add a tabs library control to the graphics page.
2. In the Tabs Genie dialog, configure the fields according to the table below.
3. Save the graphics page, and compile and run the project.

Parameter	Description
Tabs Name	MyTabs2
Width	400
Height	30
Can Remove Tab	TRUE
Initialize	MyTabs_Initdyn("#Name")

At runtime the tab layout should look like the following:

## See Also

## Table Library Control

Table genie has the following parameters:

---

**Note:** All fields are mandatory unless specified otherwise.

---

Parameter	Description
<b>Table Name</b>	Name of table (max characters). Used to identify the genie when on a graphics page
<b>Width</b>	Pixel width of the table at runtime. <b>Note:</b> Leave the size of the genie at design time as 100 pixels, as it will be automatically calculated at runtime.
<b>Number of rows</b>	Number of rows displayed on the page.
<b>Header Height</b>	Pixel Height of header row in table display.
<b>Row Height</b>	Pixel height of row in the table display.
<b>Header Padding</b>	The pixel padding between the bottom of the header text (column name) and the bottom of the header row
<b>Row Padding</b>	The pixel padding between the bottom of the cell text and the bottom of each row.
<b>Column Padding</b>	The pixel padding on the left-hand-side and right-hand-side of the cell text relative to the width of each column.
<b>Refresh Rate</b>	The minimum (quickest possible) rate that the control will be redrawn. The control is only redrawn as required upon changes to the layout, scrolling or other user initiated events.
<b>Horizontal Scrollbar (Optional)</b>	The name of the horizontal scroll bar genie on the page that allows the user to horizontally scroll the content displayed on the control genie If you will not require horizontal scrolling, leave this field blank.
<b>Vertical Scrollbar (Optional)</b>	The name of the horizontal scroll bar genie on the page that allows the user to vertically scroll the content displayed on the control genie If you will not require vertical scrolling, leave this field blank.
<b>Header Font</b>	The pre-configured font for header text.
<b>Cell Font</b>	The pre-configured font for cell text.
<b>Selection Font</b>	The pre-configured font for cell text when it is selected.
<b>Auto Width</b>	True/False drop down box. False is selected by default. Determines whether the column width will be automatically adjusted to show complete cell content when the control is redrawn.

Parameter	Description
<b>Allow Selection</b>	True/False drop down. True is selected by default. Determines whether allow the rows displayed on the control are selectable.
<b>Scan Delay (Optional)</b>	The number of page scan delay before the genie is initialized at runtime. this can be set to different number on different control genies to stagger the initialization order. If not set defaults to 1.
<b>Initialize (Optional)</b>	<p>Callback function that is called when the control initializes. The callback function should return either TRUE (1) for success or FALSE (0) if unsuccessful. By default, if the user specified function does not initialize, the control genie will retry the function a few time before giving up. This callback only supports the #Name keyword which represents the name assigned to the control genie.</p> <p><b>Note:</b> The initialization callback function may be called multiple times whenever the table is re-initialized.</p>
<b>Left Mouse (Optional)</b>	<p>Callback function that is called when the user clicks the left mouse button. No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <ul style="list-style-type: none"> <li>#Name = name assigned to the genie</li> <li>#Row = row number of the cell (w.r.t. the underlying data) that is clicked</li> <li>#Col = column number of the cell that is clicked</li> <li>#RowDsp = row number of the cell relative to the display that is clicked</li> <li>#ColDsp = column number of the cell relative to the display that is clicked</li> </ul>
<b>Right Mouse (Optional)</b>	Callback function that is called when the user clicks the right mouse button. It uses the same specification as that of the Left mouse callback .
<b>Double Click (Optional)</b>	Callback function that is called when the user double-click the left mouse button. It uses the same specification as that of the Left mouse callback.
<b>Table Reload (Optional)</b>	<p>Callback function that is called when the control is redrawn. No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <ul style="list-style-type: none"> <li>#Name = name assigned to the genie</li> </ul>

**Note:** The Table can be up to 62 columns (although the latter columns may not have the column separators). For tables that return more columns than the limit, the first 62 columns will be displayed. The Table can be up to 100 rows.

## Use the Table Genie

There are two ways to populate data to the table:

1. Set cell value directly to the table.
2. Binding a Cicode function to return the value for the individual cells of the table.

### Example 1

#### Set cell value directly to the table

In this case, the value is stored with the table. You will need to set a new value to the individual cell of the table if required.

The Cicode sample below will be used in the following example. Open the Cicode Editor and create a new cicode file, for example, \_MyTable\_Ex1.ci

```
//Callback function to respond to the initialization event of the table genie
INT FUNCTION MyTable_Init(STRING sTable)
    // Add your columns
    LibTable_AddColumn(sTable, "Column1", 150);
    LibTable_AddColumn(sTable, "Column2", 100);

    // Add data directly to the table
    MyTable_AddRow(sTable, "Value for Cell(1,1)", "Value for Cell(1,2)");
    MyTable_AddRow(sTable, "Value for Cell(2,1)", "Value for Cell(2,2)");
    MyTable_AddRow(sTable, "Value for Cell(3,1)", "Value for Cell(3,2)");
    RETURN TRUE;
END
//?Function to add a new row of data to the table
INT FUNCTION MyTable_AddRow(STRING sTable, STRING sCol1Value, STRING sCol2Value)
    // Add data to the table, and the data is stored in the table
    INT nRow = LibTable_SetCellValue(sTable, -1, 1, sCol1Value);
    RETURN LibTable_SetCellValue(sTable, nRow, 2, sCol2Value);
END
```

1. From the Graphics Builder create a new page (E.g. the Normal Tab Style Page)
2. When created, from the **Object toolbox** select -> The **Paste Genie** icon.
3. In the **Paste Genie** window select the **lib\_controls** library
4. Select the Table genie. The Table genie is pasted onto the graphics page.
5. In the Table Genie property dialog, configure the fields according to the table below. Click OK to save your changes.

6. Save the graphics page and compile and run the project.

Parameter	Description
Table Name	Table 1
Width	400 (all columns within the table are displayed. If left at 100 some columns may not be displayed)
Number of rows	10
Header Height	18
Row Height	15
Header Padding	5
Row Padding	4
Column Padding	5
Horizontal Scrollbar	
Vertical Scrollbar	
Initialize	MyTable_Init("#Name")

At runtime the table will look like the following:

Table with Stored Value		
Column1 Value for Cell(1,1) Value for Cell(2,1) Value for Cell(3,1)	Column2 Value for Ce... Value for Ce... Value for Ce...	

## Example 2

### Binding a Cicode function to return the value for the individual cells of the table

This is similar to setting a formula in Excel. With binding, cell values are not stored in the table. The table will call the provided Cicode function when it needs data.

The Cicode sample below will be used in the following example. Open the Cicode Editor and create a new cicode file, for example, \_MyTable\_Ex2.ci

```
INT FUNCTION MyTable_InitDyn(STRING sTable)
    // Add your columns
```

```

LibTable_AddColumn(sTable, "Column1", 150);
LibTable_AddColumn(sTable, "Column2", 100);

// Bind callback function for data display
LibTable_SetDataTask(sTable, "Value", "MyTable_GetCellValue", "^^#Name^", #Row, #Col");

// Set the number of rows for the table
LibTable_SetPropertyInt(sTable, "RowCount", 9);

RETURN TRUE;
END
//Function to return the value for a data cell
STRING FUNCTION MyTable_GetCellValue(STRING sTable, INT nRow, INT nCol)
IF (nRow > LibTableGetPropertyInt(sTable, "RowCount")) THEN
    RETURN "";
END
RETURN "Dyn. value for Cell(" + nRow:# + "," + nCol:# + ")";
END

```

1. As in example 1, add a table library control to the graphics page.
2. In the Table Genie property dialog, configure the fields according to the table below. Click **OK** to save the changes.
3. Compile and then run the project.

Parameter	Description
Table Name	MyTable2
Width	400 (all columns within the table are displayed. If left at 100 some columns may not be displayed)
Number of rows	10
Header Height	18
Row Height	15
Header Padding	5
Row Padding	4
Column Padding	5
Horizontal Scrollbar	
Vertical Scrollbar	
Initialize	MyTable_InitDyn("#Name")

At runtime the table will look like the following:

**Table with Dynamic Data**

Column1	Column2	
Dyn. value for Cell(1,1)	Dyn. value f...	
Dyn. value for Cell(2,1)	Dyn. value f...	
Dyn. value for Cell(3,1)	Dyn. value f...	
Dyn. value for Cell(4,1)	Dyn. value f...	
Dyn. value for Cell(5,1)	Dyn. value f...	
Dyn. value for Cell(6,1)	Dyn. value f...	
Dyn. value for Cell(7,1)	Dyn. value f...	
Dyn. value for Cell(8,1)	Dyn. value f...	
Dyn. value for Cell(9,1)	Dyn. value f...	

**See Also**[Use the Library Controls](#)**Table Row Library Control**

Table Row genie has the following parameters:

Parameter	Description
<b>Table Name</b>	The name of the table (or its derived) genies that already exists on the page.
<b>Row</b>	Number of row as it appears on screen

**See Also**[Use the Library Controls](#)**Tag Table Library Control**

Tag table genie has the following parameters:

Parameter	Description
<b>Tag Table Name</b>	Name of table (max characters). Used to identify the genie when on a graphics page.
<b>Width</b>	Pixel width of the table at runtime. Note: Leave the size of the genie at design time as 100 pixels, as it will be automatically calculated at runtime.
<b>Number of rows</b>	Number of rows displayed on the page.

Parameter	Description
<b>Header Height</b>	Pixel Height of header row in table display.
<b>Row Height</b>	Pixel height of row in the table display.
<b>Header Padding</b>	The pixel padding between the bottom of the header text (column name) and the bottom of the header row
<b>Row Padding</b>	The pixel padding between the bottom of the cell text and the bottom of each row.
<b>Column Padding</b>	The pixel padding on the left-hand-side and right-hand-side of the cell text relative to the width of each column.
<b>Refresh Rate</b>	<p>The minimum (quickest possible) rate that the control will be redrawn.</p> <p>The control is only redrawn as required upon changes to the layout, scrolling or other user initiated events.</p>
<b>Scan Delay (Optional)</b>	The number of page scan delay before the genie is initialized at runtime. this can be set to different number on different control genies to stagger the initialization order. If not set defaults to 1.
<b>Horizontal Scrollbar (Optional)</b>	The name of the horizontal scroll bar genie on the page that allows the user to horizontally scroll the content displayed on the control genie If you will not require horizontal scrolling, leave this field blank.
<b>Vertical Scrollbar (Optional)</b>	The name of the horizontal scroll bar genie on the page that allows the user to vertically scroll the content displayed on the control genie If you will not require vertical scrolling, leave this field blank.
<b>Header Font</b>	The pre-configured font for header text.
<b>Cell Font</b>	The pre-configured font for cell text.
<b>Selection Font</b>	The pre-configured font for cell text when it is selected.
<b>Auto Width</b>	True/False drop down box. False is selected by default. Determines whether the column width will be automatically adjusted to show full cell content when the control is redrawn.
<b>Allow Selection</b>	True/False drop down. True is selected by default. Determines whether allow the rows displayed on the control are selectable.

Parameter	Description
<b>Initialize (Optional)</b>	<p>Callback function that is called when the control initializes. The callback function should return either TRUE (1) for success or FALSE (0) if unsuccessful. By default, if the user specified function does not initialize, the control genie will retry the function a few times before giving up. This callback only supports the #Name keyword which represents the name assigned to the control genie.</p> <p><b>Note:</b> The initialization callback function may be called multiple times whenever the table is re-initialized.</p>
<b>Left Mouse (Optional)</b>	<p>Callback function that is called when the user clicks the left mouse button. No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <ul style="list-style-type: none"> <li>#Name = name assigned to the genie</li> <li>#Row = row number of the cell (w.r.t. the underlying data) that is clicked</li> <li>#Col = column number of the cell that is clicked</li> <li>#RowDsp = row number of the cell relative to the display that is clicked</li> <li>#ColDsp = column number of the cell relative to the display that is clicked</li> </ul>
<b>Right Mouse (Optional)</b>	<p>Callback function that is called when the user clicks the right mouse button. It uses the same specification as that of the Left mouse callback.</p>
<b>Double Click (Optional)</b>	<p>Callback function that is called when the user double-clicks the left mouse button. It uses the same specification as that of the Left mouse callback.</p>
<b>Table Reload (Optional)</b>	<p>Callback function that is called when the control is redrawn. No particular return value is expected from this function, and it supports the following keywords in its argument list:</p> <ul style="list-style-type: none"> <li>#Name = name assigned to the genie</li> </ul>

**Note:** The Table can be up to 62 columns (although the latter columns may not have the column separators).

## See Also

## Using the Tag Table Genie

Use the Tag Table Genie on a page when you want to be able to view variable tags where the value of each tag changes constantly within your project.

The table does not automatically populate with variable tags unless a Cicode function is called to add the tags to it. The Cicode function you use to add a variable tag to the table is:

```
LibTagTable_AddTag(STRING sTable, STRING sTag, STRING sName = "", STRING sFormat = "", STRING sFormatActive = "", INT iArrayIndex = 0)
```

Where:

- *sTable* = the name of the Tag Table Genie where values will be inserted (required)
- *sTag* = the actual tag itself (required)
- *sName* = the name of the tag (optional)
- *sFormat* = A replacement value to insert into the table if the tag's value is empty or equal to zero (and *sFormat* and *sFormatActive* are both not empty). For example, "bad tag". (optional)
- *sFormatActive* = A replacement value to insert into the table if the tag value is not empty or not equal to zero (and *sFormat* and *sFormatActive* are both not empty). For example, "good tag". (optional)
- *iArrayIndex* = The index of the element in the tag to insert the value for if an array tag is provided in the *sTag* parameter (optional)

For example:

```
LibTagTable_AddTag("TestTable", "ModnetIntArray[1]", "ModnetIntArray[1]", "Array","",1)
```

## Example 1

### Populating the table with a button

1. From the **Object toolbox** select -> The **Paste Genie** icon.
2. In the **Paste Genie** window select the **lib\_controls** library.
3. Select the Tag Table genie. The tag Table genie is pasted onto the graphics page.
4. In the Tag Table Genie properties dialog, configure the fields according to the table below. Click **OK** to save the changes.

Parameter	Description
TagTable Name	Tags
Width	300 ( all columns within the table are displayed. If left at 100 the value column is not displayed)
Number of rows	20
Header Height	18
Row Height	15
Header Padding	5

Parameter	Description
Row Padding	4
Column Padding	5
Horizontal Scrollbar	
Vertical Scrollbar	Verbar (name of horizontal scroll bar placed on current page)

Paste the Vertical Scrollbar genie onto the graphics page.

1. Position where the width of the table might end. In the 'Library\_Control - Scrollbar' dialog:
  - **Scrollbar Name:** Verbar
  - **Height:** 100
  - **Update on Drag:** True (default)
  - **Allow double-click:** True (default)
  - **Auto Hide:** False (default)
  - **Hidden When:** False (default)
2. Click **OK** to save the changes
3. From the Object toolbox select the 'Button' object
4. Draw a button onto the page and configure as follows:
  - **Action:** Up
  - **Up Command:** LibTagTable\_AddTag("VariableTags","Bit\_1")
5. Click **OK** to save the changes
6. Compile and Run the project.
7. At runtime open the example page and click on the 'VariableTag' button
8. The table will refresh and the Bit\_1 tag and corresponding value will be displayed.

Variations of the example include:

- Adding a second button for another Tag e.g Bit\_2
- Configuring the button to accept multiple tags( though space is limited). The Cicode for the up command could be :
 

```
LibTagTable_AddTag("VariableTags","Bit_1");
LibTagTable_AddTag("VariableTags","Bit_2");
LibTagTable_AddTag("VariableTags","Bit_4")
```
- Configuring a button to launch a form field where you can enter the name of the tag: The Cicode for the up command could be:
 

```
LibTagTable_AddTag("Variabletags", Input("Add Tag","Tag name:", ""));
```

**Example 2:****Initialized Cicode function in table configuration**

Using the Cicode sample below, open the Cicode Editor and create a function.

Example: 'MyTagTableInitialize' initialization function:

```
INT FUNCTION MyTagTableInitialize(STRING sTable)
    INT hSession;
    STRING sCluster;
    STRING sTag;
    INT nError;
    // Add all variable tags to the tag table
    hSession = TagBrowseOpen("", "Cluster,Tag", "Cluster:A,Tag:A", "");
    nError = TagBrowseFirst(hSession);
    WHILE (nError = 0) DO
        sCluster = TagBrowseGetField(hSession, "Cluster");
        sTag = TagBrowseGetField(hSession, "Tag");
        LibTagTable_AddTag(sTable, sCluster + "." + sTag);
        nError = TagBrowseNext(hSession);
    END
    IsError();
    TagBrowseClose(hSession);
    // Tell the tag table initialization is
    RETURN TRUE;
END
```

As in example 1, add the Tag Table Genie and Vertical scroll bar to the graphics page.

In the Tag Table Genie property dialog, configure the following fields:

Parameter	Description
TagTable Name	Tags
Width	300 ( all columns within the table are displayed. If left at 100 the value column is not displayed)
Number of rows	20
Header Height	18
Row Height	15
Header Padding	5
Row Padding	4
Column Padding	5
Horizontal Scrollbar	
Vertical Scrollbar	Verbar (name of horizontal scroll bar placed on current page)

Parameter	Description
Initialize	MyTagTableInitialize("#Name")

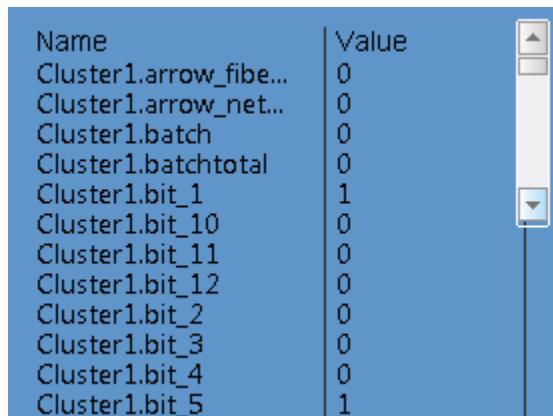

Paste the Vertical Scrollbar genie onto the graphics page. Position where the width of the table might end.

In the 'Library\_Control - Scrollbar' dialog, configure the following fields.

Parameter	Description
Scrollbar Name	Verbar
Height	100
Update on Drag	True (default)
Allow double-click	True (default)
Auto Hide	False (default)
Hidden When	False (default)

Compile and then run the project.

At runtime the table will look like the following:

A screenshot of a scrollable table control. The table has two columns: 'Name' and 'Value'. The 'Name' column lists various tags from a cluster, including arrow\_fibre, arrow\_net, batch, batchtotal, bit\_1 through bit\_12, and bit\_3 through bit\_5. The 'Value' column shows binary values (0 or 1) corresponding to each tag. A vertical scrollbar is visible on the right side of the table, indicating it can be scrolled vertically.

Name	Value
Cluster1.arrow_fibre	0
Cluster1.arrow_net	0
Cluster1.batch	0
Cluster1.batchtotal	0
Cluster1.bit_1	1
Cluster1.bit_10	0
Cluster1.bit_11	0
Cluster1.bit_12	0
Cluster1.bit_2	0
Cluster1.bit_3	0
Cluster1.bit_4	0
Cluster1.bit_5	1

## Tree Library Control

Tree Genie has the following parameters:

Parameter	Description
<b>Tree Name</b>	Name of the tree. Used to identify the Genie when on a graphics page.
<b>Width</b>	<p>Pixel width of the table at runtime.</p> <p><b>Note:</b> Leave the size of the Genie at design time as 100 pixels, as it will be automatically calculated at runtime.</p>
<b>Menu (Page) Name</b>	Name of page with menu items to display. If not specified it will default to the menu configuration of the current window.
<b>Number of items</b>	Number of items displayed on the page.
<b>Item Height</b>	Pixel height of item in the tree display.
<b>Show CheckBox</b>	True/False drop down box. False is selected by default. Determines whether to show the checkboxes next to each of the tree items.
<b>Force Child</b>	True/False drop down box. False is selected by default. Determines whether to force all children tree items to follow the checked status of their parent when the latter is checked / unchecked.
<b>Window Inst</b>	True/False drop down box. True is selected by default. Determines whether create a new instance of the equipment hierarchy on each window where the equipment tree is displayed.
<b>Refresh Rate</b>	<p>The minimum (quickest possible) rate that the control will be redrawn.</p> <p>The control is only redrawn as required upon changes to the layout, scrolling or other user initiated events</p>
<b>Expand Level</b>	The minimum expand level of the tree hierarchy. Set to 0 to allow the tree to be collapsed to its root items.
<b>Horizontal Scrollbar (Optional)</b>	The name of the horizontal scroll bar Genie on the page that allows the user to horizontally scroll the content displayed on the control Genie If you will not require horizontal scrolling, leave this field blank.
<b>Vertical Scrollbar (Optional)</b>	The name of the horizontal scroll bar Genie on the page that allows the user to vertically scroll the content displayed on the control Genie If you will not require vertical scrolling, leave this field blank.

Parameter	Description
<b>Label Font</b>	The font used for displaying the tree item label.
<b>Item Font</b>	The font used for displaying the optional dynamic text next to the tree item.
<b>Symbol Library (Optional)</b>	The name of the symbol library that contains the symbols for displayed next to the tree items.
<b>Refresh Rate</b>	<p>The minimum rate that the control will be redrawn.</p> <p><b>Note:</b> The control is only redrawn as required upon changes to the layout, scrolling or other user initialized events.</p>
<b>Scan Delay</b>	The number of page scan delay before the Genie is initialized at runtime. This can be set to different number on different control Genies to stagger the initialization order.
<b>Expand Level</b>	The minimum expand level of the tree hierarchy. Set this to 0 to allow the tree to be collapsed to its root items.
<b>Initialize</b>	Callback function that is called when the control initializes. The callback function should return either TRUE (1) for success or FALSE (0) for unsuccessful. By default, if the user specified function cannot initialize successfully, the control Genie will retry the function a few time before giving up. This callback only supports the #Name keyword which represents the name assigned to the control Genie.
<b>Row Item</b>	<p>Callback function that is called when the table initializes. The callback function should return a string value. The value returned will be displayed next to the tree item label. It supports the following keyword in its argument list:</p> <ul style="list-style-type: none"> <li>#Name - Name assigned to the Genie</li> <li>#Ref – the complete path of the tree item</li> <li>#Label – the label of the tree item</li> <li>#ItemDsp- The position of the item as displayed on screen</li> <li>#IsChecked - The checked status of the tree item</li> <li>#IsParent - Whether the item is expanded/collapsed</li> <li>#ItemDsp - The position of the item as displayed on screen</li> </ul>

Parameter	Description
	#Node - The handle to the internal menu node object that represents the tree item #Level - The level of the tree item
<b>Selected</b>	Callback function that is called when a tree item is selected. No particular return value is expected from this function, and it supports the same set of keywords as that of the Row Item function in its argument list. Callback function that is called when the check box of a tree item is clicked. No particular return value is expected from this function, and it supports the same set of keywords as that of the Row Item function in its argument list.
<b>Checked</b>	Callback function that is called when a tree item is selected. No particular return value is expected from this function, and it supports the same set of keywords as that of the Row Item function in its argument list. Callback function that is called when the check box of a tree item is clicked. No particular return value is expected from this function, and it supports the same set of keywords as that of the Row Item function in its argument list.
<b>Left Mouse</b>	Callback function that is called when the user clicks the left mouse button. No particular return value is expected from this function, and it supports the following keywords in its argument list: #Node - The handle to the internal menu node object that represents the tree item #Level - The level of the tree item
<b>Right Mouse</b>	Callback function that is called when the user clicks the right mouse button. It uses the same specification as that of the Left mouse callback .
<b>Double Click</b>	Callback function that is called when the user double-click the left mouse button. It uses the same specification as that of the Left mouse callback.
<b>Tree Reload</b>	Callback function that is called when the control is redrawn. No particular return value is expected from this function, and it supports the following keywords in its argument list: #Name = name assigned to the Genie

[Use the Tree Genie](#)

[Use the Library Controls](#)

### Use the Tree Genie

Use the [Tree Library Control](#) on a page when you want to be able to view hierarchical data such as a menu.

**Note:** Configure the [Equipment Tree Library Control](#) to view equipment in your system.

The example below illustrates how the Genie can be used to view menu items within your system for a particular page. A basic example, the implementation of the tree Genie can also be used to display dynamic generated menu items using Cicode.

#### Example 1: Displaying Pre-configured Menu Items

Using the Example project, if you would like to display the menu items for the "\_plant" page, complete the following:

1. From the **Object toolbox** select the **Paste Genie** icon.
2. In the **Paste Genie** window, select the **lib\_controls** library
3. Select the Tree Genie. The Tree Genie is pasted onto the graphics page.
4. In the Tree Genie property dialog, configure the fields according to the table below. Click **OK** to save the changes.

Parameter	Description
Tree Name	PlantMenu
Width	200
Number of rows	10
Row Height	15
Show CheckBox	False (default)
Force Child	False (default)
Window Inst	True (default)
Expand Level	0
Menu (Page) Name	_Plant
Selected	MenuNodeRunCommand(#Node)

When you compile and then run the project, the tree (menu) will look like the following in the runtime environment.

### Example 2: Displaying Dynamic Menu Items

This is the more versatile usage of the menu tree where you can create an in-memory menu hierarchy and populate it with your own data, and use the Tree control to display it on the screen. The EquipTree Genie is an example of such usage.

Using the Cicode sample below, open the Cicode Editor and create a callback function.

Example: 'Mytree' initialization callback function.

```
INT FUNCTION MyTreeInitialize(STRING sTreeName)
    // get the menu name for my instance of tree control
    STRING sMenu = LibTreeGetProperty(sTreeName, "Menu");
    // create a in-memory menu hierarchy
    INT hMenu = MenuGetPageNode(sMenu, 1);
    INT hNode;
    // populate the menu hierarchy (only once)
    IF (hMenu > -1) AND (MenuGetFirstChild(hMenu) < 0) THEN
        // add level 1 item
        hNode = MenuNodeAddChild(hMenu, "Item 1", "");
        // add level 2 (sub) items
        MenuNodeAddChild(hNode, "Sub-item 1", "");
        MenuNodeAddChild(hNode, "Sub-item 2", "");
        // add level 1 item
        hNode = MenuNodeAddChild(hMenu, "Item 2", "");
        // add level 2 (sub) items
        MenuNodeAddChild(hNode, "Sub-item 1", "");
        MenuNodeAddChild(hNode, "Sub-item 2", "");
        // add level 1 item
        MenuNodeAddChild(hMenu, "Item 3", "");
    END
    // return TRUE (1) to signal initialization completes
    RETURN 1;
END
```

As in example 1, paste the Tree Genie onto a graphics page.

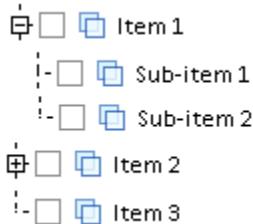

In the Tree Genie property dialog configure the following fields:

Parameter	Description
Tree Name	TreeMenu
Width	200
Number of rows	10
Show CheckBox	True
Force Child	False (default)
Window Inst	True (default)
Expand Level	0
Menu (Page) Name	MyMenu
Initialize	MyTreeInitialize("#Name")
Selected	MenuNodeRunCommand(#Node)

Assign the name of the in-memory menu hierarchy to the Menu name field of the Genie by assigning this name to the "Menu (Page) Name" field of the Tree Genie at configuration time.

Click **OK** to save the changes and save the page.

Compile and then run the project. At runtime the tree (menu) will look like the following:

[Use the Library Controls](#)

## Include Project Specifications

This section of the help defines specifications for the predefined components included in the Plant SCADA Include project.

- [Predefined Commands](#)
- [Predefined Character Sets](#)
- [Predefined Fonts](#)
- [Predefined Devices](#)

- Predefined Cicode Files
- Predefined Color Names and Codes
- Predefined Keyboard Key Codes
- Predefined Labels.

**Note:** The Include project is a system include project, and only appears in the Project List tree in Plant SCADA Studio if the **System Projects** filter is applied in the Projects activity. See the System Projects described in [Project Types](#).

## Predefined Commands

This section describes the system keyboard commands that are predefined in the Include Project. (System keyboard commands operate on any graphics page displayed on the computer screen).

- [System Keyboard Commands Database](#)
- [Predefined Keyboard Keys](#).

### System Keyboard Commands Database

The table below gives the key sequences associated with commands and their function.

Key Sequence	Command	Description
*BS	KeyBS()	Backspace over the current key
DOWN	KeyDown()	Move the cursor down
PGDN	PagePrev()	Display the previous page
PGUP	PageNext()	Display the next page
RIGHT	KeyRight()	Move the cursor right
UP	KeyUp()	Move the cursor up

Usually you can override a predefined command by configuring a new command in your project with the same key sequence.

The only command that you cannot override is the \*BS command, as this sequence is a hotkey used to remove the last key from the key command line.

**Note:** Do not modify the Include Project. Your changes to the Include project will be lost when you reinstall Plant SCADA or upgrade to a new version.

## Predefined Keyboard Keys

The keyboard keys described below are predefined in the Include Project. You can use these keys in any key sequence field; for example, to define the keyboard commands for an object.

The table below defines the key names, codes, and description.

Key Name	Key Code	Description
BS	KEY_BACKSPACE	BackSpace key
DOWN	KEY_DOWN	Cursor down
DOWN_SHIFT	KEY_DOWN_SHIFT	Shift down key
ENTER	KEY_ENTER	Enter key
LBUTTON_DBL	KEY_LBUTTON_DBL	Left mouse button double click
LBUTTON_DN	KEY_LBUTTON_DN	Left mouse button down
LBUTTON_UP	KEY_LBUTTON_UP	Left mouse button up
LBUTTON_CMD_DN	KEY_LBTN_CMD_DN	Left mouse button down (command cursor)
LBUTTON_CMD_DNC	KEY_LBTN_CMD_DNC	Ctrl left mouse button down (command cursor)
LBUTTON_CMD_DNS	KEY_LBTN_CMD_DNS	Shift left mouse button down (command cursor)
LBUTTON_CMD_UP	KEY_LBTN_CMD_UP	Left mouse button up (command cursor)
LBUTTON_CMD_UPC	KEY_LBTN_CMD_UPC	Ctrl left mouse button up (command cursor)
LBUTTON_CMD_UPS	KEY_LBTN_CMD_UPS	Shift left mouse button up (command cursor)
LEFT	KEY_LEFT	Cursor left
MBUTTON_DN	KEY_MBUTTON_DN	Middle mouse button down
MBUTTON_UP	KEY_MBUTTON_UP	Middle mouse button up
PGDN	KEY_PGDN	Page down key
PGUP	KEY_PGUP	Page up key
RBUTTON_DN	KEY_RBUTTON_DN	Right mouse button down
RBUTTON_UP	KEY_RBUTTON_UP	Right mouse button up
RBUTTON_CMD_DN	KEY_RBTN_CMD_DN	Right mouse button down (command cursor)
RBUTTON_CMD_UP	KEY_RBTN_CMD_UP	Right mouse button up (command

Key Name	Key Code	Description
		cursor)
RIGHT	KEY_RIGHT	Cursor right
UP	KEY_UP	Cursor up
UP_SHIFT	KEY_UP_SHIFT	Shift up key

**Note:** Do not modify the Include Project. Changes to the Include project are lost when you reinstall or upgrade Plant SCADA.

---

## Predefined Character Sets

The following character sets are predefined as labels in the Include Project:

Label	Value	Description
DEFAULT_CHARSET	1	Use the default Windows character set
SHIFTJIS_CHARSET	128	Japanese character set
HANGEUL_CHARSET	129	Korean character set
GB2312_CHARSET	134	Chinese character set
CHINESEBIG5_CHARSET	136	Chinese character set
JOHAB_CHARSET	130	
HEBREW_CHARSET	177	
ARABIC_CHARSET	178	
GREEK_CHARSET	161	
TURKISH_CHARSET	162	
VIETNAMESE_CHARSET	163	
THAI_CHARSET	222	
EASTEUROPE_CHARSET	238	
RUSSIAN_CHARSET	204	
BALTIC_CHARSET	186	

**Note:** Do not modify the Include Project. Changes to the Include project are lost when you reinstall or upgrade Plant SCADA.

---

## Predefined Fonts

The following fonts are predefined in the Include Project:

Font Name	Font Type	Size	Color
AlmAccOffFont	Arial	10	White
AlmAccOnFont	Arial	10	Cyan
AlmDisabledFont	Arial	10	White
AlmUnAccOffFont	Arial	10	Brown
AlmUnAccOnFont	Arial	10	Yellow
ButtonFont	Arial	10	Black
Casanova	Arial	-10	Black
ControlLimits	Times New Roman	14	Black
DefaultFont	Courier New	14	White
DisabledFont	Arial	10	White
FontOP	Courier New	14	Light Cyan
FontPV	Courier New	14	Light Green
FontSP	Courier New	14	Light Red
FontTune	Courier New	14	Yellow
GraphBigFont	Arial	60	Black
GraphColour	Arial	32	Blue
GraphColourBig	Arial	60	Red
GraphColourSmall	Courier New	20	Black
GraphFont	Arial	32	Black
GraphSmallFont	Courier New	20	Black
HardwareFont	Arial	10	Light_Red
Pen1SpcFont	Courier	10	White
Pen1TrendFont	Courier New	14	Light_Green
Pen2SpcFont	Courier New	14	Light_Green

Font Name	Font Type	Size	Color
Pen2TrendFont	Courier New	14	Yellow
Pen3SpcFont	Courier New	14	Light_Cyan
Pen3TrendFont	Courier New	14	Light_Red
Pen4SpcFont	Courier New	14	Light_Blue
Pen4TrendFont	Courier New	14	Light_Cyan
Pen5TrendFont	Courier New	14	Light_Magenta
Pen6TrendFont	Courier New	14	White
Pen7TrendFont	Courier New	14	Light_Blue
Pen8TrendFont	Courier New	14	Gray
PromptFont	Arial	10	White
SpcFont	Courier New	14	White
TextFont	Arial	10	White
TimeFont	Arial	10	Black
TrendFont	Courier New	14	White
TrendHistFont	Courier New	14	Yellow
TrendSHistFont	Arial	-10	Magenta
TrendSFont	Arial	-10	Black
UnacceptedFont	Arial	10	Yellow
Vanuatu	Arial	-9	Black
System	Arial	10	Black
TrendSCentreFont	Arial	-10	Yellow
PopFont	Arial	9	Black

You can override a predefined font by adding a new font with the same name to your project.

---

**Note:** Do not modify the Include Project. Changes to the Include project are lost when you reinstall or upgrade Plant SCADA.

---

## Predefined Devices

This section describes devices that are predefined in the Include Project.

### Devices database

The table below shows the devices supported by Plant SCADA.

Device Name	Type	Description
ASCII_DEV	0	Ascii Device number
PRINTER_DEV	1	Printer Device number
dBASE_DEV	2	dBASE device number
SQL_DEV	4	SQL device number
AlarmDisk	0 (ASCII File)	Default alarm log file
AlarmPrint	0 (ASCII File)	Default alarm print device
KeyDisk	0 (ASCII File)	Default keyboard log file
KeyPrint	1 (Printer)	Default keyboard printer log
Printer1	1 (Printer) LPT1:	Printer 1 device
Printer2	1 (Printer) LPT2:	Printer 2 device
SummaryPrint	0 (ASCII File)	Default alarm summary printer device
SummaryDisk	0 (ASCII File)	Default alarm summary log file
_Trend	3 (dBASE)	Trend RDB device
Scratch	0 (ASCII File)	Device for DevModify function

**Note:** Do not modify the Include Project. Changes to the Include project are lost when you reinstall or upgrade Plant SCADA.

## Predefined Cicode Files

The following Cicode files are part of the Include Project:

File Name	Description
citect.ci	General utility functions
debug.ci	User Cicode debugging functions

File Name	Description
export.ci	Information functions
graph.ci	Trend data export functions
info.ci	Information functions
numpad.ci	Number entry keypad functions
page.ci	Graphics page utility functions
pareto.ci	Functions for the Pareto charts
spc.ci	Default SPC functions
spcplus.ci	SPC functions - extension
statpop.ci	Trend statistic functions
tag.ci	Functions for Tag assignment and manipulation
trend.ci	Default trend functions
trninfo.ci	Functions to gather trend information
zoom.ci	Trend zoom functions

**Note:** Do not modify the Include Project. Changes to the Include project are lost when you reinstall or upgrade Plant SCADA.

## Predefined Color Names and Codes

Sixteen standard colors are available for use with your Plant SCADA system. They have been predefined in the Include Project. refer to these colors by name which make them more readily understandable, wherever you would use the code value:

Color Label	Code
Black	0x000000
Blue	0x000080
Green	0x008000
Cyan	0x008080
Red	0x800000
Magenta	0x800080
Brown	0x808000

Color Label	Code
Grey	0xBFBFBF
Dark_Grey	0x7F7F7F
Light_Blue	0x0000FF
Light_Green	0x00FF00
Light_Cyan	0x00FFFF
Light_Red	0xFF0000
Light_Magenta	0xFF00FF
Yellow	0xFFFF00
White	0xFFFFFFFF
TRANSPARENT	0XFF000000

**Note:** Do not modify the Include Project. Changes to the Include project are lost when you reinstall or upgrade Plant SCADA.

## Predefined Keyboard Key Codes

The following meaningful key code labels are predefined in the Plant SCADA Include Project. They can be entered as key codes when you define your keyboard keys, so you don't need to remember the hex value associated with each key.

Key Code (Plant SCADA label)	Key Code (Hex Value)	Key Description
KEY_LBUTTON	0x0001	Left Mouse Button
KEY_RBUTTON	0x0002	Right Mouse Button
KEY_MBUTTON	0x0004	Middle Mouse Button
KEY_LBUTTON_UP	0x0201	Left Mouse Button Up
KEY_RBUTTON_UP	0x0202	Right Mouse Button Up
KEY_MBUTTON_UP	0x0204	Middle Mouse Button Up
KEY_LBUTTON_DBL	0x0401	Left Mouse Button Double Click
KEY_RBUTTON_DBL	0x0402	Right Mouse Button Double Click
KEY_MBUTTON_DBL	0x0403	Middle Mouse Button Double Click
KEY_LBUTTON_DN	0x0801	Left Mouse Button Down

<b>Key Code (Plant SCADA label)</b>	<b>Key Code (Hex Value)</b>	<b>Key Description</b>
KEY_RBUTTON_DN	0x0802	Right Mouse Button Down
KEY_MBUTTON_DN	0x0804	Middle Mouse Button Down
KEY_LBTN_CMD_UP	0x0601	Left Mouse Button Up (Command Cursor)
KEY_RBTN_CMD_UP	0x0602	Right Mouse Button Up (Command Cursor)
KEY_MBTN_CMD_UP	0x0604	Middle Mouse Button Up (Command Cursor)
KEY_LBTN_CMD_DN	0x0605	Left Mouse Button Down (Command Cursor)
KEY_RBTN_CMD_DN	0x0606	Right Mouse Button Down (Command Cursor)
KEY_MBTN_CMD_DN	0x0608	Middle Mouse Button Down (Command Cursor)
KEY_LBTN_CMD_UPS	0x1601	Shift Left Mouse Button Up (Command Cursor)
KEY_RBTN_CMD_UPS	0x1602	Shift Right Mouse Button Up (Command Cursor)
KEY_MBTN_CMD_UPS	0x1604	Shift Middle Mouse Button Up (Command Cursor)
KEY_LBTN_CMD_DNS	0x1605	Shift Left Mouse Button Down (Command Cursor)
KEY_RBTN_CMD_DNS	0x1606	Shift Right Mouse Button Down (Command Cursor)
KEY_MBTN_CMD_DNS	0x1608	Shift Middle Mouse Button Down (Command Cursor)
KEY_LBTN_CMD_UPC	0x2601	Ctrl Left Mouse Button Up (Command Cursor)
KEY_RBTN_CMD_UPC	0x2602	Ctrl Right Mouse Button Up (Command Cursor)
KEY_MBTN_CMD_UPC	0x2604	Ctrl Middle Mouse Button Up (Command Cursor)
KEY_LBTN_CMD_DNC	0x2605	Ctrl Left Mouse Button Down

Key Code (Plant SCADA label)	Key Code (Hex Value)	Key Description
		(Command Cursor)
KEY_RBTN_CMD_DNC	0x2606	Ctrl Right Mouse Button Down (Command Cursor)
KEY_MBTN_CMD_DNC	0x2608	Ctrl Middle Mouse Button Down (Command Cursor)
KEY_BACKSPACE	0x0008	Backspace
KEY_TAB	0x0009	Tab
KEY_LF	0x000A	Line Feed
KEY_VT	0x000B	Vertical Tab
KEY_FF	0x000C	Form Feed
KEY_RETURN	0x000D	Return
KEY_ENTER	0x000D	Enter (same key as above)
KEY_ESCAPE	0x001B	Escape
KEY_ESC	0x001B	Escape (same key as above)
KEY_DELETE	0x012E	Delete
KEY_PGUP	0x0121	PageUp
KEY_PGDN	0x0122	PageDown
KEY_END	0x0123	End
KEY_HOME	0x0124	Home
KEY_LEFT	0x0125	Cursor Left
KEY_UP	0x0126	Cursor Up
KEY_RIGHT	0x0127	Cursor Right
KEY_DOWN	0x0128	Cursor Down
KEY_LEFT_SHIFT	0x1125	Shift Left
KEY_UP_SHIFT	0x1126	Shift Up
KEY_RIGHT_SHIFT	0x1127	Shift Right
KEY_DOWN_SHIFT	0x1128	Shift Down

<b>Key Code (Plant SCADA label)</b>	<b>Key Code (Hex Value)</b>	<b>Key Description</b>
KEY_INSERT	0x012D	Insert
KEY_HELP	0x012F	Help
KEY_F1	0x0170	F1
KEY_F2	0x0171	F2
KEY_F3	0x0172	F3
KEY_F4	0x0173	F4
KEY_F5	0x0174	F5

KEY_A_CTRL	0x2041	Ctrl A
KEY_B_CTRL	0x2042	Ctrl B

Key Code (Plant SCADA label)	Key Code (Hex Value)	Key Description
KEY_C_CTRL	0x2043	Ctrl C
KEY_D_CTRL	0x2044	Ctrl D
KEY_E_CTRL	0x2045	Ctrl E
KEY_F_CTRL	0x2046	Ctrl F
KEY_G_CTRL	0x2047	Ctrl G
KEY_H_CTRL	0x2048	Ctrl H
KEY_I_CTRL	0x2049	Ctrl I
KEY_K_CTRL	0x204B	Ctrl K
KEY_L_CTRL	0x204C	Ctrl L
KEY_M_CTRL	0x204D	Ctrl M
KEY_N_CTRL	0x204E	Ctrl N
KEY_O_CTRL	0x204F	Ctrl O
KEY_P_CTRL	0x2050	Ctrl P
KEY_Q_CTRL	0x2051	Ctrl Q
KEY_R_CTRL	0x2052	Ctrl R
KEY_S_CTRL	0x2053	Ctrl S
KEY_T_CTRL	0x2054	Ctrl T
KEY_U_CTRL	0x2055	Ctrl U
KEY_V_CTRL	0x2056	Ctrl V
KEY_W_CTRL	0x2057	Ctrl W
KEY_X_CTRL	0x2058	Ctrl X
KEY_Y_CTRL	0x2059	Ctrl Y
KEY_Z_CTRL	0x205A	Ctrl Z
KEY_A_ALT	0x4041	Alt A
KEY_B_ALT	0x4042	Alt B
KEY_C_ALT	0x4043	Alt C

Key Code (Plant SCADA label)	Key Code (Hex Value)	Key Description
KEY_D_ALT	0x4044	Alt D
KEY_E_ALT	0x4045	Alt E
KEY_F_ALT	0x4046	Alt F
KEY_G_ALT	0x4047	Alt G
KEY_H_ALT	0x4048	Alt H
KEY_I_ALT	0x4049	Alt I
KEY_J_ALT	0x404A	Alt J
KEY_K_ALT	0x404B	Alt K
KEY_L_ALT	0x404C	Alt L
KEY_M_ALT	0x404D	Alt M
KEY_N_ALT	0x404E	Alt N
KEY_O_ALT	0x404F	Alt O
KEY_P_ALT	0x4050	Alt P
KEY_Q_ALT	0x4051	Alt Q
KEY_R_ALT	0x4052	Alt R
KEY_S_ALT	0x4053	Alt S
KEY_T_ALT	0x4054	Alt T
KEY_U_ALT	0x4055	Alt U
KEY_V_ALT	0x4056	Alt V
KEY_W_ALT	0x4057	Alt W
KEY_X_ALT	0x4058	Alt X
KEY_Y_ALT	0x4059	Alt Y
KEY_Z_ALT	0x405A	Alt Z

To define a key with:

1. The Shift key, add 0x1000 to the value of the key.
2. The Ctrl key, add 0x2000 to the value of the key.
3. The Alt key, add 0x4000 to the value of the key.

The above key definitions are standard IBM-compatible keys.

**Note:** Do not modify the Include Project. Changes to the Include project are lost when you reinstall or upgrade Plant SCADA.

## Predefined Labels

The table below defines the labels predefined in the Include project's labels database (labels.dbf).

Name	Expression	Comment
__DATE__	\$1	Date of compilation
__DB__	\$4	Compiler database name
__FIELD__	\$6	Compiler field name
__FILE__	\$2	Compiler file name
__LINE__	\$3	Compiler line number
__RECORD__	\$5	Compiler record number
__TIME__	\$0	Time of compilation
_BLANK_		NULL Definition
AlarmFirstCatRec(hCat,nType,hArea=-1)	_AlarmQueryFirstRec(hCat,nType,hArea,0)	Get Alarm Cat Rec with Area
AlarmFirstPriRec(hPri,nType,hArea=-1)	_AlarmQueryFirstRec(hPri,nType,hArea,1)	Get Alarm Pri Rec with Area
AlarmNextCatRec(hRec,hCat,nType,hArea=-1)	_AlarmQueryNextRec(hRec,hCat,nType,hArea,0)	Get Alarm Cat Rec with Area
AlarmNextPriRec(hRec,hPri,nType,hArea=-1)	_AlarmQueryNextRec(hRec,hPri,nType,hArea,1)	Get Alarm Pri Rec with Area
ANIMATE	2	Display mode 2
ANM_ARRAY	16	Animated symbols in array mode
ANSI_CHARSET	0	ANSI character set
Arg1	GetGlbStr(0)	keyboard argument 1
Arg2	GetGlbStr(1)	keyboard argument 2
Arg3	GetGlbStr(2)	keyboard argument 3
Arg4	GetGlbStr(3)	keyboard argument 4

Name	Expression	Comment
Arg5	GetGlbStr(4)	keyboard argument 5
Arg6	GetGlbStr(5)	keyboard argument 6
Arg7	GetGlbStr(6)	keyboard argument 7
Arg8	GetGlbStr(7)	keyboard argument 8
ArgValue1	StrToValue(Arg1)	Get the value of argument 1
Assert(arg)	IF NOT (arg) THEN _Assert (#arg, __FILE__, __LINE__); END	Process an assertion
BAD_HANDLE	-1	Bad Handle
BORDER	2	Border Only
BORDER_3D	1	3D Transparent Button
_CreateControlObject(sCls,sName,x1,y1,x2,y2,sEventCls)	_CreateControlObject(sCls,sName,x1,y1,x2,y2,sEventCls)	_CreateControlObject default event class
DateDay(time)	_TimeSub(time,3)	Get days from time
DateDayMonth(time)	_TimeSub(time,10)	Get the last day of the month
DateMonth(time)	_TimeSub(time,5)	Get month from time
DateWeekDay(time)	_TimeSub(time,4)	Get weekday from time
DELETE_ANM	000	Delete animation
DevFirst(hDev)	DevSeek(hDev,0)	DevSeek with Offset=0
DspButton(hAn,UK=0,sText,hFont=0,nW=0,nH=0,DK=0,RK=0,nM=0)	_DspButton(hAn,UK,sText,hFont,nW,nH,DK,RK,nM)	Display button
DspButtonFn(hAn,UF=0,sText,hFont=0,nW=0,nH=0,DF=0,RF=0,nM=0)	_DspButtonFn(hAn,UF,sText,hFont,nW,nH,DF,RF,nM)	Display a button
DspSymAnmEx(hAn,mode,s1,s2=0,s3=0,s4=0,s5=0,s6=0,s7=0,s8=0,s9=0)	_DspSymAnm(hAn,s1,s2,s3,s4,s5,s6,s7,s8,mode,s9)	DspSymAnm with mode
EVEN_P	2	Even Parity
Exec(sText,mode=1)	_Exec(sText,mode)	Exec program, default to normal

Name	Expression	Comment
FALSE	0	Boolean False
FlashColourState()	StrToInt(PageInfo(18))	Flashing Color State as a boolean
GetBlueValue(PackedRGB)	((PackedRGB) / 65536) BITAND 255	Get the blue component of a packed RGB color
GetGreenValue(PackedRGB)	((PackedRGB) / 256) BITAND 255	Get the green component of a packed RGB color
GetRedValue(PackedRGB)	((PackedRGB) BITAND 255)	Get the red component of a packed RGB color
GetVar(sTag,sField)	\$7	Get variable field data
GetVarDef(sTag,sField,sDefault)	\$10	Get variable field data if defined
GetVarStr(sTag,sField)	\$8	Get variable field data as str
GetVarStrDef(sTag,sField,sDefault)	\$11	Get variable field data as a str if defined
GRAY_ALL	3	Gray the entire button
GRAY_HIDE	4	Hide object when grayed
GRAY_PART	2	Sink and gray the text / symbol
GRAY_SUNK	1	Sink the text / symbol
IFDEF(sTag,sTrue,sFalse)	\$9	Inline IF defined macro
IFDEFDIGALM(sTag,sTrue,sFalse)	\$12	Inline IF defined macro
IFDEFADVALM(sTag,sTrue,sFalse)	\$13	Inline IF defined macro
IFDEFANAALM(sTag,sTrue,sFalse)	\$14	Inline IF defined macro
InAnimationCycle()	StrToInt(PageInfo(19))	In Animation Cycle as a boolean
InCommunicationsCycle()	StrToInt(PageInfo(20))	In Communications Cycle as a boolean
KeyDown()	KeyMove(4)	Move Cursor down
KeyLeft()	KeyMove(1)	Move Cursor left
KeyReplayAll()	_KeyReplay(0)	Key Replay All
KeyRight()	KeyMove(2)	Move Cursor right

Name	Expression	Comment
KeyUp()	KeyMove(3)	Move Cursor up
MakeCitectColour(Red, Green, Blue)	MakeColour(Red, Green, Blue)	Alias for <a href="#">MakeColour</a>
NONE	0	No Parity
NORMAL	0	Normal Button
ObjectByName(sName)	ObjectByNameEx(WinNumber(),sName)	Get ActiveX object on current page by name
ODD_P	1	Odd Parity
OVERLAP	1	Display mode 1
Print(sText,nMode=0)	DevPrint(DevCurr(),sText,nMode)	Print output to device
PrintLn(sText)	DevPrint(DevCurr(),sText,1)	Print output to device, newline
Pulse(arg)	arg = TRUE; Sleep(2); arg = FALSE;	Pulse the variable
RAboveUCL	8192	
RBelowLCL	16384	
ROutsideCL	4096	
Shutdown(sDest="",sProject="",nMode=1)	_Shutdown(sDest,sProject,nMode)	Shutdown macro
SQLNoFields(hSQL)	SQLNumFields(hSQL)	Get the number of fields
SOFT	0	Display mode 0
TARGET	3	Screen Target
TestRandomWave(p=60,lo=0,hi=100,off=0)	_Wave(4,p,lo,hi,off)	Test random wave
TestSawWave(p=60,lo=0,hi=100,off=0)	_Wave(3,p,lo,hi,off)	Test Saw wave
TestSinWave(p=60,lo=0,hi=100,off=0)	_Wave(0,p,lo,hi,off)	Test sin wave
TestSquareWave(p=60,lo=0,hi=100,off=0)	_Wave(1,p,lo,hi,off)	Test square wave
TestTriangWave(p=60,lo=0,hi=100,o	_Wave(2,p,lo,hi,off)	Test Triag wave

Name	Expression	Comment
ff=0)		
TimeHour(time)	_TimeSub(time,0)	Get hours from time
TimeMidNight(time)	_TimeSub(time, 7)	Extract time at midnight
TimeMin(time)	_TimeSub(time,1)	Get minutes from time
TimeSec(time)	_TimeSub(time,2)	Get seconds from time
TimeSecond(time)	_TimeSub(time, 2)	Get seconds from time
TimeYearDay(time)	_TimeSub(time, 8)	
Toggle(arg)	arg = NOT arg;	Toggle the variable
TRN_EVENT	2	Event trend
TRN_PERIODIC	1	Periodic trend
TRN_PERIODIC_EVENT	3	Periodic Event trend
TRUE	1	Boolean True
UnitControl(IODev,Type,Data)	IODeviceControl(IODev,Type,Data)	
UnitInfo(IODev,Type)	IODeviceInfo(IODev,Type)	
UnitStats()	IODeviceStats()	
VarToArrayIndex(sTag)	\$16	Get the array index of a tag as a value
VarToStr(sTag)	\$15	Convert a tag reference to a string
WRITE_ON_DRAG	1	Write mode for slider
WRITE_ON_DROP	0	Write mode for slider
XAboveUCL	4	
XBelowLCL	8	
XDownTrend	64	
XErratic	512	
XFreak	1	
XGradualDown	256	

Name	Expression	Comment
XGradualUp	128	
XMixture	2048	
XOutsideCL	2	
XOutsideWL	16	
XStratification	1024	
XUpTrend	32	

**Note:** Do not modify the Include Project. Changes to the Include project are lost when you reinstall or upgrade Plant SCADA.

---

# Extensibility

In this section you will find information about the following:

- CtAPI
- Graphics Builder Automation Interface
- Using External Databases
- Exchanging Data with Other Applications
- Integration with Historian
- Using Microsoft Excel to Edit DBF Tables
- Using an OPC AE Server
- Using an OPC DA Server.

## Components

You can also extend Plant SCADA using the following languages and libraries:

- **Cicode**

Cicode is a programming language designed for use in Plant SCADA to monitor and control plant equipment. It is a structured language similar to Visual Basic or C.

For more information, see [Cicode Reference](#).

- **.Net Libraries**

You can incorporate .Net objects into a project, allowing you to extend Plant SCADA with components that have been developed externally.

To add .Net objects to your project, see [Cicode Reference](#).

- **ActiveX Objects**

You can incorporate ActiveX objects into a project, allowing you to use extend Plant SCADA with components that have been developed externally.

For example, you can:

- Add an ActiveX object to a graphics page (see [Add an ActiveX Object](#))
- Call an ActiveX object using Cicode (see [ActiveX Functions](#) in the Cicode Reference).

---

**Note:** ActiveX objects are not supported on a 64-bit process, such as an alarm server operating in Extended Memory mode. If a call to an ActiveX Cicode function occurs from a 64-bit process, an error code will be returned, a hardware alarm will be raised and the Cicode thread will stop.

---

- **VBA**

You can use VBA to extend Plant SCADA. VBA is a Visual Basic for Applications (VBA) and VBScript-compatible Basic scripting language. Plant SCADA has embedded support for VBA.

For more information, see [VBA Programming Reference](#).

---

**Note:** VBA is not supported on a 64-bit process, such as an alarm server operating in Extended Memory

---

---

mode. If a call to a VBA Cicode function occurs from a 64-bit process, an error code will be returned, a hardware alarm will be raised and the Cicode thread will stop.

---

## CtAPI

CtAPI allows access to Plant SCADA's tag data via a DLL interface. It allows third party developers to create applications in C (or other languages) to read and write to I/O devices, to use data query, and to call Cicode functions.

### Building Applications

To build CtAPI client applications, you need runtime binaries, a DLL helper static library (CtAPI.lib) and a header file (CtAPI.h) that defines data structures and functions. Configure your project to use these files by following these steps:

1. Check that the files necessary to build your application that calls CtAPI functions are ready on your development environment as per your target platform (x86 or x64), by deploying these files into your project location:
  - All the runtime binaries packaged in the files **CtAPI.Win32.Redist.zip** and **CtAPI.x64.Redist.zip** (see *Running CtAPI Applications* below).
  - Development specific files in [bin] directory for x86 platform or in [bin]\Bin (x64)\ directory for x64 platform:
    - CtAPI.lib
    - CtAPI.
2. Add CtAPI.lib on your imported static library (dependency) list, to load up CtAPI.dll and its satellite binaries at application startup.
3. Include CtAPI.h on your source files that use CtAPI functions.

---

**Note:** This procedure may differ based on your development environment. Contact your system administrator or system provider if more detailed information is required.

---

### Running CtAPI Applications

To run a CtAPI application, the program needs to be able to locate CtAPI.dll and its dependencies. There are several ways to achieve this:

- If you are running your application on a computer where Plant SCADA is installed, you can copy your program and its dependencies to the Plant SCADA Bin directory.
- You can copy the set of required binaries into the same directory as your application. These binaries are packaged in the files **CtAPI.Win32.Redist.zip** and **CtAPI.x64.Redist.zip**, which can be found in the following directory on the Plant SCADA installation media:  
  \AVEVA Plant SCADA2023\Extras\CtAPI  
You will need to use this approach if you want to use CtAPI on a computer that does not have Plant SCADA installed.
- If the above options are not possible (for example, you are using CtAPI from VBA in a Microsoft™ Office

application such as Excel™), then you can add the Plant SCADA Bin directory to the %PATH% environment variable. This allows your application to locate CtAPI.dll, however, certain dependencies will not be located this way because Windows will not use the path to locate .NET managed assemblies.

To resolve this, call the CtAPI function [ctSetManagedBinDirectory](#) with the path to the Plant SCADA Bin directory before your call to [ctOpen](#). If Plant SCADA is not installed on the computer running the application, then extract the binaries from the above zip file to another directory and use that directory in place of the Bin directory.

---

**Note:** You can encrypt the connection between a remote CtAPI client and Plant SCADA. For more information, see [Secure the Connection from a Remote CtAPI Application](#).

---

The following needs to be installed on remote CtAPI clients:

- .NET 4.8
- Microsoft Visual C++ 2015-2022 Redistributable (x86)

Or:

Microsoft Visual C++ 2015-2022 Redistributable (x64)

---

**Note:** This API has not been designed to be called from Plant SCADA Cicode DLL functions or from a Plant SCADA protocol driver. If you attempt this, it may cause a deadlock condition to occur. If you need to call the CtAPI from a protocol driver, create a new Win32 thread to call the API. You cannot call the CtAPI from the Cicode DLL interface.

[Debug Tracing](#)

[CtAPI Functions Reference](#)

## I/O Point Count

Physical I/O Device tags read or written to, using the CtAPI are counted as dynamic Plant SCADA points. If the point limit is exceeded by making calls to this interface, those calls will not succeed and Plant SCADA will not be allocated any more dynamic points.

---

**Note:** Plant SCADA licensing works on the basis of how many points you use. Every tag in your system has the potential to add to your point count. It is important to remember this and plan your system properly; otherwise you may exceed your point limit.

---

The point limit is the maximum number of I/O Device addresses (variable tags) that can be read, and is specified by your Plant SCADA license. Plant SCADA counts I/O Device addresses dynamically at runtime. This includes tags used by alarms, trends, reports, events, pages, in Super Genies, use of the [TagRead\(\)](#) and [TagWrite\(\)](#) Cicode functions, or read or write using DDE, ODBC, or the CtAPI.

It does not count any points statically at compile time.

When your system is running, any new use of tags through Super Genies, DDE, ODBC, or CtAPI can potentially add to your dynamic point count.

[CtAPI Synchronous Operation](#)

## CtAPI Synchronous Operation

The Plant SCADA CTAPI supports both synchronous and asynchronous (or overlapped) operations. The [ctCiCode](#), [ctListRead](#), and [ctListWrite](#) functions can be performed either synchronously or asynchronously. The [ctTagRead](#) and [ctTagWrite](#) functions can be performed synchronously only.

When a function is executed synchronously, it does not return until the operation has been completed. This means that the execution of the calling thread can be blocked for an indefinite period while it waits for a time-consuming operation to finish. A function called for an overlapped operation can return immediately, even though the operation has not been completed. This enables a time-consuming I/O operation to be executed in the background while the calling thread is free to perform other tasks. For example, a single thread can perform simultaneous operations on different handles, or even simultaneous read and write operations on the same handle. To synchronize its execution with the completion of the overlapped operation, the calling thread uses the [ctGetOverlappedResult](#) function or one of the wait functions to determine when the overlapped operation has been completed. You can also use the [ctHasOverlappedIoCompleted](#) macro to poll for completion.

To call a function to perform an overlapped operation, the calling thread needs to specify a pointer to a **CTOVERLAPPED** structure. If this pointer is NULL, the function return value may incorrectly indicate that the operation completed. The **CTOVERLAPPED** structure needs to contain a handle to a manual-reset, not an auto-reset event object. The system sets the state of the event object to non-signaled when a call to the I/O function returns before the operation has been completed. The system sets the state of the event object to signaled when the operation has been completed.

When a function is called to perform an overlapped operation, it is possible that the operation will be completed before the function returns. When this happens, the results are handled as if the operation had been performed synchronously. If the operation was not completed, however, the function's return value is FALSE, and the [GetLastError\(\)](#) function returns ERROR\_IO\_PENDING.

A thread can manage overlapped operations by either of two methods:

- Use the [ctGetOverlappedResult](#) function to wait for the overlapped operation to be completed.
- Specify a handle to the **CTOVERLAPPED** structure's manual-reset event object in one of the wait functions and then call [ctGetOverlappedResult](#) after the wait function returns. The [ctGetOverlappedResult](#) function returns the results of the completed overlapped operation, and for functions in which such information is appropriate, it reports the actual number of bytes that were transferred.

When performing multiple simultaneous overlapped operations, the calling thread needs to specify a **CTOVERLAPPED** structure with a different manual-reset event object for each operation. To wait for any one of the overlapped operations to be completed, the thread specifies the manual-reset event handles as wait criteria in one of the multiple-object wait functions. The return value of the multiple-object wait function indicates which manual-reset event object was signaled, so the thread can determine which overlapped operation caused the wait operation to be completed.

You can cancel a pending asynchronous operation using the `ctCancelIO` function. Pending asynchronous operations are canceled when you call `ctClose`.

**Note:** Due to a session isolation feature introduced in an earlier version of Windows, CTAPI applications running as a service may be unable to connect. To overcome this, in the CTAPI application, specify an IP Address (which can be 127.0.0.1) and a valid username and password.

[Reading Data Using the CtAPI Functions](#)

# Reading Data Using the CtAPI Functions

## I/O tags interface

The Plant SCADA I/O Server is designed on a client read on demand basis. The Plant SCADA I/O Server will read I/O tags from the I/O Devices when requested to by a Client. This reduces the load on the I/O Devices and increases the overall system performance.

The client interface to the real time data is more complex as the client needs to wait for a physical I/O cycle to complete before the data can be used. The client needs to request the data it requires from the I/O Server and then wait up to several seconds while the I/O Server reads the requested data. This design is reflected in the operation of the CTAPI interface. Using CTAPI to read a tag can take several seconds to complete. It is up the caller to allow for this in their design in calling this interface.

If you need to use a polling type of service, use the `ctList` functions.

## The Tag functions

The simplest way to read data is via the `ctTagRead` function. This function reads the value of a single variable, and the result is returned as a formatted engineering string.

## List functions

The List functions provide a higher level of performance for reading data than the tag based interface. The List functions also provide support for overlapped operations.

The List functions allow a group of tags to be defined and then read as a single request. They provide a simple tag based interface to data which is provided in formatted engineering data. You may create several lists and control each individually.

Tags can be added to, or deleted from lists dynamically, even if a read operation is pending on the list.

## Array support

Arrays are supported in the tag functions `ctTagWrite()`, and `ctTagRead()`. These functions can take the singular tag name as "PV123", or use the array syntax as "Recipe[10]". When the array syntax is used in the "Recipe[10]" example, the single value can be read or written to, not the entire array.

## Bit shifting when reading digital arrays

When digital types are read, Plant SCADA may adjust the starting position of the first point. This is done to improve the performance of the digital read. For example, if you start reading an array of digital values, Plant SCADA may read several digitals before the start of the array, and the data will be offset. When Plant SCADA shifts the bits, extra data will be read from the I/O Device. Plant SCADA may shift the data up to 15 bits, resulting in an extra 2 bytes of buffer space necessary for reads. Therefore, always use digital buffers which contain 2 bytes extra.

[CtAPI Functions Reference](#)

## Secure the Connection from a Remote CtAPI Application

You can encrypt the connection between a remote computer running a CtAPI application and Plant SCADA's servers.

### To enable encryption for a remote CtAPI client application:

1. Copy the set of required binaries into the same directory as the CtAPI client application (see *Running CtAPI Applications* in the topic [CtAPI](#)).
2. If Plant SCADA is not installed on the computer where the CtAPI application is hosted, install a runtime-only client (see [Install a Runtime-only Client](#)).
3. Use Configurator to connect the computer to the System Management Server you use to manage the required certificates for encryption (see [Connect a Computer to a System Management Server](#)).
4. On Configurator's **Encryption** page, select **Enable Encryption**. Do not select **Accept encrypted and non-encrypted connections (mixed mode)**.

**Note:** Runtime Manager does not need to be configured to run as a service as it is not required to run a CtAPI application.

5. Confirm that the Windows user account under which the CtAPI application will run is part of the SCADA.RuntimeUsers Windows group on the CtAPI server machine, or a member of a Windows Group that is associated with the SCADA.RuntimeUsers group. For more information, see [Security Roles](#).

6. Within the `ctOpen` command, set the `sComputer` argument to the computer name of the remote CTAPI server. Do not use an IP Address for `sComputer`. If you do, encryption will not be possible as the certificate is bound to the computer name.

**Note:** Using a hostname to connect to a CTAPI server running Citect SCADA 8.20 or earlier will not work if Windows is configured to return an IPv6 address for that hostname, as 8.20 and earlier do not support IPv6 network addresses. To avoid this, configure Windows to return an IPv4 address in preference to an IPv6 address.

[CtAPI Functions Reference](#)

[Error Codes](#)

## Error Codes

The error codes returns from the CtAPI functions are the Microsoft WIN 32 error codes. These error codes are documented in the Microsoft SDKs. Where the error code is a Plant SCADA special error code, the error code is added to the value `-ERROR_USER_DEFINED_BASE`.

**Note:** If a CtAPI function returns the error 233, it typically means the connection to the client is not established. However, it may also mean the client has not logged in correctly. Check for both scenarios.

## Example

```
int bRet = ctTagWrite(hCTAPI, "SP123", "12.34");
if (bRet == 0) {
    dwStatus = GetLastError();
    if (dwStatus < ERROR_USER_DEFINED_BASE) {
        // Microsoft error codes see ERROR.H
    } else {
        short status;
        // status is thePlant SCADA error codes, see Plant SCADA help
        status = dwStatus - ERROR_USER_DEFINE_BASE;
    }
}
```

The following defines have been declared to make this checking easier:

```
IsPlantSCADAError(dwStatus) // test if Plant SCADA error
WIN32_TO_CT_ERROR(dwStatus) // Convert to Plant SCADA status
```

For example:

```
if (IsPlantSCADAError(dwStatus)) {
    short status;
    // status is the Plant SCADA error codes, see Plant SCADA help
    status = WIN32_TO_CT_ERROR(dwStatus);
}
```

If the connection is lost between your application and Plant SCADA, close the connection and reopen. An inoperative connection will be shown by the returning of a Microsoft error code. If a Plant SCADA status error is returned, the connection has not been lost. The command requested is invalid and the connection does not have to be closed and reopened.

```
int bRet = ctTagWrite(hCTAPI, "SP123", "12.34");
if (bRet == 0) {
    dwStatus = GetLastError();
    if (dwStatus < ERROR_USER_DEFINED_BASE) {
        ctClose(hCTAPI);
        hCTAPI = ctOpen(NULL, NULL, NULL, 0);
        while (hCTAPI == NULL) {
            Sleep(2000); // wait a while
            hCTAPI = ctOpen(NULL, NULL, NULL, 0);
        }
    }
}
```

When the connection between your application and Plant SCADA is lost, any pending overlapped commands will time out and be canceled by CtAPI. You need to destroy handles which are associated with the connection.

In Version 5.10, the CT\_OPEN\_RECONNECT mode was added to ctOpen(). When this mode is enabled, CtAPI will attempt to re-establish the connection to Plant SCADA if a communication interruption occurs. Handles created with the connection will remain valid when the connection is re-created. While the connection is down, functions will be ineffective and will report errors.

[Debug Tracing](#)

## Debug Tracing

Debug tracing of the CtAPI has been added to the kernel. You may enable the debug trace with the command CtAPI 1 in the main kernel window. CtAPI 0 will disable the debug tracing. You may also enable the debug tracking by setting the CITECT.INI parameter:

```
[CTAPI]
Debug=1
```

The debug tracing will display each client CtAPI traffic to Plant SCADA. This tracing may slow down the performance of Plant SCADA and the CtAPI client if a large amount of communication is occurring.

The debug trace is displayed in the main Plant SCADA kernel window and is logged to the syslog.dat file.

## CtAPI Functions Reference

The CtAPI functions allow access to Plant SCADA I/O variable tags via a DLL interface. This allows third-party developers to create applications in C or other languages to read and write to the I/O Devices.

Function	Argument(s)	Type	Description
<a href="#">ctCancelIO</a>	hCTAPI, pctOverlapped	Boolean	Cancels a pending overlapped I/O operation.
<a href="#">ctCiCode</a>	hCTAPI, sCmd, hWin, nMode, sResult, dwLength, pctOverlapped	DWORD	Executes a Cicode function.
<a href="#">ctClientCreate</a>	()	n/a	Initializes the resources for a new CtAPI client instance
<a href="#">ctClientDestroy</a>	hCTAPI	Boolean	The handle to the CTAPI as returned from <a href="#">ctOpen()</a> .
<a href="#">ctClose</a>	hCTAPI	Boolean	Closes a connection to the Plant SCADA API.
<a href="#">ctCloseEx</a>	hCTAPI,bDestroy	Handle	The handle to the CTAPI as returned from <a href="#">ctOpen()</a> .
<a href="#">ctEngToRaw</a>	pResult, dValue, pScale, dwMode	Boolean	Converts the engineering scale variable into raw I/O Device scale.
<a href="#">ctFindClose</a>	hnd	Boolean	Closes a search initiated by <a href="#">ctFindFirst()</a> .
<a href="#">ctFindFirst</a>	hCTAPI, szTableName, szFilter, pObjHnd, dwFlags	Handle	Searches for the first object in the specified database which satisfies the filter string.
<a href="#">ctFindFirstEx</a>	hCTAPI, szTableName, szFilter, szCluster, pObjHnd, dwFlags	Handle	Searches for the first object in the specified database which satisfies the filter string specified by cluster.
<a href="#">ctFindNext</a>	hnd, pObjHnd	Boolean	Retrieves the next object in a search initiated by <a href="#">ctFindFirst()</a> .
<a href="#">ctFindNumRecords</a>	hnd	Boolean	Gets the number of records for a given browsing session.
<a href="#">ctFindPrev</a>	hnd, pObjHnd	Boolean	Retrieves the previous

Function	Argument(s)	Type	Description
			object in a search initiated by ctFindFirst().
ctFindScroll	hnd, dwMode, dwOffset, pObjHnd	Handle	Scrolls to the necessary object in a search initiated by ctFindFirst().
ctGetOverlappedResult	hCTAPI, lpctOverlapped, pBytes, bWait	Boolean	Returns the results of an overlapped operation.
ctGetProperty	hnd, szName, pData, dwBufferLength, dwResultLength, dwType	Boolean	Retrieves an object property.
ctHasOverlappedIoCompleted	lpctOverlapped	Boolean	Checks for the completion of an outstanding I/O operation.
ctListAdd	hList, sTag	Handle	Adds a tag to the list.
ctListAddEx	hList, sTag, bRaw, nPollPeriodMS, dDeadband	Handle	Adds a tag to the list with a specified poll period.
ctListData	hTag, pBuffer, dwLength, dwMode	Boolean	Gets the value of a tag on the list.
ctListDelete	hTag	Boolean	Frees a tag created with ctListAdd().
ctListEvent	hCTAPI, dwMode	Handle	Returns the elements in the list which have changed state since they were last read using the ctListRead() function.
ctListFree	hList	Boolean	Frees a list created with ctListNew().
ctListItem	hTag, dwItem, pBuffer, dwLength, dwMode	Boolean	Gets the tag element item data.
ctListNew	hCTAPI, dwMode	Handle	Creates a new list.
ctListRead	hList, pctOverlapped	Boolean	Reads every tag on the list.
ctListWrite	hTag, sValue, pctOverlapped	Boolean	Writes to a single tag on the list.

Function	Argument(s)	Type	Description
<a href="#">ctOpen</a>	sComputer, sUser, sPassword, nMode	Handle	Opens a connection to the Plant SCADA API.
<a href="#">ctOpenEx</a>	sComputer, sUser, sPassword, nMode, hCTAPI	Handle	Establishes the connection to the CtAPI server using the given client instance.
<a href="#">ctRawToEng</a>	pResult, dValue, pScale, dwMode	Boolean	Converts the raw I/O Device scale variable into engineering scale.
<a href="#">ctTagGetProperty</a>	hCTAPI, szTagName, szProperty, pData, dwBufferLength, dwType	Boolean	Gets the given property of the given tag.
<a href="#">ctTagRead</a>	hCTAPI, sTag, sValue, dwLength	Boolean	Reads the current value from the given I/O Device variable tag.
<a href="#">ctTagReadEx</a>	hCTAPI, sTag, sValue, dwLength, pctTagvalueItems	Boolean	Performs the same as <a href="#">ctTagRead</a> , but with an additional new argument
<a href="#">ctTagWrite</a>	hCTAPI, sTag, sValue	Boolean	Writes the given value to the I/O Device variable tag.
<a href="#">ctTagWriteEx</a>	hCTAPI, sTag, sValue, pctOverlapped	Boolean	Performs the same as <a href="#">ctTagWrite</a> , but with an additional new argument.

## ctCancelIO

Cancels a pending overlapped I/O operation. When the I/O command is canceled, the event will be signaled to show that the command has completed. The status will be set to the Plant SCADA error **ERROR CANCELED**. If the command completes before you can cancel it, [ctCancelIO\(\)](#) will return **FALSE**, and [GetLastError\(\)](#) will return **GENERIC\_CANNOT\_CANCEL**. The status of the overlapped operation will be the completion status of the command.

The CTAPI interface will automatically cancel any pending I/O commands when you call [ctClose\(\)](#).

## Syntax

**ctCancelIO(hCTAPI, pctOverlapped)**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctOpen\(\)](#).

*pctOverlapped*

Type: CTOVERLAPPED\*

Input/output: Input

Description: Pointer to the overlapped I/O operation to cancel. If you specify NULL, any pending overlapped I/O operations on the interface will be canceled.

## Return Value

If the function succeeds, the return value is TRUE. If the function does not succeed, the return value is FALSE. To get extended error information, call [GetLastError](#).

## Related Functions

[ctOpen](#), [ctClose](#)

## Example

```
char sVersion[128];
CTOVERLAPPED ctOverlapped;
ctOverlapped.hEvent = CreateEvent(NULL, TRUE, TRUE, NULL);
ctCiCode(hCTAPI, "Version(0)", 0, 0, sVersion, sizeof(sVersion),
&ctOverlapped);
ctCancelIO(hCTAPI, &ctOverlapped);
```

## ctCiCode

Executes a Cicode function on the connected Plant SCADA computer. This allows you to control Plant SCADA or to get information returned from Cicode functions. You may call either built in or user defined Cicode functions. Cancels a pending overlapped I/O operation.

The function name and arguments to that function are passed as a single string. Standard Plant SCADA conversion is applied to convert the data from string type into the type expected by the function. When passing strings put the strings between the Plant SCADA string delimiters.

Functions which expect pointers or arrays are not supported. Functions which expect pointers are functions which update the arguments. This includes functions DspGetMouse(), DspAnGetPos(), StrWord(), and so on. Functions which expect arrays to be passed or returned are not supported, for example TableMath(), TrnSetTable(), TrnGetTable(). You may work around these limitations by calling a Cicode wrapper function which in turn calls the function you require.

If the Cicode function you are calling takes a long time to execute, is pre-empt or blocks, then the result of the function cannot be returned in the sResult argument. The Cicode function will, however, execute correctly.

## Syntax

**ctCiCode(*hCTAPI*, *sCmd*, *hWin*, *nMode*, *sResult*, *dwLength*, *pctOverlapped*)**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctOpen\(\)](#).

*sCmd*

Type: String

Input/output: Input

Description: The command to execute.

*vhWin*

Type: Dword

Input/output: Input

Description: The Plant SCADA window to execute the function. This is a logical Plant SCADA window (0, 1, 2, 3 etc.) not a Windows Handle.

*nMode*

Type: Dword

Input/output: Input

Description: The mode of the Cicode call. Set this to 0 (zero).

*sResult*

Type: LPSTR

Input/output: Output

Description: The buffer to put the result of the function call, which is returned as a string. This may be NULL if you do not require the result of the function.

*dwLength*

Type: Dword

Input/output: Input

Description: The length of the sResult buffer. If the result of the Cicode function is longer than this number, then the result is not returned and the function call does not succeed, however the Cicode function is still executed. If the sResult is NULL then this length needs to be 0.

*pctOverlapped*

Type: CTOVERLAPPED\*

Input/output: Input

Description: CTOVERLAPPED structure. This structure is used to control the overlapped notification. Set to NULL if you want a synchronous function call.

## Return Value

Type: Dword. TRUE if successful, otherwise FALSE. Use [GetLastError\(\)](#) to get extended error information.

## Related Functions

[ctOpen](#)

## Example

```
char sName[32];
ctCicode(hCTAPI, "AlarmAck(0,)", 0, 0, NULL, 0, NULL);
```

```
ctCicode(hCTAPI, "PageInfo(0)", 0, 0, sName, sizeof(sName), NULL);
/* to call the Prompt function with the string "Hello", the C code would be:
*/
ctCicode(hCTAPI, "Prompt(\"Hello\")", 0, 0, NULL, 0, NULL);
/* If the string does not contain any delimiters (for example spaces or commas) you may
omit the string delimiters. For example to display a page called "Menu" the C code would
be:
*/
ctCicode(hCTAPI, "PageDisplay(Menu)", 0, 0, NULL, 0, NULL);
```

## ctClientCreate

ctClientCreate initializes the resources for a new CtAPI client instance. Once you have called ctClientCreate, you can pass the handle returned to [ctOpenEx](#) to establish communication with the CtAPI server.

Consider a situation where you try to communicate to the CtAPI server and the server takes a long time to respond (or doesn't respond at all). If you just call , you haven't been given a handle to the CtAPI instance, so you can't cancel the ctOpen by calling [ctCancelIO](#). But if you use ctClientCreate and then call ctOpenEx, you can use the handle returned by ctClientCreate to cancel the ctOpenEx.

## Syntax

**ctClientCreate()**

## Return Value

If the function succeeds, the return value specifies a handle. If the function does not succeed, the return value is NULL. Use [GetLastError\(\)](#) to get extended error information.

## Related Functions

[ctOpen](#), [ctOpenEx](#), [ctClose](#), [ctCloseEx](#), [ctClientDestroy](#)

## Example

```
DWORD dwStatus = 0;
HANDLE hCtapi = ctClientCreate();
if (hCtapi == NULL) {
    dwStatus = GetLastError(); // An error has occurred, trap it.
} else {
    if (TRUE == ctOpenEx(NULL, NULL, NULL, 0, hCtapi)) {
        ctTagWrite(hCtapi, "Fred", "1.5");
        if (FALSE == ctCloseEx(hCtapi, FALSE)) {
            dwStatus = GetLastError(); // An error has occurred, trap it.
        }
    } else {
        dwStatus = GetLastError(); // An error has occurred, trap it.
    }
    if (FALSE == ctClientDestroy(hCtapi)) {
        dwStatus = GetLastError(); // An error has occurred, trap it
    }
}
```

```
}
```

## ctClientDestroy

Cleans up the resources of the given CtAPI instance. Unlike [ctClose](#), ctClientDestroy does not close the connection to the CtAPI server.

You need to call [ctCloseEx](#) with *bDestroy* equal to FALSE before calling ctClientDestroy.

### Syntax

**ctClientDestroy(*hCTAPI*)**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctOpen\(\)](#).

### Return Value

TRUE if successful, otherwise FALSE. Use [GetLastError\(\)](#) to get extended error information.

### Related Functions

[ctCloseEx](#), [ctClose](#), [ctClientCreate](#), [ctOpen](#), [ctOpenEx](#)

### Example

See [ctClientCreate](#) for an example.

## ctClose

Closes the connection between the application and the CtAPI. When called, any pending commands will be canceled. You need to free any handles allocated before calling ctClose. These handles are not freed when ctClose is called. Call this function from an application on shutdown or when a major error occurs on the connection.

### Syntax

**ctClose(*hCTAPI*)**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctOpen](#).

## Return Value

TRUE if successful, otherwise FALSE. Use GetLastError() to get extended error information.

## Related Functions

[ctOpen](#)

## Example

See the example for [ctOpen](#).

## ctCloseEx

Closes the connection to the CtAPI server for the given CtAPI instance. It closes the connection the same way as does the [ctClose](#) method, but provides an option for whether or not to destroy the CtAPI instance within the [ctCloseEx](#) function call. [ctClose](#) always destroys the CtAPI instance within its function call.

For example, consider a situation where when we try to close the connection to the CtAPI server and it takes a long time to respond (or doesn't at all). If you call [ctClose](#), you can't cancel the [ctClose](#) by calling [ctCancelIO](#) because you cannot guarantee that the CtAPI instance is not in the process of being destroyed. But if you call [ctCloseEx](#) with the option of not destroying the CtAPI instance, you can call [ctCancelIO](#) to cancel the [ctCloseEx](#).

When you call [ctCloseEx](#) with *bDestroy* equal to FALSE, you need to then call [ctClientDestroy](#) afterwards to free the CtAPI client instance.

## Syntax

**ctCloseEx(*hCTAPI*,*bDestroy*);**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctOpen\(\)](#).

*bDestroy*

Type: boolean

Input/output: Input

Description: If TRUE will destroy the CtAPI instance within the [ctCloseEx](#) function call. Default is FALSE.

## Return Value

TRUE if successful, otherwise FALSE. Use GetLastError() to get extended error information.

## Related Functions

[ctClientDestroy](#), [ctClose](#), [ctClientCreate](#), [ctOpen](#), [ctOpenEx](#)

## Example

See [ctClientCreate](#) for an example.

## ctEngToRaw

Converts the engineering scale variable into raw I/O Device scale. This is not necessary for the Tag functions as Plant SCADA will do the scaling. Scaling is not necessary for digitals, strings or if no scaling occurs between the values in the I/O Device and the Engineering values. You need to know the scaling for each variables as specified in the Plant SCADA Variable Tags table.

## Syntax

**ctEngToRaw(*pResult*, *dValue*, *pScale*, *dwMode*)**

*pResult*

Type: Double

Input/output: Output

Description: The resulting raw scaled variable.

*dValue*

Type: Double

Input/output: Input

Description: The engineering value to scale.

*pScale*

Type: CTSCALE\*

Input/output: Input

Description: The scaling properties of the variable.

*dwMode*

Type: Dword

Input/output: Input

Description: The mode of the scaling:

**CT\_SCALE\_RANGE\_CHECK:** Range check the result. If the variable is out of range then generate an error. The *pResult* still contains the raw scaled value.

**CT\_SCALE\_CLAMP\_LIMIT:** Clamp limit to maximum or minimum scales. If the result is out of scale then set result to minimum or maximum scale (which ever is closest). No error is generated if the scale is clamped. Cannot be used with CT\_SCALE\_RANGE\_CHECK or CT\_SCALE\_NOISE\_FACTOR options.

**CT\_SCALE\_NOISE\_FACTOR:** Allow noise factor for range check on limits. If the variable is our of range by less than 0.1 % then a range error is not generated.

## Return Value

TRUE if successful, otherwise FALSE. Use [GetLastError\(\)](#) to get extended error information.

## Related Functions

[ctOpen](#), [ctRawToEng](#), [ctTagRead](#)

## Example

```
CTSCALE Scale = { 0.0, 32000.0, 0.0, 100.0};  
double dSetPoint = 42.23;  
double dRawValue;  
ctEngToRaw(&dRawValue, dSetPoint, &Scale, CT_SCALE_RANGE_CHECK);
```

## ctFindClose

Closes a search initiated by [ctFindFirst](#).

## Syntax

```
ctFindClose(hnd)  
hnd  
Type: Handle  
Input/output: Input  
Description: Handle to the search, as returned by ctFindFirst\(\).
```

## Return Value

If the function succeeds, the return value is non-zero. If the function does not succeed, the return value is zero.  
To get extended error information, call [GetLastError\(\)](#).

## Related Functions

[ctOpen](#), [ctFindNext](#), [ctFindPrev](#), [ctFindScroll](#), [ctGetProperty](#)

## Example

See [ctFindFirst](#)

## ctFindFirst

Searches for the first object in the specified table, device, trend, tag, or alarm data which satisfies the filter string. A handle to the found object is returned via pObjHnd. The object handle is used to retrieve the object properties. To find the next object, call the [ctFindNext](#) function with the returned search handle.

If you experience server performance problems when using [ctFindFirst\(\)](#) refer to [CPULoadCount](#) and [CpuLoadSleepMS](#).

## Syntax

**ctFindFirst(*hCTAPI*, *szTableName*, *szFilter*, *pObjHnd*,*dwFlags*)**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from ctOpen().

*szTableName*

Type: LPCTSTR

Input/output: Input

Description: The table, device, trend, or alarm data to be searched. The following tables and fields can be searched:

**Trend** - Trend Tags

CLUSTER, TAG, RAW\_ZERO, RAW\_FULL, ENG\_ZERO, ENG\_FULL, ENG\_UNITS, COMMENT, SAMPLEPER, TYPE, ACQERROR, HISTORIAN, EQUIPMENT, EXPRESSION, ITEM, FORMAT, STORMETHOD

**DigAlm** - Digital Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, ALMCOMMENT, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**AnaAlm** - Analog Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, VALUE, HIGH, LOW, HIGHHIGH, LOWLOW, DEADBAND, RATE, DEVIATION, ALMCOMMENT, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**AdvAlm** - Advanced Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, ALMCOMMENT, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**HResAlm** - Time-Stamped Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, MILLISEC, DATE, AREA, ALMCOMMENT, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**ArgDigAlm** - Argyle Digital (Multi-digital) Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, ALMCOMMENT, PRIORITY, STATE\_DESC, OLD\_DESC, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**ArgAnaAlm** - Argyle Analog Alarm Tags

CLUSTER, TAG, NAME, HELP, ALMCOMMENT, CATEGORY, STATE, TIME, DATE, AREA, VALUE, PRIORITY, HIGH, LOW, HIGHHIGH, LOWLOW, DEADBAND, RATE, DEVIATION, EQUIPMENT, ACQERROR, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**TsDigAlm** - Time-Stamped Digital Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, ALMCOMMENT, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**TsAnaAlm** - Time-Stamped Analog Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, VALUE, HIGH, LOW, HIGHHIGH, LOWLOW, DEADBAND, RATE, DEVIATION, ALMCOMMENT, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**ArgDigAlmStateDesc** - Argyle Digital (Multi-digital) Alarm Tag State Descriptions

CLUSTER, TAG, STATE\_DESC0, STATE\_DESC1, STATE\_DESC2, STATE\_DESC3, STATE\_DESC4, STATE\_DESC5, STATE\_DESC6, STATE\_DESC7, EQUIPMENT, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**DoublePointAlarm** - Double Point Status Alarm

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, ALMCOMMENT, PRIORITY, STATE\_DESC, OLD\_DESC, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**DoublePointAlarmStateName** - Double Point Status Alarm State Name

CLUSTER, TAG, STATE\_DESC0, STATE\_DESC1, STATE\_DESC2, STATE\_DESC3, STATE\_DESC4, STATE\_DESC5, STATE\_DESC6, STATE\_DESC7, EQUIPMENT, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**Alarm** - Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, ALMCOMMENT, VALUE, HIGH, LOW, HIGHHIGH, LOWLOW, DEADBAND, RATE, DEVIATION, PRIORITY, STATE\_DESC, OLD\_DESC, ALARMTYPE, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**AlarmSummary** - Alarm Summary

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, TIME, DATE, AREA, VALUE, HIGH, LOW, HIGHHIGH, LOWLOW, DEADBAND, RATE, DEVIATION, PRIORITY, STATE\_DESC, OLD\_DESC, ALARMTYPE, ONDATE, ONDATEEXT, ONTIME, ONMILLI, OFFDATE, OFFDATEEXT, OFFTIME, OFFMILLI, DELTATIME, ACKDATE, ACKDATEEXT, ACKTIME, ALMCOMMENT, USERNAME, FULLNAME, USERDESC, SUMSTATE, SUMDESC, NATIVE\_SUMDESC, COMMENT, NATIVE\_COMMENT, EQUIPMENT, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**AlarmSOE** - Alarm Sequence Of Events

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, TIME, DATE, AREA, VALUE, HIGH, LOW, HIGHHIGH, LOWLOW, DEADBAND, RATE, DEVIATION, PRIORITY, STATE\_DESC, OLD\_DESC, ALARMTYPE, ONDATE, ONDATEEXT, ONTIME, ONMILLI, OFFDATE, OFFDATEEXT, OFFTIME, OFFMILLI, DELTATIME, ACKDATE, ACKDATEEXT, ACKTIME, ALMCOMMENT, USERNAME, FULLNAME, USERDESC, SUMSTATE, SUMDESC, NATIVE\_SUMDESC, COMMENT, NATIVE\_COMMENT, EQUIPMENT, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8, USERNAME, USERLOCATION

**Accum** - Accumulators

PRIV, AREA, CLUSTER, NAME, TRIGGER, VALUE, RUNNING, STARTS, TOTALISER

**Equip** – Equipment

CLUSTER, NAME, IODEVICE, AREA, LOCATION, SCHEDULED, DEFSTATE, COMMENT, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8, COMPOSITE, PARENT, PAGE, HELP, REFERENCE, DEVSCHEDE, SCHEDID

**EquipState** – Equipment State

CLUSTER, NAME, EQUIPMENT, PERIOD, DELAY, PRIORITY, DESCRIPTION, DRMODE

**EquipRef** – Equipment Reference

CLUSTER, EQUIP, REFCLUST, REFEQUIP, REFITEM, CATEGORY, ORDER, COMMENT, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**Tag - Variable Tags**

TAG, RAW\_ZERO, RAW\_FULL, ENG\_ZERO, ENG\_FULL, ENG\_UNITS, COMMENT, TYPE, CLUSTER, FULLNAME, IODEV, ADDR, DEADBAND, LOG\_UNIT, NET\_UNIT, EQUIPMENT, ITEM, HISTORIAN, OVR\_MODE, CTRL\_MODE, NUM\_SUBS, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8, ARR\_SIZE, BIT\_WIDTH, FORMAT

**Cluster - Clusters**

NAME, COMMENT, ACTIVE

**Server**

NAME, TYPE, COMMENT, CLUSTER, MODE, NETADDR, PORT, LEGACYPORT

**Schedule\_Config - Schedule Configuration**

ID, EQUIPMENT, STATE, START, OCCURRENCESTART, END, OCCURRENCEEND, DESC, MODIFIEDTIME, FREQ, INTERVAL, WEEKDAY, WEEKDAYMASK, MAXREC, RECOUNTIL, DAYORD, DAY, MONTH, SPECIALINC, GROUPIDS, RESOURCETYPE, SOURCEVALUE, SOURCEID

**Schedule\_Runtime - Schedule Runtime**

EQUIPMENT, STATE, START, END, INHERITED, DESC, RESOURCETYPE, SOURCEVALUE, SOURCEID

**Schedule\_Special\_Group - Schedule Special Group**

NAME, ID, RESOURCE, CHILDRESOURCES

**Schedule\_SpecialItem - Schedule Special Item**

ID, NAME, DAY, GROUPNAME, GROUPID

---

**Note:** The migration tool in Plant SCADA 2023 converts memory PLC variables to local variable tags which are in a separate table to the variable tags. Calling ctFindFirst with *szTableName* "Tag" will not return the local variable tags. In order to return the local variable tags you need to call ctFindFirst with the *szTableName* of "LocalTag". Local variables do not have clusters and have only one pair of zero/full scales (as opposed to raw and engineering scales for variable tags).

---

**LocalTag - The field names for local variable tags are:**

NAME, TYPE, ASIZE (array size), ZERO, FULL, UNITS, COMMENT, FORMAT.

The array size field is only available for local tags.

**szFilter**

Type: LPCTSTR

Input/output: Input

Description: Filter criteria. This is a string based on the following format:

"PropertyName1=FilterCriteria1;PropertyName2=FilterCriteria2"

The wildcard \* may be used as part of the filter criteria to match multiple entries. Use an empty string, or "\*" as the filter string to match every entry.

**pObjHnd**

Type: HANDLE

Input/output: Output

Description: The pointer to the found object handle. This is used to retrieve the properties.

**dwFlags**

This argument is no longer used, pass in a value of 0 for this argument.

**To search a table:**

- In *szTableName* specify the name of the table.

**To search a device:**

- In *szTableName* specify the name as defined in the Plant SCADA devices settings, for example "RECIPES" for the Example project.

**To search trend data:**

- In *szTableName* specify the trend using the following format (including the quotation marks):  
'TRNQUERY,Endtime,EndtimeMs,Period,NumSamples,Tagname,Displaymode,Datemode'  
See [TrnQuery](#) for syntax details.

**To search alarm data:**

- In *szTableName* specify the alarm data using the following format (including the quotation marks):  
'ALMQUERY,Database,TagName,Starttime,StarttimeMs,Endtime,EndtimeMs,Period'  
See [AlmQuery](#) for syntax details.

**Return Value**

If the function succeeds, the return value is a search handle used in a subsequent call to `ctFindNext()` or `ctFindClose()`. If the function does not succeed, the return value is NULL. To get extended error information, call `GetLastError()`

**Example**

```
HANDLE hSearch;
HANDLE hObject;
HANDLE hFind;
// Search the Tag table
hSearch = ctFindFirst(hCTAPI, "Tag", NULL, &hObject, 0);
if (hSearch == NULL) {
    // no tags found
} else {
    do {
        char sName[32];
        // Get the tag name
        ctGetProperty(hObject, "Tag", sName, sizeof(sName), NULL,
        DBTYPE_STR);
    } while (ctFindNext(hSearch, &hObject));
    ctFindClose(hSearch);
}
```

```
// Get Historical Trend data via CTAPI
// Get 100 samples of the CPU trend at 2 second
hFind = ctFindFirst(hCTAPI, "CTAPITrend(\"10:15:00 \", \"11/8/1998\", 2, 100, 0,
\"CPU\")", &hObject, 0);
while (hFind) {
    char sTime[32], sDate[32], sValue[32];
    ctGetProperty(hObject, "TIME", sTime, sizeof(sTime), NULL, DBTYPE_STR);
    ctGetProperty(hObject, "DATE", sDate, sizeof(sDate), NULL, DBTYPE_STR);
    ctGetProperty(hObject, "CPU", sValue, sizeof(sValue), NULL, DBTYPE_STR);
    // do something with the trend data.
    if (!ctFindNext(hFind, &hObject)) {
        ctFindClose(hFind);
        hFind = NULL;
        break;
    }
}
```

## ctFindFirstEx

Performs the same as [ctFindFirst](#), but with an additional new argument. Searches for the first object in the specified table, device, trend, or alarm data which satisfies the filter string. A handle to the found object is returned via *pObjHnd*. The object handle is used to retrieve the object properties. To find the next object, call the [ctFindNext](#) function with the returned search handle.

If you experience server performance problems when using [ctFindFirst\(\)](#) refer to [CPULoadCount](#) and [CpuLoadSleepMS](#).

If [ctFindFirst](#) is called instead of [ctFindFirstEx](#), the *szCluster* defaults to NULL.

**ctFindFirstEx(*hCTAPI*, *szTableName*, *szFilter*, *szCluster*, *pObjHnd*, *dwFlags*)**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctOpen\(\)](#).

*szTableName*

Type: LPCTSTR

Input/output: Input

Description: The table, device, trend, or alarm data to be searched. The following tables and fields can be searched:

**Trend** - Trend Tags

CLUSTER, TAG, RAW\_ZERO, RAW\_FULL, ENG\_ZERO, ENG\_FULL, ENG\_UNITS, COMMENT, SAMPLEPER, TYPE, ACQERROR, HISTORIAN, EQUIPMENT, EXPRESSION, ITEM, FORMAT, STORMETHOD

**DigAlm** - Digital Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, ALMCOMMENT, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**AnaAlm** - Analog Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, VALUE, HIGH, LOW, HIGHHIGH, LOWLOW, DEADBAND, RATE, DEVIATION, ALMCOMMENT, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**AdvAlm** - Advanced Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, ALMCOMMENT, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**HResAlm** - Time-Stamped Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, MILLISEC, DATE, AREA, ALMCOMMENT, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**ArgDigAlm** - Argyle Digital (Multi-digital) Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, ALMCOMMENT, PRIORITY, STATE\_DESC, OLD\_DESC, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**ArgAnaAlm** - Argyle Analog Alarm Tags

CLUSTER, TAG, NAME, HELP, ALMCOMMENT, CATEGORY, STATE, TIME, DATE, AREA, VALUE, PRIORITY, HIGH, LOW, HIGHHIGH, LOWLOW, DEADBAND, RATE, DEVIATION, EQUIPMENT, ACQERROR, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**TsDigAlm** - Time-Stamped Digital Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, ALMCOMMENT, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**TsAnaAlm** - Time-Stamped Analog Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, VALUE, HIGH, LOW, HIGHHIGH, LOWLOW, DEADBAND, RATE, DEVIATION, ALMCOMMENT, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**ArgDigAlmStateDesc** - Argyle Digital (Multi-digital) Alarm Tag State Descriptions

CLUSTER, TAG, STATE\_DESC0, STATE\_DESC1, STATE\_DESC2, STATE\_DESC3, STATE\_DESC4, STATE\_DESC5, STATE\_DESC6, STATE\_DESC7, EQUIPMENT, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**DoublePointAlarm** - Double Point Status Alarm

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, ALMCOMMENT, PRIORITY, STATE\_DESC, OLD\_DESC, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**DoublePointAlarmStateName** - Double Point Status Alarm State Name

CLUSTER, TAG, STATE\_DESC0, STATE\_DESC1, STATE\_DESC2, STATE\_DESC3, STATE\_DESC4, STATE\_DESC5, STATE\_DESC6, STATE\_DESC7, EQUIPMENT, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**Alarm** - Alarm Tags

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, STATE, TIME, DATE, AREA, ALMCOMMENT, VALUE, HIGH, LOW, HIGHHIGH, LOWLOW, DEADBAND, RATE, DEVIATION, PRIORITY, STATE\_DESC, OLD\_DESC, ALARMTYPE, EQUIPMENT, ACQERROR, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**AlarmSummary** - Alarm Summary

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, TIME, DATE, AREA, VALUE, HIGH, LOW, HIGHHIGH, LOWLOW,

DEADBAND, RATE, DEVIATION, PRIORITY, STATE\_DESC, OLD\_DESC, ALARMTYPE, ONDATE, ONDATEEXT, ONTIME,  
ONMILLI, OFFDATE, OFFDATEEXT, OFFTIME, OFFMILLI, DELTATIME, ACKDATE, ACKDATEEXT, ACKTIME,  
ALMCOMMENT, USERNAME, FULLNAME, USERDESC, SUMSTATE, SUMDESC, NATIVE\_SUMDESC, COMMENT,  
NATIVE\_COMMENT, EQUIPMENT, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5,  
CUSTOM6, CUSTOM7, CUSTOM8

**AlarmSOE** - Alarm Sequence Of Events

CLUSTER, TAG, NAME, DESC, HELP, CATEGORY, TIME, DATE, AREA, VALUE, HIGH, LOW, HIGHHIGH, LOWLOW,  
DEADBAND, RATE, DEVIATION, PRIORITY, STATE\_DESC, OLD\_DESC, ALARMTYPE, ONDATE, ONDATEEXT, ONTIME,  
ONMILLI, OFFDATE, OFFDATEEXT, OFFTIME, OFFMILLI, DELTATIME, ACKDATE, ACKDATEEXT, ACKTIME,  
ALMCOMMENT, USERNAME, FULLNAME, USERDESC, SUMSTATE, SUMDESC, NATIVE\_SUMDESC, COMMENT,  
NATIVE\_COMMENT, EQUIPMENT, HISTORIAN, ITEM, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5,  
CUSTOM6, CUSTOM7, CUSTOM8, USERNAME, USERLOCATION

**Accum** - Accumulators

PRIV, AREA, CLUSTER, NAME, TRIGGER, VALUE, RUNNING, STARTS, TOTALISER

**Equip** – Equipment

CLUSTER, NAME, IODEVICE, AREA, LOCATION, SCHEDULED, DEFSTATE, COMMENT, CUSTOM1, CUSTOM2,  
CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8, COMPOSITE, PARENT, PAGE, HELP,  
REFERENCE, DEVSCHEID, SCHEDID

**EquipState** – Equipment State

CLUSTER, NAME, EQUIPMENT, PERIOD, DELAY, PRIORITY, DESCRIPTION, DRMODE

**EquipRef** – Equipment Reference

CLUSTER, EQUIP, REFCLUST, REFEQUIP, REFITEM, CATEGORY, ORDER, COMMENT, CUSTOM1, CUSTOM2,  
CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8

**Tag** - Variable Tags

TAG, RAW\_ZERO, RAW\_FULL, ENG\_ZERO, ENG\_FULL, ENG\_UNITS, COMMENT, TYPE, CLUSTER, FULLNAME,  
IODEV, ADDR, DEADBAND, LOG\_UNIT, NET\_UNIT, EQUIPMENT, ITEM, HISTORIAN, OVR\_MODE, CTRL\_MODE,  
NUM\_SUBS, CUSTOM1, CUSTOM2, CUSTOM3, CUSTOM4, CUSTOM5, CUSTOM6, CUSTOM7, CUSTOM8,  
ARR\_SIZE, BIT\_WIDTH, FORMAT

**Cluster** - Clusters

NAME, COMMENT, ACTIVE

**Server**

NAME, TYPE, COMMENT, CLUSTER, MODE, NETADDR, PORT, LEGACYPOR

**Schedule\_Config** - Schedule Configuration

ID, EQUIPMENT, STATE, START, OCCURRENCESTART, END, OCCURRENCEEND, DESC, MODIFIEDTIME, FREQ,  
INTERVAL, WEEKDAY, WEEKDAYMASK, MAXREC, RECUNTIL, DAYORD, DAY, MONTH, SPECIALINC, GROUPIDS,  
RESOURCETYPE, SOURCEVALUE, SOURCEID

**Schedule\_Runtime** - Schedule Runtime

EQUIPMENT, STATE, START, END, INHERITED, DESC, RESOURCETYPE, SOURCEVALUE, SOURCEID

**Schedule\_Special\_Group** - Schedule Special Group

NAME, ID, RESOURCE, CHILDRESOURCES

**Schedule\_SpecialItem** - Schedule Special Item

ID, NAME, DAY, GROUPNAME, GROUPID

---

**Note:** The migration tool in Plant SCADA 2023 converts memory PLC variables to local variable tags which are in a separate table to the variable tags. Calling `ctFindFirst` with `szTableName` "Tag" will not return the local variable tags. In order to return the local variable tags you need to call `ctFindFirst` with the `szTableName` of "LocalTag". Local variables do not have clusters and have only one pair of zero/full scales (as opposed to raw and engineering scales for variable tags).

**LocalTag** - The field names for local variable tags are:

NAME, TYPE, ASIZE (array size), ZERO, FULL, UNITS, COMMENT, FORMAT.

The array size field is only available for local tags.

*szFilter*

Type: LPCTSTR

Input/output: Input

Description: Filter criteria. This is a string based on the following format:

"PropertyName1=FilterCriteria1;PropertyName2=FilterCriteria2"\.

Use "\*" as the filter to achieve the same result.

*szCluster*

Type: LPCTSTR

Input/output: Input

Description: Specifies on which cluster the `ctFindFirst` function will be performed. This can be left empty (null) for a single cluster system. In this case, `ctFindFirst` will be performed on the active cluster. In a system with multiple clusters, you need to specify a cluster.

*pObjHnd*

Type: HANDLE

Input/output: Output

Description: The pointer to the found object handle. This is used to retrieve the properties.

*dwFlags*

This argument is no longer used, pass in a value of 0 for this argument.

### To search a table:

- In `szTableName` specify the name of the table.

### To search a device:

- In `szTableName` specify the name as defined in the Plant SCADA Devices form, for example "RECIPES" for the Example project.

### To search trend data:

- In `szTableName` specify the trend using the following format (including the quotation marks):  
'TRNQUERY,Endtime,EndtimeMs,Period,NumSamples,Tagname,Displaymode,Datemode'  
See [TrnQuery](#) for syntax details.

### To search alarm data:

- In `szTableName` specify the alarm data using the following format (including the quotation marks):

'ALMQUERY,Database,TagName,Starttime,StarttimeMs,Endtime,EndtimeMs,Period'

See [AlmQuery](#) for syntax details.

## Return Value

If the function succeeds, the return value is a search handle used in a subsequent call to [ctFindNext\(\)](#) or [ctFindClose\(\)](#). If the function does not succeed, the return value is NULL. To get extended error information, call [GetLastError\(\)](#).

## Related Functions

[ctOpen](#), [ctFindNext](#), [ctFindClose](#), [ctGetProperty](#), [ctFindFirst](#)

## ctFindNext

Retrieves the next object in the search initiated by [ctFindFirst](#).

## Syntax

**ctFindNext(*hnd*, *pObjHnd*)**

*hnd*

Type: Handle

Input/output: Input

Description: Handle to the search, as returned by [ctFindFirst\(\)](#).

*pObjHnd*

Type: HANDLE

Input/output: Output

Description: The pointer to the found object handle. This is used to retrieve the properties.

## Return Value

If the function succeeds, the return value is TRUE (1). If the function does not succeed, the return value is FALSE (0). To get extended error information, call [GetLastError\(\)](#). If you reach the end of the search, the [GetLastError\(\)](#) function returns an Object Not Found error. Once past the end of the search, you cannot scroll the search using [ctFindNext\(\)](#) or [ctFindPrev\(\)](#) commands. You need to reset the search pointer by creating a new search using [ctFindFirst\(\)](#), or by using the [ctFindScroll\(\)](#) function to move the pointer to a valid position.

## Related Functions

[ctOpen](#), [ctFindFirst](#), [ctFindPrev](#), [ctFindClose](#), [ctGetProperty](#)

## Example

See [ctFindFirst](#).

## ctFindNumRecords

Gets the number of records for a given browsing session.

### Syntax

**ctFindNumRecords(*hnd*)**

*hnd*

Type: Handle

Input/output: Input

Description: Handle to the search, as returned by [ctFindFirst\(\)](#).

### Return Value

If the function succeeds, the return value is the number of records (INT) or -1 if unsuccessful.

### Related Functions

[ctOpen](#), [ctFindFirst](#), [ctFindPrev](#), [ctFindClose](#), [ctGetProperty](#)

## ctFindPrev

Retrieves the previous object in the search initiated by [ctFindFirst](#).

### Syntax

**ctFindPrev(*hnd*, *pObjHnd*)**

*hnd*

Type: Handle

Input/output: Input

Description: Handle to the search, as returned by [ctFindFirst\(\)](#).

*pObjHnd*

Type: HANDLE

Input/output: Output

Description: The pointer to the found object handle. This is used to retrieve the properties.

### Return Value

If the function succeeds, the return value is TRUE (1). If the function does not succeed, the return value is FALSE (0). To get extended error information, call [GetLastError](#)(). If you reach the end of the search, the [GetLastError](#)() function returns an Object Not Found error. Once past the end of the search, you cannot scroll the search using [ctFindNext\(\)](#) or [ctFindPrev\(\)](#) commands. You need to reset the search pointer by creating a new search using [ctFindFirst\(\)](#), or by using the [ctFindScroll\(\)](#) function to move the pointer to a valid position.

## Related Functions

[ctOpen](#), [ctFindFirst](#), [ctFindNext](#), [ctFindClose](#), [ctGetProperty](#)

## Example

See [ctFindFirst](#)

## ctFindScroll

Scrolls to the necessary object in the search initiated by [ctFindFirst](#).

To find the current scroll pointer, you can scroll relative (dwMode = CT\_FIND\_SCROLL\_RELATIVE) with an offset of 0. To find the number of records returned in a search, scroll to the end of the search.

## Syntax

**ctFindScroll(hnd, dwMode, dwOffset, pObjHnd)**

*hnd*

Type: Handle

Input/output: Input

Description: Handle to the search, as returned by [ctFindFirst\(\)](#).

*dwMode*

Type: DWORD

Input/output:

Description: Mode of the scroll. The following modes are supported:

**CT\_FIND\_SCROLL\_NEXT:** Scroll to the next record. The dwOffset parameter is ignored.

**CT\_FIND\_SCROLL\_PREV:** Scroll to the previous record. The dwOffset parameter is ignored.

**CT\_FIND\_SCROLL\_FIRST:** Scroll to the first record. The dwOffset parameter is ignored.

**CT\_FIND\_SCROLL\_LAST:** Scroll to the last record. The dwOffset parameter is ignored.

**CT\_FIND\_SCROLL\_ABSOLUTE:** Scroll to absolute record number. The record number is specified in the dwOffset parameter. The record number is from 1 to the maximum number of records returned in the search.

**CT\_FIND\_SCROLL\_RELATIVE:** Scroll relative records. The number of records to scroll is specified by the dwOffset parameter. If the offset is positive, this function will scroll to the next record, if negative, it will scroll to the previous record. If 0 (zero), no scrolling occurs.

*dwOffset*

Type: LONG

Input/output: Input

Description: Offset of the scroll. The meaning of this parameter depends on the dwMode of the scrolling operation.

*pObjHnd*

Type: HANDLE

Input/output: Output

Description: The pointer to the found object handle. This is used to retrieve the properties.

*pObjHnd*

Type: HANDLE

Input/output: Output

Description: The pointer to the found object handle. This is used to retrieve the properties.

## Return Value

If the function succeeds, the return value is non-zero. If the function does not succeed, the return value is zero. To get extended error information, call **GetLastError()**. If you reach the end of the search, the **GetLastError()** function returns an Object Not Found error. The return value is the current record number in the search. Record numbers start at 1 (for the first record) and increment until the end of the search has been reached. Remember, 0 (zero) is not a valid record number - it signifies that the function was not successful.

## Related Functions

[ctOpen](#), [ctFindFirst](#), [ctFindNext](#), [ctFindPrev](#), [ctFindClose](#), [ctGetProperty](#)

## Example

```
HANDLE hSearch;
HANDLE hObject;
DWORD dwNoRecords;
// Search the Tag table
hSearch = ctFindFirst(hCTAPI, "Tag", NULL, &hObject, 0);
// Count number of records
dwNoRecords = ctFindScroll(hSearch, CT_FIND_SCROLL_LAST, 0, &hObject);
// scroll back to beginning
ctFindScroll(hSearch, CT_FIND_SCROLL_FIRST, 0, &hObject);
do {
    char sName[32];
    // Get the tag name
    ctGetProperty(hObject, "Tag", sName, sizeof(sName), NULL, DBTYPE_STR);
} while (ctFindScroll(hSearch, CT_FIND_SCROLL_NEXT, 0, &hObject));
ctFindClose(hSearch);
```

## ctGetOverlappedResult

Returns the results of an overlapped operation. The results reported by the **ctGetOverlappedResult()** function are those of the specified handle's last CTOVERLAPPED operation to which the specified **CTOVERLAPPED** structure was provided, and for which the operation's results were pending. A pending operation is indicated when the function that started the operation returns FALSE, and the **GetLastError** function returns ERROR\_IO\_PENDING. When an I/O operation is pending, the function that started the operation resets the **hEvent** member of the **CTOVERLAPPED** structure to the non-signaled state. Then when the pending operation has been completed, the system sets the event object to the signaled state.

If the *bWait* parameter is TRUE, **ctGetOverlappedResult()** determines whether the pending operation has been completed by waiting for the event object to be in the signaled state.

Specify a manual-reset event object in the CTOVERLAPPED structure. If an auto-reset event object is used, the event handle needs to not be specified in any other wait operation in the interval between starting the

CTOVERLAPPED operation and the call to **ctGetOverlappedResult()**. For example, the event object is sometimes specified in one of the wait functions to wait for the operation's completion. When the wait function returns, the system sets an auto-reset event's state to non-signaled, and a subsequent call to **ctGetOverlappedResult()** with the bWait parameter set to TRUE causes the function to be blocked indefinitely.

## Syntax

**ctGetOverlappedResult(*hCTAPI*, *lpctOverlapped*, *pBytes*, *bWait*)**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctOpen\(\)](#).

*lpctOverlapped*

Type: CTOVERLAPPED\*

Input/output: Input

Description: Address of the CTOVERLAPPED structure which was used when an overlapped operation was started.

*pBytes*

Type: DWORD\*

Input/output: Input

Description: Address of actual bytes transferred. For the CTAPI this value is undefined.

*bWait*

Type: BOOL

Input/output: Input

Description: Specifies whether the function waits for the pending overlapped operation to be completed. If TRUE, the function does not return until the operation has been completed. If FALSE and the operation is still pending, the function returns FALSE and the GetLastError function returns ERROR\_IO\_INCOMPLETE.

## Return Value

If the function succeeds, the return value is TRUE. If the function does not succeed, the return value is FALSE. Use [GetLastError\(\)](#) to get extended error information.

## Related Functions

[ctOpen](#), [ctHasOverlappedIoCompleted](#)

## Example

```
DWORD Bytes;
char sVersion[128];
CTOVERLAPPED ctOverlapped;
ctOverlapped.hEvent = CreateEvent(NULL, TRUE, TRUE, NULL);
ctCicode(hCTAPI, "Version(0)", 0, 0, sVersion, sizeof(sVersion), &ctOverlapped);
...
// do something else.
```

```
///  
// wait for the ctCicode to complete  
ctGetOverlappedResult(hCTAPI, &ctOverlapped, &Bytes, TRUE);
```

## ctGetProperty

Retrieves an object property or meta data for an object. Use this function in conjunction with the `ctFindFirst()` and `ctFindNext()` functions. i.e. First, you find an object, then you retrieve its properties.

To retrieve property meta data such as type, size and so on, use the following syntax for the `szName` argument:

- `object.fields.count` - the number of fields in the record
- `object.fields(n).name` - the name of the nth field of the record
- `object.fields(n).type` - the type of the nth field of the record
- `object.fields(n).actualsize` - the actual size of the nth field of the record

## Syntax

**ctGetProperty(*hnd*, *szName*, *pData*, *dwBufferLength*, *dwResultLength*, *dwType*)**

*hnd*

Type: Handle

Input/output: Input

Description: Handle to the search, as returned by [ctFindFirst\(\)](#).

*szName*

Type: LPCTSTR\*

Input/output: Input

Description: The name of the property to be retrieved. The following properties are supported:

**Name** - The name of the tag.

**FullName** - The full name of the tag in the form cluster.tagname.

**Network** - The unique I/O Device Number.

**BitWidth** - Width of the data type in bits. for example digital will be 1, integer 16, long 32, etc.

**UnitType** - The protocol specific unit type.

**UnitAddress** - The protocol specific unit address.

**UnitCount** - The protocol specific unit count.

**RawType** - The raw data type of the point. The following types are returned: 0 (Digital), 1 (Integer), 2 (Real), 3 (BCD), 4 (Long), 5 (Long BCD), 6 (Long Real), 7 (String), 8 (Byte), 9 (Void), 10 (Unsigned integer).

**Raw\_Zero** - Raw zero scale.

**Raw\_Full** - Raw full scale.

**Eng\_Zero** - Engineering zero scale.

**Eng\_Full** - Engineering full scale.

**Equipment** – The associated equipment name

**Name** - The name of the equipment.

**Cluster** - The name of the cluster that this equipment runs on.

**Type** - The specific type of equipment in the system.

**IoDevice** - The I/O Device used to communicate with this piece of equipment.

**Area** - The area number or label to which this equipment belongs.

**Location** - A string describing the location of the equipment.

**Comment** - Comment.

**Page** - The name of the page on which this equipment appears.

**Help** - The help context string.

**Parent** - The name of the parent equipment derived from the name of the equipment.

**Composite** – The equipment specific composite name

**Custom1 .. Custom8** - User-defined strings.

*pData*

Type: VOID\*

Input/output: Output

Description: The result buffer to store the read data. The data is raw binary data, no data conversion or scaling is performed. If this buffer is not large enough to receive the data, the data will be truncated, and the function will return false.

*dwBufferLength*

Type: DWORD

Input/output: Input

Description: Length of result buffer. If the result buffer is not large enough to receive the data, the data will be truncated, and the function will return false.

*dwResultLength*

Type: DWORD\*

Input/output: Output

Description: Length of returned result. You can pass NULL if you want to ignore this parameter

*dwType*

Type: DWORD

Input/output: Input

Description: The desired return type as follows:

Value	Meaning
DBTYPE_UI1	UCHAR
DBTYPE_I1	1 byte INT
DBTYPE_I2	2 byte INT
DBTYPE_I4	4 byte INT
DBTYPE_R4	4 byte REAL
DBTYPE_R8	8 byte REAL
DBTYPE_BOOL	BOOLEAN

DBTYPE_BYTES	Byte stream
DBTYPE_STR	NULL Terminated STRING

## Return Value

If the function succeeds, the return value is non-zero. If the function does not succeed, the return value is zero. To get extended error information, call GetLastError().

## Related Functions

[ctOpen](#), [ctFindFirst](#), [ctFindNext](#), [ctFindPrev](#), [ctFindClose](#)

## Example

```
// get the property of the TAG field
ctGetProperty(hObject, "TAG", sName, sizeof(sName), NULL, DBTYPE_STR);
// Use the meta property fields to enumerate the entire row of data
// first get number of fields in the row
ctGetProperty(hObject, "object.fields.count", &dwFields, sizeof(dwFields),
NULL, DBTYPE_I4);
for (i = 0; i < dwFields; i++) {
    sprintf(sObject, "object.fields(%d).name", i + 1);
    // get name of field
    if (ctGetProperty(hObject, sObject, sName, sizeof(sName), NULL, DBTYPE_STR)) {
        // get value of field
        if (ctGetProperty(hObject, sName, sData, sizeof(sData),
NULL, DBTYPE_STR)) {
            printf("%8.8s ", sData);
        }
    }
}
```

Also see [ctFindFirst\(\)](#).

## ctHasOverlappedIoCompleted

Provides a high performance test operation that can be used to poll for the completion of an outstanding I/O operation.

## Syntax

**ctHasOverlappedIoCompleted(*lpctOverlapped*)**

*lpctOverlapped*

Type: CTOVERLAPPED\*

Input/output: Input

Description: Address of the CTOVERLAPPED structure which was used when an overlapped operation was started.

## Return Value

TRUE if the I/O operation has completed, and FALSE otherwise.

## Return Value

[ctOpen](#), [ctGetOverlappedResult](#)

## ctListAdd

Adds a tag or tag element to the list. Once the tag has been added to the list, it may be read using [ctListRead\(\)](#) and written to using [ctListWrite\(\)](#). If a read is already pending, the tag will not be read until the next time [ctListRead\(\)](#) is called. [ctListWrite\(\)](#) may be called immediately after the [ctListAdd\(\)](#) function has completed.

## Syntax

**ctListAdd(*hList*, *sTag*)**

*hList*

Type: HANDLE

Input/output: Input

Description: The handle to the list, as returned from [ctListNew\(\)](#).

*sTag*

Type: LPCSTR

Input/output: Input

Description: The tag or tag name and element name, separated by a dot to be added to the list. If the element name is not specified, it will be resolved at runtime as for an unqualified tag reference.

Variable tags can be specified as a string in multiple forms. Refer to [Tag Names](#) for more information.

## Return Value

If the function succeeds, the return value specifies a handle. If the function does not succeed, the return value is NULL. To get extended error information, call [GetLastError\(\)](#)

If a tag not currently defined in your system is specified using this function then the return value will specify a valid handle. Calling [ctListData](#) will allow identification of the true state of the tag. Passing an empty tag to this function will result in the function exiting immediately and returning NULL.

## Related Functions

[ctOpen](#), [ctListNew](#), [ctListFree](#), [ctListRead](#), [ctListWrite](#), , [ctListAddEx](#)

## Example

```
HANDLE hCTAPI;  
HANDLE hList;  
HANDLE hTagOne;
```

```
HANDLE hTagOneField;
HANDLE hTagOneControlMode;
HANDLE hTagOneStatus;
char sProcessValue[20];
char sProcessValueField[20];
char sProcessValueControlMode[20];
char sProcessValueStatus[20];
hCTAPI = ctOpen(NULL, NULL, NULL, 0);
hList = ctListNew(hCTAPI, 0);
hTagOne = ctListAdd(hList, "TagOne");
hTagOneField = ctListAdd(hList, "TagOne.Field");
hTagOneControlMode = ctListAdd(hList, "TagOne.ControlMode");
hTagOneStatus = ctListAdd(hList, "TagOne.Status");
ctListRead(hList, NULL);
ctListData(hTagOne, sProcessValue, sizeof(sProcessValue), 0);
ctListData(hTagOneField, sProcessValueField, sizeof(sProcessValueField) , 0);
ctListData(hTagOneControlMode, sProcessValueControlMode, sizeof(sProcessValueControlMode) , 0);
ctListData(hTagOneStatus, sProcessValueStatus, sizeof(sProcessValueStatus) , 0);
ctListFree(hList);
```

## ctListAddEx

Performs the same as `ctListAdd`, but with 2 additional new arguments. Adds a tag, or tag element, to the list. Once the tag has been added to the list, it may be read using `ctListRead()` and written to using `ctListWrite()`. If a read is already pending, the tag will not be read until the next time `ctListRead()` is called. `ctListWrite()` may be called immediately after the `ctListAdd()` function has completed.

If `ctListAdd` is called instead of `ctListAddEx`, The poll period of the subscription for the tag defaults to 500 milliseconds, and the `bRaw` flag defaults to the engineering value of FALSE.

## Syntax

**ctListAddEx(*hList*, *sTag*, *bRaw*, *nPollPeriodMS*, *dDeadband*)**

*hList*

Type: HANDLE

Input/output: Input

Description: The handle to the list, as returned from `ctListNew()`.

*sTag*

Type: LPCSTR

Input/output: Input

Description: The tag or tag name and element name, separated by a dot to be added to the list. If the element name is not specified, it will be resolved at runtime as for an unqualified tag reference.

Variable tags can be specified as a string in multiple forms. Refer to [Tag Names](#) for more information.

*bRaw*

Type: BOOL

Input/output: Input

Description: Specifies whether to subscribe to the given tag in the list using raw mode if TRUE or engineering mode if FALSE.

*nPollPeriodMS*

Type: INTEGER

Input/output: Input

Description: Dictates the poll period used in the subscription made for the tag (in milliseconds).

*dDeadband*

Type: DOUBLE

Input/output: Input

Description: Percentage of the variable tag's engineering range that a tag needs to change by in order for an update to be sent through the system. A value of -1.0 indicates that the default deadband specified by the tag definition is to be used.

## Return Value

If the function succeeds, the return value specifies a handle. If the function does not succeed, the return value is NULL. To get extended error information, call GetLastError()

If a tag not currently defined in your system is specified using this function then the return value will specify a valid handle. Calling ctListData will allow identification of the true state of the tag. Passing an empty tag to this function will result in the function exiting immediately and returning NULL.

## Related Functions

[ctOpen](#), [ctListNew](#), [ctListFree](#), [ctListRead](#), [ctListWrite](#), [ctListData](#), [ctListItem](#)

## Example

See [ctListNew](#)

## ctListData

Gets the value of a tag on the list. Call this function after [ctListRead\(\)](#) has completed for the added tag. You may call [ctListData\(\)](#) while subsequent [ctListRead\(\)](#) functions are pending, and the last data read will be returned. If you wish to get the value of a specific quality part of a tag element item data use [ctListItem](#) which includes the same parameters with the addition of the *dwItem* parameter.

## Syntax

**ctListData(*hTag*, *pBuffer*, *dwLength*, *dwMode*)**

*hTag*

Type: HANDLE

Input/output: Input

Description: The handle to the tag, as returned from [ctListAdd\(\)](#).

*pBuffer*

Type: VOID\*

Input/output: Input

Description: Pointer to a buffer to return the data. The data is returned scaled and as a formatted string.

*dwLength*

Type: Dword

Input/output: Input

Description: Length (in bytes) of the raw data buffer.

*dwMode*

Type: DWORD

Input/output: Input

Description: Mode of the data. The following modes are supported:

**0 (zero)** - The value is scaled using the scale specified in the Plant SCADA project, and formatted using the format specified in the Plant SCADA project.

To choose the format of the value returned, you can use the Citect INI parameter [\[CtAPI\]RoundToFormat](#).

The *dwMode* argument no longer supports option FMT\_NO\_SCALE which allowed you to dynamically get the raw value or the engineering value of a tag in the list. If you wish to get the raw value of a tag, add it to the list with this mode by calling `ctListAddEx` and specifying `bRaw = TRUE`.

## Return Value

If the function succeeds, the return value is TRUE. If the function does not succeed, the return value is FALSE. To get extended error information, call `GetLastError()`.

If an error occurred when reading the data from the I/O Device, the return value will be FALSE and `GetLastError()` will return the associated Plant SCADA error code.

## Related Functions

[ctListItem](#), [ctOpen](#), [ctListNew](#), [ctListFree](#), [ctListAdd](#), [ctListRead](#), [ctListWrite](#)

## Example

See [ctListItem](#).

## ctListDelete

Frees a tag created with [ctListAdd](#). Your program is permitted to call `ctListDelete()` while a read or write is pending on another thread. The `ctListWrite()` and `ctListRead()` will return once the tag has been deleted.

## Syntax

**ctListDelete(*hTag*)**

*hTag*

Type: HANDLE

Input/output: Input

Description: The handle to the tag, as returned from [ctListAdd\(\)](#).

## Return Value

If the function succeeds, the return value is TRUE. If the function does not succeed, the return value is FALSE. To get extended error information, call GetLastError().

## Related Functions

[ctOpen](#), [ctListNew](#), [ctListFree](#), [ctListAdd](#), [ctListRead](#), [ctListWrite](#), [ctListData](#), [ctListItem](#)

## Example

```
HANDLE hList;
HANDLE hTagOne;
HANDLE hTagTwo;
hList = ctListNew(hCTAPI, 0);
hTagOne = ctListAdd(hList, "TagOne");
hTagTwo = ctListAdd(hList, "TagTwo");
ctListRead(hList, NULL); // read TagOne and TagTwo
ctListData(hList, hTagOne, sBufOne, sizeof(sBufOne), 0);
ctListData(hList, hTagTwo, sBufTwo, sizeof(sBufTwo) , 0);
ctListDelete(hTagOne); // delete TagOne;
ctListRead(hList, NULL); // read TagTwo only
ctListData(hList, hTagTwo, sBufTwo, sizeof(sBufTwo) , 0);
```

## ctListEvent

Returns the elements in the list which have changed state since they were last read using the [ctListRead\(\)](#) function. You need to have created the list with CT\_LIST\_EVENT mode in the [ctListNew\(\)](#) function.

## Syntax

**ctListEvent(*hCTAPI*, *dwMode*)**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctListNew\(\)](#).

*dwMode*

Type: Dword

Input/output: Input

Description: The mode of the list event. You need to use the same mode for each call to [ctListEvent\(\)](#) until NULL is returned before changing mode. The following modes are supported:

**CT\_LIST\_EVENT\_NEW** - Gets notifications when tags are added to the list. When this mode is used, you will get an event message when new tags added to the list.

**CT\_LIST\_EVENT\_STATUS** - Gets notifications for status changes. Tags will change status when the I/O Device goes offline. When this mode is used, you will get a notification when the tag goes into #COM and another one when it goes out of #COM. You can verify that the tag is in #COM when an error is returned from [ctListData\(\)](#) for that tag.

## Return Value

If the function succeeds, the return value specifies a handle to a tag which has changed state since the last time ctListRead was called. If the function does not succeed or there are no changes, the return value is NULL. To get extended error information, call GetLastError().

## Related Functions

[ctListAdd](#), [ctListDelete](#), [ctListWrite](#), [ctListData](#), [ctListItem](#)

## Example

```
HANDLE hList; HANDLE hTag[100];
hList = ctListNew(hCTAPI, CT_LIST_EVENT);
hTagArray[0] = ctListAdd(hList, "TagOne");
hTagArry[1] = ctListAdd(hList, "TagTwo");
and so on...
while (TRUE) {
    ctListRead(hList, NULL);
    hTag = ctListEvent(hList, 0);
    while (hTag != NULL) {
        // hTag has changed state, do whatever you need
        hTag = ctListEvent(hList, 0);
    }
}
```

## ctListFree

Frees a list created with ctListNew. Every tag added to the list is freed, you do not have to call ctListDelete() for each tag. not call ctListFree() while a read operation is pending. Wait for the read to complete before freeing the list.

## Syntax

**ctListFree(*hList*)**  
*hList*  
Type: HANDLE  
Input/output: Input  
Description: The handle to the list, as returned from ctListNew().

## Return Value

If the function succeeds, the return value is TRUE. If the function does not succeed, the return value is FALSE. To get extended error information, call GetLastError().

## Related Functions

[ctOpen](#), [ctListNew](#), [ctListAdd](#), [ctListDelete](#), [ctListEvent](#), [ctListRead](#), [ctListWrite](#), [ctListData](#)

## Example

See [ctListNew](#).

## ctListNew

Creates a new list. The CTAPI provides two methods to read data from I/O Devices. Each level varies in its complexity and performance. The simplest way to read data is via the `ctTagRead()` function. This function reads the value of a single variable, and the result is returned as a formatted engineering string.

The List functions provide a higher level of performance for reading data than the tag based interface. The List functions also provide support for overlapped operations.

The list functions allow a group of tags to be defined and then read as a single request. They provide a simple tag based interface to data which is provided in formatted engineering data. You can create several lists and control each individually.

Tags can be added to, or deleted from lists dynamically, even if a read operation is pending on the list.

## Syntax

`ctListNew(hCTAPI, dwMode)`

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctOpen\(\)](#).

*dwMode*

Type: DWORD

Input/output: Input

Description: The mode of the list creation. The following modes are supported:

**CT\_LIST\_EVENT** - Creates the list in event mode. This mode allows you to use the [ctListEvent\(\)](#) function.

**CT\_LIST\_LIGHTWEIGHT\_MODE** - Setting this mode for a list means any tag updates will use a "lightweight" version of the tag value that does not include a quality timestamp or value timestamp.

These flags can be used in combination with each other.

## Return Value

If the function succeeds, the return value specifies a handle. If the function does not succeed, the return value is NULL. To get extended error information, call `GetLastError()`.

## Related Functions

[ctOpen](#), [ctListFree](#), [ctListAdd](#), [ctListDelete](#), [ctListEvent](#), [ctListRead](#), [ctListWrite](#), [ctListData](#)

## Example

```
HANDLE hList;
HANDLE hTagOne;
HANDLE hTagTwo;
hList = ctListNew(hCTAPI, 0);
hTagOne = ctListAdd(hList, "TagOne");
hTagTwo = ctListAdd(hList, "TagTwo");
while (you want the data) {
    ctListRead(hList, NULL);
    ctListData(hTagOne, sBufOne, sizeof(sBufOne), 0);
    ctListData(hTagTwo, sBufTwo, sizeof(sBufTwo), 0);
}
ctListFree(hList);
```

## ctListItem

Gets the tag element item data. For specific quality part values please refer to The Quality Tag Element.

## Syntax

**ctListItem(*hTag*, *dwItem*, *pBuffer*, *dwLength*, *dwMode*)**

*hTag*

Type: HANDLE

Input/output: Input

Description: The handle to the tag, as returned from [ctListAdd\(\)](#).

*dwitem*

Type: DWORD

Input/output: Input

Description: The tag element item:

CT\_LIST\_VALUE - value.

CT\_LIST\_TIMESTAMP – timestamp.

CT\_LIST\_VALUE\_TIMESTAMP – value timestamp.

CT\_LIST\_QUALITY\_TIMESTAMP quality timestamp.

CT\_LIST\_QUALITY\_GENERAL - quality general.

CT\_LIST\_QUALITY\_SUBSTATUS - quality substatus.

CT\_LIST\_QUALITY\_LIMIT - quality limit .

CT\_LIST\_QUALITY\_EXTENDED\_SUBSTATUS - quality extended substatus.

CT\_LIST\_QUALITY\_DATASOURCE\_ERROR - quality datasource error.

CT\_LIST\_QUALITY\_OVERRIDE - quality override flag.

CT\_LIST\_QUALITY\_CONTROL\_MODE - quality control mode flag.

*pBuffer*

Type: VOID\*

Input/output: Input

Description: Pointer to a buffer to return the data. The data is returned scaled and as a formatted string.

*dwLength*

Type: Dword

Input/output: Input

Description: Length (in bytes) of the raw data buffer.

*dwMode*

Type: DWORD

Input/output: Input

Description: Mode of the data. The following modes are supported:

**0 (zero)** - The value is scaled using the scale specified in the Plant SCADA project, and formatted using the format specified in the Plant SCADA project.

**FMT\_NO\_FORMAT** - The value is not formatted to the format specified in the Plant SCADA project. A default format is used. If there is a scale specified in the Plant SCADA project, it will be used to scale the value.

The dwMode argument no longer supports option FMT\_NO\_SCALE which allowed you to dynamically get the raw value or the engineering value of a tag in the list. If you wish to get the raw value of a tag, add it to the list with this mode by calling ctListAddEx and specifying bRaw = TRUE..

## Return Value

If the function succeeds, the return value is TRUE. If the function does not succeed, the return value is FALSE. To get extended error information, call GetLastError().

If an error occurred when reading the data from the I/O Device, the return value will be FALSE and GetLastError() will return the associated Plant SCADA error code.

## Related Functions

[ctOpen](#), [ctListNew](#), [ctListFree](#), [ctListAdd](#), [ctListRead](#), [ctListData](#), [ctListWrite](#)

## Example

```
HANDLE hCTAPI;
HANDLE hList;
HANDLE hTagOne;
HANDLE hTagOneField;
HANDLE hTagOneControlMode;
HANDLE hTagOneStatus;
char sProcessValue[20];
char sProcessValueField[20];

ctListItem(hTagOneField, CT_LIST_QUALITY_GENERAL, sProcessValueFieldQualityGeneral,
sizeof(sProcessValueFieldQualityGeneral), 0);
ctListItem(hTagOneField, CT_LIST_QUALITY_SUBSTATUS, sProcessValueFieldQualitySubstatus,
sizeof(sProcessValueFieldQualitySubstatus), 0);
ctListItem(hTagOneField, CT_LIST_QUALITY_LIMIT, sProcessValueFieldQualityLimit,
sizeof(sProcessValueFieldQualityLimit), 0);
ctListItem(hTagOneField, CT_LIST_QUALITY_EXTENDED_SUBSTATUS,
sProcessValueFieldQualityExtendedSubstatus,
sizeof(sProcessValueFieldQualityExtendedSubstatus), 0);
ctListItem(hTagOneField, CT_LIST_QUALITY_OVERRIDE, sProcessValueFieldQualityOverride,
sizeof(sProcessValueFieldQualityOverride), 0);
ctListItem(hTagOneField, CT_LIST_QUALITY_CONTROL_MODE,
sProcessValueFieldQualityControlMode, sizeof(sProcessValueFieldQualityControlMode), 0);
ctListItem(hTagOneField, CT_LIST_QUALITY_DATASOURCE_ERROR,
sProcessValueFieldQualityDatasourceError, sizeof(sProcessValueFieldQualityDatasourceError),
0);
ctListFree(hList);
```

## ctListRead

Reads the tags on the list. This function will read tags which are attached to the list. Once the data has been read from the I/O Devices, you may call `ctListData()` to get the values of the tags. If the read does not succeed, `ctListData()` will return an error for the tags that cannot be read.

While `ctListRead()` is pending you are allowed to add and delete tags from the list. If you delete a tag from the list while `ctListRead()` is pending, it may still be read one more time. The next time `ctListRead()` is called, the tag will not be read. If you add a tag to the list while `ctListRead()` is pending, the tag will not be read until the next time `ctListRead()` is called. You may call `ctListData()` for this tag as soon as you have added it. In this case `ctListData()` will not succeed, and `GetLastError()` will return `GENERIC_INVALID_DATA`.

You can only have 1 pending read command on each list. If you call `ctListRead()` again for the same list, the function will not succeed.

Before freeing the list, check that there are no reads still pending. wait for the any current `ctListRead()` to return

and then delete the list.

## Syntax

**ctListRead(*hList*, *pctOverlapped*)**

*hList*

Type: HANDLE

Input/output: Input

Description: The handle to the list, as returned from ctListNew().

*pctOverlapped*

Type: CTOVERLAPPED\*

Input/output: Input

Description: CTOVERLAPPED structure. This structure is used to control the overlapped notification. Set to NULL if you want a synchronous function call.

## Return Value

If the function succeeds, the return value is TRUE. If the function does not succeed, the return value is FALSE. To get extended error information, call GetLastError().

If an error occurred when reading any of the list data from the I/O Device, the return value will be FALSE and GetLastError() will return the associated Plant SCADA error code. As a list can contain tags from many data sources, some tags may be read correctly while other tags may not. If any tag read does not succeed, ctListRead() will still return TRUE, the other tags will contain valid data. You can call ctListData() to retrieve the value of each tag and the individual error status for each tag on the list.

## Related Functions

[ctOpen](#), [ctListNew](#), [ctListFree](#), [ctListAdd](#), [ctListWrite](#), [ctListData](#), [ctListItem](#)

## Example

See [ctListNew](#)

To read the Paging Alarm property using ctListRead:

```
HANDLE hList;
HANDLE hAlarmOne;
HANDLE hAlarmTwo;
hList = ctListNew(hCTAPI, 0);
hTagOne = ctListAdd(hList, "AlarmOne.Paging");
hTagTwo = ctListAdd(hList, "AlarmTwo.Paging");
while (you want the data) {
    ctListRead(hList, NULL);
    ctListData(hAlarmOne, sBufOne, sizeof(sBufOne), 0);
    ctListData(hAlarmTwo, sBufTwo, sizeof(sBufTwo), 0);
}
ctListFree(hList);
```

## ctListWrite

Writes to a single tag on the list.

### Syntax

**ctListWrite(*hTag*, *sValue*, *pctOverlapped*)**

*hTag*

Type: HANDLE

Input/output: Input

Description: The handle to the tag, as returned from ()�.

*sValue*

Type: LPCSTR

Input/output: Input

Description: The value to write to the tag as a string. The value will be converted and scaled into the correct format to write to the tag.

*pctOverlapped*

Type: CTOVERLAPPED\*

Input/output: Input

Description: CTOVERLAPPED structure. This structure is used to control the overlapped notification. Set to NULL if you want a synchronous function call.

### Return Value

If the function succeeds, the return value is TRUE. If the function does not succeed, the return value is FALSE. To get extended error information, call GetLastError().

### Related Functions

[ctOpen](#), [ctListNew](#), [ctListFree](#), [ctListDelete](#), [ctListRead](#), [ctListData](#), [ctListItem](#)

### Example

```
HANDLE hTagOne;
HANDLE hList;
hList = ctListNew(hCTAPI, 0);
hTagOne = ctListAdd(hList, "TagOne");
ctListWrite(hTagOne, "1.23", NULL); // write to TagOne
```

## ctOpen

Opens a connection to the Plant SCADA API. The CTAPI.DLL is initialized and a connection is made to Plant SCADA. If Plant SCADA is not running when this function is called, the function will exit and report an error. This function needs to be called before any other CTAPI function to initialize the connection to Plant SCADA.

If you use the CT\_OPEN\_RECONNECT mode, and the connection is lost, the CTAPI will attempt to reconnect to

Plant SCADA. When the connection has been re-established, you can continue to use the CTAPI. However, while the connection is down, every function will return errors. If a connection cannot be created the first time `ctOpen()` is called, a valid handle is still returned; however `GetLastError()` will indicate an error.

If you do not use the `CT_OPEN_RECONNECT` mode, and the connection to Plant SCADA is lost, you need to free handles returned from the CTAPI and call `ctClose()` to free the connection. You need to then call `ctOpen()` to re-establish the connection and re-create any handles.

---

**Note:** To use CtAPI on a remote computer without installing Plant SCADA, you will need several CtAPI binaries. These binaries are packaged in the files `CtApi.Win32.Redist.zip` and `CtApi.x64.Redist.zip`, which can be found in the `<Plant SCADA_Disk>\Plant SCADA <VersionNumber>\Extras\CtAPI` directory of the Plant SCADA installation media. See *Running CtAPI Applications* in the topic [CtAPI](#).

If calling this function from a remote computer, a valid username and a non-blank password needs to be used.

To establish encrypted communications for a remote connection, see [Secure the Connection from a Remote CtAPI Application](#).

## Syntax

**ctOpen(sComputer, sUser, sPassword, nMode)**

*sComputer*

Type: LPCSTR

Input/output: Input

Description: The computer you want to communicate with via CTAPI. For a local connection, specify NULL as the computer name. The Windows Computer Name is the name as specified in the Identification tab, under the Network section of the Windows Control Panel.

---

**Note:** To use a local connection when the CtAPI process is running as a Windows service, you need to add the user account as a member to the **Runtime Users** security role in Configurator (see [Security Roles](#)). You also need to check that the **Enable Encryption** option is selected on Configurator's Encryption page.

---

**Note:** Using a hostname to connect to a CTAPI server running Plant SCADA 8.20 or earlier will not work if Windows is configured to return an IPv6 address for that hostname, as 8.20 and earlier do not support IPv6 network addresses. To avoid this, use an IPv4 address directly, or if encryption is enabled, configure Windows to return an IPv4 address in preference to an IPv6 address.

*sUser*

Type: LPCSTR

Input/output: Input

Description: A user name as defined in the Plant SCADA project running on the computer to which you want to connect, or a Windows user name if `nMode` is set to `CT_OPEN_WINDOWSUSER`.

This argument is only necessary if you are calling this function from a remote computer. On a local computer, it is optional.

*sPassword*

Type: LPCSTR

Input/output: Input

Description: The `sUser` password defined in the Plant SCADA project running on the computer to which you want to connect, or the password for the Windows user name if `nMode` is set to `CT_OPEN_WINDOWSUSER`.

This argument is only necessary if you are calling this function from a remote computer. You need to use a non-blank password. On a local computer, it is optional.

*nMode*

Type: DWORD

Input/output: Input

Description: The mode of the CtAPI call. Set this to 0 (zero). The following modes are supported:

**CT\_OPEN\_RECONNECT** (0x00000002) — Reopen connection on error or communication interruption. If the connection to Plant SCADA is lost CTAPI will continue to retry to connect to Plant SCADA.**CT\_OPEN\_READ\_ONLY** (0x00000004) — Open the CTAPI in read only mode. This allows read only access to data - you cannot write to any variable in Plant SCADA or call any Cicode function.**CT\_OPEN\_BATCH** (0x00000008) — Disables the display of message boxes when an error occurs.**CT\_OPEN\_EXTENDED** (0x00000010) — Allows for encrypted communication. This parameter is implicitly set when encryption is enabled (with the Accept encrypted and non-encrypted connections option not selected) via the Configurator.**CT\_OPEN\_WINDOWSUSER** (0x00000020) — Indicates that sUser and sPassword are Windows user credentials. If sUser and sPassword are blank, then the credentials of the Windows user that is launching the application will be used.

To use Windows credentials to run CtAPI operations, you need to confirm the following:

- 1) Your server needs to be running Plant SCADA 2020 R2 (or later).
- 2) You need to use the **CT\_OPEN\_WINDOWSUSER** mode, and either:

**CT\_OPEN\_EXTENDED** mode is used in the CtOpen call.

Or:

The encryption mode on the CtAPI client is set to "Encrypted".

**Return Value**

If the function succeeds, the return value specifies a handle. If the function does not succeed, the return value is NULL. Use GetLastError() to get extended error information.

**Related Functions**[ctCiCode](#), [ctClose](#), [ctEngToRaw](#), [ctGetOverlappedResult](#), [ctHasOverlappedIoCompleted](#), [ctRawToEng](#), [ctTagRead](#), [ctTagWrite](#)**Examples**

```
HANDLE hCTAPI;
hCTAPI = ctOpen(NULL, NULL, NULL, 0);
if (hCTAPI == NULL) {
    dwStatus = GetLastError(); // get error
} else {
    ctTagWrite(hCTAPI, "SP123", "1.23");
    ctClose(hCTAPI);
}
// example of open for remote TCP/IP connection.
hCTAPI = ctOpen("203.19.130.2", "ENGINEER", "PASSWORD", 0);
.
```

```
STRING sComputer, sUser, sPassword;
HANDLE hCTAPI;
// get input for sComputer, sUser, sPassword variables from UI, or 3rd party APIs
hCTAPI = ctOpen(sComputer, sUser, sPassword, CT_OPEN_WINDOWSUSER);
```

## ctOpenEx

Establishes the connection to the CtAPI server using the given client instance. Create the client instance prior to calling `ctOpenEx`, using the function `ctClientCreate`.

`ctOpenEx` provides exactly the same connection functionality as `ctOpen`, the only difference being that `ctOpen` also creates the CtAPI client instance. See [ctOpen](#) for details on the connection mechanism and the parameters involved.

## Syntax

`ctOpenEx(sComputer, sUser, sPassword, nMode, hCTAPI);`

*sComputer*

Type: LPCSTR

Input/output: Input

Description: The computer you want to communicate with via CtAPI. For a local connection, specify NULL as the computer name. The Windows Computer Name is the name as specified in the Identification tab, under the Network section of the Windows Control Panel.

---

**Note:** To use a local connection when the CtAP process is running as a Windows service, you need to:

- (i) Add the user account as a member to the **Runtime Users** security role in Configurator (see [Security Roles](#))
  - (ii) Check that the **Enable Encryption** option is selected on the Configurator, Encryption page.
- 

**Note:** Using a hostname to connect to a CtAPI server running Plant SCADA 8.20 or earlier will not work if Windows is configured to return an IPv6 address for that hostname, as 8.20 and earlier do not support IPv6 network addresses. To avoid this, use an IPv4 address directly, or if encryption is enabled, configure Windows to return an IPv4 address in preference to an IPv6 address.

---

*sUser*

Type: LPCSTR

Input/output: Input

Description: A user name as defined in the Plant SCADA project running on the computer to which you want to connect, or a Windows user name if *nMode* is set to `CT_OPEN_WINDOWSUSER`.

This argument is only necessary if you are calling this function from a remote computer. On a local computer, it is optional.

*sPassword*

Type: LPCSTR

Input/output: Input

Description: The *sUser* password defined in the Plant SCADA project running on the computer to which you want to connect, or the password for the Windows user name if *nMode* is set to `CT_OPEN_WINDOWSUSER`.

This argument is only necessary if you are calling this function from a remote computer. You need to use a non-blank password. On a local computer, it is optional.

*nMode*

Type: Dword

Input/output: Input

Description: The mode of the Cicode call.

**CT\_OPEN\_WINDOWSUSER** — Indicates that *sUser* and *sPassword* are Windows user credentials. If *sUser* and *sPassword* are blank, then the credentials of the Windows user that is launching the application will be used.

To use Windows credentials to run CtAPI operations, you need to confirm the following:

- Your server needs to be running Plant SCADA 2020 R2 (or later).
- You need to use the CT\_OPEN\_WINDOWSUSER mode, and either:
  - CT\_OPEN\_EXTENDED mode is used in the CtOpen call.
  - Or:
  - The encryption mode on the CtAPI client is set to "Encrypted" or "Mixed Mode".

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctOpen\(\)](#).

## Return Value

TRUE if successful, otherwise FALSE. Use [GetLastError\(\)](#) to get extended error information.

## Related Functions

[ctClientCreate](#), [ctOpen](#), [ctClose](#), [ctCloseEx](#), [ctClientDestroy](#)

## Example

See [ctClientCreate](#).

## ctRawToEng

Converts the raw I/O Device scale variable into Engineering scale. This is not necessary for the Tag functions as Plant SCADA will do the scaling. Scaling is not necessary for digitals, strings or if no scaling occurs between the values in the I/O Device and the Engineering values. You need to know the scaling for each variables as specified in the Plant SCADA Variable Tags table.

## Syntax

**ctRawToEng(*pResult*, *dValue*, *pScale*, *dwMode*)**

*pResult*

Type: Double

Input/output: Output

Description: The resulting raw scaled variable.

*dValue*

Type: Double

Input/output: Input

Description: The engineering value to scale.

*pScale*

Type: CTSCALE\*

Input/output: Input

Description: The scaling properties of the variable.

*dwMode*

Type: Dword

Input/output: Input

Description: The mode of the scaling. The following modes are supported:

**CT\_SCALE\_RANGE\_CHECK** - Range check the result. If the variable is out of range then generate an error. The pResult still contains the raw scaled value.

**CT\_SCALE\_CLAMP\_LIMIT** - Clamp limit to max or minimum scales. If the result is out of scale then set result to minimum or maximum scale (which ever is closest). No error is generated if the scale is clamped. Cannot be used with CT\_SCALE\_RANGE\_CHECK or CT\_SCALE\_NOISE\_FACTOR options.

**CT\_SCALE\_NOISE\_FACTOR** - Allow noise factor for range check on limits. If the variable is our of range by less than 0.1 % then a range error is not generated.

## Return Value

TRUE if successful, otherwise FALSE. Use GetLastError() to get extended error information.

## Related Functions

[ctOpen](#), [ctEngToRaw](#)

## Example

```
// SP123 is type INTEGER and has raw scale 0 to 32000 and Eng scale
// 0 to 100
HANDLE hList = ctListNew(s_hCTAPI, 0);
HANDLE hTag = ctListAddEx(hList, "SP123", TRUE, 500, -1);
CTSCALE Scale = { 0.0, 32000.0, 0.0, 100.0};
CHAR valueBuf[256] = {0};
double dRawValue = 0.0;
double dSetPoint = 0.0;
ctListRead(hList, NULL);
ctListData(hTag, valueBuf, sizeof(valueBuf), 0);
dRawValue = strtod(valueBuf, NULL);
ctEngToRaw(&dSetPoint, dRawValue, &Scale, CT_SCALE_RANGE_CHECK);
// dSetPoint now contains the Engineering scaled setpoint.
```

## ctSetManagedBinDirectory

Allows a CTAPI consumer to specify from where it will load certain CTAPI dependencies (.NET managed dependencies).

Typically, this would be the Plant SCADA Bin directory (for example, C:\Program Files (x86)\AVEVA Plant SCADA\Bin). This is only required when the dependencies are not located in the same directory as the consuming application, see *Running CTAPI Applications* in the topic [CtAPI](#) for more details.

This function takes a single string containing a path. Calling this multiple times is safe. If a different path is specified it will replace the previous path; if the same path is specified then nothing will happen.

If called with a NULL or empty string, then any previous path will be removed and the default search order will be used.

## Syntax

**ctSetManagedBinDirectory(*sPath*)**

*sPath*

Type: LPCSTR

Input/output: Input

Description: A path representing the location of the CTAPI managed dependencies.

## Return Value

The function will return TRUE if successful.

The function will return FALSE if passed an invalid path, a path that does not exist, or a path that specifies a file instead of a directory.

## Related Functions

This function should be called before [ctOpen](#).

## ctTagGetProperty

Gets the given property of the given tag.

## Syntax

**ctTagGetProperty(*hCTAPI*, *szTagName*, *szProperty*, *pData*, *dwBufferLength*, *dwType*)**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctOpen\(\)](#).

*szTagName*

Type: LPCSTR

Input/output: Input

Description: The name of the tag. To specify cluster add "ClusterName." in front of the tag. For example Cluster1.Tag1 (note the period at the end of the cluster name).

Variable tags can be specified as a string in multiple forms. Refer to [Tag Names](#) for more information.

*szProperty*

Type: LPCSTR

Input/output: Input

Description: The property to read. Property names are case sensitive. Supported properties are:

**ArraySize:** Array size of the associated tag. Returns 1 for non-array types.

**DataBitWidth:** Number of bits used to store the value.

**Description:** Tag description.

**EngUnitsHigh:** Maximum scaled value.

**EngUnitsLow:** Minimum scaled value.

**Format:** Format bit string. The format information is stored in the integer as follows:

\* Bits 0-7 - format width

\* Bits 8-15 - number of decimal places

\* Bits 16 - zero-padded

\* Bit 17- left-justified

\* Bit 18 - display engineering units

\* Bit 20 - exponential (scientific) notation

**FormatDecPlaces:** Number of decimal places for default format.

**FormatWidth:** Number of characters used in default format.

**RangeHigh:** Maximum unscaled value.

**RangeLow:** Minimum unscaled value.

**Type:** Type of tag as a number:

\* 0 = Digital

\* 1 = Byte

\* 2 = Integer16

\* 3 = UInteger16

\* 4 = Long

\* 5 = Real

\* 6 = String

\* 7 = ULONG

\* 8 = Undefined

**Units:** Engineering Units for example %, mm, Volts.

*pData*

Type: VOID\*

Input/output: Output

Description: The output data buffer for the property value retrieved.

*dwBufferLength*

Type: DWORD

Input/output: Input

Description: The length of the output data buffer in bytes.

*dwType*

Type: DWORD

Input/output: Input

Description: The type of data to return.

Value	Meaning
DBTYPE_U11	UCHAR
DBTYPE_I1	1 byte INT
DBTYPE_I2	2 byte INT
DBTYPE_I4	4 byte INT
DBTYPE_R4	4 byte REAL
DBTYPE_R8	8 byte REAL
DBTYPE_BOOL	BOOLEAN
DBTYPE_BYTES	Byte Stream
DBTYPE_STR	NULL terminated STRING

## Return Value

If the function succeeds, the return value is non-zero. If the function does not succeed, the return value is zero. To get extended error information, call GetLastError().

## ctTagRead

Reads the value, quality and timestamp, not only a value. The data will be returned in string format and scaled using the Plant SCADA scales.

The function will request the given tag from the Plant SCADA I/O Server. If the tag is in the I/O Servers device cache the data will be returned from the cache. If the tag is not in the device cache then the tag will be read from the I/O Device. The time taken to complete this function will be dependent on the performance of the I/O Device. The calling thread is blocked until the read is completed.

## Syntax

**ctTagRead(*hCTAPI*, *sTag*, *sValue*, *dwLength*)**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from ctOpen().

*sTag*

Type: LPCSTR

Input/output: Input

Description: The tag name or tag name and element name, separated by a dot. If the element name is not

specified, it will be resolved at runtime as for an unqualified tag reference. You may use the array syntax [] to select an element of an array.

Variable tags can be specified as a string in multiple forms. Refer to Tag Names for more information.

#### sValue

Type: LPCSTR

Input/output: Output

Description: The buffer to store the read data. The data is returned in string format.

#### dwLength

Type: Dword

Input/output: Input

Description: The length of the read buffer. If the data is bigger than the dwLength, the function will not succeed.

## Return Value

TRUE if successful, otherwise FALSE. Use GetLastError() to get extended error information.

## Related Functions

[ctOpen](#), [ctTagWrite](#), [ctTagWriteEx](#)

## Example

```
HANDLE hCTAPI = ctOpen(NULL, NULL, NULL, 0);
...
char sProcessValue[20];
char sProcessValueField[20];
char sProcessValueControlMode[20];
char sProcessValueStatus[20];
ctTagRead(hCTAPI, "PV123", sProcessValue, sizeof(sProcessValue));
ctTagRead(hCTAPI, "PV123.Field", sProcessValueField, sizeof(sProcessValueField));
ctTagRead(hCTAPI, "PV123.Field.V", sProcessValueField, sizeof(sProcessValueField));
ctTagRead(hCTAPI, "PV123.ControlMode", sProcessValueControlMode,
sizeof(sProcessValueControlMode));
ctTagRead(hCTAPI, "PV123.Status", sProcessValueStatus, sizeof(sProcessValueStatus));
```

## ctTagReadEx

Performs the same as ctTagRead, but with an additional new argument. Reads the value, quality and timestamp, not only a value. The data will be returned in string format and scaled using the Plant SCADA scales.

The function will request the given tag from the Plant SCADA I/O Server. If the tag is in the I/O Servers device cache the data will be returned from the cache. If the tag is not in the device cache then the tag will be read from the I/O Device. The time taken to execute this function will be dependent on the performance of the I/O Device. The calling thread is blocked until the read is finished.

## Syntax

`ctTagReadEx(hCTAPI, sTag, sValue, dwLength, pctTagvalueItems)`

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctOpen\(\)](#).

*sTag*

Type: LPCSTR

Input/output: Input

Description: The tag name or tag name and element name, separated by a dot. If the element name is not specified, it will be resolved at runtime as for an unqualified tag reference. You may use the array syntax [] to select an element of an array.

Variable tags can be specified as a string in multiple forms. Refer to [Tag Names](#) for more information.

*sValue*

Type: LPCSTR

Input/output: Output

Description: The tag element value.

*dwLength*

Type: Dword

Input/output: Input

Description: The length of the read buffer. If the data is bigger than the dwLength, the function will not succeed.

*pctTagvalueItems*

Type: CT\_TAGVALUE\_ITEMS

Input/output: Input

Description: The pointer to CT\_TAGVALUE\_ITEMS structure containing quality and timestamp data or NULL. For specific quality part values, refer to [The Quality Item](#).

## Return Value

TRUE if successful, otherwise FALSE. Use [GetLastError\(\)](#) to get extended error information.

## Related Functions

[ctOpen](#), [ctTagWrite](#), [ctTagWriteEx](#)

## Example

```
HANDLE hCTAPI = ctOpen(NULL, NULL, NULL, 0);
char sProcessValue[20];
char sProcessValueField[20];
char sProcessValueControlMode[20];
char sProcessValueStatus[20];
CT_TAGVALUE_ITEMS ctTagvalueItems = {0};
ctTagvalueItems.dwLength = sizeof(CT_TAGVALUE_ITEMS);
```

```
ctTagReadEx(hCTAPI, "PV123", sProcessValue, sizeof(sProcessValue), NULL);
ctTagReadEx(hCTAPI, "PV123", sProcessValue, sizeof(sProcessValue), &ctTagvalueItems);
ctTagReadEx(hCTAPI, "PV123.Field", sProcessValueField, sizeof(sProcessValueField),
&ctTagvalueItems);
ctTagReadEx(hCTAPI, "PV123.ControlMode", sProcessValueControlMode,
sizeof(sProcessValueControlMode), &ctTagvalueItems);
ctTagReadEx(hCTAPI, "PV123.Status", sProcessValueStatus, sizeof(sProcessValueStatus),
&ctTagvalueItems);
```

## ctTagWrite

Writes to the given Plant SCADA I/O Device variable tag. The value, quality and timestamp, not only a value, is converted into the correct data type, then scaled and then written to the tag. If writing to an array element only a single element of the array is written to. This function will generate a write request to the I/O Server. The time taken to complete this function will be dependent on the performance of the I/O Device. The calling thread is blocked until the write is completed. Writing operation will succeed only for those tag elements which have read/write access.

## Syntax

**ctTagWrite(*hCTAPI*, *sTag*, *sValue*)**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from [ctOpen\(\)](#).

*sTag*

Type: LPCSTR

Input/output: Input

Description: The tag name or tag name and element name, separated by a dot. If the element name is not specified, it will be resolved at runtime as for an unqualified tag reference. You may use the array syntax [] to select an element of an array.

Variable tags can be specified as a string in multiple forms. Refer to [Tag Names](#) for more information.

*sValue*

Type: LPCSTR

Input/output: Input

Description: The value to write to the tag as a string.

## Return Value

TRUE if successful, otherwise FALSE. Use [GetLastError\(\)](#) to get extended error information.

## Related Functions

[ctOpen](#), [ctTagWrite](#), [ctTagRead](#)

## Example

```
HANDLE hCTAPI = ctOpen(NULL, NULL, NULL, 0);
ctTagWrite (hCTAPI, "PV123", "123.12");
ctTagWrite (hCTAPI, "PV123.Field", "123.12");
ctTagWrite (hCTAPI, "PV123.Field.V", "123.12");
ctTagWrite (hCTAPI, "PV123.ControlMode", "1");
ctTagWrite (hCTAPI, "PV123.Status", "0");
```

## ctTagWriteEx

Performs the same as ctTagWrite, but with an additional new argument. Writes to the given Plant SCADA I/O Device variable tag. The value, quality and timestamp, not only a value, is converted into the correct data type, then scaled and then written to the tag. If writing to an array element only a single element of the array is written to. This function will generate a write request to the I/O Server. The time taken to complete this function will be dependent on the performance of the I/O Device.

If the value of pctOverlapped is NULL, the function behaves the same as ctTagWrite, and the calling thread is blocked until the write is completed. If the value of pctOverlapped is not NULL, the write is completed asynchronously and the calling thread is not blocked.

## Syntax

**ctTagWriteEx(*hCTAPI*, *sTag*, *sValue*, *pctOverlapped*)**

*hCTAPI*

Type: Handle

Input/output: Input

Description: The handle to the CTAPI as returned from ctOpen().

*sTag*

Type: LPCSTR

Input/output: Input

Description: The tag name or tag name and element name, separated by a dot to write to. If the element name is not specified, it will be resolved at runtime as for an unqualified tag reference. You may use the array syntax [] to select an element of an array.

Variable tags can be specified as a string in multiple forms. Refer to [Tag Names](#) for more information.

*sValue*

Type: LPSTR

Input/output: Input

Description: The value to write to the tag as a string.

*pctOverlapped*

Type: CTOVERLAPPED\*

Input/output: Input

Description: Passes in an overlapped structure so ctTagWriteEx can complete asynchronously. If the pctOverlapped structure is NULL, the function will block, completing synchronously.

## Return Value

TRUE if successful, otherwise FALSE. Use GetLastError() to get extended error information.

## Related Functions

[ctOpen](#), [ctTagRead](#)

## AlmQuery

Provides an interface into the alarm summary archive from external applications, replacing the old [CtAPIAlarm](#) query. AlmQuery performs significantly better than CtAPIAlarm.

---

**Note:** The AlmQuery function has been re-implemented to return results based on the sequence of events (SOE) page. The format of the result has not been modified and is compatible with 7.20. The re-implementation includes:

- *TableName* : No longer supports ArgAnaAlm.
- Alarm tags are unique (enforced by the compiler), so the comment on *alarmTag* is no longer necessary.
- The comment associated with the sample is coming from the user comments on the SOE page.

AlmQuery is performed through the same mechanism as CtAPIAlarm. To establish the query and return the first record, you call [ctFindFirst](#). Then, to browse the remaining records, you call [ctFindNext](#). To access the data of the current record, [ctGetProperty](#) is called for each field of the record.

[ctFindFirst](#) is called with the following parameters:

- *hCtapi*: Handle to a valid CtAPI client instance.
- *szTableName*: Command string for the almquery, see below.
- *szFilter*: Not used for Almquery. Just pass in NULL.
- *hObject*: Handle to the first record retrieved for the query.
- *dwFlags*: Not used for Almquery. Just pass in 0.

The *szTableName* is the command string for the query and contains the parameters for the query.

## Syntax

**'ALMQUERY,Database,TagName,Starttime,StarttimeMs,Endtime,EndtimeMs,Period'**

---

**Note:** Arguments need to be comma-separated. Spaces between arguments are supported but not necessary. We recommend no spaces between arguments as they require more processing and take up more space in the query string.

**Database:**

The Alarm database that the alarm is in (alarm type). The following databases are supported: DigAlm (Digital), AnaAlm (Analog), AdvAlm (Advanced), HResAlm (Time Stamped), ArgDigAlm (Multi-Digital), TsDigAlm (Time Stamped Digital), TsAnaAlm (Timestamped Analog).

**TagName:**

The Alarm tag as a string.

**Starttime:**

The start time of the alarm query in seconds since 1970 as an integer in UTC time.

**StarttimeMs:**

The millisecond portion of the start time as an integer. It is expected to be a number between 0 and 999.

**Endtime:**

The end time of the alarm query in seconds since 1970 as an integer in UTC time.

**EndtimeMs:**

Millisecond portion of the end time as an integer. It is expected to be a number between 0 and 999.

**Period:**

Time period in seconds between the samples returned as a floating point value. The only decimal separator supported is the `.'.

## Return Value

The maximum number of samples returned is the time range divided by the period, plus 3 (one for the sample exactly on the end time, and two for the previous and next samples).

---

**Note:** Divide the period evenly into the time range, otherwise one extra sample may be returned.

The AlmQuery does not return interpolated samples in periods where there were no alarm samples. However, to stay within the allowable number of samples, the raw alarm samples will be compressed when more than one sample occurs in one period.

When this compression occurs, the returned sample is flagged as a multiple sample. The timestamp is then an average of the samples within the period. The value and comment returned reflects that of the last sample in the period.

The following properties are returned for each data record of the query.

- **DateTime:** The time of the alarm sample in seconds since 1970 as an integer. This Time is in UTC (Universal Time Coordinates).
- **MSeconds:** The millisecond component of the time of the trend sample as an integer. This value is in between 0 and 999.
- **Comment:** The comment associated with the alarm sample as a string. Corresponds to the latest user comment associated with the most recent event on the alarm within the current period.
- **Value:** The alarm value of the sample as an unsigned integer. See below for a detailed description of the alarm value. The alarm value contains information describing the state of the alarm at the time of the sample:

**bGood (Bit 0)**- Future use only, intended to show when the quality of the alarm data goes bad. At the moment every sample has this bit set to 1 to say the sample is good.

**bDisabled (Bit 1)**- 1 if the alarm is disabled at the sample's time, 0 otherwise.

**bMultiple (Bit 2)**- 1 if the alarm sample is based on multiple raw samples, 0 if it is based on only 1 raw sample.

**bOn (Bit 3)**- 1 if the alarm is on at the sample's time, 0 otherwise.

**bAck (Bit 4)**- 1 if the alarm is acknowledged at the sample's time, 0 otherwise.

**state (Bits 5 - 7)**- Contains the state information of the alarm at the sample's time.

The alarm state represents the different states of the different alarm types. The state only contains relevant information if the alarm is on.

For analog, and time-stamped analog alarm the state can be as follows:

- **Deviation High (1)**- The alarm has deviated above the Setpoint by more than the specified threshold.
- **Deviation Low (2)**- The alarm has deviated below the Setpoint by more than the specified threshold.
- **Rate of Change (3)**- The alarm has changed at a faster rate than expected.
- **Low (4)**- The alarm has entered the low alarm range of values.
- **High (5)**- The alarm has entered the high alarm range of values.
- **Low Low (6)**- The alarm has entered the low low alarm range of values.
- **High High (7)**- The alarm has entered the high high alarm range of values.

For Multi-Digital Alarms the state can be as follows:

- **000 (0)**- Digital tags for the alarm are off.
- **00A (1)**- Tag A is on, B and C are off.
- **0B0 (2)**- Tag B is on, A and C are off.
- **0BA (3)**- Tags B and A are on, C is off.
- **C00 (4)**- Tag C is on, B and C are off.
- **C0A (5)**- Tag C and A are on, B is off.
- **CBO (6)**- Tag C and B are on, A is off.
- **CBA (7)**-Digital tags for the alarm are on.

For the rest of the alarm types ignore the state information.

## TrnQuery

Provides a powerful interface into the trend archive from external applications, replacing the old [CtAPITrend](#) query. TrnQuery performs significantly better than CtAPITrend.

TrnQuery is performed through the same mechanism as CtAPITrend. To establish the query and return the first record, you call [ctFindFirst](#). Then, to browse the remaining records, you call [ctFindNext](#). To access the data of the current record, [ctGetProperty](#) is called for each field of the record.

[ctFindFirst](#) is called with the following parameters:

- *hCtapi*: handle to a valid Ctapi client instance.
- *szTableName*: command string for the Trnquery, see below.
- *szFilter*: Not used for Trnquery. Just pass in NULL.
- *hObject*: handle to the first record retrieved for the query.
- *dwFlags*: Not used for Trnquery. Just pass in 0.

The *szTableName* is the command string for the query. It contains the parameters for the query.

## Syntax

**TRNQUERY,Endtime,EndtimeMs,Period,NumSamples,Tagname,Displaymode,Datamode,InstantTrend,SamplePeriod'**

**Note:** Arguments needs to be comma-separated. Spaces between arguments are supported but not necessary. We recommend no spaces between arguments as they require more processing and take up more space in the

---

query string.

***Endtime:***

End time of the trend query in seconds since 1970 as an integer. This time is expected to be a UTC time (Universal Time Coordinates).

***EndtimeMs:***

Millisecond portion of the end time as an integer, expected to be a number between 0 and 999.

***Period:***

Time period in seconds between the samples returned as a floating point value. The only decimal separator supported is the `.'

***NumSamples:***

Number of samples requested as an integer. The start time of the request is calculated by multiplying the Period by NumSamples - 1, then subtracting this from the EndTime.

The actual maximum amount of samples returned is actually NumSamples + 2. This is because we return the previous and next samples before and after the requested range. This is useful as it tells you where the next data is before and after where you requested it.

***TagName:***

The name of the trend tag as a string. This query only supports the retrieval of trend data for one trend at a time.

***DisplayMode:***

Specifies the different options for formatting and calculating the samples of the query as an unsigned integer.

See [Display Mode](#) for information.

***DataMode:***

Mode of this request as an integer. 1 if you want the timestamps to be returned with their full precision and accuracy. Mode 1 does not interpolate samples where there were no values. 0 if you want the timestamps to be calculated, one per period. Mode 0 does interpolate samples, where there was no values.

***InstantTrend:***

An integer specifying whether the query is for an instant trend. 1 if for an instant trend. 0 if not.

***SamplePeriod:***

An integer specifying the requested sample period in milliseconds for the instant trend's tag value.

## Return Value

See [Returned Data](#) for return values.

## Display Mode

The data returned can vary drastically depending on the display mode of the TrnQuery. The display mode is split into the following mutually exclusive options:

**Ordering Trend sample options**

- 0 - Order returned samples from oldest to newest
- 2 - Order returned samples from newest to oldest. This mode is not supported when the Raw data option has been specified.

### Condense method options

- 0 - Set the condense method to use the mean of the samples.
- 4 - Set the condense method to use the minimum of the samples.
- 8 - Set the condense method to use the maximum of the samples.
- 12 - Set the condense method to use the newest of the samples.

### Timestamp options

- 0 - Returns the mean timestamp for all of the samples in the sample period.
- 33554432 - Returns the actual timestamp of the minimum/maximum/newest sample (depending on the current condense method setting). A condense method of "mean" will still return the mean timestamp for all of the samples in the sample period.

## Example

The following table represents samples every ten minutes across an hour.

0:10:00	40
0:20:00	70
0:30:00	60
0:40:00	20
0:50:00	10
1:00:00	50

Based on the current condense method setting (see above), the following would be returned when the timestamp option is set to 33554432.

- 0 (mean) — the timestamp = **0:35:00** ( $10 + 20 + 30 + 40 + 50 + 60 / 6 = 210 / 6 = 35$ )
- 4 (minimum) — value = 10; timestamp = **0:50:00**.
- 8 (maximum) — value = 70, timestamp = **0:20:00**.
- 12 (newest) — value = 50, timestamp = **1:00:00**.

### Stretch method options

- 0 - Set the stretch method to step.
- 128 - Set the stretch method to use a ratio.
- 256 - Set the stretch method to use raw samples (no interpolation).

### Gap Fill Constant option

- n - the number of missed samples that the user wants to gap fill) x 4096.

### Last valid value options

- 0 - If we are leaving the value given with a bad quality sample as 0.
- 2097152 - If we are to set the value of a bad quality sample to the last valid value (zero if there is no last valid value).

### Raw data options

- 0 - If we are not returning raw data, that is we are using the condense and stretch modes to compress and interpolate the data.
- 4194304 - If we are to return totally raw data, that is no compression or interpolation. This mode is only supported if we have specified the DataMode of the query = 1. When using this mode, more samples than the maximum specified above will be returned if there are more raw samples than the maximum in the time range.

## Returned Data

The following properties are returned for each data record of the query.

- *DateTime*: Time of the trend sample in seconds since 1970 as an integer in UTC (Universal Time Coordinates).
- *MSeconds*: Millisecond component of the time of the trend sample as an integer. This value is inbetween 0 and 999.
- *Value*: Trend value of the sample as a double.
- *Quality*: The quality information associated with the trend sample as an unsigned integer. The Quality property contains specific information in each bit in the unsigned integer.

To interpret the quality code, converted to its underlying binary value (for example, 0001 0001 0011) and read the bits from right to left. Each bit represents the following:

#### Value Type (Bits 0 - 3)

- *ValueType\_None* (0): There is no value in the given sample. Ignore the sample value, time and quality.
- *ValueType\_Interpolated* (1): The value has been interpolated from data around it.
- *ValueType\_SingleRaw* (2): The value is based on one raw sample.
- *ValueType\_MultipleRaw* (3): The value has been calculated from multiple raw samples.

#### Value Quality (Bits 4 - 7)

- *ValueQuality\_Bad* (0): Ignore the value of the sample as there was no raw data to base it on.
- *ValueQuality\_Good* (1): The value of the sample is valid, and is based on some raw data.

#### Last Value Quality (Bits 8 - 11)

- *LastValueQuality\_Bad* (0): The value of the sample should be ignored as there was no raw data to base it on.
- *LastValueQuality\_Good* (1): The value quality of the last raw sample in the period was good.
- *LastValueQuality\_NotAvailable* (2): The value quality of the last raw sample in the period was Not Available.
- *LastValueQuality\_Gated* (3): The value quality of the last raw sample in the period was Gated.

#### Partial Flag (Bit 12)

When the Partial Flag is set to 1 it indicates that the sample may change the next time it is read. This occurs when you get samples right at the current time, and a sample returned is not necessarily complete because more samples may be acquired in this period.

## Quality examples

If the returned quality code is **275**, the binary conversion is **0001 0001 0011**.

Reading from right to left, the quality code includes the following information:

- Bit 0: ValueType\_None (0): There is no value in the given sample. Ignore the sample value, time and quality.
- Bit 1: ValueType\_Interpolated (1): The value has been interpolated from data around it.
- Bit 4: ValueQuality\_Bad (0): Ignore the value of the sample as there was no raw data to base it on.
- Bit 8: LastValueQuality\_Bad (0): The value of the sample should be ignored as there was no raw data to base it on.

If the returned quality code is **4609**, the binary conversion is **0001 0010 0000 0001**.

Reading from right to left, the quality code includes the following information:

- Bit 0: ValueType\_None (0): There is no value in the given sample. Ignore the sample value, time and quality.
- Bit 9: LastValueQuality\_Good (1): The value quality of the last raw sample in the period was good.
- Bit 12: The Partial Flag is set to 1 indicating that the sample may change the next time it is read.

## CtAPIAlarm

Provides an interface into the alarm summary archive from external applications. For performance improvements, use the [AlmQuery](#) function instead.

To establish the query and return the first record, you call [ctFindFirst](#). Then, to browse the remaining records, you call [ctFindNext](#). To access the data of the current record, [ctGetProperty](#) is called for each field of the record.

[ctFindFirst](#) is called with the following parameters:

- hCtapi: Handle to a valid CtAPI client instance.
- szTableName: Command string for the almquery, see below.
- szFilter: Not used for Almquery. Just pass in NULL.
- hObject: Handle to the first record retrieved for the query.
- dwFlags: Not used for Almquery. Just pass in 0.

The szTableName is the command string for the query and contains the parameters for the query.

## Syntax

**CTAPIAlarm**(*Category,Type,Area*)

---

**Note:** Arguments needs to be comma-separated. Spaces between arguments are supported but not necessary. We recommend no spaces between arguments as they require more processing and take up more space in the query string.

---

**Category:**

The alarm category or group number to match. Set Category to 0 (zero) to match every alarm categorie.

**Type:**

The type of alarms to find:

**Non-hardware alarms**

1. Unacknowledged alarms, ON and OFF.
2. Acknowledged ON alarms.
3. Disabled alarms.
4. Configured alarms, i.e. Types 0 to 3, plus acknowledged OFF alarms.

If you do not specify a Type, the default is 0.

**Area:**

The area in which to search for alarms. If you do not specify an area, or if you set Area to -1, only the current area will be searched.

To simplify the passing of this argument, you could first pass the CTAPIAlarm() function as a string, then use the string as the szTableName argument (without quotation marks).

## CtAPITrend

Provides an interface into the trend archive from external applications, replacing the old [CtAPITrend](#) query. For performance improvements, use the TrnQuery function instead.

To establish the query and return the first record, you call [ctFindFirst](#). Then, to browse the remaining records, you call [ctFindNext](#). To access the data of the current record, [ctGetProperty](#) is called for each field of the record.

[ctFindFirst](#) is called with the following parameters:

- *hCtapi*: handle to a valid Ctapi client instance.
- *szTableName*: command string for the Trnquery, see below.
- *szFilter*: Not used for Trnquery. Just pass in NULL.
- *hObject*: handle to the first record retrieved for the query.
- *dwFlags*: Not used for Trnquery. Just pass in 0.

The *szTableName* is the command string for the query. It contains the parameters for the query.

## Syntax

**CTAPITrend(*sTime*,*sDate*,*Period*,*Length*,*Mode*,*Tag*)**

---

**Note:** Arguments needs to be comma-separated. Spaces between arguments are supported but not necessary. We recommend no spaces between arguments as they require more processing and take up more space in the query string.

---

***sTime*:**

The starting time for the trend. Set the time to an empty string to search the latest trend samples.

***sDate*:**

The date of the trend.

**Period:**

The period (in seconds) that you want to search (this period can differ from the actual trend period).

The Period argument used in the CTAPITrend() function needs to be 0 (zero) when this function is used as an argument to ctFindFirst() for an EVENT trend query.

**Length:**

The length of the data table, i.e. the number of rows of samples to be searched.

**Mode:**

The format mode to be used:

**Periodic trends**

- 1 - Search the Date and Time, followed by the tags.
- 2 - Search the Time only, followed by the tags.
- 3 - Ignore any invalid or gated values. (This mode is only supported for periodic trends.)

**Event trends**

- 1 - Search the Time, Date, and Event Number, followed by the tags.
- 2 - Search the Time and Event Number, followed by the tags.

**Tag:**

The trend tag name for the data to be searched.

To simplify the passing of this argument, you could first pass the CTAPITrend() function as a string, then use the string as the szTableName argument (without quotation marks).

## Graphics Builder Automation Interface

The Plant SCADA Graphics Builder now offers support for "automation," an OLE service that allows applications to expose their functionality, or to control the functionality of other applications on the same computer or across a network. As a result, applications can be integrated and automated with programming code.

The two key elements of automation are:

- Applications or software components, called **automation servers**, that can be controlled because their functionality has been exposed and made accessible to other applications. Examples of Microsoft Automation servers are Microsoft Office applications and Microsoft Project. These Automation servers expose their functionality through object models.
- Other applications or development tools, called **automation controllers**, that can control OLE Automation servers through programming code, by accessing the functionality exposed by the Automation servers. Examples of Microsoft Automation controllers are Microsoft Visual Basic, Microsoft Visual C++, and Microsoft Visual Basic for Applications (which is built into Microsoft Access, Microsoft Excel, and Microsoft Project).

*Automation* is the umbrella term for the process by which an automation controller sends instructions to an automation server (using the functionality exposed by the automation server), where they are run.

The Plant SCADA Graphics Builder automation interface enables the Plant SCADA Graphics Builder to act as an automation server as it exposes many Graphics Builder functions.

The interface supports a simple object model: functions are on the root level. Names are structured and contain a group identifier and a function name; for example, DrawLine, DrawRectangle, PositionAt, PositionRotate, ProjectSelect, ProjectUpgrade. These functions can be called from a Visual Basic (VB) program.

**Note:** In the VB development environment, the reference GraphicsBuilder Type Library needs to have previously been selected. If it has not, choose **References** from the Project menu in the VB and check the Graphics Builder Type Library.

## Example

The following sample VB code allows you to create a new Plant SCADA page, place a Genie at a specific location, set one of its parameter, draw a line, and then save the page with the name "TEST". This example is compatible with the ExampleSA project.

```
Dim GraphicsBuilder As IGraphicsBuilder2
Set GraphicsBuilder = New GraphicsBuilder.GraphicsBuilder
With GraphicsBuilder
    .Visible = True
    .PageNew "sa_include", "situational_awareness", "pagecontent", 0, False, True
    .LibraryObjectPlace "sa_include", "sa_filter", "item_priority_hd1080", 0, True
    .PositionAt 300, 500
    .LibraryObjectPutProperty "AsmPriority", "1"
    .DrawLine 100, 100, 300, 300
    .AttributeLineColour = 120
    .PageSaveAs "ExampleSA", "TEST_AUTOMATION"
    .PageClose
End With
Set GraphicsBuilder = Nothing
```

## Error Handling

Functions, when called from VB, throw an exception on error. The following table lists the possible HRESULT errors that may be encountered:

C++ define	Hex value	Hex codes in VB	Description
S_OK	0	No exception	Successful execution
E_INVALIDARG	80070057	5	One or more arguments are out of range
E_HANDLE	80070006	80070006	No active object (page or graphical object)
E_POINTER	80004003	80004003	Missing or broken link encountered
E_ABORT	80000007	11F	Enumeration terminated

C++ define	Hex value	Hex codes in VB	Description
			or function manually canceled (for example ProjectUpdate)
E_FAIL	80004005	80004005	Every other error

The following VB code can be used to process the error code:

```
On Error Resume Next
Err.Clear
GraphicsBuilder.LibObjectName Project, File, Page, Type
If Err.Number <> 0 Then
    Debug.Print "Error occurred in LibObjectName"
End If
```

Note the following points:

- VB sets the Err variable only in the erroneous case. It will not be set to 0 if the function succeeds.
- When VB handles an exception, it ignores the functions parameters. Hence when a function like ProjectNext does not succeed, the returned string is undefined and not an empty string.

The functions in the groups Page Functions, Options Functions, Object Drawing and Property Functions, Text Property Functions and the individual functions LibSelectionHooksEnabled, SelectionEventEnabled, BrokenLinkCancelEnabled and Visible are treated as variables in VB.

When calling these functions from C++, you need to use a "put\_" or "get\_" prefix, for example, "put\_Visible(TRUE)", "get\_Visible(bValue)" to set or fetch the values, except if the Attribute is read-only. In this case the function is the same in C++; for example, PageName.

To evaluate the correct function name for C++ reference the Type library CTDRAW32.TLB, which can be found in Plant SCADA's BIN directory. You can use Microsoft's Visual Studio Tool OLE / COM Object Viewer (select menu File | View Typelib...) to look at a type library.

[Automation Events](#)

## Automation Events

The graphics builder also provides event-based notification of actions, which an Automation client can intercept and react to accordingly. The following example creates a form, creates a graphics builder automation object with event capability and performs actions on two events that the graphics builder might generate, pasting a symbol and saving a page.

To enable this:

- The Graphics Builder object needs to be declared "WithEvents"
- The event handler subroutine needs to have the correct name and signature. Note how the event handler function names are gb, the graphics builder object, followed by \_<eventName> e.g gb\_PasteSymbol. This is consistent with standard Visual Basic event handling subroutine naming.

For details, see the individual event subroutine description.

```
Private WithEvents gb As GraphicsBuilder.GraphicsBuilder
Public Sub Form_Load()
    Set gb = New GraphicsBuilder.GraphicsBuilder
    gb.LibrarySelectionHooksEnabled = True
    gb.Visible = True
End Sub
Public Sub gb_PasteSymbol()
    MsgBox ("PasteSymbol")
End Sub
Private Sub gb_PageSaved(ByVal Project As String, ByVal Page As String,
    ByVal LastPage As Boolean)
    MsgBox "PageSaved: " + Project + "." + Page + "--"
End Sub
```

## Function Categories

This table lists the Plant SCADA functions exposed through the Graphics Builder automation interface, grouped into the following categories:

<a href="#">Alarm Indicator Functions</a>	Allows you to define the look of the Alarm Indicator attached to a genie. Related to the Alarm Indicator Properties Tab part of the Genie Properties dialog.
<a href="#">Arrange and Position Functions</a>	Allow you to modify the position of a selected object in three dimensions (X,Y and Z order).
<a href="#">Composite Genie Functions</a>	Allow you to place or locate Composite Genies.
<a href="#">Dynamic Properties Functions</a>	Allow you to modify the dynamic properties of the graphics objects in your project (movement, scaling, rotation, sliders, dynamic color fill).
<a href="#">Event Functions</a>	Allow you to use the automation dispatch mechanism to fire events in specific situations.
<a href="#">Library Object Functions</a>	Allow you to use and manipulate the objects stored in libraries in your project. This includes such objects as Genies, Super Genies, Symbols, and so on.
<a href="#">Metadata Functions</a>	Allow you to configure the metadata of the current object on a page.
<a href="#">Miscellaneous Functions</a>	Used for special interactions with the Graphics Builder, for example an external drag-and-drop action could be performed by requesting the active window handle.

Object Drawing and Property Functions	Allow you to draw objects and manipulate the properties of objects.
Options Functions	Relate to the options found under the Graphics Builder 's Tools menu.
Page Functions	Allow you to manipulate the pages in your project (for example open, close, save, delete), and select objects on those pages. This includes templates, symbols, Genies, Super Genies.
Page Properties Functions	Allow you to manipulate the properties of the pages in your project.
Project Functions	These functions operate on the project level. Some are actually initiated within Plant SCADA Studio.
Specific Functions	Currently include only the Visible function.
Text Property Functions	Allow you to read and modify the properties of the text objects in your project.

For details and a VB example on handling return and error values, see [Error Handling](#).

## Alarm Indicator Functions

The following functions set and define the look of the Alarm indicator belonging to an object or a Genie.

<a href="#">AlarmIndicatorGetBorderIsInside</a>	Retrieves the status for the 'Is Inside Flag' for the alarm indicator.
<a href="#">AlarmIndicatorGetBorderPadding</a>	Retrieves the size of the border padding for the alarm indicator.
<a href="#">AlarmIndicatorGetBorderWidth</a>	Retrieves the width of the Alarm Indicator border.
<a href="#">AlarmIndicatorGetEnabled</a>	Retrieves the state of the Alarm Indicator option for an object or genie.
<a href="#">AlarmIndicatorGetEquipHierarchy</a>	Retrieves the location in the equipment hierarchy that will be used to determine the highest priority alarm for the alarm indicator.
<a href="#">AlarmIndicatorGetExpr</a>	Retrieves the Equipment string or expression belonging to the Alarm Indicator.

<a href="#">AlarmIndicatorGetFlagEnabled</a>	Retrieves the status of the Alarm Indicator flag.
<a href="#">AlarmIndicatorGetFlagLocation</a>	Retrieves the position of the flag for the Alarm Indicator.
<a href="#">AlarmIndicatorGetFrameColor</a>	Retrieves the color of the frame of the Alarm indicator.
<a href="#">AlarmIndicatorGetInclude</a>	Retrieves the status of the Include Equipment reference option for the Alarm indicator.
<a href="#">AlarmIndicatorSetBorderIsInside</a>	Sets the Alarm Indicator 'Is Inside flag'. If set to True the border is located within the extent of the object group or Genie.
<a href="#">AlarmIndicatorSetBorderPadding</a>	Sets the size of the border padding in pixels for the Alarm Indicator.
<a href="#">AlarmIndicatorSetBorderWidth</a>	Sets the width in pixels of the Alarm Indicator border.
<a href="#">AlarmIndicatorSetEnabled</a>	Sets the status of the Alarm Indicator option for an object or genie.
<a href="#">AlarmIndicatorSetEquipHierarchy</a>	Set the location in the equipment hierarchy that will be used to determine the highest priority alarm for the Alarm Indicator.
<a href="#">AlarmIndicatorSetExpr</a>	Set the Equipment string or expression that will be used to determine the highest priority alarm for the Alarm Indicator.
<a href="#">AlarmIndicatorSetFlagEnabled</a>	Sets the Alarm Indicator enabled flag. When set to True a flag is applied to the alarm indicator.
<a href="#">AlarmIndicatorSetFlagLocation</a>	Sets the Alarm Indicator flag location. Flag can be positioned at any of the 7 points around the border.
<a href="#">AlarmIndicatorSetFrameColor</a>	Sets the color of the frame for the Alarm Indicator in RGB hex or decimal values.
<a href="#">AlarmIndicatorSetInclude</a>	Sets the status of the "Include Equipment reference count" option for the Alarm indicator. When set to true the count will include equipment references when determining the highest priority alarm for an alarm indicator.

For details and a VB example on handling return and error values, see [Error Handling](#).

[AlarmIndicatorSetInclude](#)

## Example

```
bFlagEnabledGet = gb2.AlarmIndicatorGetFlagEnabled;
```

### AlarmIndicatorGetFlagLocation

Retrieves the position of the flag for the Alarm Indicator.

## Syntax

**AlarmIndicatorGetFlagLocation**

## Return Value

0 to 7

The position is outlined below:

- 0 - Top Left
- 1 - Center Left
- 2 - Bottom Left
- 3 - Top Center
- 4 - Bottom Center
- 5 - Top Right
- 6 - Middle Right
- 7 - Bottom Right

## Example

```
bIncludeGet = gb2.AlarmIndicatorGetInclude;
```

### AlarmIndicatorSetBorderIsInside

Sets the Alarm Indicator 'Is Inside flag'.

## Syntax

**AlarmIndicatorSetBorderIsInside(IndicatorIsInside)**

*IndicatorIsInside:*

True or false. If set to True the border is located within the extent of the object group or Genie. This means no additional space will be required to support a border. If false there will be no inside border.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

[AlarmIndicatorSetFlagEnabled](#), [AlarmIndicatorSetFlagLocation](#), [AlarmIndicatorSetFrameColor](#),  
[AlarmIndicatorSetInclude](#)

## Example

```
gb2.AlarmIndicatorSetEnabled = true;
gb2.AlarmIndicatorSetExpr = "C1.Motor1";
gb2.AlarmIndicatorSetEquipHierarchy = 0;
gb2.AlarmIndicatorSetBorderIsInside = false;
gb2.AlarmIndicatorSetBorderWidth = 2;
gb2.AlarmIndicatorSetFrameColour = 0x80AAD5;
gb2.AlarmIndicatorSetBorderPadding = 5;
```

```
gb2.AlarmIndicatorSetInclude = true;  
gb2.AlarmIndicatorSetFlagEnabled = false;  
gb2.AlarmIndicatorSetFlagLocation = 0;
```

## AlarmIndicatorSetBorderPadding

Set the size of the border padding for the Alarm Indicator.

## Syntax

**AlarmIndicatorSetBorderPadding(*BorderPadding*)**

*BorderPadding*:

Amount of space between the extent of the object group or Genie and the inside edge of the alarm border (in pixels). Set the value to be between 1 and 100 px.

## Return Value

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

[AlarmIndicatorSetInclude](#)

## Example

```
gb2.AlarmIndicatorSetEnabled = true;  
gb2.AlarmIndicatorSetExpr = "C1.Motor1";  
gb2.AlarmIndicatorSetEquipHierarchy = 0;  
gb2.AlarmIndicatorSetBorderIsInside = false;  
gb2.AlarmIndicatorSetBorderWidth = 2;  
gb2.AlarmIndicatorSetFrameColour = 0x80AAD5;  
gb2.AlarmIndicatorSetBorderPadding = 5;  
gb2.AlarmIndicatorSetInclude = true;  
gb2.AlarmIndicatorSetFlagEnabled = false;  
gb2.AlarmIndicatorSetFlagLocation = 0;
```

## AlarmIndicatorSetBorderWidth

Set the size of the Alarm Indicator border .

## Syntax

**AlarmIndicatorSetBorderWidth(*BorderPadding*)**

*BorderPadding*:

The width of the alarm border (in pixels) between 1 to 20 px.

## Return Value

1 - 20

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Example

```
gb2.AlarmIndicatorSetEnabled = true;
gb2.AlarmIndicatorSetExpr = "C1.Motor1";
gb2.AlarmIndicatorSetEquipHierarchy = 0;
gb2.AlarmIndicatorSetBorderIsInside = false;
gb2.AlarmIndicatorSetBorderWidth = 2;
gb2.AlarmIndicatorSetFrameColour = 0x80AAD5;
gb2.AlarmIndicatorSetBorderPadding = 5;
gb2.AlarmIndicatorSetInclude = true;
gb2.AlarmIndicatorSetFlagEnabled = false;
gb2.AlarmIndicatorSetFlagLocation = 0;
```

## AlarmIndicatorSetEnabled

Sets the status of the Alarm Indicator option for an object or genie.

## Syntax

**AlarmIndicatorSetEnabled(*IndicatorEnabled*)**

*IndicatorEnabled*:

True or False. When set to True an alarm indicator will be applied to an object or genie.

## Return Value

True or False

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[AlarmIndicatorGetBorderIsInside](#), [AlarmIndicatorGetBorderPadding](#), [AlarmIndicatorGetBorderWidth](#),

[AlarmIndicatorSetBorderWidth](#), [AlarmIndicatorSetEquipHierarchy](#), [AlarmIndicatorSetExpr](#),  
[AlarmIndicatorSetFlagEnabled](#), [AlarmIndicatorSetFlagLocation](#), [AlarmIndicatorSetFrameColor](#),  
[AlarmIndicatorSetInclude](#)

## Example

```
gb2.AlarmIndicatorSetEnabled = true;
gb2.AlarmIndicatorSetExpr = "C1.Motor1";
gb2.AlarmIndicatorSetEquipHierarchy = 0;
gb2.AlarmIndicatorSetBorderIsInside = false;
gb2.AlarmIndicatorSetBorderWidth = 2;
gb2.AlarmIndicatorSetFrameColour = 0x80AAD5;
gb2.AlarmIndicatorSetBorderPadding = 5;
gb2.AlarmIndicatorSetInclude = true;
gb2.AlarmIndicatorSetFlagEnabled = false;
gb2.AlarmIndicatorSetFlagLocation = 0;
```

## AlarmIndicatorSetEquipHierarchy

Set the location in the equipment hierarchy that will be used to determine the highest priority alarm for the alarm indicator.

## Syntax

**AlarmIndicatorSetEquipHierarchy(*EquipmentHierarchy*)**

*EquipmentHierarchy*:

Locations you can set include:

0 = Equipment and Children

1= Equipment Only

2= Children Only.

## Return Value

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

[AlarmIndicatorSetBorderWidth](#), [AlarmIndicatorSetEnabled](#), [AlarmIndicatorSetExpr](#),  
[AlarmIndicatorSetFlagEnabled](#), [AlarmIndicatorSetFlagLocation](#), [AlarmIndicatorSetFrameColor](#),  
[AlarmIndicatorSetInclude](#)

## Example

```
gb2.AlarmIndicatorSetEnabled = true;
gb2.AlarmIndicatorSetExpr = "C1.Motor1";
gb2.AlarmIndicatorSetEquipHierarchy = 0;
gb2.AlarmIndicatorSetBorderIsInside = false;
gb2.AlarmIndicatorSetBorderWidth = 2;
gb2.AlarmIndicatorSetFrameColour = 0x80AAD5;
gb2.AlarmIndicatorSetBorderPadding = 5;
gb2.AlarmIndicatorSetInclude = true;
gb2.AlarmIndicatorSetFlagEnabled = false;
gb2.AlarmIndicatorSetFlagLocation = 0;
```

## AlarmIndicatorSetExpr

Sets the equipment string or expression that will be used to determine the highest priority alarm for the alarm indicator.

## Syntax

**AlarmIndicatorSetExpr(*Expression*)**

*Expression*

Enter the Equipment string that will be used to determine the highest priority alarm for the alarm indicator.

## Return Value

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

[AlarmIndicatorSetBorderWidth](#), [AlarmIndicatorSetEnabled](#), [AlarmIndicatorSetEquipHierarchy](#),  
[AlarmIndicatorSetFlagEnabled](#), [AlarmIndicatorSetFlagLocation](#), [AlarmIndicatorSetFrameColor](#),  
[AlarmIndicatorSetInclude](#)

## Example

```
gb2.AlarmIndicatorSetEnabled = true;
gb2.AlarmIndicatorSetExpr = "C1.Motor1";
gb2.AlarmIndicatorSetEquipHierarchy = 0;
gb2.AlarmIndicatorSetBorderIsInside = false;
gb2.AlarmIndicatorSetBorderWidth = 2;
gb2.AlarmIndicatorSetFrameColour = 0x80AAD5;
gb2.AlarmIndicatorSetBorderPadding = 5;
gb2.AlarmIndicatorSetInclude = true;
gb2.AlarmIndicatorSetFlagEnabled = false;
gb2.AlarmIndicatorSetFlagLocation = 0;
```

## AlarmIndicatorSetFlagEnabled

Sets the Alarm Indicator flag.

## Syntax

**AlarmIndicatorSetFlagEnabled(*FlagEnabled*)**

*FlagEnabled*:

When set to True a flag is applied to the alarm indicator. When set to false no flag is applied.

## Return Value

True or False

---

**Note:** For details on handling return and error values, see [Error Handling](#).

gb2.AlarmIndicatorSetBorderPadding = 5;
gb2.AlarmIndicatorSetInclude = true;
gb2.AlarmIndicatorSetFlagEnabled = true;
```

```
gb2.AlarmIndicatorSetFlagLocation = 3;
```

## AlarmIndicatorSetFlagLocation

Sets the position of the Alarm Indicator Flag.

## Syntax

**AlarmIndicatorSetFlagLocation(*FlagLocation*)**

*FlagLocation*:

Flag can be positioned at the following points around the border:

- 0 - Top Left
- 1 - Center Left
- 2 - Bottom Left
- 3 - Top Center
- 4 - Bottom Center
- 5 - Top Right
- 6 - Center Right
- 7 - Bottom Right

## Return Value

[AlarmIndicatorSetExpr](#), [AlarmIndicatorSetFlagEnabled](#), [AlarmIndicatorSetFrameColor](#), [AlarmIndicatorSetInclude](#)

## Example

```
gb2.AlarmIndicatorSetEnabled = true; gb2.AlarmIndicatorSetExpr = "C1.Motor1";
gb2.AlarmIndicatorSetEquipHierarchy = 0; gb2.AlarmIndicatorSetBorderIsInside = false;
gb2.AlarmIndicatorSetBorderWidth = 2; gb2.AlarmIndicatorSetFrameColour = 0x80AAD5;
gb2.AlarmIndicatorSetBorderPadding = 5; gb2.AlarmIndicatorSetInclude = true;
gb2.AlarmIndicatorSetFlagEnabled = true; gb2.AlarmIndicatorSetFlagLocation = 3;
```

## AlarmIndicatorSetFrameColor

Sets the color of the frame for the Alarm Indicator.

---

**Note:** Colors are referenced by using hex codes for red, green and blue (RGB) values. You can view RGB values (in decimal) of a selected color by choosing **Tools|Edit Favorite Colors** in Graphics Builder. If, for example, the color you want to use has the values R = 128, G = 170, B = 213, you can convert these to their hex equivalents (R = 0x80, G = 0xAA, B = 0xD5).

---

## Syntax

**AlarmIndicatorSetFrameColor(*FrameColor*)**

*FrameColor*:

RGB value and -1 for transparency

## Return Value

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

[AlarmIndicatorSetBorderWidth](#), [AlarmIndicatorSetEnabled](#), [AlarmIndicatorSetEquipHierarchy](#),  
[AlarmIndicatorSetExpr](#), [AlarmIndicatorSetFlagEnabled](#), [AlarmIndicatorSetFlagLocation](#), [AlarmIndicatorSetInclude](#)

## Example

```
gb2.AlarmIndicatorSetEnabled = true;
gb2.AlarmIndicatorSetExpr = "C1.Motor1";
gb2.AlarmIndicatorSetEquipHierarchy = 0;
gb2.AlarmIndicatorSetBorderIsInside = false;
gb2.AlarmIndicatorSetBorderWidth = 2;
gb2.AlarmIndicatorSetFrameColour = 0x80AAD5;
gb2.AlarmIndicatorSetBorderPadding = 5;
gb2.AlarmIndicatorSetInclude = true;
gb2.AlarmIndicatorSetFlagEnabled = true;
gb2.AlarmIndicatorSetFlagLocation = 3;
```

## AlarmIndicatorSetInclude

Sets the status of the "Include Equipment references in count" option for the Alarm indicator.

## Syntax

**AlarmIndicatorSetInclude(*IndicatorInclude*)**

*IndicatorInclude*:

True or False. When set to true the count will include equipment references when determining the highest priority alarm for an alarm indicator.

## Return Value

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AlarmIndicatorGetBorderIsInside](#), [AlarmIndicatorGetBorderPadding](#), [AlarmIndicatorGetBorderWidth](#),

[AlarmIndicatorSetExpr](#), [AlarmIndicatorSetFlagEnabled](#), [AlarmIndicatorSetFlagLocation](#),  
[AlarmIndicatorSetFrameColor](#)

## Example

```
gb2.AlarmIndicatorSetEnabled = true;
gb2.AlarmIndicatorSetExpr = "C1.Motor1";
gb2.AlarmIndicatorSetEquipHierarchy = 0;
gb2.AlarmIndicatorSetBorderIsInside = false;
gb2.AlarmIndicatorSetBorderWidth = 2;
gb2.AlarmIndicatorSetFrameColour = 0x80AAD5;
gb2.AlarmIndicatorSetBorderPadding = 5;
gb2.AlarmIndicatorSetInclude = true;
gb2.AlarmIndicatorSetFlagEnabled = false;
gb2.AlarmIndicatorSetFlagLocation = 0;
```

## Arrange and Position Functions

The following functions modify the position of a selected object in three dimensions (X, Y and Z order).

<a href="#">PositionAt</a>	Positions the active object at the specified location.
<a href="#">PositionBringForwards</a>	Moves the last object addressed one step forward in the layering of objects on a page, creating the appearance of moving forward.
<a href="#">PositionBringToFront</a>	Positions the last object addressed as the closest layer on a graphics page, giving it the appearance of being in front of the other objects.
<a href="#">PositionMirrorHorizontal</a>	Turns the last object addressed into a mirror image of itself across a horizontal axis.
<a href="#">PositionMirrorVertical</a>	Turns the last object addressed into a mirror image of itself across a vertical axis.
<a href="#">PositionRotate</a>	Rotates the last object addressed by 90 degrees clockwise.

PositionSendBackwards	Moves the last object addressed one step backwards in the layering of objects on a page, creating the appearance of moving backwards.
PositionSendToBack	Positions the last object addressed as the lowest layer on a graphics page, giving it the appearance of being behind the other objects.

For details and a VB example on handling return and error values, see [Error Handling](#).

## See Also

[Automation Events](#)

[Function Categories](#)

## PositionAt

Positions the active object at the specified location. The destination coordinates is adjusted if OptionSnapToGrid or OptionSnapToGuidelines are set to TRUE.

## Syntax

**PositionAt(*XPosition*, *YPosition*)**

*XPosition*:

Absolute X position in pixels from the left side of the page.

*YPosition*:

Absolute Y position in pixels from the top of the page.

## Return Value

0 (zero) if successful; otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PositionRotate](#), [PositionMirrorVertical](#), [PositionMirrorHorizontal](#), [PositionSendToBack](#), [PositionBringToFront](#), [PositionBringForwards](#), [PositionSendBackwards](#)

## Example

```
GraphicsBuilder.LibraryObjectPlace "include", "agitator", "agit_1_Pos1_g", 2, True
GraphicsBuilder.PositionAt "200,200"
```

## PositionBringForwards

Moves the last object addressed one step forward in the layering of objects on a page, creating the appearance of moving forward.

## Syntax

**PositionBringForwards**

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PositionAt](#), [PositionRotate](#), [PositionSendToBack](#), [PositionBringToFront](#)

## Example

```
' Moves an object forward in the layering of objects on a graphics page
GraphicsBuilder.LibraryObjectPlace "include", "agitator", "agit_1_Pos1_g", 2, True
GraphicsBuilder.PositionAt 200, 200
GraphicsBuilder.PositionBringForwards
```

## PositionBringToFront

Positions the last object addressed as the closest layer on a graphics page, giving it the appearance of being in front of other objects.

## Syntax

**PositionBringToFront**

## Return Value

0 (zero) if successful; otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PositionAt](#), [PositionRotate](#), [PositionSendToBack](#), [PositionBringForwards](#), [PositionSendBackwards](#)

## Example

```
' Places an object in front of other objects on a graphics page
GraphicsBuilder.LibraryObjectPlace "include", "agitator", "agit_1_Pos1_g", 2, True
GraphicsBuilder.PositionAt 200, 200
GraphicsBuilder.PositionBringToFront
```

## PositionMirrorHorizontal

Turns the last object addressed into a mirror image of itself across a horizontal axis.

## Syntax

**PositionMirrorHorizontal**

## Return Value

0 (zero) if successful; otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PositionAt](#), [PositionRotate](#), [PositionMirrorVertical](#), [PositionSendToBack](#), [PositionBringToFront](#),  
[PositionBringForwards](#), [PositionSendBackwards](#)

## Example

```
' Mirrors an object across a horizontal access
GraphicsBuilder.LibraryObjectPlace "include", "agitator", "agit_1_Pos1_g", 2, True
GraphicsBuilder.PositionAt 200, 200
GraphicsBuilder.PositionMirrorHorizontal
```

## PositionMirrorVertical

Turns the last object addressed into a mirror image of itself across a vertical axis.

## Syntax

**PositionMirrorVertical**

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PositionAt](#), [PositionRotate](#), [PositionMirrorHorizontal](#), [PositionSendToBack](#), [PositionBringToFront](#),  
[PositionBringForwards](#), [PositionSendBackwards](#)

## Example

```
' Mirrors an object across a vertical accessGraphicsBuilder.LibraryObjectPlace "include",
"agitator", "agit_1_Pos1_g", 2, True
GraphicsBuilder.PositionAt 200, 200
GraphicsBuilder.PositionMirrorVertical
```

## PositionRotate

Rotates the last object addressed by 90 degrees clockwise.

## Syntax

**PositionRotate**

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PositionAt](#), [PositionMirrorVertical](#), [PositionMirrorHorizontal](#), [PositionSendToBack](#), [PositionBringToFront](#),  
[PositionBringForwards](#), [PositionSendBackwards](#)

## Example

```
' Rotates an object 90 degrees
GraphicsBuilder.LibraryObjectPlace "include", "agitator", "agit_1_Pos1_g", 2, True
GraphicsBuilder.PositionAt 200, 200
GraphicsBuilder.PositionRotate
```

## PositionSendBackwards

Moves the last object addressed one step backwards in the layering of objects on a page, creating the appearance of moving backwards.

## Syntax

**PositionSendBackwards**

## Return Value

0 (zero) if successful; otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PositionAt](#), [PositionMirrorVertical](#), [PositionMirrorHorizontal](#), [PositionSendToBack](#), [PositionBringToFront](#),  
[PositionBringForwards](#),

## Example

```
' Moves an object backwards in the layering of objects on a graphics page
GraphicsBuilder.LibraryObjectPlace "include", "agitator", "agit_1_Pos1_g", 2, True
GraphicsBuilder.PositionAt 200, 200
GraphicsBuilder.PositionSendBackwards
```

## PositionSendToBack

Positions the last object addressed as the lowest layer on a graphics page, giving it the appearance of being behind other objects.

## Syntax

**PositionSendToBack**

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PositionAt](#), [PositionMirrorHorizontal](#), [PositionSendBackwards](#), [PositionBringToFront](#), [PositionBringForwards](#),  
[PositionRotate](#)

## Example

```
' Places an object behind other objects on a graphics page
GraphicsBuilder.LibraryObjectPlace "include", "agitator", "agit_1_Pos1_g", 2, True
GraphicsBuilder.PositionAt 200, 200
GraphicsBuilder.PositionSendToBack
```

## Composite Genie Functions

Use Composite Genie functions to place or locate Composite Genies.

<a href="#">CompositeGeniePlace</a>	Places a Composite Genie at the specified co-ordinates on the active page.
<a href="#">PageSelectFirstCompositeGenie</a>	Selects the first Composite Genie on the active page.
<a href="#">PageSelectNextCompositeGenie</a>	Selects the next Composite Genie on the active page.

For details and a VB example on handling return and error values, see [Error Handling](#).

### See Also

[Automation Events](#)

[Function Categories](#)

### CompositeGeniePlace

Places a Composite Genie at the specified co-ordinates on the active page.

---

**Note:** This function does not support implicit value type casting.

---

### Syntax

**CompositeGeniePlace**(*templateID*, *KeyValuePair*, *nXPos*, *nYPos*)

*templateID*

Visual template ID of the Composite Genie template. This can be found in the root node attribute "Guid" of the Composite Genie's XML template.

*KeyValuePair*

This is a special key value pair that comes from the Graphics Builder. Note that this is different from the .NET key value pair.

*nXPos*

The horizontal offset position on the page where you want to place the Composite Genie.

*nYPos*

The vertical offset position on the page where you want to place the Composite Genie.

### HResult

The HResult is retrieved from the calling function's exception-handling mechanism. For example, if the calling function is .NET-based, a COM exception such as System.Runtime.InteropServices.COMException will be thrown if the HRESULT is not S\_OK.

The possible values for HResult include:

- S\_OK indicates success

- E\_FAIL indicates an error condition in the system. For example, the Composite Genie template may have a syntactical error, or if one of the Content Item Genies is missing.
- E\_INVALIDARG indicates that one of the arguments is incorrect. For example, one of the key names in the KeyValuePair does not exist or one of the value types does not match the parameter definition.
- E\_ABORT is returned if you attempt to place the Composite Genie at an invalid location on the page.

## Troubleshooting

If you encounter E\_FAIL, it is recommended that you manually paste the Composite Genie on the page.

If you encounter E\_INVALIDARG, check that the parameter names exist and parameter values match the type described in the visual template.

## Related Functions

[PageSelectFirstCompositeGenie](#), [PageSelectNextCompositeGenie](#)

### PageSelectFirstCompositeGenie

Selects the first Composite Genie on the active page.

## Syntax

**PageSelectFirstCompositeGenie()**

## HResult

The HResult is retrieved from the calling function's exception-handling mechanism. For example, if the calling function is .NET-based, a COM exception such as System.Runtime.InteropServices.COMException will be thrown if the HRESULT is not S\_OK.

The possible values for HResult include:

- E\_ABORT is returned when no more Composite Genies are found.

## Related Functions

[PageSelectNextCompositeGenie](#), [CompositeGeniePlace](#)

### PageSelectNextCompositeGenie

Selects the next Composite Genie on the active page.

## Syntax

**PageSelectNextCompositeGenie()**

## HResult

The HResult is retrieved from the calling function's exception-handling mechanism. For example, if the calling function is .NET-based, a COM exception such as System.Runtime.InteropServices.COMException will be thrown if the HRESULT is not S\_OK.

The possible values for HResult include:

- E\_ABORT is returned when no more Composite Genies are found.

## Related Functions

[PageSelectFirstCompositeGenie](#), [CompositeGeniePlace](#)

## Dynamic Properties Functions

With these functions, you can modify the dynamic properties of the graphics objects in your project (movement, scaling, rotation, sliders, dynamic color fill).

The error E\_HANDLE is returned if there is no selected or active object, or if an object does not support this type of property. E\_INVALIDARG is returned if an argument is out of range.

<a href="#">PropertiesAccessDisableGet</a>	Reads the current values set on the Access   Disable tab of the Object Properties dialog.
<a href="#">PropertiesAccessDisablePut</a>	Sets the values on the Access   Disable tab of the Object Properties dialog.

<a href="#">PropertiesFillColourColourGetEx</a>	Reads the current color value set for the specified index point on the Fill   Color tab of the Object Properties dialog.
<a href="#">PropertiesFillColourColourPut</a>	Sets the color at the specific index on the Fill   Color tab of the Object Properties dialog. This function has been superseded by the function <a href="#">PropertiesFillColourColourPutEx</a> .
<a href="#">PropertiesFillColourColourPutEx</a>	Sets the color at the specific index on the Fill   Color tab of the Object Properties dialog.
<a href="#">PropertiesFillColourGet</a>	Reads the values set on the Fill   Color tab of the Object Properties dialog for the current object.
<a href="#">PropertiesFillColourPut</a>	Sets the values on the Fill   Color tab of the Object Properties dialog.
<a href="#">PropertiesFillLevelGet</a>	Reads the values set on the Fill   Level tab of the Object Properties dialog. This function has been superseded by the function <a href="#">PropertiesFillLevelGetEx</a> .
<a href="#">PropertiesFillLevelGetEx</a>	Reads the values set on the Fill   Level tab of the Object Properties dialog.
<a href="#">PropertiesFillLevelPut</a>	Sets the values on the Fill   Level tab of the Object

	Properties dialog. This function has been superseded by the function PropertiesFillLevelPutEx.
PropertiesFillLevelPutEx	Sets the values on the Fill   Level tab of the Object Properties dialog.
PropertiesInputKeyboardGet	Reads the values set on the Input   Keyboard Command tab of the Object Properties dialog
PropertiesInputKeyboardPut	Sets the values on the Input   Keyboard Commands tab of the Object Properties dialog
PropertiesInputTouchGet	Reads the values set on the Input   Touch tab of the Object Properties dialog
PropertiesInputTouchPut	Sets the values on the Input   Touch tab of the Object Properties dialog.
PropertiesShowDialog	Shows the property dialog for an object or a form for Genies.
PropertiesSymbolSetGet	Reads the type and expressions configured on the Appearance   General tab of the Object Properties dialog.
PropertiesSymbolSetPut	Sets the type defined for a symbol set on the Appearance   General tab of the Object Properties dialog.
PropertiesSymbolSetSymbolGet	Retrieves the Element name and Library name of the "Index" element of the currently selected object.
PropertiesSymbolSetSymbolPut	Sets the Element name and Library name of the "Index" element of the currently selected object.
PropertiesTransCentreOffsetExpressGet	Retrieve the express properties.
PropertiesTransCentreOffsetExpressPut	Set the express properties.
PropertiesTransformationGet	Reads the property values set on the Movement, Scaling and Slider tabs of the Object Properties dialog.
PropertiesTransformationPut	Sets values for the properties on the Movement, Scaling and Slider tabs of the Object Properties dialog.
PropertiesTrendGet	Reads the values for a trend object as set on the Appearance   General tab of the Object Properties dialog. This function has been superseded by the function PropertiesTrendGetEx.
PropertiesTrendGetEx	Reads the values for a trend object as set on the

	Appearance   General tab of the Object Properties dialog.
PropertiesTrendPut	Sets the values for a trend object that appear on the Appearance   General tab of the Object Properties dialog. This function has been superseded by the function PropertiesTrendPutEx.
PropertiesTrendPutEx	Sets the values for a trend object that appear on the Appearance   General tab of the Object Properties dialog
PropertyVisibility	Sets the Hidden when argument on the Appearance   Visibility tab of the Object Properties dialog.

## PropertiesAccessDisableGet

Reads the current values set on the **Access | Disable** tab of the Object Properties dialog for the current object.

## Syntax

**PropertiesAccessDisableGet(Expression, DisableFlag, DisableStyle)**

*Expression:*

The string for the Disable when command.

*DisableFlag:*

TRUE if the object is configured to disable when an insufficient area or privilege setting is encountered.

*DisableStyle:*

The disable style setting:

0 = Embossed

1 = Grayed

2 = Hidden

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PropertiesAccessDisablePut](#)

### PropertiesAccessDisablePut

Sets the values on the **Access | Disable** tab of the Object Properties dialog for the current object.

## Syntax

**PropertiesAccessDisablePut**(*Expression*, *DisableFlag*, *DisableStyle*)

*Expression*:

The string for the Disable when command.

*DisableFlag*:

TRUE if the object is configured to disable when an insufficient area or privilege setting is encountered.

*DisableStyle*:

The disable style setting:

0 = Embossed

1 = Grayed

2 = Hidden

## Return Value

0 (zero) if successful, otherwise an error is returned

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesAccessDisableGet](#)

### PropertiesAccessGeneralGet

Reads the values on the **Access | General** tab of the Object Properties dialog for the current object.

## Syntax

**PropertiesAccessGeneralGet**(STRING *pbstrName*, STRING *Description*, STRING *Tooltip*, INT *Area*, INT *Privilege*, STRING *LogDevice*)

*pbstrName*:

Name of the graphics object.

*Description*:

Description string for the object.

*Tooltip:*

Tooltip string for the object.

*Area:*

1 to 255 representing the current area setting, or 0 if the Same area as page check box is ticked.

*Privilege:*

1 to 255 representing the current privilege setting, or 0 if the No privilege restrictions check box is ticked.

*LogDevice:*

The name of the log device as a string.

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesAccessGeneralPut](#)

### PropertiesAccessGeneralPut

Sets the values on the **Access | General** tab of the Object Properties dialog for the current object.

## Syntax

**PropertiesAccessGeneralPut**(STRING *pbstrName*, STRING *Description*, STRING *Tooltip*, INT *Area*, INT *Privilege*,  
STRING *LogDevice*)

*pbstrName:*

Name of the graphics object.

*Description:*

Description string for the object.

*Tooltip:*

Tooltip string for the object.

*Area:*

1 to 255 representing the current area setting, or 0 if the Same area as page check box is ticked.

*Privilege:*

1 to 255 representing the current privilege setting, or 0 if the No privilege restrictions check box is ticked.

*LogDevice:*

The name of the log device as a string.

## Return Value

0 (zero) if successful, otherwise an error is returned

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesAccessGeneralGet](#)

### PropertiesAttributeNameGetEx

Retrieves the name of a graphics object on the current page.

## Syntax

**PropertiesAttributeNameGetEx(INT nAN, STRING\* pbstrName)**

*nAN*:

Animation number of graphics object

*pbstrName*:

Name of graphics object

---

**Note:** Names need to be unique within the group. Names should not start with a number or contain the following chars <>:"^|?\*.

---

## Return Value

The requested values, as a string

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageOpen](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

### PropertiesAttributeNamePutEx

Sets the Name of a graphics object on the current page.

## Syntax

**PropertiesAttributeNamePutEx(INT nAN, STRING\* pbstrName)**

*nAN*:

Animation number of graphics object

*pbstrName*:

Name of graphics object

**Note:** Names need to be unique within the group. Names should not start with a number or contain the following chars <>:"^|?\*.

## Return Value

An error if the name cannot be set.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageOpen](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

### PropertiesButtonGet

Reads the values for a button object from the **Appearance | General** tab of the Object Properties dialog.

## Syntax

**PropertiesButtonGet(ButtonType, Text, TextFont, Library, SymbolName)**

*ButtonType*:

Defines the button type:

0 = Text

1 = Border 3D Target

2 = Border Target

3 = Target

4 = Symbol

5 = XP Style button with text

6 = XP Style Button with Symbol

*Text*:

Button text. This argument is only valid for ButtonType = 0 and 5 (text).

*TextFont*:

The font use for the button text. This argument is only valid for ButtonType = 0 and 5 (text).

*Library*:

Library where the button symbol can be found. This argument is only valid for ButtonType = 4 and 6 (symbol).

*SymbolName*:

Name of the symbol to be displayed for a button. This argument is only valid for ButtonType = 4 and 6 (symbol).

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesButtonPut](#)

### PropertiesButtonGetEx

Reads the values for a button object from the **Appearance | General** tab of the Object Properties dialog.

## Syntax

**PropertiesButtonGetEx**(*Type*, *Text*, *Font*, *Library*, *Element*, *CustomFillColor*, *FillColorUp*, *FillColorDown*)

*Type:*

Defines the button type:

0 = Text

1 = Border 3D Target

2 = Border Target

3 = Target

4 = Symbol

5 = XP Style button with text

6 = XP Style Button with Symbol

*Text:*

Button text. This argument is only valid for button Type = 0 and 5 (text).

*Font:*

The font use for the button text. This argument is only valid for button Type = 0 and 5 (text).

*Library:*

Library where the button symbol can be found. This argument is only valid for button Type = 4 and 6 (symbol).

*Element:*

Name of the symbol to be displayed for a button. This argument is only valid for button Type = 4 and 6 (symbol).

*CustomFillColor:*

TRUE if a custom fill color is defined for the button, otherwise FALSE.

*FillColorUp:*

Fill color (RBB value converted to decimal) defined for the button in the Up state.

*FillColorDown:*

Fill color (RBB value converted to decimal) defined for the button in the Down state.

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesButtonPut](#)

### PropertiesButtonPut

Sets the values on the **Appearance | General** tab of the Object Properties dialog for a button object.

## Syntax

**PropertiesButtonPut**(*Type*, *Text*, *TextFont*, *Library*, *SymbolName*)

*ButtonType*:

Defines the button type:

0 = Text

1 = Border 3D Target

2 = Border Target

3 = Target

4 = Symbol

5 = XP Style button with text

6 = XP Style Button with Symbol

*Text*:

Button text. This argument is only valid for *ButtonType* = 0 and 5 (text).

*TextFont*:

The font use for the button text. This argument is only valid for *ButtonType* = 0 and 5 (text).

*Library*:

Library where the button symbol can be found. This argument is only valid for *ButtonType* = 4 and 6 (symbol).

*SymbolName*:

Name of the symbol to be displayed for a button. This argument is only valid for *ButtonType* = 4 and 6 (symbol).

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesButtonGet](#)

### PropertiesCicodeObjectGet

Reads the values set for a Cicode object on the **Cicode | General** tab of the Object Properties dialog.

## Syntax

**PropertiesCicodeObjectGet**(*Expression*, *Library*, *SymbolName*)

*Expression*:

The command expression.

*Library*:

Name of the library where the symbol used can be found.

*SymbolName*:

Name of the symbol used.

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesCicodeObjectPut](#)

### PropertiesCicodeObjectPut

Sets the values for a Cicode object on the **Cicode | General** tab of the Object Properties dialog.

## Syntax

**PropertiesCicodeObjectPut**(*Expression*, *Library*, *SymbolName*)

*Expression*:

The command expression.

*Library*:

Name of the library where the symbol used can be found.

*SymbolName*:

Name of the symbol used.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesCicodeObjectGet](#)

## PropertiesDisplayValueGet

Reads the type and expressions configured on the **Appearance | Display Value** tab of the Object Properties dialog for a number or text object.

## Syntax

**PropertiesDisplayValueGet**(*SymbolSetType*, *ExpressionA*, *ExpressionB*, *ExpressionC*, *ExpressionD*, *ExpressionE*)

*SymbolSetType*:

Defines the symbol set type:

0 = On / Off

1 = Multi-state

2 = Array

3 = Numeric

4 = String

*ExpressionA*:

This is the main expression:

- ON text when for type On / Off.
- Conditions A for type Multi-state.
- Array expression for type Array.
- Numeric Expression for type Numeric.
- String Expression for type String.

*ExpressionB*:

Conditions B, only used for multistate type.

*ExpressionC*:

Conditions C, only used for multistate type.

*ExpressionD*:

Conditions D, only used for multistate type.

*ExpressionE*:

Conditions E, only used for multistate type.

## Return Value

The requested values, as a string

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesDisplayValuePut](#)

## Example

```
` Gets the properties on the Appearance/DisplayValue sheet for a number or text object  
  
GraphicsBuilder.PropertiesDisplayValueGet nType, Expression1, Expression2, Expression3,  
Expression4, Expression5
```

## PropertiesDisplayValuePut

Sets the fields that appear on the **Appearance | Display Value** tab of the Object Properties dialog for a number or text object. This includes the type setting and related expressions.

## Syntax

**PropertiesDisplayValueGet**(*SymbolSetType*, *ExpressionA*, *ExpressionB*, *ExpressionC*, *ExpressionD*, *ExpressionE*)

*SymbolSetType*:

Defines the symbol set type:

0 = On / Off

1 = Multi-state

2 = Array

3 = Numeric

4 = String

*ExpressionA*:

This is the main expression:

- ON text when for type On / Off.
- Conditions A for type Multi-state.
- Array expression for type Array.
- Numeric Expression for type Numeric.
- String Expression for type String.

*ExpressionB*:

Conditions B, only used for multistate type.

*ExpressionC*:

Conditions C, only used for multistate type.

*ExpressionD*:

Conditions D, only used for multistate type.

*ExpressionE*:

Conditions E, only used for multistate type.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesDisplayValueGet](#)

### PropertiesDisplayValueTextGet

Reads the text for a specific index from the **Appearance | Display Value** tab of the Object Properties dialog for a number or text object of type Multistate, Array or Numeric.

## Syntax

**PropertiesDisplayValueTextGet(Index, Text)**

*Index:*

The position of the text:

0..31 for type Multistate.

0..255 for type Array.

0 for type Numeric.

*Text:*

The text written to the field:

- State text for type Multi-state.

- Array text for type Array.

- Format for type Numeric.

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesDisplayValueTextPut](#), [PropertiesDisplayValuePut](#), [PropertiesCicodeObjectPut](#)

### PropertiesDisplayValueTextPut

Sets the text for a specific index on the **Appearance | Display Value** tab of the Object Properties dialog for a number or text object of type Multistate, Array, or Numeric.

## Syntax

**PropertiesDisplayValueTextGet(Index, Text)**

*Index:*

The position of the text:

0..31 for type Multistate.

0..255 for type Array.

0 for type Numeric.

*Text:*

The text written to the field:

- State text for type Multi-state.
- Array text for type Array.
- Format for type Numeric.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesDisplayValueTextGet](#), [PropertiesSymbolSetPut](#), [PropertiesSymbolSetGet](#)

### PropertiesFillColourColourGet

Reads the current color value set for the specified index point on the **Fill | Color** tab of the Object Properties dialog for Array, Threshold and Gradient types.

---

**Note:** As this function does not support True Color functionality, it has been superseded by the function [PropertiesFillColourColourGetEx](#).

---

## Syntax

**PropertiesFillColourColourGet(Index, ColourNo, Limit, Operator)**

*Index:*

Specify the index you would like to read the current color for. This values depends on the type of color fill selected:

0 - 31 for type Multi-state

0 - 255 for type Array

0 - 255 for type Threshold

0- 1 for Gradient

*ColourNo:*

A value between 0 and 255 representing the color applied to the Index setting.

*Limit:*

A value between 0 and 100 representing the threshold limit. Used for type Threshold only.

*Operator:*

The value representing the current operator used for the threshold limit setting:

- 0 : < (less than)
- 1 : > (greater than)
- 2 : <= (less than or equal to)
- 3 : >= (greater than or equal to)

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesFillColourColourPut](#), [PropertiesFillColourGet](#), [PropertiesFillColourPutEx](#)

### PropertiesFillColourColourGetEx

Reads the current color value set for the specified index point on the **Fill | Color** tab of the Object Properties dialog for Array, Threshold and Gradient types.

## Syntax

**PropertiesFillColourColourGet(Index, OnColourNo, OffColourNo, Limit, Operator)**

*Index:*

Specify the index you would like to read the current color for. This value depends on the type of color fill selected:

0 - 31 for type Multi-state

0 - 255 for type Array

0 - 255 for type Threshold

0 - 1 for Gradient

*OnColourNo:*

An RGB value representing the "on" color applied to the Index setting.

*OffColourNo:*

An RGB value representing the "off" color applied to the Index setting.

*Limit:*

A value between 0 and 100 representing the threshold limit. Used for type Threshold only.

*Operator:*

The value representing the current operator used for the threshold limit setting:

- 0 : < (less than)
- 1 : > (greater than)
- 2 : <= (less than or equal to)

3 : >= (greater than or equal to)

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PropertiesFillColourColourPutEx](#), [PropertiesFillColourGet](#), [PropertiesFillColourPut](#)

### PropertiesFillColourColourPut

Sets the color at the specific index on the **Fill | Color** tab of the Object Properties dialog for type Array, Threshold and Gradient.

**Note:** As this function does not support True Color functionality, it has been superseded by the function.

## Syntax

**PropertiesFillColourColourPut**(*Index*, *ColourNo*, *Limit*, *Operator*)

*Index*:

Specify the index you would like to set the current color for. This value depends on the type of color fill selected:

0 - 31 for type Multi-state

0 - 255 for type Array

0 - 255 for type Threshold

0- 1 for Gradient

To set the fill color for on/off mode use index values of OFF = 0 or ON = 1.

*ColourNo*:

A value between 0 and 255 representing the color applied to the Index setting.

*Limit*:

A value between 0 and 100 representing the threshold limit. Used for type Threshold only.

*Operator*:

The value representing the current operator used for the threshold limit setting:

0 : < (less than)

1 : > (greater than)

2 : <= (less than or equal to)

3 : >= (greater than or equal to)

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesFillColourColourGet](#), [PropertiesFillColourGet](#), [PropertiesFillColourPut](#)

### PropertiesFillColourColourPutEx

Sets the color at the specific index on the **Fill | Color** tab of the Object Properties dialog for type Array, Threshold and Gradient.

## Syntax

**PropertiesFillColourColourPutEx**(*Index*, *OnColourNo*, *OffColourNo*, *Limit*, *Operator*)

*Index*:

Specify the index you want to read the current color for. This values depends on the type of color fill selected:

0 - 31 for type Multi-state

0 - 255 for type Array

0 - 255 for type Threshold

0- 1 for Gradient

*OnColourNo*:

An RGB value representing the "on" color applied to the Index setting.

*OffColourNo*:

An RGB value representing the "off" color applied to the Index setting.

*Limit*:

A value between 0 and 100 representing the threshold limit. Used for type Threshold only.

*Operator*:

The value representing the current operator used for the threshold limit setting:

0 : < (less than)

1 : > (greater than)

2 : <= (less than or equal to)

3 : >= (greater than or equal to)

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesFillColourColourGetEx](#), [PropertiesFillColourPut](#)

## PropertiesFillColourGet

Reads the values set on the **Fill | Color** tab of the Object Properties dialog for the current object.

## Syntax

**PropertiesFillColourGet**(*FillColourType*, *ExpressionA*, *ExpressionB*, *ExpressionC*, *ExpressionD*, *ExpressionE*,  
*RangeFlag*, *RangeMin*, *RangeMax*)

*FillColourType*:

The fill color type:

0 = On / Off

1 = Multi-state

2 = Array

3 = Threshold

4 = Gradient

*ExpressionA*:

This is the main expression:

- ON color when for type On / Off
- Conditions A for type Multi-state
- Array expression for type Array
- Color expression for type Animated

*ExpressionB*:

Conditions B, only used for multistate symbol sets.

*ExpressionC*:

Conditions C, only used for multistate symbol sets.

*ExpressionD*:

Conditions D, only used for multistate symbol sets.

*ExpressionE*:

Conditions E, only used for multistate symbol sets.

*RangeFlag*:

If set to TRUE, checks the Specify range check box. Flag is only valid for Threshold and Gradient types.

*RangeMin*:

This floating point value sets the minimum range of the tag value. Only necessary if the argument RangeFlag is set to TRUE.

*RangeMax*:

This floating point value sets the maximum range of the tag value. Only necessary, if the argument RangeFlag is set to TRUE.

## Return Value

The requested values, as a string.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PropertiesFillColourPut](#), [PropertiesFillColourColourPut](#)

### PropertiesFillColourPut

sets the values on the **Fill | Color** tab of the Object Properties dialog for the current object.

## Syntax

**PropertiesFillColourPut**(*FillColourType*, *ExpressionA*, *ExpressionB*, *ExpressionC*, *ExpressionD*, *ExpressionE*,  
*RangeFlag*, *RangeMin*, *RangeMax*)

*FillColourType*:

The fill color type:

0 = On / Off

1 = Multi-state

2 = Array

3 = Threshold

4 = Gradient

*ExpressionA*:

This is the main expression:

- ON color when for type On / Off
- Conditions A for type Multi-state
- Array expression for type Array
- Color expression for type Animated

*ExpressionB*:

Conditions B, only used for multistate symbol sets.

*ExpressionC*:

Conditions C, only used for multistate symbol sets.

*ExpressionD*:

Conditions D, only used for multistate symbol sets.

*ExpressionE*:

Conditions E, only used for multistate symbol sets.

*RangeFlag*:

If set to TRUE, checks the Specify range check box. Flag is only valid for Threshold and Gradient types.

*RangeMin:*

This floating point value sets the minimum range of the tag value. Only necessary if the argument RangeFlag is set to TRUE.

*RangeMax:*

This floating point value sets the maximum range of the tag value. Only necessary, if the argument RangeFlag is set to TRUE.

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PropertiesFillColourGet](#), [PropertiesFillColourColourGet](#), [PropertiesFillColourColourPut](#)

### PropertiesFillLevelGet

Reads the values set on the **Fill | Level** tab of the Object Properties dialog for the current object.

**Note:** As this function does not support True Color functionality, it has been superseded by the function [PropertiesFillLevelGetEx](#).

## Syntax

**PropertiesFillLevelGet(Expression, RangeFlag, RangeMin, RangeMax, OffsetMin, OffsetMax, FillDirection, BackgroundColour)**

*Expression:*

The level expression.

*RangeFlag:*

TRUE if the Specify range check box is selected.

*RangeMin:*

The minimum floating point value in the range of the tag. This argument is only valid if RangeFlag is set to TRUE.

*RangeMax:*

The maximum floating point value in the range of the tag. This argument is only valid if RangeFlag is set to TRUE.

*OffsetMin:*

The value between 0 and 100 representing the percentage of the area displayed as filled when the tag value is at its minimum.

*OffsetMax:*

The value between 0 and 100 representing the percentage of the area displayed as filled when the tag value is at its maximum.

*FillDirection:*

The current fill direction setting:

0 = up

1 = down

2 = left

3 = right

*BackgroundColour:*

A value between 0 and 255 representing the background color setting.

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesFillColourPut](#)

### PropertiesFillLevelGetEx

Reads the values set on the **Fill | Level** tab of the Object Properties dialog for the current object.

## Syntax

**PropertiesFillLevelGetEx**(*Expression*, *RangeFlag*, *RangeMin*, *RangeMax*, *OffsetMin*, *OffsetMax*, *FillDirection*, *OnColour*, *OffColour*)

*Expression:*

The level expression.

*RangeFlag:*

TRUE if the Specify range check box is selected.

*RangeMin:*

The minimum floating point value in the range of the tag. This argument is only valid if RangeFlag is set to TRUE.

*RangeMax:*

The maximum floating point value in the range of the tag. This argument is only valid if RangeFlag is set to TRUE.

*OffsetMin:*

The value between 0 and 100 representing the percentage of the area displayed as filled when the tag value is at its minimum.

*OffsetMax:*

The value between 0 and 100 representing the percentage of the area displayed as filled when the tag value is at its maximum.

*FillDirection:*

The current fill direction setting:

0 = up

1 = down

2 = left

3 = right

*OnColour:*

An RGB value representing the background "on" color setting.

*OffColour:*

An RGB value representing the background "off" color setting.

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

[PropertiesFillColourPut](#)

### PropertiesFillLevelPut

Sets the values on the Fill | Level tab of the Object Properties dialog for the current object.

---

**Note:** As this function does not support True Color functionality, it is superseded by the function [PropertiesFillLevelPutEx](#).

---

## Syntax

**PropertiesFillLevelPut**(*Expression*, *RangeFlag*, *RangeMin*, *RangeMax*, *OffsetMin*, *OffsetMax*, *FillDirection*, *BackgroundColour*)

*Expression:*

The level expression.

*RangeFlag:*

TRUE if the Specify range check box is selected.

*RangeMin:*

The minimum floating point value in the range of the tag. This argument is only valid if RangeFlag is set to TRUE.

*RangeMax:*

The maximum floating point value in the range of the tag. This argument is only valid if RangeFlag is set to TRUE.

*OffsetMin:*

The value between 0 and 100 representing the percentage of the area displayed as filled when the tag value is at its minimum.

*OffsetMax:*

The value between 0 and 100 representing the percentage of the area displayed as filled when the tag value is at its maximum.

*FillDirection:*

The current fill direction setting:

0 = up

1 = down

2 = left

3 = right

*BackgroundColour:*

A value between 0 and 255 representing the background color setting.

## Related Functions

[PropertiesFillLevelPutEx](#), [PropertiesFillLevelGet](#)

### PropertiesFillLevelPutEx

Sets the values on the **Fill | Level** tab of the Object Properties dialog for the current object.

## Syntax

**PropertiesFillLevelPutEx(Expression, RangeFlag, RangeMin, RangeMax, OffsetMin, OffsetMax, FillDirection, OnColour, OffColour)**

*Expression:*

The level expression.

*RangeFlag:*

TRUE if the Specify range check box is selected.

*RangeMin:*

The minimum floating point value in the range of the tag. This argument is only valid if RangeFlag is set to TRUE.

*RangeMax:*

The maximum floating point value in the range of the tag. This argument is only valid if RangeFlag is set to TRUE.

*OffsetMin:*

The value between 0 and 100 representing the percentage of the area displayed as filled when the tag value is at its minimum.

*OffsetMax:*

The value between 0 and 100 representing the percentage of the area displayed as filled when the tag value is at its maximum.

*FillDirection:*

The current fill direction setting:

0 = up

1 = down

2 = left

3 = right

*OnColour:*

An RGB value representing the background "on" color setting.

*OffColour:*

An RGB value representing the background "off" color setting.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

## PropertiesInputKeyboardGet

Reads the values set on the **Input | Keyboard Command** tab of the Object Properties dialog for the current object.

## Syntax

**PropertiesInputKeyboardGet(Index, KeySequence, Command, Area, Privilege, LogMessage)**

*Index:*

0 to 255 for the key sequence.

*KeySequence:*

String of the keys to be pressed.

*Command:*

Expression for the key sequence command.

*Area:*

0 to 255 for the area, where 0 ticks the check box Same area as object.

*Privilege:*

0 to 255 for the privilege, where 0 ticks the check box Same privilege as object.

*LogMessage:*

The message text to be logged.

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesInputKeyboardPut](#)

### PropertiesInputKeyboardPut

Sets the values on the Input | Keyboard Commands tab of the Object Properties dialog for the current object.

## Syntax

**PropertiesInputKeyboardPut**(*Index*, *KeySequence*, *Command*, *Area*, *Privilege*, *LogMessage*)

*Index*:

0 to 255 for the key sequence.

*KeySequence*:

String of the keys to be pressed.

*Command*:

Expression for the key sequence command.

*Area*:

0 to 255 for the area, where 0 ticks the check box Same area as object.

*Privilege*:

0 to 255 for the privilege, where 0 ticks the check box Same privilege as object.

*LogMessage*:

The message text to be logged.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

[PropertiesInputKeyboardGet](#)

### PropertiesInputTouchGet

Reads the values set on the **Input | Touch** tab of the Object Properties dialog for the current object.

## Syntax

**PropertiesInputTouchGet**(*Action*, *Expression*, *LogMessage*, *RepeatRate*)

*Action*:

The type of keyboard action:

0 = Up

1 = Down

2 = Repeat

*Expression*:

The expression configured for the selected keyboard action (either up, down or repeat).

*LogMessage*:

The message text to be logged.

*RepeatRate*:

A value between 1 and 32000 representing the repeat rate in milliseconds.

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesInputTouchPut](#)

## PropertiesInputTouchPut

Sets the values on the **Input | Touch** tab of the Object Properties dialog for the current object.

## Syntax

**PropertiesInputTouchPut**(*Action*, *Expression*, *LogMessage*, *RepeatRate*)

*Action*:

The type of keyboard action:

0 = Up

1 = Down

2 = Repeat

*Expression*:

The expression configured for the selected keyboard action (either up, down or repeat).

*LogMessage*:

The message text to be logged.

*RepeatRate*:

A value between 1 and 32000 representing the repeat rate in milliseconds.

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

[PropertiesInputTouchGet](#)

### PropertiesShowDialog

Shows the properties dialog for an object or a form for Genies.

## Syntax

**PropertiesShowDialog**

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

### PropertiesSymbolSetGet

Reads the type and expressions configured on the **Appearance | General** tab of the Object Properties dialog for a symbol set.

## Syntax

**PropertiesSymbolSetGet**(*SymbolSetType*, *ExpressionA*, *ExpressionB*, *ExpressionC*, *ExpressionD*, *ExpressionE*)

*SymbolSetType*:

Defines the symbol set type:

0 = On / Off

1 = Multi-state

2 = Array

3 = Animated

*ExpressionA*:

This is the main expression:

- ON symbol when for type On / Off
- Conditions A for type Multi-state

- Array expression for type Array
- Animate when for type Animated

*ExpressionB:*

Conditions B, only used for multistate symbol sets.

*ExpressionC:*

Conditions C, only used for multistate symbol sets.

*ExpressionD:*

Conditions D, only used for multistate symbol sets.

*ExpressionE:*

Conditions E, only used for multistate symbol sets.

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesSymbolSetPut](#)

## Example

```
` Gets the properties on the Appearance/General sheet for a symbol set
GraphicsBuilder.PropertiesSymbolSetGet nType, Expression1, Expression2, Expression3,
Expression4, Expression5
```

## PropertiesSymbolSetPut

Sets the type defined for a symbol set on the **Appearance | General** tab of the Object Properties dialog, as well any expressions used

## Syntax

**PropertiesSymbolSetPut**(*SymbolSetType*, *ExpressionA*, *ExpressionB*, *ExpressionC*, *ExpressionD*, *ExpressionE*)

*SymbolSetType:*

Defines the symbol set type:

0 = On / Off

1 = Multi-state

2 = Array

3 = Animated

*ExpressionA:*

This is the main expression:

- ON symbol when for type On / Off
- Conditions A for type Multi-state
- Array expression for type Array
- Animate when for type Animated

*ExpressionB:*

Conditions B, only used for multistate symbol sets.

*ExpressionC:*

Conditions C, only used for multistate symbol sets.

*ExpressionD:*

Conditions D, only used for multistate symbol sets.

*ExpressionE:*

Conditions E, only used for multistate symbol sets.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesSymbolSetGet](#)

## Example

```
` Sets the properties on the Appearance General sheet for a symbol set
GraphicsBuilder.PropertiesSymbolSetPut 0, "ON / OFF", "", "", "", ""
```

## PropertiesSymbolSetSymbolGet

Retrieves the Element name and Library name of the "Index" element of the currently selected object.

"Index" refers to the element within the currently selected object. For example:

- If the currently selected object is an On/Off symbol set, index can be a value in the range 0..1
- If the currently selected object is a multistate symbol set, index can be a value in the range 0..31
- If the currently selected object is an array symbol set, index can be a value in the range 0..255
- If the currently selected object is an animated symbol set, index can be a value in the range 0..255
- On return, "Element" will contain the name of the symbol set element name for the "Index" element
- On return, "Library" will contain the name of the symbol set library name for the "Index" element, for example:

```
Index=0, Element="detail_entrycoil1_grey_01", Library="steelmill"
Index=1, Element="detail_entrycoil1_green_01", Library="steelmill"
```

## Syntax

**PropertiesSymbolSetSymbolGet(Index, Library, Element)**

## Return Value

N/A

**Note:** For details on handling return and error values, see [Error Handling](#).

## Example

```
Public Sub Test()
Dim gb As GraphicsBuilder.GraphicsBuilder
.
.
.
gb.PropertiesSymbolSetSymbolPut(1, "Library", "Element")
Dim sLibrary As String
Dim sElement As String
gb.PropertiesSymbolSetSymbolGet(1, sLibrary, sElement)
End Sub
```

## Related Functions

[PropertiesSymbolSetSymbolPut](#)

### PropertiesSymbolSetSymbolPut

Sets the Element name and Library name of the "Index" element of the currently selected object.

"Index" refers to the element within the currently selected object. For example:

- If the currently selected object is an On/Off symbol set, index can be a value in the range 0..1
- If the currently selected object is a multistate symbol set, index can be a value in the range 0..31
- If the currently selected object is an array symbol set, index can be a value in the range 0..255
- If the currently selected object is an animated symbol set, index can be a value in the range 0..255
- On return, "Element" will contain the name of the symbol set element name for the "Index" element
- On return, "Library" will contain the name of the symbol set library name for the "Index" element, for example:

```
Index=0, Element="detail_entrycoil1_grey_01", Library="steelmill"
Index=1, Element="detail_entrycoil1_green_01", Library="steelmill"
```

## Syntax

**PropertiesSymbolSetSymbolPut(Index, Library, Element)**

## Return Value

N/A

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Example

```
Public Sub Test()
Dim gb As GraphicsBuilder.GraphicsBuilder
.
.
.
gb.PropertiesSymbolSetSymbolPut(1, "Library", "Element")
Dim sLibrary As String
Dim sElement As String
gb.PropertiesSymbolSetSymbolGet(1, sLibrary, sElement)
End Sub
```

[PropertiesSymbolSetSymbolGet](#)

### PropertiesTransCentreOffsetExpressGet

Retrieve the express properties.

## Syntax

**PropertiesTransCentreOffsetExpressGet**(*movementRotationalExpress*, *scalingHorizontalExpress*,  
*scalingVerticalExpress*, *sliderRotationalExpress*)

*movementRotationalExpress*  
Movement Rotational Express

*scalingHorizontalExpress*  
Scaling Horizontal Express

*scalingVerticalExpress*  
Scaling Vertical Express

*sliderRotationalExpress*  
Slider Rotational Express

## Return Value

N/A

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Example

```
Public Sub Test()
Dim gb As GraphicsBuilder.GraphicsBuilder
gb = New GraphicsBuilder.GraphicsBuilder
.
.
.
gb.PropertiesTransCentreOffsetExpressPut(0, 0, 0, 0)
Dim nMovRot As Short
Dim nScaleHorz As Short
Dim nScaleVert As Short
Dim nSliderRot As Short
gb.PropertiesTransCentreOffsetExpressGet(nMovRot, nScaleHorz, nScaleVert, nSliderRot)
End Sub
```

## Related Functions

[PropertiesTransCentreOffsetExpressPut](#)

### PropertiesTransCentreOffsetExpressPut

Sets the express properties.

## Syntax

**PropertiesTransCentreOffsetExpressPut**(*movementRotationalExpress*, *scalingHorizontalExpress*,  
*scalingVerticalExpress*, *sliderRotationalExpress*)

*movementRotationalExpress*  
Movement Rotational Express

*scalingHorizontalExpress*  
Scaling Horizontal Express

*scalingVerticalExpress*  
Scaling Vertical Express

*sliderRotationalExpress*  
Slider Rotational Express

## Return Value

N/A

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Example

```
Public Sub Test()
Dim gb As GraphicsBuilder.GraphicsBuilder
```

```
gb = New GraphicsBuilder.GraphicsBuilder
.
.
.
gb.PropertiesTransCentreOffsetExpressPut(0, 0, 0, 0)
Dim nMovRot As Short
Dim nScaleHorz As Short
Dim nScaleVert As Short
Dim nSliderRot As Short
gb.PropertiesTransCentreOffsetExpressGet(nMovRot, nScaleHorz, nScaleVert, nSliderRot)
End Sub
```

## Related Functions

[PropertiesTransCentreOffsetExpressGet](#)

### PropertiesTransformationGet

Reads the property values set on the **Movement**, **Scaling** and **Slider** tabs of the Object Properties dialog for the current object.

## Syntax

**PropertiesTransformationGet**(*Action*, *Expression*, *RangeFlag*, *RangeMin*, *RangeMax*, *OffsetMin*, *OffsetMax*,  
*CustomFlag*, *CentreOffsetRight*, *CentreOffsetDown*)

*Action*:

Selects the tab on the Object Properties dialog that data will be read from:

0 = MovementHorizontal

1 = MovementVertical

2 = MovementRotational

3 = ScalingHorizontal

4 = ScalingVertical

5 = SliderHorizontal

6 = SliderVertical

7 = SliderRotational

*Expression*:

The main expression in Field:

- **Movement expression** for the actions MovementHorizontal or MovementVertical
- **Angle expression** for action MovementRotational
- **Scaling expression** for actions ScalingHorizontal or ScalingVertical
- **Tag** for actions SliderHorizontal, SliderVertical or SliderRotational

*RangeFlag*:

TRUE if Specify range is checked

*RangeMin*:

The minimum floating point value. 0 (zero) if RangeFlag is not set.

*RangeMax:*

This maximum floating point value. 0 (zero) if RangeFlag is set to TRUE.

*OffsetMin:*

The value of Angle at minimum for the actions MovementRotational and SliderRotational, or Offset at minimum for other actions.

*OffsetMax:*

The value of Angle at maximum for the actions MovementRotational and SliderRotational, or Offset at maximum for other actions.

*CustomFlag:*

TRUE if custom is selected for the center axis offset setting for the actions MovementRotational, SliderRotational, Scaling Horizontal or ScalingVertical.

*CentreOffsetRight:*

A value between 0 and 32767 representing the customized setting for center offset right. 0 (zero) if CustomFlag is not set.

*CentreOffsetDown:*

A value between 0 and 32767 representing the customized setting for center offset down. 0 (zero) if CustomFlag is not set.

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesTransformationPut](#)

### PropertiesTransformationPut

Sets values for the properties on the **Movement**, **Scaling** and **Slider** tabs of the Object Properties dialog.

## Syntax

**PropertiesTransformationGet**(*Action*, *Expression*, *RangeFlag*, *RangeMin*, *RangeMax*, *OffsetMin*, *OffsetMax*, *CustomFlag*, *CentreOffsetRight*, *CentreOffsetDown*)

*Action:*

Selects the tab on the Object Properties dialog that data will be read from:

0 = MovementHorizontal

1 = MovementVertical

2 = MovementRotational

3 = ScalingHorizontal

4 = ScalingVertical

5 = SliderHorizontal

6 = SliderVertical

7 = SliderRotational

*Expression:*

The main expression in Field:

- **Movement expression** for the actions MovementHorizontal or MovementVertical
- **Angle expression** for action MovementRotational
- **Scaling expression** for actions ScalingHorizontal or ScalingVertical
- **Tag** for actions SliderHorizontal, SliderVertical or SliderRotational

*RangeFlag:*

TRUE if Specify range is checked

*RangeMin:*

The minimum floating point value. 0 (zero) if RangeFlag is not set.

*RangeMax:*

This maximum floating point value. 0 (zero) if RangeFlag is set to TRUE.

*OffsetMin:*

The value of Angle at minimum for the actions MovementRotational and SliderRotational, or Offset at minimum for other actions.

*OffsetMax:*

The value of Angle at maximum for the actions MovementRotational and SliderRotational, or Offset at maximum for other actions.

*CustomFlag:*

TRUE if custom is selected for the center axis offset setting for the actions MovementRotational, SliderRotational, Scaling Horizontal or ScalingVertical.

*CentreOffsetRight:*

A value between 0 and 32767 representing the customized setting for center offset right. 0 (zero) if CustomFlag is not set.

*CentreOffsetDown:*

A value between 0 and 32767 representing the customized setting for center offset down. 0 (zero) if CustomFlag is not set.

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesTransformationGet](#)

## PropertiesTrendGet

Reads the values for a trend object as set on the **Appearance | General** tab of the Object Properties dialog.

---

**Note:** As this function does not support True Color functionality, it has been superseded by the [function](#).

---

## Syntax

**PropertiesTrendGet**(*NumberOfSamples*, *PixelPerSample*, *Expression1*, *Colour1*, *Expression2*, *Colour2*,  
*Expression3*, *Colour3*, *Expression4*, *Colour4*, *Expression5*, *Colour5*, *Expression6*, *Colour6*, *Expression7*, *Colour7*,  
*Expression8*, *Colour8*)

*NumberOfSamples*:

A value between 0 and 32767 representing the number of samples in a trend display.

*PixelPerSample*:

A value between 1 and 32, representing the width of each sample in pixels.

*Expression1*:

String argument for the field Pen1.

*Colour1*:

A value between 0 and 255 representing the color of trend Pen1.

*Expression2*:

String argument for the field Pen2.

*Colour2*:

A value between 0 and 255 representing the color of trend Pen2.

*Expression3*:

String argument for the field Pen3.

*Colour3*:

A value between 0 and 255 representing the color of trend Pen3.

*Expression4*:

String argument for the field Pen4.

*Colour4*:

A value between 0 and 255 representing the color of trend Pen4.

*Expression5*:

String argument for the field Pen5.

*Colour5*:

A value between 0 and 255 representing the color of trend Pen5.

*Expression6*:

String argument for the field Pen6.

*Colour6*:

A value between 0 and 255 representing the color of trend Pen6.

*Expression7*:

String argument for the field Pen7.

*Colour7:*

A value between 0 and 255 representing the color of trend Pen7.

*Expression8:*

String argument for the field Pen8.

*Colour8:*

A value between 0 and 255 representing the color of trend Pen8.

## Return Value

The requested values, as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PropertiesTrendPut](#)

### PropertiesTrendGetEx

Reads the values for a trend object as set on the **Appearance | General** tab of the Object Properties dialog.

## Syntax

**PropertiesTrendGetEx**(*NumberOfSamples*, *PixelPerSample*, *Expression1*, *OnColour1*, *OffColour1*, *Expression2*, *OnColour2*, *OffColour2*, *Expression3*, *OnColour3*, *OffColour3*, *Expression4*, *OnColour4*, *OffColour4*, *Expression5*, *OnColour5*, *OffColour5*, *Expression6*, *OnColour6*, *OffColour6*, *Expression7*, *OnColour7*, *OffColour7*, *Expression8*, *OnColour8*, *OffColour8*)

*NumberOfSamples:*

A value between 0 and 32767 representing the number of samples in a trend display.

*PixelPerSample:*

A value between 1 and 32, representing the width of each sample in pixels.

*Expression1:*

String argument for the field Pen1.

*OnColour1:*

An RGB value representing the "on" color of trend Pen1.

*OffColour1:*

An RGB value representing the "off" color of trend Pen1.

*Expression2:*

String argument for the field Pen2.

*OnColour2:*

An RGB value representing the "on" color of trend Pen2.

*OffColour2:*

An RGB value representing the "off" color of trend Pen2.

*Expression3:*

String argument for the field Pen3.

*OnColour3:*

An RGB value representing the "on" color of trend Pen3.

*OffColour3:*

An RGB value representing the "off" color of trend Pen3.

*Expression4:*

String argument for the field Pen4.

*OnColour4:*

An RGB value representing the "on" color of trend Pen4.

*OffColour4:*

An RGB value representing the "off" color of trend Pen4.

*Expression5:*

*String argument for the field Pen5.*

*OnColour5:*

An RGB value representing the "on" color of trend Pen5.

*OffColour5:*

An RGB value representing the "off" color of trend Pen5.

*Expression6:*

String argument for the field Pen6.

*OnColour6:*

An RGB value representing the "on" color of trend Pen6.

*OffColour6:*

An RGB value representing the "off" color of trend Pen6.

*Expression7:*

String argument for the field Pen7.

*OnColour7:*

An RGB value representing the "on" color of trend Pen7.

*OffColour7:*

An RGB value representing the "off" color of trend Pen7.

*Expression8:*

String argument for the field Pen8.

*OnColour8:*

An RGB value representing the "on" color of trend Pen8.

*OffColour8:*

An RGB value representing the "off" color of trend Pen8.

## Return Value

The requested values, as a string.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PropertiesTrendPutEx](#)

### PropertiesTrendPut

Sets the values for a trend object that appear on the **Appearance | General** tab of the Object Properties dialog.

**Note:** As this function does not support True Color functionality, it has been superseded by the functions [PropertiesTrendPutEx](#).

## Syntax

**PropertiesTrendGet**(*NumberOfSamples*, *PixelPerSample*, *Expression1*, *Colour1*, *Expression2*, *Colour2*,  
*Expression3*, *Colour3*, *Expression4*, *Colour4*, *Expression5*, *Colour5*, *Expression6*, *Colour6*, *Expression7*, *Colour7*,  
*Expression8*, *Colour8*)

*NumberOfSamples*:

A value between 0 and 32767 representing the number of samples in a trend display.

*PixelPerSample*:

A value between 1 and 32, representing the width of each sample in pixels.

*Expression1*:

String argument for the field Pen1.

*Colour1*:

A value between 0 and 255 representing the color of trend Pen1

*Expression2*:

String argument for the field Pen2.

*Colour2*:

A value between 0 and 255 representing the color of trend Pen2.

*Expression3*:

String argument for the field Pen3.

*Colour3*:

A value between 0 and 255 representing the color of trend Pen3.

*Expression4*:

String argument for the field Pen4.

*Colour4*:

A value between 0 and 255 representing the color of trend Pen4.

*Expression5*:

String argument for the field Pen5.

*Colour5:*

A value between 0 and 255 representing the color of trend Pen5.

*Expression6:*

String argument for the field Pen6.

*Colour6:*

A value between 0 and 255 representing the color of trend Pen6.

*Expression7:*

String argument for the field Pen7.

*Colour7:*

A value between 0 and 255 representing the color of trend Pen7.

*Expression8:*

String argument for the field Pen8.

*Colour8:*

A value between 0 and 255 representing the color of trend Pen8.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

String argument for the field Pen2.

*OnColour2:*

An RGB value representing the "on" color of trend Pen2.

*OffColour2:*

An RGB value representing the "off" color of trend Pen2.

*Expression3:*

String argument for the field Pen3.

*OnColour3:*

An RGB value representing the "on" color of trend Pen3.

*OffColour3:*

An RGB value representing the "off" color of trend Pen3.

*Expression4:*

String argument for the field Pen4.

*OnColour4:*

An RGB value representing the "on" color of trend Pen4.

*OffColour4:*

An RGB value representing the "off" color of trend Pen4.

*Expression5:*

String argument for the field Pen5.

*OnColour5:*

An RGB value representing the "on" color of trend Pen5.

*OffColour5:*

An RGB value representing the "off" color of trend Pen5.

*Expression6:*

String argument for the field Pen6.

*OnColour6:*

An RGB value representing the "on" color of trend Pen6.

*OffColour6:*

An RGB value representing the "off" color of trend Pen6.

*Expression7:*

String argument for the field Pen7.

*OnColour7:*

An RGB value representing the "on" color of trend Pen7.

*OffColour7:*

An RGB value representing the "off" color of trend Pen7.

*Expression8:*

String argument for the field Pen8.

*OnColour8:*

An RGB value representing the "on" color of trend Pen8.

*OffColour8:*

An RGB value representing the "off" color of trend Pen8.

**Return Value**

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

**Related Functions**

[PropertiesTrendGetEx](#)

**PropertyVisibility**

Sets the Hidden when argument on the **Appearance | Visibility** tab of the Object Properties dialog.

**Syntax**

**PropertyVisibility**(*Text*)

*Text:*

The argument string.

**Return Value**

If retrieving the current setting, the argument string. If enabling or disabling the option, 0 (zero) if successful. In both cases, an error is returned if unsuccessful.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_PropertyVisibility` enables or disables this option, and `get_PropertyVisibility` retrieves the current option setting.

---

**Event Functions**

The following events use the automation `Idispatch` mechanism to fire events in specific situations.

<b>BrokenLink</b>	This event is fired if a missing link is encountered
-------------------	--

	while executing the functions <a href="#">ProjectUpdatePages()</a> or <a href="#">PageOpen()</a> . Details of the missing object are provided through the parameters <i>Project</i> , <i>Library</i> , <i>Object</i> , <i>GenieOrSymbol</i> .
<a href="#">PasteGenie</a>	When the <a href="#">LibrarySelectionHooksEnabled()</a> attribute is set to TRUE, this event is fired when: the paste Genie menu item is selected; the paste genie toolbar button is pressed; or F11 is pressed.
<a href="#">PasteSymbol</a>	When the <a href="#">LibrarySelectionHooksEnabled()</a> attribute is set to TRUE, this event is fired when the paste symbol menu item is selected, the paste symbol toolbar button is pressed, or F6 is pressed.
<a href="#">ProjectChange</a>	This event is fired whenever a new project is selected in Plant SCADA Studio.
<a href="#">Selection</a>	When <a href="#">SelectionEventEnabled()</a> is set to TRUE, this event is fired every time a selection is made within a graphics page. The dimension of the selection rectangle is passed as parameters.
<a href="#">SwapObject</a>	When the <a href="#">LibrarySelectionHooksEnabled()</a> attribute is set to TRUE, this event is fired when pressing the CTRL+SHIFT keys and double-clicking on the object in the graphics page.

For details and a VB example on handling return and error values, see [Error Handling](#).

## See Also

[Automation Events](#)

[Function Categories](#)

## BrokenLink

This event is fired if a missing link is encountered while executing the functions [ProjectUpdatePages](#) or [PageOpen](#). Details of the missing object are provided through the parameters *Project*, *Library*, *Object*, *GenieOrSymbol*.

## Syntax

**BrokenLink(*Project*, *Library*, *Object*, *GenieOrSymbol*)**

*Project*:

The name of the project.

*Library*:

The name of the library.

*Object:*

The name of the symbol or Genie.

*GenieOrSymbol:*

Identifies if the object is a symbol or Genie: 1 = Genie; 2 = symbol.

## See Also

[Automation Events](#)

### PasteGenie

When the `LibSelectionHooksEnabled` attribute is set to TRUE, this event is fired when the Paste Genie menu item is selected, the Paste Genie toolbar button is pressed, or when F11 is pressed.

## Syntax

**PasteGenie**

## See Also

[Automation Events](#)

### PasteSymbol

When the `LibSelectionHooksEnabled` attribute is set to TRUE, this event is fired when the paste symbol menu item is selected, the paste symbol toolbar button is pressed, or F6 is pressed.

## Syntax

**PasteSymbol**

## See Also

[Automation Events](#)

### ProjectChange

This event is fired whenever a new project is selected in Plant SCADA Studio.

## Syntax

**ProjectChange**

## See Also

[Automation Events](#)

## Selection

When [SelectionEventEnabled](#) is set to TRUE, this event is fired every time a selection is made within a graphics page. The dimension of the selection rectangle is passed as parameters.

## Syntax

**Selection** (*FromXPosition*, *FromYPosition*, *ToXPosition*, *ToYPosition*)

*FromXPosition*:

Distance from the left-hand side of the page to top-left hand corner of the selection rectangle (in pixels).

*FromYPosition*:

Distance from the top of the page to the top-left hand corner of the selection rectangle (in pixels).

*ToXPosition*:

Distance from the left-hand side of the page to the bottom-right hand corner of the selection rectangle (in pixels).

*ToYPosition*:

Distance from the top of the page to the bottom-right hand corner of the selection rectangle (in pixels).

## See Also

[Automation Events](#)

## SwapObject

When the [LibSelectionHooksEnabled](#) attribute is set to TRUE, this event is fired when pressing the CTRL+SHIFT keys and double-clicking the object in the graphics page.

## Syntax

**SwapObject**

## See Also

[Automation Events](#)

## Library Object Functions

With Library Object functions you can use and manipulate the objects stored in libraries in your project. This includes such objects as Genies, Super Genies, Symbols, and so on.

<a href="#">LibraryFirstObject</a>	Returns the name of the first library object.
<a href="#">LibraryNextObject</a>	Returns the name of the next library object when following a call of the function LibraryFirstObject.
<a href="#">LibraryObjectFirstProperty</a>	Returns the name and value of the active Genie's first property.
<a href="#">LibraryObjectFirstPropertyEx</a>	Returns the name and value of a specified Genie's first property.
<a href="#">LibraryObjectHotspotGet</a>	Retrieves the hotspot marker in a Genie or symbol page.
<a href="#">LibraryObjectHotspotPut</a>	Positions the hotspot marker in a Genie or symbol page.
<a href="#">LibraryObjectName</a>	Returns the name of the selected object.
<a href="#">LibraryObjectNextProperty</a>	Returns the name and value of the active Genie's "next" property when implemented following a call of the function LibraryObjectFirstProperty.
<a href="#">LibraryObjectNextPropertyEx</a>	Returns the name and value of the "next" property of the Genie specified by the implementation of LibraryObjectFirstPropertyEx.
<a href="#">LibraryObjectPlace</a>	Places a library object (a symbol or genie) on the active Plant SCADA graphics page at the default location (top left corner).
<a href="#">LibraryObjectPlaceEx</a>	Places a library object (a symbol or genie) on the active Plant SCADA graphics page at the specified location.
<a href="#">LibraryObjectPutProperty</a>	Sets the value of a specified property for the active genie.
<a href="#">LibSelectionHooksEnabled</a>	Writing a TRUE value with this function enables library selection hooks. When enabled, selecting Paste Genie or Paste Symbol (or their equivalent function key of toolbar button) will not show the standard selection dialog, but will fire the automation event PasteSymbol or PasteGenie instead.
<a href="#">LibraryShowPasteDialog</a>	Shows either the paste Genie or Paste Symbol dialog.

For details and a VB example on handling return and error values, see [Error Handling](#).

## See Also

[Automation Events](#)

[Function Categories](#)

## LibraryFirstObject

Returns the name of the first library object. Can be used with [LibraryNextObject](#) to iterate through library objects.

## Syntax

**LibraryFirstObject**(*Project*,*Library*,*Type*,*Object*)

*Project*:

The name of the project that contains the object library you would like to browse.

*Library*:

Specifies the library that contains the objects you would like to browse.

*Type*:

Specifies the type of the object you want to browse.

1 = Genie

2 = Super Genie

3 = Template

*Object*:

Returns the name of the first object as a string.

## Return Value

The name of the first object as string values.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[LibraryNextObject](#), [LibraryObjectPlace](#), [LibraryObjectFirstProperty](#), [LibraryObjectNextProperty](#),  
[LibraryObjectFirstPropertyEx](#), [LibraryObjectPutProperty](#),

## Example

```
On Error Resume Next
Err.Clear
GraphicsBuilder.LibraryFirstObject ProjectName,LibraryName,1,ObjectName
While Err.Number = 0
Debug.Print ObjectName
GraphicsBuilder.LibraryNextObject ObjectName
Wend
```

## LibraryNextObject

Returns the name of the next library object when following a call of the function [LibraryFirstObject](#). By using multiple calls of this function, you can iterate through a library objects.

## Syntax

**LibraryNextObject**(*ObjectName*)

*ObjectName*:

Returns the name of the next object as a string.

## Return Value

The name of the next object as string values.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[LibraryFirstObject](#), [LibraryObjectPlace](#), [LibraryObjectFirstProperty](#), [LibraryObjectNextProperty](#),  
[LibraryObjectFirstPropertyEx](#), [LibraryObjectPutProperty](#), [LibraryObjectName](#)

## Example

```
On Error Resume Next
Err.Clear
GraphicsBuilder.LibraryFirstObject ProjectName,LibraryName,1,ObjectName
While Err.Number = 0
    Debug.Print ObjectName
    GraphicsBuilder.LibraryNextObject ObjectName
Wend
```

## LibraryObjectFirstProperty

Returns the name and value of the active Genie's first property. Can be used with [LibraryObjectNextProperty](#) to step through a genie's properties.

## Syntax

**LibraryObjectFirstProperty**(*PropertyName*, *PropertyValue*)

*PropertyName*:

Returns the name of the active genie's first property as a string.

*PropertyValue*:

Returns the value of the active genie's first property as a string.

## Return Value

The name and value of the Genie's first property as string values

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[LibraryObjectPlace](#), [LibraryObjectNextProperty](#), [LibraryObjectPutProperty](#), [LibraryObjectName](#)

## Example

```
On Error Resume Next
Err.Clear
GraphicsBuilder.LibraryObjectFirstProperty PropName, PropValue
While Err.Number = 0
    Debug.Print PropName, PropValue
    GraphicsBuilder.LibraryObjectNextProperty PropName, PropValue
Wend
```

## LibraryObjectFirstPropertyEx

Returns the name and value of a specified Genie's first property. Can be used in conjunction with [LibraryObjectNextPropertyEx](#) to step through the specified Genie's properties.

## Syntax

**LibraryObjectFirstPropertyEx**(*Project*, *Library*, *Object*, *PropertyName*, *PropertyValue*)

*Project*:

The name of the project where the Genie is located.

*Library*:

The name of the library where the Genie is located.

*Object*:

The name of the genie.

*PropertyName*:

Returns the name of the active genie's first property as a string.

*PropertyValue*:

Returns the value of the active genie's first property as a string.

## Return Value

The name and value of the specified Genie's first property as string values.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[LibraryObjectPlace](#), [LibraryObjectNextProperty](#), [LibraryObjectPutProperty](#), [LibraryObjectName](#)

## Example

```
' Retrieves the first property of the specified Genie
GraphicsBuilder.LibraryObjectFirstPropertyEx "include", "motors", "Motor_2_east", PropName,
PropValue
```

## LibraryObjectHotspotGet

Retrieves the hotspot marker in a Genie or symbol page. Fails if not a Genie or symbol page.

## Syntax

**LibraryObjectHotspotGet(*Xposition*, *YPosition*)**

*Xposition*:

Absolute X position in pixels from the left side of the page.

*YPosition*:

Absolute Y position in pixels from the top of the page.

## Return Value

X and Y values for the hotspot, where X represents the number of pixels from the left hand side of the page, and Y represents the number of pixels from the top of the page.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[LibraryObjectHotspotPut](#)

## LibraryObjectHotspotPut

Positions the hotspot marker in a Genie or symbol page. Fails if not a Genie or symbol page.

## Syntax

**LibraryObjectHotspotPut(*Xposition*, *YPosition*)**

*Xposition*:

Absolute X position in pixels from the left side of the page.

*YPosition*:

Absolute Y position in pixels from the top of the page.

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[LibraryObjectHotspotGet](#)

### LibraryObjectName

Returns the name of the selected object, if it is a library object.

## Syntax

**LibraryObjectName**(*Project*, *Library*, *Object*, *GenieOrSymbol*)

*Project*:

The name of the project that contains the object library you would like to source.

*Library*:

Specifies the library that contains the symbol or genie you would like to retrieve the name of.

*Object*:

The name of the symbol or genie as a string.

*GenieOrSymbol*:

Indicates whether the object you want to retrieve the name for is a symbol or a genie.

1 = Genie

2 = Symbol

## Return Value

The name of the specified object as a string.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[LibraryObjectFirstProperty](#), [LibraryObjectNextProperty](#), [LibraryObjectPutProperty](#)

## Example

```
On Error Resume Next
Err.Clear
GraphicsBuilder.LibraryObjectName Project, File, Page, LibType
If Err.Number = 0 Then
    Debug.Print Project; "."; File; "."; Page
```

```
Else
    Debug.Print "not a library object"
End If
```

## LibraryObjectNextProperty

Returns the name and value of the active Genie's "next" property when implemented following a call of the function [LibraryObjectFirstProperty](#). By using multiple calls of this function, you can iterate through an object's properties.

## Syntax

**LibraryObjectNextPropertyEx**(*PropertyName*, *PropertyValue*)

*PropertyName*:

Returns the name of the active genie's next property as a string.

*PropertyValue*:

Returns the value of the active genie's next property as a string.

## Return Value

The name and value of the Genie's next property as string values

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[LibraryObjectPlace](#), [LibraryObjectFirstProperty](#), [LibraryObjectPutProperty](#), [LibraryObjectName](#)

## Example

```
On Error Resume Next
Err.Clear
GraphicsBuilder.LibraryObjectFirstProperty PropName, PropValue
While Err.Number = 0
    Debug.Print PropName, PropValue
    GraphicsBuilder.LibraryObjectNextProperty PropName, PropValue
Wend
```

## LibraryObjectNextPropertyEx

Returns the name and value of the "next" property of the Genie specified by the implementation of [LibraryObjectFirstPropertyEx](#). By using multiple calls of this function, you can iterate through the specified genie's properties.

## Syntax

**LibraryObjectNextPropertyEx**(*PropertyName*, *PropertyValue*)

*PropertyName:*

Returns the name of the active genie's next property as a string.

*PropertyValue:*

Returns the value of the active genie's next property as a string.

## Return Value

The name and value of the Genie's next property as string values.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

[LibraryObjectFirstPropertyEx](#)

## Example

```
On Error Resume Next
Err.Clear
GraphicsBuilder.LibraryObjectFirstPropertyEx "include", "motors", "Motor_2_east", PropName,
PropValue
While Err.Number = 0
    Debug.Print PropName, PropValue
    GraphicsBuilder.LibraryObjectNextProperty PropName, PropValue
Wend
```

## LibraryObjectPlace

Places a library object (a symbol or genie) on the active Plant SCADA graphics page at the default location (top left corner). This function will not succeed if the specified object is not found.

## Syntax

**LibraryObjectPlace**(*Project*, *Library*, *Object*, *GenieOrSymbol*, *Linked*)

*Project:*

The name of the project that contains the object library you would like to source.

*Library:*

Specifies the library that contains the symbol or genie you would like to place on the active Plant SCADA graphics page.

*Object:*

The name of the symbol or genie you would like to place on the active Plant SCADA graphics page.

*GenieOrSymbol:*

Indicates whether the object you want to use is a symbol or a genie.

0 = Library type unknown (will automatically select genie or symbol)

1 = Genie

2 = Symbol

*Linked:*

If set to TRUE, the object will remain linked to the library it came from. (select TRUE for Genies). Can only be set to FALSE if GenieOrSymbol is set to 2 (Symbol).

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[LibraryObjectFirstProperty](#), [LibraryObjectNextProperty](#), [LibraryObjectPutProperty](#), [LibraryObjectName](#)

## Example

```
' Adds an object to the current Plant SCADA graphics page
GraphicsBuilder.LibraryObjectPlace "include", "agitator", "agit_1_Pos1_g", 2, True
GraphicsBuilder.PositionAt 200, 200
```

## LibraryObjectPlaceEx

Places a library object (a symbol or genie) on the active Plant SCADA graphics page at the specified location. This function will not succeed if the specified object is not found.

## Syntax

**LibraryObjectPlaceEx**(*Project*, *Library*, *Object*, *GenieOrSymbol*, *Linked*, *Xposition*, *YPosition*)

*Project*:

The name of the project that contains the object library you would like to source.

*Library*:

Specifies the library that contains the symbol or genie you would like to place on the active Plant SCADA graphics page.

*Object*:

The name of the symbol or genie you would like to place on the active Plant SCADA graphics page.

*GenieOrSymbol*:

Indicates whether the object you want to use is a symbol or a genie.

0 = Library type unknown (will automatically select genie or symbol)

1 = Genie

2 = Symbol

*Linked*:

If set to TRUE, the object will remain linked to the library it came from. (Select TRUE for Genies).

*Xposition*:

Absolute X position in pixels from the left hand side of the page.

***YPosition:***

Absolute Y position in pixels from the top of the page.

**Return Value**

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

**Related Functions**

[LibraryObjectFirstProperty](#), [LibraryObjectNextProperty](#), [LibraryObjectPutProperty](#), [LibraryObjectName](#)

**Example**

```
' Adds an object to the current graphics page at 200 pixels from the left and top
GraphicsBuilder.LibraryObjectPlaceEx "include", "agitator", "agit_1_Pos1_g", 2, True, 200,
200
```

**LibraryObjectPutProperty**

Sets the value of a specified property for the active genie. The field name is case-sensitive.

**Syntax**

**LibraryObjectPutProperty(*PropertyName*, *PropertyValue*)**

***PropertyName:***

The name of the property to be modified, as returned by the function [LibraryObjectFirstProperty](#) or [LibraryObjectNextProperty](#).

***PropertyValue:***

The value to be written to the property as a string.

**Return Value**

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

**Related Functions**

[LibraryObjectPlace](#), [LibraryObjectFirstProperty](#), [LibraryObjectNextProperty](#),

**Example**

```
GraphicsBuilder.LibraryObjectPlace "include", "motors", "Motor_1_east", 1, True
```

```
GraphicsBuilder.LibraryObjectPutProperty "Tag", "My test genie"
```

## LibraryShowPasteDialog

Shows either the Paste Genie or Paste Symbol dialog.

## Syntax

**LibraryShowPasteDialog(*GenieOrSymbol*)**

*GenieOrSymbol*:

Indicates whether the object you want to use is a symbol or a genie.

1 = Genie

2 = Symbol

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PasteSymbol](#), [PasteGenie](#)

## LibSelectionHooksEnabled

Writing a TRUE value with this function enables library selection hooks. When enabled, selecting **Paste Genie** or **Paste Symbol** (or their equivalent function key or toolbar button) will not show the standard selection dialog, but will fire the automation event [PasteSymbol](#) or [PasteGenie](#) instead.

Additionally, when hooks are enabled, pressing CTRL + SHIFT and double-clicking a Plant SCADA page will fire the event [SwapObject](#).

## Syntax

**LibSelectionHooksEnabled(*HooksEnabled*)**

*HooksEnabled*:

A setting of TRUE enables library selection hooks.

## Return Value

Enables library selection hooks, or retrieves the current library selection hooks setting.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PasteSymbol](#), [PasteGenie](#)

---

**Note:** This function is implemented in the C++ environment as two separate functions:

[put\\_LibSelectionHooksEnabled](#) enables selection hooks, and [get\\_LibSelectionHooksEnabled](#) retrieves

---

---

the current selection hooks setting.

---

## Metadata Functions

Use these Metadata functions to configure the metadata of the current object on a page.

<a href="#">PropertiesAddMetadata</a>	Adds a new Metadata entry to the properties of the current object.
<a href="#">PropertiesSelectFirstMetadata</a>	Selects the first metadata entry from the properties of the current object.
<a href="#">PropertiesSelectNextMetadata</a>	Selects the next metadata entry from the properties of the current object.
<a href="#">PropertiesSelectMetadataByName</a>	Selects the specified metadata entry in the current page.
<a href="#">PropertiesDeleteMetadata</a>	Deletes the selected metadata from the properties of the current object.
<a href="#">PropertiesMetadataName</a>	Sets or retrieves the name of the currently selected object metadata.
<a href="#">PropertiesMetadataValue</a>	Sets or retrieves the value of the currently selected object metadata.

For details and a VB example on handling return and error values, see [Error Handling](#).

## See Also

[Automation Events](#)

[Function Categories](#)

## PropertiesAddMetadata

Adds a new metadata entry to the current object properties. This function will return an error if metadata with the specified name already exists.

## Syntax

**PropertiesAddMetadata** (*Name*, *Value*)

*Name*:

The name of the new metadata entry to be added to the properties of the current object

*Value*:

The value of the new metadata to be added to the current object properties.

## Return Value

0 (zero) if successful, otherwise an error is returned.

## Example

Adding a new element and setting its properties:

```
GraphicsBuilder.PropertiesAddMetadata("MyName", "MyValue")
```

## Related Functions

[PropertiesMetadataValue](#), [PropertiesMetadataName](#), [PropertiesSelectNextMetadata](#),  
[PropertiesSelectFirstMetadata](#), [PropertiesDeleteMetadata](#), [PropertiesSelectMetadataByName](#)

## PropertiesDeleteMetadata

Deletes the selected metadata from the properties of the current object. After an item has been deleted, a call to [PropertiesSelectNextMetadata](#) will select the item immediately following the deleted item.

## Syntax

```
PropertiesDeleteMetadata()
```

## Return Value

0 (zero) if successful, otherwise an error is returned.

## Example

Delete any metadata starting with "a":

```
Dim name As String
On Error Resume Next
Err.Clear()
GraphicsBuilder.PropertiesSelectFirstMetadata()
While (Err.Number = 0)
    name = GraphicsBuilder.PropertiesMetadataName
    If (name.ToLower().StartsWith("a")) Then
        GraphicsBuilder.PropertiesDeleteMetadata()
    End If
    GraphicsBuilder.PropertiesSelectNextMetadata()
End While
```

## Related Functions

[PropertiesMetadataValue](#), [PropertiesMetadataName](#), [PropertiesSelectNextMetadata](#),  
[PropertiesSelectFirstMetadata](#), [PropertiesAddMetadata](#), [PropertiesSelectMetadataByName](#)

## PropertiesMetadataName

Sets or retrieves the name of the currently selected object metadata.

### Syntax

*Name* = PropertiesMetadataName  
PropertiesMetadataName (*Name*)

### Return Value

The name of the currently selected metadata item (as a string). An error is returned if unsuccessful.

## Related Functions

[PropertiesMetadataValue](#), [PropertiesDeleteMetadata](#), [PropertiesSelectNextMetadata](#),  
[PropertiesSelectFirstMetadata](#), [PropertiesAddMetadata](#), [PropertiesSelectMetadataByName](#)

## PropertiesMetadataValue

Sets or retrieves the value of the currently selected object metadata.

### Syntax

*Val* = PropertiesMetadataValue  
PropertiesMetadataValue(*Def*)

### Return Value

The value of the currently selected metadata (as a string), or 0 (zero) if successfully used to set the default. An error is returned if unsuccessful.

## Related Functions

[PropertiesMetadataName](#), [PropertiesDeleteMetadata](#), [PropertiesSelectNextMetadata](#),  
[PropertiesSelectFirstMetadata](#), [PropertiesAddMetadata](#), [PropertiesSelectMetadataByName](#)

## PropertiesSelectFirstMetadata

Selects the first metadata entry from the properties of the current object.

### Syntax

**PropertiesSelectFirstMetadata()**

## Return Value

0 (zero) if successful, otherwise an error is returned.

## Example

Determines whether the page properties of the current object has defined metadata:

```
On Error Resume Next
Err.Clear()
GraphicsBuilder.PropertiesSelectFirstMetadata()
If (Err.Number <> 0)
    ' The object has no metadata
End If
```

## Related Functions

[PropertiesMetadataValue](#), [PropertiesMetadataName](#), [PropertiesSelectNextMetadata](#), [PropertiesDeleteMetadata](#),  
[PropertiesAddMetadata](#), [PropertiesSelectMetadataByName](#)

## PropertiesSelectMetadataByName

Selects the specified metadata in the current page.

## Syntax

**PropertiesSelectMetadataByName(BSTR Name)**

*Name:*

The name of the metadata to be selected.

## Return Value

0 (zero) if successful, otherwise an error is returned.

## Example

Determining whether an metadata with a particular name exists:

```
On Error Resume Next
Err.Clear()
GraphicsBuilder.PropertiesSelectMetadataByName( "MyName" )
If (Err.Number <> 0)
    ' The metadata does not exist
End If
```

## Related Functions

[PropertiesDeleteMetadata](#)

## PropertiesSelectNextMetadata

Selects the next metadata entry from the properties of the current object.

## Syntax

```
PropertiesSelectNextMetadata()
```

## Return Value

0 (zero) if successful, otherwise an error is returned.

## Example

Print metadata entries in the current object properties:

```
On Error Resume Next
Err.Clear()
GraphicsBuilder.PropertiesSelectFirstMetadata()
While (Err.Number = 0)
    Console.Out.WriteLine(GraphicsBuilder.PropertiesMetadataName)
    GraphicsBuilder.PropertiesSelectNextMetadata()
End While
```

## Related Functions

[PropertiesMetadataValue](#), [PropertiesSelectNextMetadata](#), [PropertiesSelectFirstMetadata](#),  
[PropertiesAddMetadata](#), [PropertiesSelectMetadataByName](#)

## Miscellaneous Functions

These functions are used for special interactions with the Graphics Builder; for example, an external drag-and-drop action could be performed by requesting the active window handle.

<a href="#">BrokenLinkCancelEnabled</a>	Writing a TRUE value enables the functions ProjectUpdatePages or PageOpen to exit and report the error E-POINTER when encountering the first broken link (missing reference) during execution.
<a href="#">ClipboardCopy</a>	Copies the selected object(s) to the Windows Clipboard.
<a href="#">ClipboardCut</a>	Cuts the selected object(s) to the Windows Clipboard.
<a href="#">ClipboardPaste</a>	Paste the elements of the Windows Clipboard on to the active page.
<a href="#">ConvertToBitmap</a>	Converts the active object to a bitmap. Unable to convert if no active object.

<a href="#">GetOffBitmap</a>	Returns Bitmap data for an object.
<a href="#">GetOnBitmap</a>	Returns Bitmap data for an object.
<a href="#">Quit</a>	Exits the Plant SCADA development environment.
<a href="#">SelectionEventEnabled</a>	Writing a true value with this function enables an event to be fired for every selection performed on a graphics page. You can also use this function to retrieve the current setting for this option.
<a href="#">UnLockObject</a>	Make an object selectable.

For details and a VB example on handling return and error values, see [Error Handling](#).

## See Also

[Automation Events](#)

[Function Categories](#)

## BrokenLinkCancelEnabled

Writing a TRUE value enables the functions ProjectUpdatePages or PageOpen to exit and report the error E-POINTER when encountering the first broken link (missing reference) during execution. If set to FALSE, these functions will succeed, but will issue a BrokenLink event for every unresolved reference on a page.

## Syntax

**BrokenLinkCancelEnabled(*CancelEnabled*)**

*CancelEnabled*:

TRUE if enabled.

## Return Value

If retrieving the current setting, TRUE or FALSE. If setting this option, 0 (zero) if successful. In both cases, an error is returned if unsuccessful.

For details and a VB example on handling return and error values, see [Error Handling](#).

## Related Functions

[BrokenLink](#), [ProjectUpdatePages](#), [PageOpen](#)

---

**Note:** This function is implemented in the C++ environment as two separate functions: `put_BrokenLinkCancelEnabled` enables or disables this option, and `get_BrokenLinkCancelEnabled` retrieves the current setting.

## ClipboardCopy

Copies the selected object(s) to the Windows clipboard.

### Syntax

**ClipboardCopy**

### Related Functions

[ClipboardCut](#), [ClipboardPaste](#)

## ClipboardCut

Cuts the selected object(s) to the Windows clipboard.

### Syntax

**ClipboardCut**

### Related Functions

[ClipboardCopy](#), [ClipboardPaste](#)

## ClipboardPaste

Paste the elements of the Windows Clipboard on to the active page.

### Syntax

**ClipboardPaste**

### Related Functions

[ClipboardCut](#), [ClipboardCopy](#)

## ConvertToBitmap

Converts the active object to a bitmap. Fails if no active object.

### Syntax

**ConvertToBitmap**

## GetOffBitmap

Returns bitmap data for an object. The data can be saved directly as the contents of a bitmap file, and includes both a BITMAPFILEHEADER and a BITMAPV4HEADER with transparency information. Object needs to be a bitmap or an error message will be raised.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject\(\)](#) and [PageSelectNextObject\(\)](#) functions, you can access your objects and change or read their properties.

The On and Off versions are provided to support flashing colors (similar to other automation interface functions). The 'Off' version will return an error if there are no flashing colors for the selected bitmap.

## Syntax

**GetOffBitmap(Bitmap)**

*Bitmap:*

Returns the bitmap as SAFEARRAY.

```
Result = GraphicsBuilder.GetOffBitmap(bitmap)
```

## Return Value

Success or failure.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## GetOnBitmap

Returns bitmap data for an object. The data can be saved directly as the contents of a bitmap file, and includes both a BITMAPFILEHEADER and a BITMAPV4HEADER with transparency information. Object needs to be a bitmap or an error message will be raised.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

The On and Off versions are provided to support flashing colors (similar to other automation interface functions)

## Syntax

**GetOnBitmap(Bitmap)**

*Bitmap:*

Returns the bitmap as SAFEARRAY.

```
Result = GraphicsBuilder.GetOnBitmap(bitmap)
```

## Return Value

Success or failure.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

## Quit

Exits the Plant SCADA development environment.

## SelectionEventEnabled

Writing a true value with this function enables an event to be fired for every selection performed on a graphics page. You can also use this function to retrieve the current setting for this option.

## Syntax

**SelectionEventEnabled**(*EventEnabled*)

*EventEnabled*:

Set to TRUE to enable selection events.

## Return Value

If retrieving the current setting, TRUE or FALSE. If setting this option, 0 (zero) if successful. In both cases, an error is returned if unsuccessful.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[Selection](#)

---

**Note:** This function is implemented in the C++ environment as two separate functions:  
`put_SelectionEventEnabled` enables or disables this option, and `get_SelectionEventEnabled` retrieves the current option setting.

## UnLockObject

Make an object selectable.

## Syntax

**UnLockObject**

## Return Value

N/A

---

**Note:** For details on handling return and error values, see [Error Handling](#).

## Example

```
Public Sub Example()
Dim gb As GraphicsBuilder.GraphicsBuilder
.
.
.
gb.PageSelectFirstObjectInGenie()
gb.PageSelectNextObjectInGenie()
gb.PageTemplateSelectFirstObject()
gb.PageTemplateSelectNextObject()
gb.UnLockObject()
End Sub
```

## Related Functions

N/A

## Object Drawing and Property Functions

With these functions, you can draw objects and manipulate the properties of objects.

---

**Note:** Freehand line drawing is not supported, as the same output can be achieved using the DrawPolygon functions.

---

Only General and 3D properties are supported. Movement, Scaling, Fill, and so on are not accessible.

The settings are applied to or read from the selected object. Typically, the last placed object is the selected object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

<a href="#">Attribute3dEffects</a>	Applies a 3D effect to an object, or retrieves the current 3D effect setting.
<a href="#">Attribute3dEffectDepth</a>	Applies a level of depth to a 3D effect, or retrieves the current depth setting.
<a href="#">AttributeAN</a>	Retrieves the animation number (AN) of the active object.
<a href="#">AttributeBaseCoordinates</a>	Returns the base coordinates of an object.
<a href="#">AttributeClass</a>	Retrieves the class of the active object as a string.
<a href="#">AttributeCornerRadius</a>	Sets or retrieves the corner radius value for the current object.
<a href="#">AttributeEllipseStyle</a>	Applies a style to an ellipse, or retrieves the current ellipse style setting.
<a href="#">AttributeEndAngle</a>	Sets the end angle of an arc or pie-slice, or retrieves the end angle.

<a href="#">AttributeExtentX</a>	Retrieves the X coordinate that represents the extent of the active object.
<a href="#">AttributeExtentY</a>	Retrieves the Y coordinate that represents the extent of the active object.
<a href="#">AttributeFillColour</a>	Sets the fill color for an object, or retrieves a value representing the current fill color.
<a href="#">AttributeFillOffColourEx</a>	Sets the fill color for an object, or retrieves a value representing the current fill color.
<a href="#">AttributeFillOnColourEx</a>	Sets the fill color for an object, or retrieves a value representing the current fill color.
<a href="#">AttributeGradientMode</a>	Sets or retrieves the direction of the gradient for the current object.
<a href="#">AttributeGradientOffColour</a>	Sets or retrieves the "Off" portion of the gradient colour for the current object.
<a href="#">AttributeGradientOnColour</a>	Sets or retrieves the "On" portion of the gradient colour for the current object.
<a href="#">AttributeHiLightColour</a>	Sets the highlight color applied to the 3D effects raised, lowered or embossed, or retrieves the current highlight color setting.
<a href="#">AttributeLineColour</a>	Applies a color to a line, or retrieves the current color setting. This function has been replaced by the functions AttributeLineOnColourEx and AttributeLineOffColourEx.
<a href="#">AttributeLineOnColourEx</a>	This function supports True Color functionality and replaces AttributeLineColour.
<a href="#">AttributeLineOffColourEx</a>	This function supports True Color functionality and replaces AttributeLineColour.
<a href="#">AttributeLineStyle</a>	Applies a style to a line, or retrieves the current style setting.
<a href="#">AttributeLineWidth</a>	Sets the width of a line, or retrieves its current width.
<a href="#">AttributeLoLightColour</a>	Sets the lowlight color applied to the 3D effects raised, lowered or embossed, or retrieves the current lowlight color setting. As this function does not support True Colour functionality, it has been superseded by the functions AttributeLoLightOffColourEx and AttributeLoLightOnColourEx.

<a href="#">AttributeLoLightOffColourEx</a>	Sets the lowlight "off" color applied to the 3D effects raised, lowered or embossed, or retrieves the current lowlight color setting.
<a href="#">AttributeLoLightOnColourEx</a>	Sets the lowlight "on" color applied to the 3D effects raised, lowered or embossed, or retrieves the current lowlight color setting.
<a href="#">AttributeNodeCoordinatesFirst</a>	Returns the coordinates of the first node of a free hand line, polygon or pipe.
<a href="#">AttributeNodeCoordinatesNext</a>	Returns the coordinates of any following nodes of a free hand line, polygon or pipe when implemented after AttributeNodeCoordinatesFirst.
<a href="#">AttributePolygonOpen</a>	Defines whether a polygon (polyline) is set to open mode (i.e. its two end points are not joined) or closed (its two ends are joined).
<a href="#">AttributeRectangleStyle</a>	Sets the rectangle style, or retrieves the rectangle style setting.
<a href="#">AttributeSetFill</a>	Displays the object as filled, or retrieves the current fill value.
<a href="#">AttributeShadowColour</a>	Sets the shadow color when a shadowed 3D effect is used, or retrieves the current shadow color setting. As this function does not support True Color functionality, it has been superseded by the functions AttributeShadowOffColourEx and AttributeShadowOnColourEx.
<a href="#">AttributeShadowOffColourEx</a>	Sets the "off" shadow color when a shadowed 3D effect is used, or retrieves the current shadow color setting.
<a href="#">AttributeShadowOnColourEx</a>	Sets the "on" shadow color when a shadowed 3D effect is used, or retrieves the current shadow color setting.
<a href="#">AttributeStartAngle</a>	Sets the start angle of an arc or pie-slice, or retrieves the start angle.
<a href="#">AttributeTransformationMatrixGet</a>	Reads the elements of the transformation matrix.
<a href="#">AttributeTransformationMatrixPut</a>	Sets the elements of the transformation matrix.
<a href="#">AttributeX</a>	Retrieves the X coordinate of the active object.
<a href="#">AttributeY</a>	Retrieves the Y coordinate of the active object.

<a href="#">DrawButton</a>	Draws a button on the active page.
<a href="#">DrawCicodeObject</a>	Places a Cicode object on the page at the specified location.
<a href="#">DrawEllipse</a>	Draws an ellipse on the active page.
<a href="#">DrawLine</a>	Draws a line on the active page.
<a href="#">DrawNumber</a>	Places a number object on the page at the specified location.
<a href="#">DrawPipeEnd</a>	Terminates the drawing of a pipe on the active page.
<a href="#">DrawPipeSection</a>	Draws a section of pipe on the active page.
<a href="#">DrawPipeStart</a>	Initiates the process of drawing a pipe on the active page by defining a starting point that DrawPipeSection() can be applied to.
<a href="#">DrawPolygonEnd</a>	Terminates the drawing of a polygon on the active page.
<a href="#">DrawPolygonLine</a>	Draws a line on the active page that forms part of a polygon.
<a href="#">DrawPolygonStart</a>	Initiates the process of drawing a polygon on the active page by defining a starting point that DrawPolygonLine() can be applied to.
<a href="#">DrawRectangle</a>	Draws a rectangle on the active page.
<a href="#">DrawSymbolSet</a>	Places a Symbol Set object on the page at the specified location.
<a href="#">DrawText</a>	Draws an alphanumeric string at the specified location.
<a href="#">DrawTrend</a>	Draws a trend object on the active page.

For details and a VB example on handling return and error values, see [Error Handling](#).

[Function Categories](#)

## Attribute3dEffects

Applies a 3D effect to an object, or retrieves the current 3D effect setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**Attribute3dEffects(*Effects*)**

*Effects*:

A value between 0 and 4 representing the 3D effect type.

0 = none

1 = raised

2 = lowered

3 = shadowed

4 = embossed

## Return Value

If retrieving the current 3D effect setting, a value between 0 and 4 representing the effect type. If applying a 3D effect, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report with the error E\_INVALIDARG. If there is no active object, they will exit with a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[Attribute3dEffectDepth](#), [AttributeShadowColour](#), [AttributeHiLightColour](#), [AttributeLoLightColour](#)

## Example

```
' Applies a 3D effect (embossed) to an object
GraphicsBuilder.Attribute3dEffects = 4
' Retrieves the current 3D effect applied to an object
MyVariable = GraphicsBuilder.Attribute3dEffects
```

**Note:** This function is implemented in the C++ environment as two separate functions: put\_Attribute3dEffect applies a 3D effect, and get\_Attribute3dEffect retrieves the current 3D effect setting.

## Attribute3dEffectDepth

Applies a level of depth to a 3D effect, or retrieves the current depth setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**Attribute3dEffectDepth(*EffectDepth*)**

*EffectDepth*:

A value between 0 and 32 representing the depth of the 3D effect used.

## Return Value

If retrieving the current depth setting for a 3D effect, a value between 0 and 32. If applying depth to a 3D effect, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit with a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[Attribute3dEffects](#), [AttributeShadowColour](#), [AttributeHiLightColour](#), [AttributeLoLightColour](#)

## Example

```
' Applies depth to a 3D effect for the current object
GraphicsBuilder.Attribute3dEffectDepth = 28

' Retrieves the 3D depth for the current object
MyVariable = GraphicsBuilder.Attribute3dEffectDepth
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_Attribute3dEffectDepth` applies depth to 3D effect, and `get_Attribute3dEffectDepth` retrieves the current 3D depth setting.

## AttributeAN

Retrieves the animation number (AN) of the active object. This is a read only function.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeAN(*AN*)**

*AN*:

A value between 0 and 65536.

## Return Value

A value between 0 and 65536. If values are out of range on writing to the attribute, the function will exit and

report the error E\_INVALIDARG. If there is no active object, they will exit with a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeX](#), [AttributeY](#)

## Example

```
' Retrieves the AN for the current object
MyVariable = GraphicsBuilder.AttributeAN
```

## AttributeBaseCoordinates

Returns the base coordinates of an object. If you use these coordinates, also apply the transformation matrix.

Refer to functions [AttributeTransformationMatrixPut](#) and [AttributeTransformationMatrixGet](#).

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeBaseCoordinates**(*FromXPosition*, *FromYPosition*, *ToXPosition*, *ToYPosition*)

*FromXPosition*:

Distance from the left hand side of the page to top left hand corner of the object, measured in pixels.

*FromYPosition*:

Distance from the top of the page to the top left hand corner of the object, measured in pixels.

*ToXPosition*:

Distance from the left hand side of the page to the bottom right hand corner of the object, measured in pixels.

*ToYPosition*:

Distance from the top of the page to the bottom right hand corner of the object, measured in pixels.

## Return Value

The base coordinates of the current object. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit with a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeTransformationMatrixPut](#), [AttributeTransformationMatrixGet](#)

## AttributeClass

Retrieves the class of the active object as a string. This is a read only function.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeClass(*Class*)**

*Class*:

A string depicting the class of the object. The class options include: "Draw", "Line", "Square", "Circle", "Polyline", "Pipe", "Text", "Button", "Set", "Trend", "Advanced Animation", "Bitmap", "Group", "ActiveX", "Symbol" and "Genie".

## Return Value

A string depicting the class of the object. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit with a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Example

```
' Retrieves the Class for the current object
MyVariable = GraphicsBuilder.AttributeClass
```

## AttributeCornerRadius

Sets or retrieves the corner radius value on the **General | Appearance** tab of the Object Properties dialog for the current object. This is only supported on rectangle objects.

## Syntax

**AttributeCornerRadius(*nRadius*)**

*nRadius*:

Defines the radius of the corner. Values from 0- 32 pixels are permitted.

## Return Value

If retrieving the current corner radius, a value between 0 and 32. If applying a corner radius, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error E\_INVALIDARG. If there is no active object, they exit with a return value of E\_HANDLE.

## AttributeEllipseStyle

Applies a style to an ellipse, or retrieves the current ellipse style setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeEllipseStyle(*EllipseStyle*)**

*EllipseStyle*:

A value representing the current ellipse style.

0 = normal ellipse

1 = pie slice

2 = arc

## Return Value

If retrieving the current ellipse style setting, a value between 0 and 2 representing one of three style options. If applying a style setting, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit with a return value of E\_HANDLE.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Example

```
' Applies a style (arc) to an ellipse
GraphicsBuilder.AttributeEllipseStyle = 2

' Retrieves a value representing the style applied to an ellipse
MyVariable = GraphicsBuilder.AttributeEllipseStyle
```

---

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeEllipseStyle` applies a style to an ellipse, and `get_AttributeEllipseStyle` retrieves the current ellipse style setting.

---

## AttributeEndAngle

Sets the end angle of an arc or pie-slice, or retrieves the end angle.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeEndAngle(*Angle*)**

**Angle:**

A value between 0 and 360 representing the end angle (in degrees).

## Return Value

If retrieving the end angle, a value between 0 and 360. If applying an end angle, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[AttributeStartAngle](#)

## Example

```
' Sets the end angle of an arc
GraphicsBuilder.AttributeEndAngle = 45

' Retrieves the start angle for an arc
MyVariable = GraphicsBuilder.AttributeEndAngle
```

---

**Note:** This function is implemented in the C++ environment as two separate functions: put\_AttributeEndAngle applies an end angle setting, and get\_AttributeEndAngle retrieves the current end angle setting.

---

## AttributeExtentX

Retrieves the X coordinate that represents the extent of the active object. For example, if the active object were a line, it would be the end coordinate. This is a read only function.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeExtentX(*XPosition*)**

***XPosition:***

A value between 0 and 65536.

## Return Value

A value between 0 and 65536. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[AttributeExtentY](#), [AttributeAN](#)

## Example

```
' Retrieves the X coordinate for the extent of the current object
MyVariable = GraphicsBuilder.AttributeExtentX
```

### AttributeExtentY

Retrieves the Y coordinate that represents the extent of the active object. For example, if the active object were a line, it would be the end coordinate. This is a read only function.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeExtentY(YPosition)**

*YPosition:*

A value between 0 and 65536

## Return Value

A value between 0 and 65536. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[AttributeExtentX](#), [AttributeAN](#)

## Example

```
' Retrieves the Y coordinate for the extent of the current object
MyVariable = GraphicsBuilder.AttributeExtentY
```

### AttributeFillColour

Sets the fill color for an object, or retrieves a value representing the current fill color.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

---

**Note:** As this function does not support True Color functionality, it has been superseded by the functions [AttributeFillOffColourEx](#) and [AttributeFillOnColourEx](#).

---

## Syntax

**AttributeFillColour(*FillColour*)**

*FillColour:*

A value between 0 and 255 representing the fill color.

## Return Value

If retrieving the current fill color, a value between 0 and 255. If applying a fill color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[AttributeSetFill](#)

## Example

```
' Sets the fill color for an object
GraphicsBuilder.AttributeFillColour = 125

' Retrieves the value of the fill color
MyVariable = GraphicsBuilder.AttributeFillColour
```

---

**Note:** This function is implemented in the C++ environment as two separate functions:  
put\_AttributeFillColour applies a fill color, and get\_AttributeFillColour retrieves the current fill color setting.

---

## AttributeFillOffColourEx

Sets the fill color for an object, or retrieves a value representing the current fill color.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects, and change or read their properties.

## Syntax

**AttributeFillOffColourEx(*FillColour*)**

*FillColour:*

An RGB value.

## Return Value

If retrieving the current fill color, an RGB value. If applying a fill color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeSetFill](#)

## Example

```
' Sets the fill color for an object
GraphicsBuilder.AttributeFillOffColourEx = &hFF0000

' Retrieves the value of the fill color
MyVariable = GraphicsBuilder.AttributeFillOffColourEx
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeFillOffColourEx` applies a fill color, and `get_AttributeFillOffColourEx` retrieves the current fill color setting.

## AttributeFillOnColourEx

Sets the fill color for an object, or retrieves a value representing the current fill color.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeFillOnColourEx(*FillColour*)**

*FillColour:*

An RGB value.

## Return Value

If retrieving the current fill color, an RGB value. If applying a fill color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error E\_INVALIDARG. If there is no active object, they exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeSetFill](#)

## Example

```
' Sets the fill color for an object
GraphicsBuilder.AttributeFillOnColourEx = &hFF0000

' Retrieves the value of the fill color
MyVariable = GraphicsBuilder.AttributeFillOnColourEx
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeFillOnColourEx` applies a fill color, and `get_AttributeFillOnColourEx` retrieves the current fill color setting.

## AttributeGradientMode

Sets or retrieves the direction of the gradient on the **General | Appearance** tab of the Object Properties dialog for the current object.

This function is only supported on rectangle objects.

## Syntax

**AttributeGradientMode(*Mode*)**

*Mode:*

Direction of the gradient:

- 0 - Off
- 1 - Left To Right
- 2 - Right To Left
- 3 - Top To Bottom
- 4 - Bottom To Top
- 5 - Horizontal Edge To Middle
- 6 - Middle To Horizontal Edge
- 7 - Vertical Edge To Middle
- 8 - Middle To Vertical Edge

## Return Value

If retrieving the gradient mode, the direction of the gradient as specified above. If applying a gradient mode, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error `E_INVALIDARG`. If there is no active object, they will exit and report a return value of `E_HANDLE`.

## AttributeGradientOffColour

Sets or retrieves the "Off" portion of the gradient color on the **General | Appearance** tab of the Object Properties dialog for the current object.

This is only supported on rectangle objects.

## Syntax

**AttributeGradientOffColour(***Color***)**

*Color*:

Off portion of the gradient color.

## Return Value

If retrieving the gradient color, an RGB encoded color. If applying a gradient color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error E\_INVALIDARG. If there is no active object, they exit and report a return value of E\_HANDLE.

## AttributeGradientOnColour

Sets or retrieves the "On" portion of the gradient color on the **General | Appearance** tab of the Object Properties dialog for the current object.

This function is only supported on rectangle objects.

## Syntax

**AttributeGradientOnColour(***Color***)**

*Color*:

On portion of the gradient color.

## Return Value

If retrieving the gradient color, an RGB encoded color. If applying a gradient color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

## AttributeHiLightColour

Sets the highlight color applied to the 3D effects raised, lowered or embossed, or retrieves the current highlight color setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access objects and change or read their properties.

---

**Note:** As this function does not support True Color functionality, it has been superseded by the functions [AttributeHiLightOnColourEx](#) and [AttributeHiLightOffColourEx](#).

---

## Syntax

**AttributeHiLightColour(*HiLightColour*)**

*HiLightColour*:

A value between 0 and 255 representing the highlight color.

## Return Value

If retrieving the current highlight color setting, a value between 0 and 255. If applying a highlight color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[Attribute3dEffects](#), [Attribute3dEffectDepth](#), [AttributeShadowColour](#), [AttributeLoLightColour](#)

## Example

```
' Applies a highlight color to a 3D effect
GraphicsBuilder.AttributeHiLightColour = 125

' Retrieves a value representing a 3D effect's highlight color
MyVariable = GraphicsBuilder.AttributeHiLightColour
```

**Note:** This function is implemented in the C++ environment as two separate functions:  
`put_AttributeHiLightColour` applies a highlight color setting, and `get_AttributeHiLightColour` retrieves the current highlight color setting.

## AttributeHiLightOffColourEx

Sets the highlight color applied to the 3D effects raised, lowered or embossed, or retrieves the current highlight color setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject\(\)](#) and [PageSelectNextObject\(\)](#) functions, you can access your objects, and change or read their properties.

## Syntax

**AttributeHiLightOffColourEx(*HiLightColour*)**

*HiLightColour*:

An RGB value.

## Return Value

If retrieving the current highlight color setting, an RGB value. If applying a highlight color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error E\_INVALIDARG. If there is no active object, they exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[Attribute3dEffects](#), [Attribute3dEffectDepth](#), [AttributeShadowOffColourEx](#), [AttributeShadowOnColourEx](#),  
[AttributeLoLightOffColourEx](#), [AttributeLoLightOnColourEx](#)

## Example

```
' Applies a highlight color to a 3D effect
GraphicsBuilder.AttributeHiLightOffColourEx = &hFF0000

' Retrieves a value representing a 3D effect's highlight color
MyVariable = GraphicsBuilder.AttributeHiLightOffColourEx
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeHiLightOffColourEx` applies a highlight color setting, and

`get_AttributeHiLightOffColourEx` retrieves the current highlight color setting.

## AttributeHiLightOnColourEx

Sets the highlight color applied to the 3D effects raised, lowered or embossed, or retrieves the current highlight color setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects, and change or read their properties.

## Syntax

**AttributeHiLightOnColourEx(HiLightColour)**

*HiLightColour:*

An RGB value.

## Return Value

If retrieving the current highlight color setting, an RGB value. If applying a highlight color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error E\_INVALIDARG. If there is no active object, they exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[Attribute3dEffects](#), [Attribute3dEffectDepth](#), [AttributeShadowOffColourEx](#), [AttributeShadowOnColourEx](#),  
[AttributeLoLightOffColourEx](#), [AttributeLoLightOnColourEx](#)

## Example

```
' Applies a highlight color to a 3D effect
GraphicsBuilder.AttributeHiLightOnColourEx = &hFF0000

' Retrieves a value representing a 3D effect's highlight color
MyVariable = GraphicsBuilder.AttributeHiLightOnColourEx
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeHiLightOnColourEx` applies a highlight color setting, and `get_AttributeHiLightOnColourEx` retrieves the current highlight color setting.

## AttributeLineColour

Applies a color to a line, or retrieves the current color setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

**Note:** This function, as it does not support True Color functionality, has been superseded by the functions [AttributeLineOnColourEx](#) and [AttributeLineOffColourEx](#).

## Syntax

**AttributeLineColour**(*LineColour*)

*LineColour*:

A value between 0 and 255 representing a particular color.

## Return Value

If retrieving the current line color, a value between 0 and 255. If setting the line color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeLineWidth](#), [AttributeLineStyle](#)

## Example

```
' Applies a color to the current line
GraphicsBuilder.AttributeLineColour = 125

' Retrieves the value of the color applied to the current line
MyVariable = GraphicsBuilder.AttributeLineColour
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeLineColour` applies a particular color to a line, and `get_AttributeLineColour` retrieves the current color setting.

## AttributeLineOffColourEx

Applies a color to a line, or retrieves the current "off" color setting. The function uses RGB colors for each state of a color instead of a palette index.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects, and change or read their properties.

## Syntax

**AttributeLineOffColourEx**(*LineColour*)

*LineColour:*

An RGB value.

## Return Value

If retrieving the current line color, an RGB value. If setting the line color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error `E_INVALIDARG`. If there is no active object, they exit and report a return value of `E_HANDLE`.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeLineWidth](#), [AttributeLineStyle](#)

## Example

```
' Applies a color to the current line
GraphicsBuilder.AttributeLineOffColourEx = &hFF0000

' Retrieves the value of the color applied to the current line
MyVariable = GraphicsBuilder.AttributeLineOffColourEx
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeLineOffColourEx` applies a particular color to a line, and `get_AttributeLineOffColourEx` retrieves the current color setting.

## AttributeLineOnColourEx

Applies a color to a line, or retrieves the current "on" color setting. The function uses RGB colors for each state of a color instead of a palette index.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects, and change or read their properties.

## Syntax

**AttributeLineOnColourEx**(*LineColour*)

*LineColour*:

An RGB value.

## Return Value

If retrieving the current line color, an RGB value. If setting the line color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error E\_INVALIDARG. If there is no active object, they exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeLineWidth](#), [AttributeLineStyle](#)

## Example

```
' Applies a color to the current line
GraphicsBuilder.AttributeLineOnColourEx = &hFF0000

' Retrieves the value of the color applied to the current line
MyVariable = GraphicsBuilder.AttributeLineOnColourEx
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeLineOnColourEx` applies a particular color to a line, and `get_AttributeLineOnColourEx` retrieves the current color setting.

## AttributeLineStyle

Applies a style to a line, or retrieves the current style setting. You can only apply a line style if the line width is set to 1.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeLineStyle(*LineStyle*)**

*LineStyle*:

A value between 0 and 4 representing the style applied to a line. Line style only works if line width is set to 1.

0 = solid

1 = dashed

2 = dot

3 = dash dot

4 = dash dot dot

## Return Value

If retrieving the current line style, a value between 0 and 4 that represents a particular style. If setting the line style, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeLineWidth](#), [AttributeLineColour](#)

## Example

```
' Applies a style (dash dot) to the current line
GraphicsBuilder.AttributeLineStyle = 3

' Retrieves the style applied to the current line
MyVariable = GraphicsBuilder.AttributeLineStyle
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeLineStyle` applies a particular line style, and `get_AttributeLineStyle` retrieves the current style setting.

## AttributeLineWidth

Sets the width of a line, or retrieves its current width.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeLineWidth(*LineWidth*)**

**LineWidth:**

A value between 0 and 32 representing the line width in pixels.

## Return Value

If retrieving the current width of a line, a value between 1 and 32 (representing pixels) is returned. If setting the line width, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeLineStyle](#), [AttributeLoLightColour](#)

## Example

```
' Sets the width for the current line
GraphicsBuilder.AttributeLineWidth = 1

' Retrieves the width of the current line
MyVariable = GraphicsBuilder.AttributeLineWidth
```

**Note:** This function is implemented in the C++ environment as two separate functions:  
`put_AttributeLineWidth` sets the value for the width of a line, and `get_AttributeLineWidth` retrieves the current line width setting.

## AttributeLoLightColour

Sets the lowlight color applied to the 3D effects raised, lowered or embossed, or retrieves the current lowlight color setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeLoLightColour(LoLightColour)**

*LoLightColour:*

A value between 0 and 255 representing the lowlight color.

## Return Value

If retrieving the current lowlight color setting, a value between 0 and 255. If applying a lowlight color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and

report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[Attribute3dEffects](#), [Attribute3dEffectDepth](#), [AttributeShadowColour](#), [AttributeHiLightColour](#)

## Example

```
' Applies a lowlight color to a 3D effect
GraphicsBuilder.AttributeLoLightColour = 45

' Retrieves a value representing a 3D effect's lowlight color
MyVariable = GraphicsBuilder.AttributeLoLightColour
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeLoLightColour` applies a lowlight color setting, and `get_AttributeLoLightColour` retrieves the current lowlight color setting.

## AttributeLoLightOffColourEx

Sets the lowlight color applied to the 3D effects raised, lowered or embossed, or retrieves the current lowlight color setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeLoLightOffColourEx(LoLightColour)**

*LoLightColour:*

An RGB value.

## Return Value

If retrieving the current lowlight color setting, an RGB value. If applying a lowlight color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error E\_INVALIDARG. If there is no active object, they exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[Attribute3dEffects](#), [Attribute3dEffectDepth](#), [AttributeShadowOffColourEx](#), [AttributeShadowOnColourEx](#),  
[AttributeHiLightOffColourEx](#), [AttributeHiLightOnColourEx](#)

## Example

```
' Applies a lowlight color to a 3D effect
GraphicsBuilder.AttributeLoLightOffColourEx = &hFF0000

' Retrieves a value representing a 3D effect's lowlight color
MyVariable = GraphicsBuilder.AttributeLoLightOffColourEx
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeLoLightOffColourEx` applies a lowlight color setting, and `get_AttributeLoLightOffColourEx` retrieves the current lowlight color setting.

## AttributeLoLightOnColourEx

Sets the lowlight color applied to the 3D effects raised, lowered or embossed, or retrieves the current lowlight color setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeLoLightOnColourEx**(*LoLightColour*)

*LoLightColour*:

An RGB value.

## Return Value

If retrieving the current lowlight color setting, an RGB value. If applying a lowlight color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error E\_INVALIDARG. If there is no active object, they exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[Attribute3dEffects](#), [Attribute3dEffectDepth](#), [AttributeShadowOffColourEx](#), [AttributeShadowOnColourEx](#),  
[AttributeHiLightOffColourEx](#), [AttributeHiLightOnColourEx](#)

## Example

```
' Applies a lowlight color to a 3D effect
GraphicsBuilder.AttributeLoLightOnColourEx = &hFF0000

' Retrieves a value representing a 3D effect's lowlight color
MyVariable = GraphicsBuilder.AttributeLoLightOnColourEx
```

**Note:** This function is implemented in the C++ environment as two separate functions:

---

`put_AttributeLoLightOnColourEx` applies a lowlight color setting, and `get_AttributeLoLightOnColourEx` retrieves the current lowlight color setting.

---

## AttributeNodeCoordinatesFirst

Returns the coordinates of the first node of a free hand line, polygon or pipe.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeNodeCoordinatesFirst(*XPosition*, *YPosition*)**

*XPosition*:

Distance from the left-hand side of the page to the first node of an object, measured in pixels.

*YPosition*:

Distance from the top of the page to the first node of an object, measured in pixels.

## Return Value

The coordinates of the current object's first node. If values are out of range on writing to the attribute, the function will exit and report the error `E_INVALIDARG`. If there is no active object, they will exit and report a return value of `E_HANDLE`.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[AttributeNodeCoordinatesNext](#)

## AttributeNodeCoordinatesNext

Returns the coordinates of any following nodes of a free hand line, polygon or pipe when implemented after `AttributeNodeCoordinatesFirst`.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeNodeCoordinatesNext(*XPosition*, *YPosition*)**

*XPosition*:

Distance from the left-hand side of the page to the first node of an object, measured in pixels.

*YPosition*:

Distance from the top of the page to the first node of an object, measured in pixels.

## Return Value

The coordinates of the object's following nodes, or E\_ABORT if no more nodes are left. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeNodeCoordinatesFirst](#)

### AttributePolygonOpen

Defines whether a polygon (polyline) is set to open mode (that is, its two end points are not joined) or closed (its two ends are joined). It can also be used to retrieve the current open mode setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributePolygonOpen(OpenClose)**

*OpenClose:*

TRUE = Polygon is drawn in open mode; FALSE = Polygon is drawn in closed mode.

## Return Value

If retrieving the current open mode setting for a polygon, TRUE or FALSE is returned. If setting the open mode, 0 (zero) is returned if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Example

```
' Sets a polygon to Open mode
GraphicsBuilder.AttributePolygonOpen = TRUE

' Determines if the current polygon is defined as Open
MyVariable = GraphicsBuilder.AttributePolygonOpen
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributePolygonOpen` sets the open mode for a polygon, and `get_AttributePolygonOpen` retrieves the current open mode setting.

## AttributeRectangleStyle

Sets the rectangle style, or retrieves the rectangle style setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeRectangleStyle(Style)**

*Style:*

0 = none

1 = border

2 = extra line

3 = border and an extra line

## Return Value

If retrieving the current rectangle style setting, a value between 0 and 3. If applying a rectangle style, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[Attribute3dEffects](#), [Attribute3dEffectDepth](#), [AttributeShadowColour](#), [AttributeHiLightColour](#)

## Example

```
' Applies a style to a rectangle
GraphicsBuilder.AttributeRectangleStyle = 1

' Retrieves a value representing a rectangle style
MyVariable = GraphicsBuilder.AttributeRectangleStyle
```

---

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeRectangleStyle` applies a rectangle style, and `get_AttributeRectangleStyle` retrieves the current rectangle style setting.

## AttributeSetFill

Displays the object as filled, or retrieves the current fill value.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeSetFill(*SetFill*)**

*SetFill*:

TRUE if the object drawn filled.

## Return Value

If retrieving the current fill setting, TRUE if the object is displayed as filled. If applying a fill setting, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeFillColour](#)

## Example

```
' Displays an object as filled
GraphicsBuilder.AttributeSetFill = TRUE

' Retrieves the current fill setting
MyVariable = GraphicsBuilder.AttributeSetFill
```

**Note:** This function is implemented in the C++ environment as two separate functions: put\_AttributeSetFill applies a fill setting, and get\_AttributeSetFill retrieves the current fill setting.

## AttributeShadowColour

Sets the shadow color when a shadowed 3D effect is used, or retrieves the current shadow color setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

**Note:** As this function does not support True Color functionality, it has been superseded by the functions [AttributeShadowOffColourEx](#) and [AttributeShadowOnColourEx](#).

## Syntax

**AttributeShadowColour(*ShadowColour*)**

*ShadowColour*:

A value between 0 and 255 representing the shadow color.

## Return Value

If retrieving the current shadow color setting, a value between 0 and 255. If applying a shadow color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[Attribute3dEffects](#), [Attribute3dEffectDepth](#), [AttributeHiLightColour](#), [AttributeLoLightColour](#)

## Example

```
' Applies a shadow color to a shadowed 3D effect
GraphicsBuilder.AttributeShadowColour = 125

' Retrieves the current shadow color
MyVariable = GraphicsBuilder.AttributeShadowColour
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeShadowColour` applies a shadow color setting, and `get_AttributeShadowColour` retrieves the current shadow color setting.

## AttributeShadowOffColourEx

Sets the shadow color when a shadowed 3D effect is used, or retrieves the current shadow color setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeShadowOffColourEx(ShadowColour)**

*ShadowColour:*

An RGB value.

## Return Value

If retrieving the current shadow color setting, an RGB value. If applying a shadow color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error E\_INVALIDARG. If there is no active object, they exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[Attribute3dEffects](#), [Attribute3dEffectDepth](#), [AttributeHiLightOffColourEx](#), [AttributeHiLightOnColourEx](#),  
[AttributeLoLightOffColourEx](#), [AttributeLoLightOnColourEx](#)

## Example

```
' Applies a shadow color to a shadowed 3D effect
GraphicsBuilder.AttributeShadowOffColourEx = &hFF0000

' Retrieves the current shadow color
MyVariable = GraphicsBuilder.AttributeShadowOffColourEx
```

This function is implemented in the C++ environment as two separate functions:

`put_AttributeShadowOffColourEx` applies a shadow color setting, and `get_AttributeShadowOffColourEx` retrieves the current shadow color setting.

## AttributeShadowOnColourEx

Sets the shadow color when a shadowed 3D effect is used, or retrieves the current shadow color setting.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects, and change or read their properties.

## Syntax

**AttributeShadowOnColourEx(*ShadowColour*)**

*ShadowColour*:

An RGB value.

## Return Value

If retrieving the current shadow color setting, an RGB value. If applying a shadow color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error `E_INVALIDARG`. If there is no active object, they will exit and report a return value of `E_HANDLE`.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[Attribute3dEffects](#), [Attribute3dEffectDepth](#), [AttributeHiLightOffColourEx](#), [AttributeHiLightOnColourEx](#),  
[AttributeLoLightOffColourEx](#), [AttributeLoLightOnColourEx](#)

## Example

```
' Applies a shadow color to a shadowed 3D effect
GraphicsBuilder.AttributeShadowOnColourEx = &hFF0000
```

```
' Retrieves the current shadow color
MyVariable = GraphicsBuilder.AttributeShadowOnColourEx
```

**Note:** This function is implemented in the C++ environment as two separate functions:  
`put_AttributeShadowOnColourEx` applies a shadow color setting, and `get_AttributeShadowOnColourEx` retrieves the current shadow color setting.

## AttributeStartAngle

Sets the start angle of an arc or pie-slice, or retrieves the start angle.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeStartAngle(*Angle*)**

*Angle*:

A value between 0 and 360 representing the start angle (in degrees).

If retrieving the start angle, a value between 0 and 360. If applying a start angle, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error `E_INVALIDARG`. If there is no active object, they will exit and report a return value of `E_HANDLE`.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeEndAngle](#)

## Example

```
' Sets the start angle of an arc
GraphicsBuilder.AttributeStartAngle = 45

' Retrieves the start angle for an arc
MyVariable = GraphicsBuilder.AttributeStartAngle
```

**Note:** This function is implemented in the C++ environment as two separate functions:  
`put_AttributeStartAngle` applies a start angle setting, and `get_AttributeStartAngle` retrieves the current start angle setting.

## AttributeTransformationMatrixGet

Reads the elements of the transformation matrix. If A and D are both 1, and others are 0, the object is not transformed (identity matrix).

This function applies to the selected object, which is typically the last placed object. By using the

[PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeTransformationMatrixGet(*A, B, C, D, H, K*)**

*A*:

Element A of the transformation matrix

*B*:

Element A of the transformation matrix

*C*:

Element A of the transformation matrix

*D*:

Element A of the transformation matrix

*H*:

Element A of the transformation matrix

*K*:

Element A of the transformation matrix

## Return Value

The elements of the transformation matrix. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeTransformationMatrixPut](#)

### AttributeTransformationMatrixPut

Sets the elements of the transformation matrix.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeTransformationMatrixPut(*A, B, C, D, H, K*)**

*A*:

Element A of the transformation matrix

*B:*

Element A of the transformation matrix

*C:*

Element A of the transformation matrix

*D:*

Element A of the transformation matrix

*H:*

Element A of the transformation matrix

*K:*

Element A of the transformation matrix

## Return Value

0 (zero) if successful, otherwise an error is returned. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeTransformationMatrixGet](#)

### AttributeX

Retrieves the X coordinate of the active object. This is a read only function.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeX(*XPosition*)**

*XPosition:*

A value between 0 and 65536.

## Return Value

A value between 0 and 65536. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeY](#), [AttributeAN](#)

## Example

```
' Retrieves the X coordinate for the current object
MyVariable = GraphicsBuilder.AttributeX
```

## AttributeY

Retrieves the Y coordinate of the active object. This is a read-only function.

This function applies to the selected object, which is typically the last placed object. By using the [PageSelectFirstObject](#) and [PageSelectNextObject](#) functions, you can access your objects and change or read their properties.

## Syntax

**AttributeY(YPosition)**

*YPosition:*

A value between 0 and 65536.

## Return Value

A value between 0 and 65536. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active object, they will exit and report a return value of E\_HANDLE.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[AttributeX](#), [AttributeAN](#)

## Example

```
' Retrieves the Y coordinate for the current object
MyVariable = GraphicsBuilder.AttributeY
```

## DrawButton

Draws a button on the active page.

## Syntax

**DrawButton(FromXPosition, FromYPosition, ToXPosition, ToYPosition)**

**FromXPosition:**

Distance from the left hand side of the page to top left hand corner of the button to be drawn, measured in pixels.

**FromYPosition:**

Distance from the top of the page to the top left hand corner of the button to be drawn, measured in pixels.

**ToXPosition:**

Distance from the left hand side of the page to the bottom right hand corner of the button to be drawn, measured in pixels.

**ToYPosition:**

Distance from the top of the page to the bottom right hand corner of the button to be drawn, measured in pixels.

## Return Value

0 (zero) if successful; otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[DrawLine](#), [DrawEllipse](#), [DrawRectangle](#), [DrawPolygonStart](#), [DrawPolygonLine](#), [DrawPolygonEnd](#), [DrawPipeStart](#), [DrawPipeSection](#), [DrawPipeEnd](#), [DrawText](#), [DrawNumber](#), [DrawSymbolSet](#), [DrawTrend](#), [DrawCicodeObject](#)

## Example

```
GraphicsBuilder.DrawButton 50, 70, 400, 200
```

## DrawCicodeObject

Places a Cicode object on the page at the specified location.

## Syntax

**DrawCicodeObject(XPosition, YPosition)**

**XPosition:**

Distance in pixels from the left of the page to the point where you would like the Cicode object to be placed.

**YPosition:**

Distance in pixels from the top of the page to the point where you would like the Cicode object to be placed.

## Return Value

0 (zero) if successful; otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[DrawLine](#), [DrawEllipse](#), [DrawRectangle](#), [DrawPolygonStart](#), [DrawPolygonLine](#), [DrawPolygonEnd](#), [DrawPipeStart](#), [DrawPipeSection](#), [DrawPipeEnd](#), [DrawText](#), [DrawNumber](#), [DrawSymbolSet](#), [DrawTrend](#)

## Example

```
GraphicsBuilder.DrawCicodeObject 500, 100
```

### DrawEllipse

Draws an ellipse on the active page.

## Syntax

**DrawEllipse(FromXPosition, FromYPosition, ToXPosition, ToYPosition)**

*FromXPosition*:

Distance in pixels from the left hand side of the page to top left hand corner of the rectangle that will enclose the ellipse.

*FromYPosition*:

Distance in pixels from the top of the page to the top left hand corner of the rectangle that will enclose the ellipse.

*ToXPosition*:

Distance in pixels from the left hand side of the page to the bottom right hand corner of the rectangle that will enclose the ellipse.

*ToYPosition*:

Distance in pixels from the top of the page to the bottom-right hand corner of the rectangle that will enclose the ellipse.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[DrawButton](#), [DrawLine](#), [DrawRectangle](#), [DrawPolygonStart](#), [DrawPolygonLine](#), [DrawPolygonEnd](#), [DrawPipeStart](#), [DrawPipeSection](#), [DrawPipeEnd](#), [DrawText](#), [DrawNumber](#), [DrawSymbolSet](#), [DrawCicodeObject](#)

## Example

```
GraphicsBuilder.DrawEllipse 50, 70, 400, 200
```

## DrawLine

Draws a line on the active page.

## Syntax

**DrawLine**(*FromXPosition*, *FromYPosition*, *ToXPosition*, *ToYPosition*)

*FromXPosition*:

Distance in pixels from the left-hand side of the page to top left-hand corner of the rectangle that will enclose the line.

*FromYPosition*:

Distance in pixels from the top of the page to the top-left hand corner of the rectangle that will enclose the line.

*ToXPosition*:

Distance in pixels from the left-hand side of the page to the bottom right-hand corner of the rectangle that will enclose the line.

*ToYPosition*:

Distance in pixels from the top of the page to the bottom-right hand corner of the rectangle that will enclose the line.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[DrawButton](#), [DrawRectangle](#), [DrawPolygonStart](#), [DrawPolygonLine](#), [DrawPolygonEnd](#), [DrawPipeStart](#), [DrawPipeSection](#), [DrawPipeEnd](#), [DrawText](#), [DrawNumber](#), [DrawSymbolSet](#), [DrawCicodeObject](#)

## Example

```
GraphicsBuilder.DrawLine 50, 70, 400, 70
```

## DrawNumber

Places a number object on the page at the specified location.

## Syntax

**DrawNumber**(*XPosition*, *YPosition*)

*XPosition*:

Distance in pixels from the left of the page to the point where you would like the number object to be placed.

*YPosition*:

Distance in pixels from the top of the page to the point where you would like the number object to be placed.

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[DrawLine](#), [DrawEllipse](#), [DrawRectangle](#), [DrawPolygonStart](#), [DrawPolygonLine](#), [DrawPolygonEnd](#), [DrawPipeStart](#), [DrawPipeSection](#), [DrawPipeEnd](#), [DrawText](#), [DrawButton](#), [DrawTrend](#), [DrawCicodeObject](#)

## Example

```
GraphicsBuilder.DrawNumber 500, 100
```

## DrawPipeEnd

Terminates the drawing of a pipe on the active page. To work successfully, this function needs to follow an instance of [DrawPipeSection](#).

## Syntax

**DrawPipeEnd**

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[DrawPipeSection](#), [DrawPipeStart](#)

## Example

```
GraphicsBuilder.DrawPipeStart 50, 290
GraphicsBuilder.DrawPipeSection 200, 350
GraphicsBuilder.DrawPipeSection 350, 250GraphicsBuilder.DrawPipeSection 400, 350
GraphicsBuilder.DrawPipeEnd
```

## DrawPipeSection

Draws a section of pipe on the active page. To work successfully, this function needs to have a starting point defined by the function [DrawPipeStart](#), or it needs to follow a previous incidence of itself.

## Syntax

**DrawPipeSection(*XPosition*, *YPosition*)**

*XPosition*:

Distance in pixels from the left of the page to the point where you would like the section of pipe to end.

*YPosition*:

Distance in pixels from the top of the page to the point where you would like the section of pipe to end.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[DrawPipeStart](#), [DrawPipeEnd](#)

## Example

```
GraphicsBuilder.DrawPipeStart 50, 290
GraphicsBuilder.DrawPipeSection 200, 350
GraphicsBuilder.DrawPipeSection 350, 250
GraphicsBuilder.DrawPipeSection 400, 350
GraphicsBuilder.DrawPipeEnd
```

## DrawPipeStart

Initiates the process of drawing a pipe on the active page by defining a starting point that [DrawPipeSection](#) can be applied to.

## Syntax

**DrawPipeStart(*XPosition*, *YPosition*)**

*XPosition*:

Distance in pixels from the left of the page to the point where you would like the section of pipe to start.

*YPosition*:

Distance in pixels from the top of the page to the point where you would like the section of pipe to start.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[DrawPipeSection](#),

## Example

```
GraphicsBuilder.DrawPipeStart 50, 290
GraphicsBuilder.DrawPipeSection 200, 350
GraphicsBuilder.DrawPipeSection 350, 250
GraphicsBuilder.DrawPipeSection 400, 350
GraphicsBuilder.DrawPipeEnd
```

## DrawPolygonEnd

Terminates the drawing of a polygon on the active page. To work successfully, this function needs to follow an instance of [DrawPolygonLine](#).

## Syntax

**DrawPolygonEnd**

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[DrawPolygonLine](#), [DrawPolygonStart](#)

## Example

```
GraphicsBuilder.DrawPolygonStart 50, 290
GraphicsBuilder.DrawPolygonLine 200, 350
GraphicsBuilder.DrawPolygonLine 350, 250
GraphicsBuilder.DrawPolygonLine 400, 350
GraphicsBuilder.DrawPolygonEnd
```

## DrawPolygonLine

Draws a line on the active page that forms part of a polygon. To work successfully, this function needs to have a starting point defined by the function [DrawPolygonStart](#) or a previous incidence of itself.

## Syntax

**DrawPolygonLine(*XPosition*, *YPosition*)**

*XPosition:*

Distance in pixels from the left of the page to the point where you would like the line to end.

*YPosition:*

Distance in pixels from the top of the page to the point where you would like the line to end.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[DrawPolygonStart](#), [DrawPolygonEnd](#)

## Example

```
GraphicsBuilder.DrawPolygonStart 50, 290
GraphicsBuilder.DrawPolygonLine 200, 350
GraphicsBuilder.DrawPolygonLine 350, 250
GraphicsBuilder.DrawPolygonLine 400, 350
GraphicsBuilder.DrawPolygonEnd
```

## DrawPolygonStart

Initiates the process of drawing a polygon on the active page by defining a starting point that [DrawPolygonLine](#) can be applied to.

## Syntax

**DrawPolygonStart(*XPosition*, *YPosition*)**

*XPosition:*

Distance in pixels from the left of the page to the point where you would like the start the polygon.

*YPosition:*

Distance in pixels from the top of the page to the point where you would like the start the polygon.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[DrawPolygonLine](#), [DrawPolygonEnd](#)

## Example

```
GraphicsBuilder.DrawPolygonStart 50, 290
GraphicsBuilder.DrawPolygonLine 200, 350
GraphicsBuilder.DrawPolygonLine 350, 250
GraphicsBuilder.DrawPolygonLine 400, 350
GraphicsBuilder.DrawPolygonEnd
```

## DrawRectangle

Draws a rectangle on the active page.

## Syntax

**DrawRectangle**(*FromXPosition*, *FromYPosition*, *ToXPosition*, *ToYPosition*)

*FromXPosition*:

Distance from the left hand side of the page to top left hand corner of the rectangle to be drawn, measured in pixels.

*FromYPosition*:

Distance from the top of the page to the top left hand corner of the rectangle to be drawn, measured in pixels.

*ToXPosition*:

Distance from the left hand side of the page to the bottom right hand corner of the rectangle to be drawn, measured in pixels.

*ToYPosition*:

Distance from the top of the page to the bottom right hand corner of the rectangle to be drawn, measured in pixels.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[DrawButton](#), [DrawLine](#), [DrawEllipse](#), [DrawPolygonStart](#), [DrawPolygonLine](#), [DrawPolygonEnd](#), [DrawPipeStart](#), [DrawPipeSection](#), [DrawPipeEnd](#), [DrawText](#), [DrawNumber](#), [DrawSymbolSet](#), [DrawCicodeObject](#)

## Example

```
GraphicsBuilder.DrawRectangle 50, 70, 400, 200
```

## DrawSymbolSet

Places a symbol set object on the page at the specified location.

## Syntax

**DrawSymbolSet(*XPosition*, *YPosition*)**

*XPosition*:

Distance in pixels from the left of the page to the point where you would like the object to be placed.

*YPosition*:

Distance in pixels from the top of the page to the point where you would like the object to be placed.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[DrawLine](#), [DrawEllipse](#), [DrawPolygonStart](#), [DrawPolygonLine](#), [DrawPolygonEnd](#), [DrawPipeStart](#), [DrawPipeSection](#),  
[DrawPipeEnd](#), [DrawText](#), [DrawNumber](#), [DrawButton](#), [DrawTrend](#), [DrawCicodeObject](#), [DrawRectangle](#)

## Example

```
GraphicsBuilder.DrawSymbolSet 500, 100
```

## DrawText

Draws an alphanumeric string at the specified location.

## Syntax

**DrawText(*Text*, *XPosition*, *YPosition*)**

*Text*:

The text to be pasted on to the active graphics page.

*XPosition*:

Distance in pixels from the left of the page to the point where you would like the text to be placed.

*YPosition*:

Distance in pixels from the top of the page to the point where you would like the text to be placed.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[DrawPipeEnd](#), [DrawNumber](#), [DrawButton](#), [DrawTrend](#), [DrawCicodeObject](#), [DrawRectangle](#)

## Example

```
GraphicsBuilder.DrawText "My Text", 500, 100
```

## DrawTrend

Draws a trend object on the active page.

## Syntax

**DrawTrend(FromXPosition, FromYPosition, ToXPosition, ToYPosition)**

*FromXPosition*:

Distance from the left hand side of the page to top left hand corner of the trend object, measured in pixels.

*FromYPosition*:

Distance from the top of the page to the top left hand corner of the trend object, measured in pixels.

*ToXPosition*:

Distance from the left hand side of the page to the bottom right hand corner of the trend object, measured in pixels.

*ToYPosition*:

Distance from the top of the page to the bottom right hand corner of the trend object, measured in pixels.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

[DrawPipeEnd](#), [DrawNumber](#), [DrawButton](#), [DrawCicodeObject](#), [DrawRectangle](#), [DrawSymbolSet](#), [DrawText](#)

## Example

```
GraphicsBuilder.DrawTrend 50, 70, 400, 200
```

## Options Functions

These relate to the options found under the Graphics Builder's Tools menu. They do not throw an exception in

Visual Basic.

<a href="#">OptionDisplayPropertiesOnNew</a>	Simulates the option available on the Graphics Builder Tools menu that automatically shows the properties for a new object when inserted. You can use this function to set this option, or you can retrieve its current setting.
<a href="#">OptionSnapToGrid</a>	Simulates the option available on the Graphics Builder Tools menu that automatically snaps objects to a grid. You can use this function to set this option, or you can retrieve its current setting.
<a href="#">OptionSnapToGuidelines</a>	Simulates the option available on the Graphics Builder Tools menu that automatically snaps objects to guidelines. You can use this function to set this option, or you can retrieve its current setting.

For details and a VB example on handling return and error values, see [Error Handling](#).

## See Also

[Function Categories](#)

### OptionDisplayPropertiesOnNew

Simulates the option available on the Graphics Builder Tools menu that automatically shows the properties for a new object when inserted. You can use this function to set this option, or you can retrieve its current setting.

## Syntax

**OptionDisplayPropertiesOnNew(OptionValue)**

*OptionValue:*

TRUE activates the option, FALSE deactivates the option.

## Return Value

If retrieving the current setting, TRUE or FALSE. If enabling or disabling the option, 0 (zero) if successful. In both cases, an error is returned if unsuccessful.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[OptionSnapToGrid](#), [OptionSnapToGuidelines](#)

**Note:** This function is implemented in the C++ environment as two separate functions:

---

`put_OptionDisplayPropertiesOnNew` enables or disables this option, and `get_OptionDisplayPropertiesOnNew` retrieves the current option setting.

---

## OptionSnapToGrid

Simulates the option available on the Graphics Builder Tools menu that automatically snaps objects to a grid. You can use this function to set this option, or you can retrieve its current setting.

### Syntax

**OptionSnapToGrid(*OptionValue*)**

*OptionValue*:

TRUE activates the option, FALSE deactivates the option.

### Return Value

If retrieving the current setting, TRUE or FALSE. If enabling or disabling the option, 0 (zero) if successful. In both cases, an error is returned if unsuccessful.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[OptionDisplayPropertiesOnNew](#), [OptionSnapToGuidelines](#)

---

**Note:** This function is implemented in the C++ environment as two separate functions: `put_OptionSnapToGrid` enables or disables this option, and `get_OptionSnapToGrid` retrieves the current option setting.

---

## OptionSnapToGuidelines

Simulates the option available on the Graphics Builder Tools menu that automatically snaps objects to guidelines. You can use this function to set this option, or you can retrieve its current setting.

### Syntax

**OptionSnapToGuidelines(*OptionValue*)**

*OptionValue*:

TRUE activates the option, FALSE deactivates the option.

### Return Value

If retrieving the current setting, TRUE or FALSE. If enabling or disabling the option, 0 (zero) if successful. In both cases, an error is returned if unsuccessful.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

### [OptionDisplayPropertiesOnNew](#), [OptionSnapToGrid](#)

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_OptionSnapToGuidelines` enables or disables this option, and `get_OptionSnapToGuidelines` retrieves the current option setting.

## Page Functions

Using the page functions, you can manipulate the pages in your project (for example, open, close, save, delete), and select objects on those pages. This includes templates, symbols, Genies, Super Genies.

<a href="#">PageActiveWindowHandle</a>	Retrieves the window handle of the active page.
<a href="#">PageClose</a>	Closes the current page. This function will also close an unsaved page.
<a href="#">PageConvertWindowCoordinates</a>	Converts the raw window coordinates to page coordinates which account for the scroll bar position.
<a href="#">PageDelete</a>	Deletes the specified page.
<a href="#">PageDeleteEx</a>	Deletes a specified symbol, Genie or Super Genie from a library.
<a href="#">PageDeleteObject</a>	Deletes the currently selected object.
<a href="#">PageDeleteTemplate</a>	Deletes a specified graphics page template.
<a href="#">PageGroupSelectedObjects</a>	Groups the currently selected objects.
<a href="#">PageImport</a>	Imports a graphics file on to the page as a bitmap.
<a href="#">PageKeyboardCommandsPut</a>	Displays keyboard command options that are available in the Graphics Builder via the automation interface.
<a href="#">PageNew</a>	Creates a new Plant SCADA graphics page.
<a href="#">PageNewEx</a>	Creates a new symbol, Genie or Super Genie page.
<a href="#">PageNewLibrary</a>	Creates a new library. Does not succeed, if project is read-only or not valid.
<a href="#">PageNewTemplate</a>	Creates a new Plant SCADA graphics page template.
<a href="#">PageOpen</a>	Opens an existing Plant SCADA graphics page.
<a href="#">PageOpenEx</a>	Opens the specified symbol, Genie or Super Genie page, if it is found.
<a href="#">PageOpenTemplate</a>	Opens a specified graphics page template.

<a href="#">PagePrint</a>	Prints the current page.
<a href="#">PageUpdated</a>	The event fired when a Graphics Builder page is updated.
<a href="#">PageSave</a>	Saves the page using its current name.
<a href="#">PageSaveAs</a>	Saves the page with a new name within a specified project.
<a href="#">PageSaveAsEx</a>	Saves a symbol, Genie, Super Genie or template page to the specified location.
<a href="#">PageSelect</a>	Select an opened page.
<a href="#">PageSelectFirst</a>	Selects the first page currently open in the Graphics Builder. Does not succeed if there are no pages open.
<a href="#">PageSelectFirstObject</a>	Selects the first object on the active page, based on its z-order number. This will not succeed if no object exists. Note that an object can also be a group object, in which case this function will iterate through the items of a group.
<a href="#">PageSelectFirstObjectEx</a>	Selects the first object on the active page, based on its z-order number. This will not succeed if no object exists. This function will not iterate through the items of a group.
<a href="#">PageSelectFirstObjectInGenie</a>	Select the first sub-object in the currently selected genie
<a href="#">PageSelectFirstObjectInGroup</a>	Selects the first object in a group.
<a href="#">PageSelectNext</a>	Selects the next page currently open in the Graphics Builder. Does not succeed if there are no pages open.
<a href="#">PageSelectNextObject</a>	Selects the next object on the active page, based on its z-order number. This function will not succeed if no object exists. Note that an object can also be a group object, in which case this function will iterate through the items of a group.
<a href="#">PageSelectNextObjectEx</a>	Selects the next object on the active page, based on its z-order number. This function will not succeed if no object exists. This function will not iterate through the items of a group.
<a href="#">PageSelectNextObjectInGenie</a>	Select the next sub-object in the currently selected genie.

<a href="#">PageSelectNextObjectInGroup</a>	Selects the next object in a group.
<a href="#">PageSelectObject</a>	Selects an object using a specified AN number.
<a href="#">PageSelectObjectAdd</a>	Selects an additional object using a specified AN number. This can be used to select multiple objects for a succeeding PageGroupSelectedObjects operation.
<a href="#">PageTemplateSelectFirstObject</a>	Restart the template enumeration sequence.
<a href="#">PageTemplateSelectNextObject</a>	Select the next object in the template.
<a href="#">PageThumbnailToClipboard</a>	Creates a thumbnail image of the current page and copies it to the clipboard.
<a href="#">PageUngroupSelectedObject</a>	Ungroups the currently selected grouped object.

For details and a VB example on handling return and error values, see [Error Handling](#).

## See Also

[Automation Events](#)

[Function Categories](#)

## PageActiveWindowHandle

Retrieves the window handle of the active page.

## Syntax

**PageActiveWindowHandle(*WindowHandle*)**

*WindowHandle*:

The active window handle. The handle is NULL if there is no active window. In VB, this is the return value.

## Return Value

The active window handle. The handle is NULL if there is no active window.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Example

```
' Retrieves the window handle of the active pageMyVariable =
GraphicsBuilder.PageActiveWindowHandle
```

## PageClose

Closes the current page. This function will also close an unsaved page.

## Syntax

**PageClose**

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageNew](#), [PageOpen](#), [PageSaveAs](#), [PageSave](#)

## Example

```
' Closes the current Plant SCADA graphics page
GraphicsBuilder.PageClose
```

## PageConvertWindowCoordinates

Converts the raw window coordinates to page coordinates which account for the scroll bar position.

## Syntax

**PageConvertWindowCoordinates(*XPosition*, *YPosition*)**

*XPosition*:

The raw window X coordinate as input. The page X coordinates as output.

*YPosition*:

The raw window Y coordinate as input. The page Y coordinate as output.

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## PageDelete

Deletes the specified page.

## Syntax

**PageDelete(*Project*, *Page*, *Flag*)**

*Project*:

The name of the project where the page can be found.

*Page:*

The name of the page to be deleted.

*Flag:*

If the flag is set, associated records are deleted.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageNew](#), [PageOpen](#), [PageSaveAs](#), [PageSave](#)

## Example

```
' Deletes the current Plant SCADA graphics page
GraphicsBuilder.PageDelete "Example", "TestPage", True
```

## PageDeleteEx

Deletes the specified page.

## Syntax

**PageDelete(*Project*, *Page*, *Flag*)**

*Project:*

The name of the project where the page can be found.

*Page:*

The name of the page to be deleted.

*Flag:*

If the flag is set, associated records are deleted.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageNew](#), [PageOpen](#), [PageSaveAs](#), [PageSave](#)

## Example

```
' Deletes the current Plant SCADA graphics page
GraphicsBuilder.PageDelete "Example", "TestPage", True
```

## PageDeleteObject

Deletes a specified symbol, Genie or Super Genie from a library.

## Syntax

**PageDeleteEx**(*Project*, *Library*, *Element*, *PageType*)

*Project*:

The name of the project where the element can be found.

*Library*:

The name of the library where the element can be found.

*Element*:

Name of the symbol, Genie or Super genie.

*PageType*:

0 = Symbol

1 = Genie

2 = Super Genie

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageNew](#), [PageOpen](#), [PageSaveAs](#), [PageSave](#)

## Example

```
' Deletes the specified symbol
GraphicsBuilder.PageDeleteEx "Example", "TestLibrary", "TestObject", 0
' Deletes the specified Genie
GraphicsBuilder.PageDeleteEx "Example", "TestLibrary", "TestObject", 1
' Deletes the specified Super Genie
GraphicsBuilder.PageDeleteEx "Example", "TestLibrary", "TestObject", 2
```

## PageDeleteTemplate

Deletes a specified graphics page template.

### Syntax

**PageDeleteTemplate**(*Project*, *Style*, *Template*, *Resolution*, *Titlebar*)

*Project*:

The name of the project that contains the template.

*Style*:

The style of the template you would like to delete.

*Template*:

The name of the template you would like to delete.

*Resolution*:

The resolution of the template.

0 = Default

1 = VGA

2 = SVGA

3 = XGA

4 = SXGA

5 = User

*Titlebar*:

Set to TRUE to select a titlebar.

### Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

### Related Functions

[PageOpen](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

### Example

```
' Deletes a graphics page template
GraphicsBuilder.PageDeleteTemplate "include", "standard", "blank", 2, True
```

## PageGroupSelectedObjects

Groups the currently selected objects.

## Syntax

**PageGroupSelectedObjects**

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageSelectObject](#), [PageSelectObjectAdd](#), [PageSelectFirstObject](#), [PageSelectNextObject](#),  
[PageUngroupSelectedObject](#)

## PageImport

Imports a graphics file on to the page as a bitmap.

## Syntax

**PageImport(FileName)**

*FileName*:

The name of the graphic file, including the complete path.

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## PageKeyboardCommandsPut

Allows you to assign keyboard commands to an object or group. A keyboard command is a particular key sequence which executes a command when it is typed in by the operator at runtime.

## Syntax

**PageKeyboardCommandsPut(*nIndex*, *KeySequence*, *Command*, *nArea*, *nPrivilege*, *Logging*)**

*nIndex*:

Position of the keyboard command (as you can define more than one).

*KeySequence*

Key sequences that the operator can enter to execute a command.

*Command*

The commands (set of instructions) to be executed immediately when the selected key sequence is entered. The

commands can be a maximum of 253 characters long.

*nArea*

Use this to assign the keyboard command to the same area as the object/group.

*nPrivilege*

Use this to assign the keyboard command the same privilege as the object/group.

*Logging*

Enables sending a log message to the Log Device.

**Return Value**

Indicates success or failure. 0 indicates success.

## PageNew

Creates a new Plant SCADA graphics page.

## Syntax

**PageNew(*Project, Style, Template, Resolution, Titlebar, Linked*)**

*Project:*

The name of the project that contains the template you would like to apply to the page.

*Style:*

The style you would like to apply to your new Plant SCADA graphics page. Plant SCADA templates are grouped into styles.

*Template:*

Specifies the template you would like to apply to your new Plant SCADA graphics page.

*Resolution:*

Sets the appropriate resolution for the page being created.

0 = Default

1 = VGA

2 = SVGA

3 = XGA

4 = SXGA

5 = User

6 = WUXGA

7 = HD1080

*Titlebar:*

Set to TRUE to include a titlebar on your new Plant SCADA graphics page.

*Linked:*

Set to TRUE to link the page to the library.

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageOpen](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

## Example

```
' Creates a new Plant SCADA graphics page
GraphicsBuilder.PageNew "include", "standard", "blank", 2, True, True
```

## PageNewEx

Creates a new symbol, Genie or Super Genie page.

## Syntax

**PageNewEx(*PageType*)**

*PageType*:

Specifies the type of page you would like to create:

0 = Symbol

1 = Genie

2 = Super Genie

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageOpen](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

## Example

```
' Creates a symbol as a new graphics page
GraphicsBuilder.PageNewEx "Example", "boiler", "tubes1", 0

' Creates a Genie as a new graphics page
GraphicsBuilder.PageNewEx "Example", "example", "dial", 1

' Creates a Super Genie as a new graphics page
```

```
GraphicsBuilder.PageNewEx "Example", "utility", "!sysinfo", 2
```

## PageNewLibrary

Creates a new library. Fails, if project is read-only or not valid.

## Syntax

**PageNewLibrary**(*Project*, *Library*, *LibraryType*)

*Project*:

The name of the project where the library is created.

*Library*:

The new library name (or style for templates).

*LibraryType*:

Type:

0 = Symbol

1 = Genie

2 = Super Genie

3 = Template

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageOpen](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

## Example

```
' Creates a new symbol library
GraphicsBuilder.PageNewLibrary "Example", "newlibrary", 0
:
' Creates a new Genie library
GraphicsBuilder.PageNewLibrary "demo", "newlibrary", 1
:
' Creates a new Super Genie library
GraphicsBuilder.PageNewLibrary "Example", "newlibrary", 2
:
' Creates a new template style
GraphicsBuilder.PageNewLibrary "Example", "newstyle", 3
```

## PageNewTemplate

Creates a new Plant SCADA graphics page template.

**PageNewTemplate**(*Project*, *Style*, *Template*, *Resolution*, *Titlebar*, *Linked*)

*Project*:

The name of the project that will contain the template.

*Style*:

The style you would like to apply to your new template.

*Template*:

The name you would like to give to your new template.

*Resolution*:

Sets the appropriate resolution for the template being created.

0 = Default

1 = VGA

2 = SVGA

3 = XGA

4 = SXGA

5 = User

*Titlebar*:

Set to TRUE to include a titlebar on the template.

*Linked*:

Set to TRUE to link the page to the library.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageOpen](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

## Example

```
' Creates a new Plant SCADAGraphics page template
GraphicsBuilder.PageNewTemplate "include", "standard", "blank", 2, True, True
```

## PageOpen

Opens an existing Plant SCADA graphics page.

## Syntax

**PageOpen(*Project*, *Page*)**

*Project*:

The name of the project that contains the page you would like to open.

*Page*:

The name of the page you would like to open.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageNew](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

## Example

```
' Opens an existing Plant SCADA graphics page
GraphicsBuilder.PageOpen "Example", "Genies"
```

## PageOpenEx

Opens the specified symbol, Genie or Super Genie page, if it is found. See *BrokenLinkCancelEnabled* for more information if a missing reference is encountered.

## Syntax

**PageOpenEx(*Project*, *Library*, *Element*, *PageType*)**

*Project*:

The name of the project where the element can be found.

*Library*:

The name of the library where the element can be found.

*Element*:

The name of the symbol, Genie or Super Genie.

*PageType*:

Type:

0 = Symbol

1 = Genie

2 = Super Genie

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageNew](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

## Example

```
' Opens a symbol saved as a graphics page
GraphicsBuilder.PageOpenEx "Example", "boiler", "tubes1", 0

' Opens a Genie saved as a new graphics page
GraphicsBuilder.PageOpenEx "Example", "example", "dial", 1

' Opens a Super Genie saved as a graphics page
GraphicsBuilder.PageOpenEx "Example", "utility", "!sysinfo", 2
```

## PageOpenTemplate

Opens a specified graphics page template.

## Syntax

**PageOpenTemplate**(*Project*, *Style*, *Template*, *Resolution*, *Titlebar*)

*Project*:

The name of the project that contains the template.

*Style*:

The style of the template you would like to open.

*Template*:

The name of the template you would like to open.

*Resolution*:

The resolution of the template.

0 = Default

1 = VGA

2 = SVGA

3 = XGA

4 = SXGA

5 = User

*Titlebar*:

Set to TRUE to select a titlebar.

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageOpen](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

## Example

```
' Opens a graphics page template
GraphicsBuilder.PageOpenTemplate "include", "standard", "blank", 2, True
```

## PagePrint

Prints the current page.

## Syntax

[PagePrint](#)

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageSelectFirstObject](#), [PageSelectNextObject](#)

## PageSave

Saves the page using its current name.

## Syntax

[PageSave](#)

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageOpen](#), [PageNew](#), [PageSaveAs](#), [PageClose](#)

## Example

```
' Saves an existing Plant SCADA graphics page
GraphicsBuilder.PageSave
```

## PageSaveAs

Saves the page with a new name within a specified project.

## Syntax

**PageSaveAs**(*Project*, *Page*)

*Project*:

The name of the project you would like to save the page to.

*Page*:

The name you would like to apply to the page.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageNew](#), [PageOpen](#), [PageSave](#), [PageClose](#)

## Example

```
' Saves a Plant SCADA graphics page
GraphicsBuilder.PageSaveAs "Example", "MyPage"
```

## See Also

[Page Properties - General](#)

## PageSaveAsEx

Saves a symbol, Genie, Super Genie or template page to the specified location.

## Syntax

**PageSaveAsEx(*Project*, *Library*, *Element*)**

*Project*:

The name of the project where the element is to be saved.

*Library*:

The name of the library (or style for templates) where the element is to be saved.

*Element*:

The new name for the symbol, Genie, Super Genie, or template to be saved.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageNew](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

## Example

```
' Renames and saves the currently selected element to the specified location
GraphicsBuilder.PageSaveAsEx "Example", "TestLibrary", "TestObject"
```

## PageSelect

Selects an opened page.

## Syntax

**PageSelect**

sBase - Base name

sFile - File name

## Return Value

N/A

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Example

```
Public Sub Example()
Dim gb As GraphicsBuilder.GraphicsBuilder
.'
```

```
.  
. .  
gb.PageSelect("BaseName", "Filename")  
End Sub
```

## Related Functions

[PageSelectNext](#)

### PageSelectFirst

Selects the first page currently open in the Graphics Builder. Fails if there are no pages open.

## Syntax

[PageSelectFirst](#)

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageSelectNext](#)

## Example

```
' Selects the first page in Graphics Builder  
GraphicsBuilder.PageSelectFirst  
If Err.Number <> 0 Then  
Output.Print "PageSelectFirst Error" + "; Err.Number = " + Hex(Err.Number)  
Else  
Output.Print "PageSelectFirst OK" End If
```

### PageSelectFirstObject

Selects the first object on the active page, based on its z-order number. This will exit and return an error if no object exists.

## Syntax

[PageSelectFirstObject](#)

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageSelectObject](#), [PageSelectNextObject](#), [PageDeleteObject](#), [PageSelectFirstObjectEx](#)

### PageSelectFirstObjectEx

Selects the first object on the active page, based on its z-order number. This will exit and return an error if no object exists. This function will not iterate through the items of a group.

## Syntax

**PageSelectFirstObjectEx**

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageSelectObject](#), [PageSelectNextObject](#), [PageDeleteObject](#), [PageSelectFirstObject](#)

### PageSelectFirstObjectInGenie

Select the first sub-object in the currently selected genie

## Syntax

**PageSelectFirstObjectInGenie**

## Return Value

N/A

**Note:** For details on handling return and error values, see [Error Handling](#).

## Example

```
Public Sub Example()
Dim gb As GraphicsBuilder.GraphicsBuilder
```

```
.  
. .  
gb.PageSelectFirstObjectInGenie()  
gb.PageSelectNextObjectInGenie()  
gb.PageTemplateSelectFirstObject()  
gb.PageTemplateSelectNextObject()  
gb.UnLockObject()  
End Sub
```

## Related Functions

[PageSelectNextObjectInGenie](#)

### PageSelectFirstObjectInGroup

Selects the first object in a group.

## Syntax

**PageSelectFirstObjectInGroup**

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageSelectObject](#), [PageSelectNextObject](#), [PageDeleteObject](#), [PageSelectFirstObject](#)

### PageSelectNext

Selects the next page currently open in the Graphics Builder. Fails if there are no pages open.

## Syntax

**PageSelectNext**

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageSelectFirst](#)

## Example

```
' Selects the next page in Graphics Builder
GraphicsBuilder.PageSelectNext
If Err.Number <> 0 Then
Output.Print "PageSelectNext Error" + "; Err.Number = " + Hex(Err.Number)
Else
Output.Print "PageSelectNext OK" End If
```

## PageSelectNextObject

Selects the next object on the active page, based on its z-order number. This function will exit and return an error if no object exists. An object can also be a group object, in which case this function will iterate through the items of a group.

## Syntax

[PageSelectNextObject](#)

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageSelectObject](#), [PageSelectFirstObject](#), [PageDeleteObject](#), [PageSelectNextObjectEx](#)

## PageSelectNextObjectEx

Selects the next object on the active page, based on its z-order number. This function will exit and return an error if no object exists. This function will not iterate through the items of a group.

## Syntax

[PageSelectNextObjectEx](#)

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageSelectObject](#), [PageSelectFirstObject](#), [PageDeleteObject](#), [PageSelectNextObjectEx](#)

### PageSelectNextObjectInGenie

Select the next sub-object in the currently selected genie.

## Syntax

**PageSelectNextObjectInGenie**

## Return Value

N/A

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Example

```
Public Sub Example()
Dim gb As GraphicsBuilder.GraphicsBuilder
.
.
.
gb.PageSelectFirstObjectInGenie()
gb.PageSelectNextObjectInGenie()
gb.PageTemplateSelectFirstObject()
gb.PageTemplateSelectNextObject()
gb.UnLockObject()
End Sub
```

## Related Functions

[PageSelectFirstObjectInGenie](#)

### PageSelectNextObjectInGroup

Selects the next object in a group.

## Syntax

**PageSelectNextObjectInGroup**

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageSelectFirstObjectInGroup](#)

### PageSelectObject

Selects an object using a specified AN number.

## Syntax

**PageSelectObject(AN)**

*AN:*

The AN number of the object you would like to select.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageSelectObjectAdd](#), [PageSelectFirstObject](#), [PageSelectNextObject](#), [PageDeleteObject](#)

### PageSelectObjectAdd

Selects an additional object using a specified AN number. This can be used to select multiple objects for a succeeding PageGroupSelectedObjects operation.

## Syntax

**PageSelectObjectAdd(AN)**

*AN:*

The AN number of the object you would like to select.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageSelectObject](#), [PageSelectFirstObject](#), [PageSelectNextObject](#), [PageGroupSelectedObjects](#)

### PageTemplateSelectFirstObject

Restart the template enumeration sequence.

## Syntax

**PageTemplateSelectFirstObject**

## Return Value

N/A

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Example

```
Public Sub Example()
Dim gb As GraphicsBuilder.GraphicsBuilder
.
.
.
gb.PageSelectFirstObjectInGenie()
gb.PageSelectNextObjectInGenie()
gb.PageTemplateSelectFirstObject()
gb.PageTemplateSelectNextObject()
gb.UnLockObject()
End Sub
```

## Related Functions

[PageTemplateSelectNextObject](#)

### PageTemplateSelectNextObject

Select the next object in the template.

## Syntax

**PageTemplateSelectNextObject**

## Return Value

N/A

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Example

```
Public Sub Example()
Dim gb As GraphicsBuilder.GraphicsBuilder
.
.
.
gb.PageSelectFirstObjectInGenie()
gb.PageSelectNextObjectInGenie()
gb.PageTemplateSelectFirstObject()
gb.PageTemplateSelectNextObject()
gb.UnLockObject()
End Sub
```

## Related Functions

[PageTemplateSelectFirstObject](#)

### PageThumbnailToClipboard

Creates a thumbnail image of the current page and copies it to the clipboard.

## Syntax

**PageThumbnailToClipboard(*Size*)**

*Size*:

The size of the thumbnail image in pixels.

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

### PageUngroupSelectedObject

Ungroups the currently selected grouped object.

## Syntax

**PageUngroupSelectedObject**

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageSelectObject](#), [PageSelectObjectAdd](#), [PageSelectFirstObject](#), [PageSelectNextObject](#),  
[PageGroupSelectedObjects](#)

## PageUpdated

The event fired when a Graphics Builder page is updated.

## Syntax

**PageUpdated**(*sProject*, *sPage*)

*sProject*

The name of the project.

*sPage*

The name of the page.

## Return Value

N/A

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageSelectNext](#)

## Example

```
Sub PageUpdated(ByVal bstrProject As String, ByVal bstrPage As String, ByVal bLastPage As Boolean)
    ' Add your code here
End sub
```

## Page Properties Functions

Using the page properties functions, you can manipulate the properties of the pages in your project.

<a href="#">PageAddAssociation</a>	Adds a new association to the current page. This function will return an error if an association with the specified name already exists.
<a href="#">PageAssociationDefault</a>	Sets or retrieves the default for the currently selected page association.

<a href="#">PageAssociationDescription</a>	Sets or retrieves the description for the currently selected page association.
<a href="#">PageAssociationName</a>	Retrieves the name of the currently selected page association.
<a href="#">PageAssociationValueOnError</a>	Sets or retrieves the value-on-error for the currently selected page association.
<a href="#">PageAppearanceGet</a>	Retrieves the appearance properties of a page. This function, since it does not support True Color functionality, has been superseded by PageAppearanceGetEx.
<a href="#">PageAppearanceGetEx</a>	Retrieves the appearance properties of a page. This function supports True Color functionality and replaces PageAppearanceGet.
<a href="#">PageArea</a>	Retrieves or sets the PageArea property for the current graphics page.
<a href="#">PageClusterInherit</a>	Retrieves or sets the cluster context inherit flag setting for current graphics page.
<a href="#">PageClusterName</a>	Retrieves or sets the cluster context name property for the current graphics page.
<a href="#">PageDeleteAssociation</a>	Deletes the selected association from the current page. After an item has been deleted, a call to PageSelectNextAssociation will select the item immediately following the deleted item.
<a href="#">PageDescription</a>	Sets or retrieves the description attached to the active Plant SCADA graphics page.
<a href="#">PageEnvironmentAdd</a>	Adds a new environment variable to the current page. This function will return an error if an environment variable with the specified name already exists.
<a href="#">PageEnvironmentFirst</a>	Retrieves the first environment variable in the current page. This function will return an error if there are no environment variables in the page.
<a href="#">PageEnvironmentNext</a>	Retrieves the next environment variable in the current page. This function will return an error if there are no more environment variables in the page.
<a href="#">PageEnvironmentRemove</a>	Removes an environment variable from the current page. This function will return an error if an environment variable with the specified name does not exist.

<a href="#">PageEventGet</a>	Gets the event (command or value) that will be triggered at runtime depending on the page behavior.
<a href="#">PageEventGetEx</a>	Gets the event (command or value) that will be triggered at runtime when the window is activated or deactivated.
<a href="#">PageEventPut</a>	Sets the event (command or value) that will be triggered at runtime.
<a href="#">PageEventPutEx</a>	Sets the event (command or value) that will be triggered at runtime, including when the window is activated or deactivated.
<a href="#">PageLogDevice</a>	Retrieves or sets the LogDevice property setting for the current graphics page.
<a href="#">PageName</a>	Returns the name of the active page. This is a read only attribute.
<a href="#">PageNext</a>	Retrieves the name of the page currently defined as "next" for the active graphics page, or sets the page you would like defined as next.
<a href="#">PagePrevious</a>	Retrieves the name of the page currently defined as "previous" to the active graphics page, or sets the page you would like defined as previous to the current page.
<a href="#">PageScanTime</a>	Retrieves or sets the PageScanTime property for the current graphics page.
<a href="#">PageSelectAssociationByName</a>	Selects the specified association in the current page.
<a href="#">PageSelectFirstAssociation</a>	Selects the first association in the current page.
<a href="#">PageSelectNextAssociation</a>	Selects the next association in the current page.
<a href="#">PageTitle</a>	Sets or retrieves the title of the active Plant SCADA graphics page.

For details and a VB example on handling return and error values, see [Error Handling](#).

## See Also

[Automation Events](#)

[Function Categories](#)

## PageAddAssociation

Adds a new association to the current page. This function will return an error if an association with the specified name already exists.

## Syntax

**PageAddAssociation(*Name*)**

*Name*:

The name of the new association to be added to the current page.

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Example

Adding a new element and setting its properties:

```
GraphicsBuilder.PageAddAssociation("MyAssociation")
GraphicsBuilder.SelectAssociationByName("MyAssociation")
GraphicsBuilder.PageAssociationsDefault = "TAG0"
GraphicsBuilder.PageAssociationValueOnError = "Oops"
GraphicsBuilder.PageAssociationDescription = "My Association"
```

## Related Functions

[PageAssociationDefault](#), [PageAssociationDescription](#)

## PageAppearanceGet

Retrieves the appearance properties of a page.

**Note:** As this function does not support True Color functionality, this function has been superseded by the function [PageAppearanceGetEx](#).

## Syntax

**PageAppearanceGet(*Project*, *Style*, *Template*, *Resolution*, *Titlebar*, *Width*, *Height*, *Color*)**

*Project*:

The name of the project that contains the template.

*Style*:

The style of the template.

*Template*:

The name of the template.

*Resolution:*

The resolution of the template.

0 = Default

1 = VGA

2 = SVGA

3 = XGA

4 = SXGA

5 = User

6 = WUXGA

7 = HD1080

*Titlebar:*

TRUE if titlebar is selected.

*Width:*

The width of the page in pixels.

*Height:*

The height of the page in pixels.

*Color:*

The color of the page background.

## Return Value

The requested values, as a string

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageOpen](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

### PageAppearanceGetEx

Retrieves the appearance properties of a page.

## Syntax

**PageAppearanceGetEx**(*Project*, *Style*, *Template*, *Resolution*, *Titlebar*, *Width*, *Height*, *OnColour*, *OffColour*)

*Project:*

Name of project that contains the template.

*Style:*

Style of template.

*Template:*

Name of template.

*Resolution:*

Resolution of template.

0 = Default

1 = VGA

2 = SVGA

3 = XGA

4 = SXGA

5 = User

6 = WUXGA

7 = HD1080

*Titlebar:*

TRUE if titlebar is selected.

*Width:*

Width of the page in pixels.

*Height:*

Height of the page in pixels.

*OnColour:*

"On" color of the page background as an RGB value.

*OffColour:*

"Off" color of the page background as an RGB value.

## Return Value

The requested values, as a string

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageOpen](#), [PageSave](#), [PageSaveAs](#), [PageClose](#)

### PageArea

Retrieves or sets the PageArea property for the current graphics page.

## Syntax

**PageArea(*Area*)**

*Area:*

1... 255 as a string, or blank to assign the page to every area.

## Return Value

If retrieving the current PageArea setting, 1... 255 is returned as a string if a numeric value is used, or a group name is returned as a string if security has been set up using a preconfigured group. A blank string is returned if the active page is assigned to every area.

If you are using the function to apply an area setting, 0 (zero) is returned if successful, or an E\_INVALIDARG error if the value you want to apply is out of range.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageName](#), [PageTitle](#), [PageDescription](#), [PagePrevious](#), [ProjectNext](#), [PageScanTime](#), [PageLogDevice](#)

## Example

```
' Assigns a page to one of the areas defined in a Plant SCADA project
GraphicsBuilder.PageArea = "1"

' Retrieves the name of the area the current page is assigned to
MyVariable = GraphicsBuilder.PageArea
```

**Note:** This function is implemented in the C++ environment as two separate functions: put\_PageArea applies an Area setting for active graphics page, and get\_PageArea retrieves the current Area setting.

## See Also

[Page Properties - General](#)

### PageAssociationDefault

Sets or retrieves the default for the currently selected page association.

## Syntax

```
Def=PageAssociationDefault
PageAssociationDefault(Def)
Def:
```

Default substitution string to be used if the page association has not been performed using the Ass(..) Cicode function at runtime. The default needs to be either a literal string enclosed in single quotes (e.g. 'a literal value') or a valid tag name.

## Return Value

The default for the currently selected association (as a string), or 0 (zero) if successfully used to set the default. An error is returned if unsuccessful.

## Related Functions

[PageAddAssociation](#), [PageAssociationDescription](#)

### PageAssociationDescription

Sets or retrieves the description for the currently selected page association.

## Syntax

*Description* = PageAssociationDescription

**PageAssociationDescription**(*Description*)

*Description*:

Free text description of the association.

## Return Value

The description of the currently selected association (as a string), or 0 (zero) if successfully used to set the description. An error is returned if unsuccessful.

## Related Functions

[PageAddAssociation](#)

### PageAssociationName

Retrieves the name of the currently selected page association.

## Syntax

Name = PageAssociationName

## Return Value

The name of the currently selected association (as a string). An error is returned if unsuccessful.

## Related Functions

[PageAddAssociation](#), [PageAssociationDescription](#)

### PageAssociationValueOnError

Sets or retrieves the value-on-error for the currently selected page association.

## Syntax

*ValOnErr* = PageAssociationValueOnError

**PageAssociationValueOnError(*ValOnErr*)**

*ValOnErr*:

Value to be used if the substitution was not performed and a default value was not defined, or a tag name was specified that did not resolve.

## Return Value

The value-on-error for the currently selected association (as a string), or 0 (zero) if successfully used to set the value-on-error. An error is returned if unsuccessful.

## Related Functions

[PageAddAssociation](#), [PageAssociationDescription](#)

## PageClusterInherit

Retrieves or sets the Cluster context inherit flag property setting for the current graphics page.

## Syntax

**PageClusterInherit(*bInherit*)**

*bInherit*:

The setting of the cluster context inherit flag as a boolean value.

## Return Value

The cluster context inherit flag for the active graphics page (as a boolean value), or 0 (zero) if successfully used to set the inherit flag. In both cases, an error is returned if unsuccessful.

## Related Functions

[PageClusterName](#)

## Example

```
' Sets the cluster context inherit flag for current page
GraphicsBuilder.PageClusterInherit = "1"

' Retrieves the cluster context inherit flag for current page
MyVariable = GraphicsBuilder.PageClusterInherit
```

## See Also

[Page Properties - General](#)

### PageClusterName

Retrieves or sets the Cluster context name property setting for the current graphics page.

## Syntax

**PageClusterName(ClusterName)**

*ClusterName*:

The name of the cluster as a string.

## Return Value

The ClusterName setting for the active graphics page (as a string), or 0 (zero) if successfully used to set the ClusterName. In both cases, an error is returned if unsuccessful.

## Related Functions

[PageClusterInherit](#)

## Example

```
' Sets the cluster context name property setting for current page
GraphicsBuilder.PageClusterName = "Cluster1"
' Retrieves the cluster context name property setting for current page
MyVariable = GraphicsBuilder.PageClusterName
```

## See Also

[Page Properties - General](#)

### PageDeleteAssociation

Deletes the selected association from the current page.

After an item has been deleted, a call to [PageSelectNextAssociation](#) will select the item immediately following the deleted item.

## Syntax

**PageDeleteAssociation()**

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Example

Deleting any associations starting with "a":

```
Dim name As String
On Error Resume Next
Err.Clear()
GraphicsBuilder.SelectFirstAssociation()
While (Err.Number = 0)
name = GraphicsBuilder.PageAssociationName
If (name.ToLower().StartsWith("a")) Then
GraphicsBuilder.PageDeleteAssociation()
End If
GraphicsBuilder.PageSelectNextAssociation()
End While
```

## Related Functions

### PageDescription

Sets or retrieves the description attached to the active Plant SCADA graphics page.

## Syntax

**PageDescription**(*Description*)

*Description:*

The description applied to the active graphics page, as a string.

## Return Value

The description of the active graphics page as a string, or 0 (zero) if successfully used to apply a description to the active graphics page. In both cases, an error is returned if unsuccessful.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageName](#), [PageTitle](#), [PagePrevious](#), [ProjectNext](#), [PageScanTime](#), [PageLogDevice](#), [PageNext](#), [PageArea](#)

## Example

```
' Attaches a description to the active graphics page
GraphicsBuilder.PageDescription = "MyDescription"
```

```
' Retrieves the description for the active graphics page MyVariable =  
GraphicsBuilder.PageDescription
```

**Note:** This function is implemented in the C++ environment as two separate functions: put\_PageDescription sets the title of the active graphics page, and get\_PageDescription retrieves the title of the active graphics page.

## See Also

[Page Properties - General](#)

### PageEnvironmentAdd

Adds a new environment variable to the current page. This function will return an error if an environment variable with the specified name already exists

## Syntax

**PageEnvironmentAdd(*Name*, *Value*)**

*Name*:

Specifies the name of the new environment variable.

*Value*:

Specifies the value to associate with the new environment variable

## Return Value

0 (zero) if successful, otherwise an error is returned.

## Example

Adding a new environment variable:

```
GraphicsBuilder.PageEnvironmentAdd("Foo", "Bar")
```

## Related Functions

[PageEnvironmentFirst](#)

### PageEnvironmentFirst

Retrieves the first environment variable in the current page. This function will return an error if there are no environment variables in the page.

## Syntax

**PageEnvironmentFirst(*Name*, *Value*)**

*Name*:

Receives the name of the first environment variable in the current page.

*Value*:

Receives the value associated with the first environment variable.

## Return Value

0 (zero) if successful, otherwise an error is returned.

## Example

Printing out environment variables:

```
Dim name As String
Dim value As String
Dim prevName As String
On Error Resume Next
Err.Clear()
GraphicsBuilder.PageEnvironmentFirst(name, value)
While (Err.Number = 0)
Console.Out.WriteLine(name + "=" + value)
prevName = name
GraphicsBuilder.PageEnvironmentNext(prevName, name, value)
End While
```

## Related Functions

[PageEnvironmentAdd](#)

## PageEnvironmentNext

Retrieves the next environment variable in the current page. This function will return an error if there are no more environment variables in the page.

## Syntax

**PageEnvironmentNext(*currentName*, *nextName*, *nextValue*)**

*currentName*:

Specifies the name of the current environment variable.

*nextName*:

Receives the name of the next environment variable.

*nextValue*:

Receives the value associated with the next environment variable.

## Return Value

0 (zero) if successful, otherwise an error is returned.

## Related Functions

[PageEnvironmentFirst](#)

### PageEnvironmentRemove

Removes an environment variable from the current page. This function will return an error if an environment variable with the specified name does not exist.

## Syntax

**PageEnvironmentRemove(*Name*)**

*Name*:

Specifies the name of the environment variable to be removed.

## Return Value

0 (zero) if successful, otherwise an error is returned.

## Example

Deleting an existing environment variable

```
GraphicsBuilder.PageEnvironmentRemove("Foo")
```

Updating an existing environment variable

```
GraphicsBuilder.PageEnvironmentRemove("Foo")
GraphicsBuilder.PageEnvironmentAdd("Foo", "Bar2")
```

## Related Functions

[PageEnvironmentFirst](#)

### PageEventGet

Gets the event (command or value) that will be triggered at runtime depending on the page behavior.

See Page Properties - Events for more information.

## Syntax

**PageEventGet( )**

## Return Value

Command (Cicode function) or value that was set for the page event.

## Example

```
{  
    string strEventOnEntryCommand,  
    strEventOnExitCommand,  
    strEventWhileShownCommand,  
    strEventOnShownCommand,  
    strEventOnActivateCommand,  
    strEventOnDeactivateCommand,  
    strEventOnEntryCommandExp,  
    strEventOnExitCommandExp,  
    strEventWhileShownCommandExp,  
    strEventOnShownCommandExp,  
    strEventOnActivateCommandExp,  
    strEventOnDeactivateCommandExp  
    .  
  
    gb.ProjectSelect("Example_AlarmIndicator");  
    gb.PageOpen("Example_AlarmIndicator", "Test");  
    .  
    strEventOnEntryCommand = "PageEventsPutEntryCommandEx";  
    strEventOnExitCommand = "PageEventsPutExitCommandEx";  
    strEventWhileShownCommand = "PageEventsPutShownCommandEx";  
    strEventOnShownCommand = "PageEventsPutShownCommandEx";  
    strEventOnActivateCommand = "PageEventsPutActivateCommandEx";  
    strEventOnDeactivateCommand = "PageEventsPutDeactivateCommandEx";  
    gb2.PageEventsPutEx(strEventOnEntryCommand, strEventOnExitCommand,  
    strEventWhileShownCommand,  
    strEventOnShownCommand,  
    strEventOnActivateCommand, strEventOnDeactivateCommand);  
    gb2.PageEventsGetEx(out strEventOnEntryCommandExp, out strEventOnExitCommandExp, out  
    strEventWhileShownCommandExp,  
    out strEventOnShownCommandExp, out strEventOnActivateCommandExp, out  
    strEventOnDeactivateCommandExp);  
    .  
    .  
    strEventOnEntryCommand = "PageEventsPutEntryCommand";  
    strEventOnExitCommand = "PageEventsPutExitCommand";  
    strEventWhileShownCommand = "PageEventsPutShownCommand";  
    strEventOnShownCommand = "PageEventsPutShownCommand";  
  
    gb2.PageEventsPut(strEventOnEntryCommand, strEventOnExitCommand, strEventWhileShownCommand,  
    strEventOnShownCommand);  
    gb2.PageEventsGet(out strEventOnEntryCommandExp, out strEventOnExitCommandExp, out  
    strEventWhileShownCommandExp,  
    out strEventOnShownCommandExp);  
}
```

## Related Functions

[PageEventPut](#)

### PageEventGetEx

Gets the event (command or value) that will be triggered at runtime when the window is activated or deactivated.

See Page Properties - Events for more information

## Syntax

**PageEventGetEx ()**

## Return Value

Command (Cicode function) or value that was set for the window.

## Example

```
{  
    string strEventOnEntryCommand,  
    strEventOnExitCommand,  
    strEventWhileShownCommand,  
    strEventOnShownCommand,  
    strEventOnActivateCommand,  
    strEventOnDeactivateCommand,  
    strEventOnEntryCommandExp,  
    strEventOnExitCommandExp,  
    strEventWhileShownCommandExp,  
    strEventOnShownCommandExp,  
    strEventOnActivateCommandExp,  
    strEventOnDeactivateCommandExp  
  
    gb.ProjectSelect("Example_AlarmIndicator");  
    gb.PageOpen("Example_AlarmIndicator", "Test");  
  
    strEventOnEntryCommand = "PageEventsPutEntryCommandEx";  
    strEventOnExitCommand = "PageEventsPutExitCommandEx";  
    strEventWhileShownCommand = "PageEventsPutShownCommandEx";  
    strEventOnShownCommand = "PageEventsPutShownCommandEx";  
    strEventOnActivateCommand = "PageEventsPutActivateCommandEx";  
    strEventOnDeactivateCommand = "PageEventsPutDeactivateCommandEx";  
  
    gb2.PageEventsPutEx(strEventOnEntryCommand, strEventOnExitCommand,  
    strEventWhileShownCommand,  
    strEventOnShownCommand,

strEventWhileShownCommandExp,  
out strEventOnShownCommandExp);  
}
```

## Related Functions

[PageEventPutEx](#)

### PageEventPut

Sets the event (command or value) that will be triggered at runtime either:

- on page entry.
- exiting the page.
- when the page is first displayed and objects on it have been initialized.
- or executed continually for the entire time the page is open.

## Syntax

```
PageEventPut (sEventOnEntryCommand, sEventOnExitCommand, sEventWhileShownCommand,  
sEventOnShownCommand,sOnActivateCommand, sOnDeactivateCommand )
```

## Example

```
{  
string strEventOnEntryCommand,  
strEventOnExitCommand,  
strEventWhileShownCommand,  
strEventOnShownCommand,  
strEventOnActivateCommand,  
strEventOnDeactivateCommand,  
strEventOnEntryCommandExp,  
strEventOnExitCommandExp,  
strEventWhileShownCommandExp,  
strEventOnShownCommandExp,  
strEventOnActivateCommandExp,  
strEventOnDeactivateCommandExp  
  
gb.ProjectSelect("Example_AlarmIndicator");
```

```
gb.PageOpen("Example_AlarmIndicator", "Test");

strEventOnEntryCommand = "PageEventsPutEntryCommandEx";
strEventOnExitCommand = "PageEventsPutExitCommandEx";
strEventWhileShownCommand = "PageEventsPutShownCommandEx";
strEventOnShownCommand = "PageEventsPutShownCommandEx";
strEventOnActivateCommand = "PageEventsPutActivateCommandEx";
strEventOnDeactivateCommand = "PageEventsPutDeactivateCommandEx";

gb2.PageEventsPutEx(strEventOnEntryCommand, strEventOnExitCommand,
strEventWhileShownCommand,
strEventOnShownCommand,
strEventOnActivateCommand, strEventOnDeactivateCommand);
gb2.PageEventsGetEx(out strEventOnEntryCommandExp, out strEventOnExitCommandExp, out
strEventWhileShownCommandExp,
out strEventOnShownCommandExp, out strEventOnActivateCommandExp, out
strEventOnDeactivateCommandExp);

strEventOnEntryCommand = "PageEventsPutEntryCommand";
strEventOnExitCommand = "PageEventsPutExitCommand";
strEventWhileShownCommand = "PageEventsPutShownCommand";
strEventOnShownCommand = "PageEventsPutShownCommand";

gb2.PageEventsPut(strEventOnEntryCommand, strEventOnExitCommand, strEventWhileShownCommand,
strEventOnShownCommand);
gb2.PageEventsGet(out strEventOnEntryCommandExp, out strEventOnExitCommandExp, out
strEventWhileShownCommandExp,
out strEventOnShownCommandExp);
}
```

## Related Functions

[PageEventGet](#)

### PageEventPutEx

Sets the event (command or value) that will be triggered at runtime either:

- on page entry.
- exiting the page.
- when the page is first displayed and objects on it have been initialized.
- or executed continually for the entire time the page is open.
- when the window becomes active (in context).
- when the window is no longer active.

See Page Properties - Events for more information

## Syntax

**PageEventPutEx** (*sEventOnEntryCommand*, *sEventOnExitCommand*, *sEventWhileShownCommand*,  
*sEventOnShownCommand*, *sOnActivateCommand*, *sOnDeactivateCommand*)

## Example

```
{  
    string strEventOnEntryCommand,  
    strEventOnExitCommand,  
    strEventWhileShownCommand,  
    strEventOnShownCommand,  
    strEventOnActivateCommand,  
    strEventOnDeactivateCommand,  
    strEventOnEntryCommandExp,  
    strEventOnExitCommandExp,  
    strEventWhileShownCommandExp,  
    strEventOnShownCommandExp,  
    strEventOnActivateCommandExp,  
    strEventOnDeactivateCommandExp  
  
    gb.ProjectSelect("Example_AlarmIndicator");  
    gb.PageOpen("Example_AlarmIndicator", "Test");  
  
    strEventOnEntryCommand = "PageEventsPutEntryCommandEx";  
    strEventOnExitCommand = "PageEventsPutExitCommandEx";  
    strEventWhileShownCommand = "PageEventsPutShownCommandEx";  
    strEventOnShownCommand = "PageEventsPutShownCommandEx";  
    strEventOnActivateCommand = "PageEventsPutActivateCommandEx";  
    strEventOnDeactivateCommand = "PageEventsPutDeactivateCommandEx";  
  
    gb2.PageEventsPutEx(strEventOnEntryCommand, strEventOnExitCommand,  
    strEventWhileShownCommand,  
    strEventOnShownCommand,  
    strEventOnActivateCommand, strEventOnDeactivateCommand);  
    gb2.PageEventsGetEx(out strEventOnEntryCommandExp, out strEventOnExitCommandExp, out  
    strEventWhileShownCommandExp,  
    out strEventOnShownCommandExp, out strEventOnActivateCommandExp, out  
    strEventOnDeactivateCommandExp);  
  
    strEventOnEntryCommand = "PageEventsPutEntryCommand";  
    strEventOnExitCommand = "PageEventsPutExitCommand";  
    strEventWhileShownCommand = "PageEventsPutShownCommand";  
    strEventOnShownCommand = "PageEventsPutShownCommand";  
  
    gb2.PageEventsPut(strEventOnEntryCommand, strEventOnExitCommand, strEventWhileShownCommand,  
    strEventOnShownCommand);  
    gb2.PageEventsGet(out strEventOnEntryCommandExp, out strEventOnExitCommandExp, out  
    strEventWhileShownCommandExp,  
    out strEventOnShownCommandExp);  
}
```

## Related Functions

[PageEventGetEx](#)

### PageLogDevice

Retrieves or sets the LogDevice property setting for the current graphics page.

## Syntax

**PageLogDevice(*LogDevice*)**

*LogDevice*:

The name of the log device as a string.

## Return Value

The LogDevice setting for the active graphics page (as a string), or 0 (zero) if successfully used to set the LogDevice. In both cases, an error is returned if unsuccessful.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageName](#), [PageTitle](#), [PageDescription](#), [PagePrevious](#), [PageNext](#), [PageScanTime](#)

## Example

```
' Sets the LogDevice for the current graphics page
GraphicsBuilder.PageLogDevice = "MyDevice"
' Retrieves the name of the LogDevice for the current page
MyVariable = GraphicsBuilder.PageLogDevice
```

**Note:** This function is implemented in the C++ environment as two separate functions: put\_PageLogDevice applies a LogDevice setting for active graphics page, and get\_PageLogDevice retrieves the current LogDevice setting.

## See Also

[Page Properties - General](#)

### PageName

Returns the name of the active page. This is a read only attribute.

## Syntax

**PageName(*PageName*)**

*PageName:*

Returns the name of the active page as a string.

## Return Value

The name of the active Plant SCADA graphics page as a string.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageTitle](#), [PageDescription](#), [PagePrevious](#), [PageNext](#), [PageArea](#), [PageScanTime](#), [PageLogDevice](#)

## Example

```
Debug.Print "PageName"; GraphicsBuilder.PageName
```

## See Also

[Page Properties - General](#)

## PageNext

Retrieves the name of the page currently defined as "next" for the active graphics page, or sets the page you would like defined as next.

## Syntax

**PageNext(*PageName*)**

*PageName:*

The name of the page defined as next for the active graphics page, as a string.

## Return Value

The name of the page defined as next for the active graphics page (as a string), or 0 (zero) if successfully used to set the page that is defined as next. In both cases, an error is returned if unsuccessful.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[PageName](#), [PageTitle](#), [PageDescription](#), [PagePrevious](#), [PageArea](#), [PageScanTime](#), [PageLogDevice](#)

## Example

```
' Defines a page as the one that follows the current page in a browse sequence
```

```
GraphicsBuilder.PageNext = "MyPage3"
' Retrieves the name of the page that follows the current page in a browse sequence
MyVariable = GraphicsBuilder.PageNext
```

**Note:** This function is implemented in the C++ environment as two separate functions: put\_PageNext sets the page defined as next for the active graphics page, and get\_PageNext retrieves the name of the next graphics page.

## See Also

[Page Properties - General](#)

### PagePrevious

Retrieves the name of the page currently defined as "previous" to the active graphics page, or sets the page you would like defined as previous to the current page.

## Syntax

**PagePrevious(***PageName***)**

*PageName*:

The name of the page defined as previous for the active graphics page, as a string.

## Return Value

The name of the page defined as previous to the active graphics page (as a string), or 0 (zero) if successfully used to set the page that is previous to the active graphics page. In both cases, an error is returned if unsuccessful.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageTitle](#), [PageDescription](#), [PageNext](#), [PageArea](#), [PageScanTime](#), [PageLogDevice](#)

## Example

```
' Defines a page as previous to the current page in a browse sequence
GraphicsBuilder.PagePrevious = "MyPage1"
' Retrieves the name for the page defined as previous to the current page
MyVariable = GraphicsBuilder.PagePrevious
```

**Note:** This function is implemented in the C++ environment as two separate functions: put\_PagePrevious sets the page defined as previous to the active graphics page, and get\_PagePrevious retrieves the name of the previous graphics page.

## See Also

[Page Properties - General](#)

## PageScanTime

Retrieves or sets the PageScanTime property for the current graphics page.

## Syntax

**PageScanTime(ScanTime)**

*ScanTime:*

A value between 1 and 60000 as a string, or blank to set to default.

## Return Value

If retrieving the current PageScanTime setting, the value returned is between 1 and 60000 as a string, or a blank string if set to default.

If you are using the function to apply a ScanTime setting, 0 (zero) is returned if successful, or an E\_INVALIDARG error if the value you want to apply is out of range.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageName](#), [PageTitle](#), [PageDescription](#), [PagePrevious](#), [PageNext](#), [PageLogDevice](#)

## Example

```
' Assigns a ScanTime value to the current graphics page
GraphicsBuilder.PageScanTime = "2000"
' Retrieves the ScanTime setting for the current page
MyVariable = GraphicsBuilder.PageScanTime
```

**Note:** This function is implemented in the C++ environment as two separate functions: `put_PageScanTime` applies an ScanTime setting to active graphics page, and `get_PageScanTime` retrieves the current ScanTime setting.

## See Also

[Page Properties - General](#)

## PageSelectAssociationByName

Selects the specified association in the current page.

## Syntax

**PageSelectAssociationByName(Name)**

*Name*

The name of the association to be selected.

## Return Value

0 (zero) if successful, otherwise an error is returned.

## Example

Determining whether an association with a particular name exists:

```
On Error Resume Next
Err.Clear()
GraphicsBuilder.SelectAssociationByName("MyAssociation")
If (Err.Number <> 0)
    ' The association does not exist
End If
```

## Related Functions

[PageAddAssociation](#)

## PageSelectFirstAssociation

Selects the first association in the current page.

## Syntax

`PageSelectFirstAssociation()`

## Return Value

0 (zero) if successful, otherwise an error is returned.

## Example

Determine whether the current page has associations in the page properties:

```
On Error Resume Next
Err.Clear()
GraphicsBuilder.SelectFirstAssociation()
If (Err.Number <> 0)
    ' The page has no associations
End If
```

## Related Functions

[PageAddAssociation](#), [PageAssociationDescription](#)

## PageSelectNextAssociation

Selects the next association in the current page.

### Syntax

```
PageSelectNextAssociation()
```

### Return Value

0 (zero) if successful, otherwise an error is returned.

### Example

Print associations in the current page's properties:

```
On Error Resume Next
Err.Clear()
GraphicsBuilder.SelectFirstAssociation()
While (Err.Number = 0)
Console.Out.WriteLine(GraphicsBuilder.PageAssociationName)
GraphicsBuilder.SelectNextAssociation()
End While
```

## Related Functions

[PageAddAssociation](#), [PageAssociationDescription](#)

### PageTitle

Sets or retrieves the title of the active Plant SCADA graphics page.

### Syntax

```
PageTitle(Title)
```

*Title*:

The title of the active page as a string.

### Return Value

The title of the active graphics page as a string, or 0 (zero) if successfully used to set the title of the active graphics page. In both cases, an error is returned if unsuccessful.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[PageName](#), [PageDescription](#), [PagePrevious](#), [PageNext](#), [PageArea](#), [PageScanTime](#), [PageLogDevice](#)

## Example

```
' Sets the title of the active graphics page
GraphicsBuilder.PageTitle = "MyTitle"

' Retrieves the title of the active graphics page
MyVariable = GraphicsBuilder.PageTitle
```

**Note:** This function is implemented in the C++ environment as two separate functions: put\_PageTitle sets the title of the active graphics page, and get\_PageTitle retrieves the title of the active graphics page.

## Project Functions

These functions operate on the project level. Some are initiated within Plant SCADA Studio. If they experience an error in Visual Basic, they throw an exception with a return value E\_FAIL.

<a href="#">ProjectCompile</a>	This function starts the Plant SCADA compiler with the current project.
<a href="#">ProjectFirst</a>	Retrieves the name of the first project defined in Plant SCADA.
<a href="#">ProjectFirstInclude</a>	Retrieves the name of the first included project defined for the current Plant SCADA project.
<a href="#">ProjectNext</a>	Retrieves the name of the next project defined in Plant SCADA.
<a href="#">ProjectNextInclude</a>	Retrieves the name of the next included project defined for the current Plant SCADA project.
<a href="#">ProjectPackDatabase</a>	Packs the current project's database files.
<a href="#">ProjectPackLibraries</a>	Packs the library files for the current Plant SCADA project.
<a href="#">ProjectSelect</a>	Selects the passed project as the current project within Plant SCADA.
<a href="#">ProjectSelected</a>	Retrieves the name of the project that is currently selected in Plant SCADA.

ProjectUpdatePages	Updates the pages for the current Plant SCADA project.
ProjectUpgrade	Performs a project upgrade on the current Plant SCADA project.
ProjectUpgradeAll	Performs a project upgrade on the Plant SCADA projects.

For details and a VB example on handling return and error values, see [Error Handling](#).

## See Also

[Automation Events](#)

[Function Categories](#)

## ProjectCompile

This function starts the Plant SCADA compiler with the current project. There are currently no functions to check errors or trigger the compiler's cancel function.

## Syntax

**ProjectCompile**

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[ProjectSelect](#), [ProjectSelected](#), [ProjectFirst](#), [ProjectNext](#), [ProjectFirstInclude](#), [ProjectNextInclude](#), [ProjectUpgrade](#), [ProjectUpgradeAll](#), [ProjectPackLibraries](#), [ProjectUpdatePages](#), [ProjectPackDatabase](#)

## Example

```
GraphicsBuilder.ProjectCompile
If Err.Number <> 0 Then
    Debug.Print "Error in ProjectCompile"
    Err.Clear
Else
    Debug.Print "ProjectCompile OK"
End If
```

## ProjectFirst

Retrieves the name of the first project defined in Plant SCADA. Can be used in conjunction with [ProjectNext](#) to call the projects currently defined in Plant SCADA.

## Syntax

**ProjectFirst(*Project*)**

*Project:*

The name of the project.

## Return Value

The name of the first Plant SCADA project. If no project exists, an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[ProjectSelect](#), [ProjectSelected](#), [ProjectNext](#), [ProjectFirstInclude](#), [ProjectNextInclude](#), [ProjectUpgrade](#), [ProjectUpgradeAll](#), [ProjectPackLibraries](#), [ProjectUpdatePages](#), [ProjectPackDatabase](#), [ProjectCompile](#)

## Example

```
On Error Resume Next
sProject = GraphicsBuilder.ProjectSelected
If Err.Number <> 0 Then
    Debug.Print "Error in ProjectSelected"
    Err.Clear
Else
    Debug.Print "Selected project:", sProject
End If
Debug.Print "list of projects:"
sProject = GraphicsBuilder.ProjectFirstWhile Err.Number = 0
Debug.Print sProject
sProject = GraphicsBuilder.ProjectNext
Wend
```

## ProjectFirstInclude

Retrieves the name of the first included project defined for the current Plant SCADA project. Can be used in conjunction with [ProjectNextInclude](#) to call the projects defined as included for current Plant SCADA project.

## Syntax

**ProjectFirstInclude(*Project*)**

*Project:*

The name of the project.

## Return Value

The name of the first include project for the current Plant SCADA project. If no project exists, an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[ProjectSelect](#), [ProjectSelected](#), [ProjectFirst](#), [ProjectNext](#), [ProjectNextInclude](#), [ProjectUpgrade](#), [ProjectUpgradeAll](#), [ProjectPackLibraries](#), [ProjectUpdatePages](#), [ProjectPackDatabase](#), [ProjectCompile](#)

## ProjectNext

Retrieves the name of the next project defined in Plant SCADA. Can be used with [ProjectFirst](#) to call projects currently defined in Plant SCADA.

## Syntax

**ProjectNext(*Project*)**

*Project*:

The name of the project.

## Return Value

The name of the next Plant SCADA project. If no project exists, an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[ProjectSelected](#), [ProjectFirst](#), [ProjectFirstInclude](#), [ProjectNextInclude](#), [ProjectUpgrade](#), [ProjectUpgradeAll](#), [ProjectPackLibraries](#), [ProjectUpdatePages](#), [ProjectPackDatabase](#), [ProjectCompile](#)

## Example

```
On Error Resume Next
sProject = GraphicsBuilder.ProjectSelected
If Err.Number <> 0 Then
    Debug.Print "Error in ProjectSelected"
    Err.Clear
Else
    Debug.Print "Selected project:", sProject
End If
Debug.Print "list of projects:"
sProject = GraphicsBuilder.ProjectFirst
```

```
While Err.Number = 0
Debug.Print sProject
sProject = GraphicsBuilder.ProjectNext
Wend
```

## ProjectNextInclude

Retrieves the name of the next included project defined for the current Plant SCADA project. Can be used with [ProjectFirstInclude](#) to call the projects defined as included for current Plant SCADA project.

## Syntax

**ProjectNextInclude(*Project*)**

*Project*:

The name of the project.

## Return Value

The name of the next include project for the current Plant SCADA project. If no project exists, an error is returned.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[ProjectSelect](#), [ProjectSelected](#), [ProjectFirst](#), [ProjectNext](#), [ProjectFirstInclude](#), [ProjectUpgrade](#), [ProjectUpgradeAll](#),  
[ProjectUpdatePages](#), [ProjectPackDatabase](#), [ProjectCompile](#)

## ProjectPackDatabase

Packs the current project's database files.

## Syntax

**ProjectPackDatabase**

## Return Value

0 (zero) if successful, otherwise an error is returned.

---

**Note:** This function displays a cancel dialog. It will exit and report error code E\_ABORT, if the cancel button is pressed. For details on handling return and error values, see [Error Handling](#).

## Related Functions

[ProjectSelect](#), [ProjectSelected](#), [ProjectFirst](#), [ProjectNext](#), [ProjectFirstInclude](#), [ProjectNextInclude](#), [ProjectUpgrade](#),  
[ProjectUpgradeAll](#), [ProjectPackLibraries](#), [ProjectUpdatePages](#), [ProjectCompile](#)

## Example

```
GraphicsBuilder.ProjectPackDatabase
If Err.Number <> 0 Then
    Debug.Print "Error in ProjectPackDatabase"
    Err.Clear
Else
    Debug.Print "ProjectPackDatabase OK"
End If
```

## ProjectPackLibraries

Packs the library files for the current Plant SCADA project.

## Syntax

**ProjectPackLibraries**

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** This function displays a cancel dialog. It will exit and report error code E\_ABORT, if the cancel button is pressed. For details on handling return and error values, see [Error Handling](#).

## Related Functions

[ProjectSelect](#), [ProjectSelected](#), [ProjectFirst](#), [ProjectNext](#), [ProjectFirstInclude](#), [ProjectNextInclude](#), [ProjectUpgrade](#), [ProjectUpgradeAll](#), [ProjectUpdatePages](#), [ProjectPackDatabase](#), [ProjectCompile](#)

## Example

```
GraphicsBuilder.ProjectPackLibraries
If Err.Number <> 0 Then
    Debug.Print "Error in ProjectPackLibraries"
    Err.Clear
Else
    Debug.Print "ProjectPackLibraries OK"
End If
```

## ProjectSelect

Selects the passed project as the current project within Plant SCADA Studio.

## Syntax

**ProjectSelect(*Project*)**

*Project*:

The name of the project.

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[ProjectSelected](#), [ProjectFirst](#), [ProjectNext](#), [ProjectFirstInclude](#), [ProjectNextInclude](#), [ProjectUpgrade](#), [ProjectUpgradeAll](#), [ProjectPackLibraries](#), [ProjectUpdatePages](#), [ProjectPackDatabase](#), [ProjectCompile](#)

## Example

```
GraphicsBuilder.ProjectSelect "Example"
```

### ProjectSelected

Retrieves the name of the project that is currently selected in Plant SCADA.

## Syntax

**ProjectSelected**(*Project*)

*Project*:

The name of the project.

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[ProjectSelect](#), [ProjectFirst](#), [ProjectNext](#), [ProjectFirstInclude](#), [ProjectNextInclude](#), [ProjectUpgrade](#), [ProjectUpgradeAll](#), [ProjectPackLibraries](#), [ProjectUpdatePages](#), [ProjectPackDatabase](#), [ProjectCompile](#)

## Example

```
On Error Resume Next
sProject = GraphicsBuilder.ProjectSelected
If Err.Number <> 0 Then
    Debug.Print "Error in ProjectSelected"
    Err.Clear
Else
    Debug.Print "Selected project:", sProject
End If
```

```
Debug.Print "list of projects:"  
sProject = GraphicsBuilder.ProjectFirst  
While Err.Number = 0  
Debug.Print sProject  
sProject = GraphicsBuilder.ProjectNext  
Wend
```

## ProjectUpdatePages

Updates the pages for the current Plant SCADA project. If you encounter missing references during the update, see [BrokenLinkCancelEnabled](#).

## Syntax

**ProjectUpdatePages(*FastUpdate*)**

*FastUpdate*:

Set to TRUE to enable a fast update.

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** This function displays a cancel dialog. It will exit and report error code E\_ABORT, if the cancel button is pressed. For details on handling return and error values, see [Error Handling](#).

## Related Functions

[ProjectSelect](#), [ProjectSelected](#), [ProjectFirst](#), [ProjectNext](#), [ProjectFirstInclude](#), [ProjectNextInclude](#), [ProjectUpgrade](#), [ProjectUpgradeAll](#), [ProjectPackLibraries](#), [ProjectPackDatabase](#), [ProjectCompile](#)

## Example

```
GraphicsBuilder.ProjectUpdatePages True  
If Err.Number <> 0 Then  
    Debug.Print "Error in ProjectUpdatePages"  
    Err.Clear  
Else  
    Debug.Print "ProjectUpdatePages OK"  
End If
```

## ProjectUpgrade

Performs a project upgrade on the current Plant SCADA project.

## Syntax

**ProjectUpgrade**

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** This function displays a cancel dialog. It will exit and report error code E\_ABORT, if the cancel button is pressed. For details on handling return and error values, see [Error Handling](#).

## Related Functions

[ProjectSelect](#), [ProjectSelected](#), [ProjectFirst](#), [ProjectNext](#), [ProjectFirstInclude](#), [ProjectNextInclude](#),  
[ProjectUpgradeAll](#), [ProjectPackLibraries](#), [ProjectUpdatePages](#), [ProjectPackDatabase](#), [ProjectCompile](#)

## Example

```
On Error Resume Next
Err.Clear
GraphicsBuilder.ProjectUpgrade
If Err.Number <> 0 Then
    Debug.Print "Error in ProjectUpgrade"
    Err.Clear
Else
    Debug.Print "ProjectUpgrade OK"
End If
```

## ProjectUpgradeAll

Performs a project upgrade on Plant SCADA projects. This function produces the same result as setting Upgrade=1 in the Citect.ini file.

## Syntax

**ProjectUpgradeAll**

## Return Value

0 (zero) if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[ProjectSelect](#), [ProjectSelected](#), [ProjectFirst](#), [ProjectFirstInclude](#), [ProjectNextInclude](#), [ProjectUpgrade](#),  
[ProjectPackLibraries](#), [ProjectUpdatePages](#), [ProjectPackDatabase](#), [ProjectCompile](#)

## Example

```
On Error Resume Next
Err.Clear
GraphicsBuilder.ProjectUpgrade
```

```
If Err.Number <> 0 Then
    Debug.Print "Error in ProjectUpgrade"
    Err.Clear
Else
    Debug.Print "ProjectUpgrade OK"
End If
```

## Specific Functions

The specific functions category currently includes only the [Visible](#) function.

<a href="#">Visible</a>	Controls visibility of the Plant SCADA Graphics Builder, or retrieves its current visible state.
-------------------------	--

For details and a VB example on handling return and error values, see [Error Handling](#).

## See Also

[Automation Events](#)

[Function Categories](#)

### Visible

Controls visibility of the Plant SCADA Graphics Builder or retrieves its current visible state.

## Syntax

**Visible**

### Return Value

If determining the current visible state of the Graphics Builder, TRUE or FALSE is returned. If applying a setting to this function, 0 (zero) is returned if successful, otherwise an error is returned.

**Note:** For details on handling return and error values, see [Error Handling](#).

### Example

```
' Make Plant SCADA Graphics Builder appear
GraphicsBuilder.Visible = TRUE
' Retrieve the current visible state of the Graphics Builder
MyVariable = GraphicsBuilder.Visible
```

**Note:** This function is implemented in the C++ environment as two separate functions: `put_Visible` sets the visible state of the Graphics Builder, and `get_Visible` retrieves the current state of the Graphics Builder (TRUE = visible).

## Text Property Functions

These functions allow you to read and modify the properties of the text objects in your project.

<a href="#">AttributeText</a>	Sets the text for a text object, or retrieves the current text.
<a href="#">AttributeTextColour</a>	Applies a color to the selected text, or retrieves the current font color setting.
<a href="#">AttributeTextOffColourEx</a>	Applies the "off" color to the selected text, or retrieves the current font color setting.
<a href="#">AttributeTextOnColourEx</a>	Applies the "on" color to the selected text, or retrieves the current font color setting.
<a href="#">AttributeTextFont</a>	Applies a specific font to the selected text, or retrieves the font setting.
<a href="#">AttributeTextFontSize</a>	Applies a font size to the selected text, or retrieves the current font size.
<a href="#">AttributeTextJustification</a>	Applies a specific justification setting to selected text, or retrieves the current text justification value.
<a href="#">AttributeTextStyle</a>	Sets a specific text style, or retrieves the current text style setting.

The following object functions are also valid for text objects:

<a href="#">Attribute3dEffects</a>	Applies a 3D effect to an object, or retrieves the current 3D effect setting.
<a href="#">Attribute3dEffectDepth</a>	Applies a level of depth to a 3D effect, or retrieves the current depth setting.
<a href="#">AttributeHiLightColour</a>	Sets the highlight color applied to the 3D effects raised, lowered or embossed, or retrieves the current highlight color setting.
<a href="#">AttributeLoLightColour</a>	Sets the lowlight color applied to the 3D effects raised, lowered or embossed, or retrieves the current lowlight color setting.
<a href="#">AttributeShadowColour</a>	Sets the shadow color when a shadowed 3D effect is used, or retrieves the current shadow color setting.

For details and a VB example on handling return and error values, see [Error Handling](#).

## See Also

[Automation Events](#)

[Function Categories](#)

## AttributeText

Sets the text for a text object, or retrieves the current text.

## Syntax

**AttributeText(*Text*)**

*Text*:

The text object's text as a string.

## Return Value

If retrieving the current text for the object, the text is returned as a string. If setting the text, a 0 (zero) is returned if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active text object, these functions throw an exception with a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeTextStyle](#), [AttributeTextJustification](#), [AttributeTextFont](#), [AttributeTextFontSize](#), [AttributeTextColour](#)

## Example

```
' Sets the text for the currently text object
GraphicsBuilder.AttributeText = "TestText"

' Retrieves text for the current text object
MyVariable = GraphicsBuilder.AttributeText
```

This function is implemented in the C++ environment as two separate functions: put\_AttributeText sets the text for the currently selected text object, and get\_AttributeText retrieves the text for the current text object.

## AttributeTextColour

Applies a color to the selected text, or retrieves the current font color setting.

**Note:** As this function does not support True Color functionality, it has been superseded by the functions [AttributeTextOnColourEx](#) and [AttributeTextOffColourEx](#).

## Syntax

**AttributeTextColour(*TextColour*)**

*TextColour*:

A value between 0 and 255 representing the font color.

## Return Value

If retrieving the current font color, a value between 0 and 255. If applying a particular font color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error E\_INVALIDARG. If there is no active text object, these functions throw an exception with a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeText](#), [AttributeTextStyle](#), [AttributeTextJustification](#), [AttributeTextFont](#), [AttributeTextFontSize](#)

## Example

```
' Applies a color to the selected text
GraphicsBuilder.AttributeTextColour = 255

`Retrieves the current font color setting
MyVariable = GraphicsBuilder.AttributeTextColour
```

**Note:** This function is implemented in the C++ environment as two separate functions:  
put\_AttributeTextColour applies a color to the currently selected text, and get\_AttributeTextColour retrieves the current text color.

## AttributeTextOffColourEx

Applies the "off" color to the selected text, or retrieves the current font color setting.

## Syntax

**AttributeTextOffColourEx(*TextColour*)**

*TextColour*:

An RGB value.

## Return Value

If retrieving the current font color, an RGB value. If applying a particular font color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error E\_INVALIDARG. If there is no active text object, these functions throw an exception with a return value of E\_HANDLE.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

## Example

```
' Applies a color to the selected text
GraphicsBuilder.AttributeTextOffColourEx = &hFF0000

`Retrieves the current font color setting
MyVariable = GraphicsBuilder.AttributeTextOffColourEx
```

---

**Note:** This function is implemented in the C++ environment as two separate functions:  
`put_AttributeTextOffColourEx` applies a color to the currently selected text, and  
`get_AttributeTextOffColourEx` retrieves the current text color.

---

## AttributeTextOnColourEx

Applies the "on" color to the selected text, or retrieves the current font color setting.

## Syntax

**AttributeTextOnColourEx(*TextColour*)**

*TextColour:*

An RGB value.

## Return Value

If retrieving the current font color, an RGB value. If applying a particular font color, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function exits and reports the error `E_INVALIDARG`. If there is no active text object, these functions throw an exception with a return value of `E_HANDLE`.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

## Example

```
' Applies a color to the selected text
GraphicsBuilder.AttributeTextOnColourEx = &hFF0000

`Retrieves the current font color setting
MyVariable = GraphicsBuilder.AttributeTextOnColourEx
```

---

**Note:** This function is implemented in the C++ environment as two separate functions: `put_AttributeTextOnColourEx` applies a color to the currently selected text, and `get_AttributeTextOnColourEx` retrieves the current text color.

---

## AttributeTextFont

Applies a specific font to the selected text, or retrieves the font setting.

## Syntax

**AttributeTextFont(*TextFont*)**

*TextFont*:

The font name as a string.

## Return Value

If retrieving the current font, the name of the font as a string, for example "courier". If applying a particular font, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error `E_INVALIDARG`. If there is no active text object, these functions throw an exception with a return value of `E_HANDLE`.

---

**Note:** For details on handling return and error values, see [Error Handling](#).

---

## Related Functions

[AttributeText](#), [AttributeTextStyle](#), [AttributeTextJustification](#), [AttributeTextFontSize](#), [AttributeTextColour](#)

## Example

```
' Applies the font Courier to the selected text
GraphicsBuilder.AttributeTextFont = "Courier"

' Retrieves the font setting
MyVariable = GraphicsBuilder.AttributeTextFont
```

---

**Note:** This function is implemented in the C++ environment as two separate functions: `put_AttributeTextFont` applies a font to the currently selected text, and `get_AttributeTextFont` retrieves the current font setting.

---

## AttributeTextFontSize

Applies a font size to the selected text, or retrieves the current font size.

## Syntax

**AttributeTextFontSize(*TextFontSize*)**

*TextFontSize*:

A value between 0 and 65535 representing the font size.

## Return Value

If retrieving the current font size, a value between 0 and 65535. If applying a particular font size, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active text object, these functions throw an exception with a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeText](#), [AttributeTextStyle](#), [AttributeTextJustification](#), [AttributeTextFont](#), [AttributeTextColour](#)

## Example

```
' Applies the font size to the selected text
GraphicsBuilder.AttributeTextFontSize = 12

' Retrieves the font size
MyVariable = GraphicsBuilder.AttributeTextFontSize
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeTextFontSize` sets the font size, and `get_AttributeTextFontSize` retrieves the current font size.

## AttributeTextJustification

Applies a specific justification setting to selected text, or retrieves the current text justification value.

## Syntax

**AttributeTextJustification**(*TextJustification*)

*TextJustification*:

A value depicting the type of justification used:

0 = left justified

1 = right justified

2 = centered

## Return Value

If retrieving the current text justification, a value between 0 and 2 depicting the type of justification used. If applying justification, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active text object, these functions throw an exception with a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeText](#), [AttributeTextStyle](#), [AttributeTextFont](#), [AttributeTextFontSize](#), [AttributeTextColour](#)

## Example

```
' Applies right justification to the selected text
GraphicsBuilder.AttributeTextJustification = 1

' Retrieves the current text justification value
MyVariable = GraphicsBuilder.AttributeTextJustification
```

**Note:** This function is implemented in the C++ environment as two separate functions:  
`put_AttributeTextJustification` applies justification to the currently selected text, and  
`get_AttributeTextJustification` retrieves the current justification setting.

## AttributeTextStyle

Sets a specific text style, or retrieves the current text style setting.

## Syntax

**AttributeTextStyle(*TextStyle*)**

*TextStyle*:

A value depicting text style:

0 = normal

1 = bold

2 = italic

4 = underline

8 = strikeout

You can superimpose styles by adding the above values.

## Return Value

If retrieving the current text style, a value between 0 and 8 depicting the applied style. If applying a text style, 0 (zero) if successful. In both cases, an error is returned if unsuccessful. If values are out of range on writing to the attribute, the function will exit and report the error E\_INVALIDARG. If there is no active text object, these functions throw an exception with a return value of E\_HANDLE.

**Note:** For details on handling return and error values, see [Error Handling](#).

## Related Functions

[AttributeText](#), [AttributeTextJustification](#), [AttributeTextFont](#), [AttributeTextFontSize](#), [AttributeTextColour](#)

## Example

```
' Sets the normal text style
GraphicsBuilder.AttributeTextStyle = 0

' Retrieves the current text style setting
MyVariable = GraphicsBuilder.AttributeTextStyle
```

**Note:** This function is implemented in the C++ environment as two separate functions:

`put_AttributeTextStyle` applies a style to the currently selected text, and `get_AttributeTextStyle` retrieves the current text style setting.

## Using External Databases

You can store and update runtime data from your plant floor in a database external to Plant SCADA. You can also use Plant SCADA to send information from the database (such as a recipe) to I/O Devices in your plant.

Plant SCADA supports two types of databases:

- [dBASE Databases](#)
- [SQL Databases](#)

By using an external application to read and write the same database records, you can effectively interface to an external application through, for example, a relational database.

Plant SCADA provides two methods of communication with a database:

- using Devices
- using the [Using Structured Query Language](#).

Devices are most useful when the automatic reporting and logging features of Plant SCADA are used.

## dBASE Databases

The dBASE file format has become an industry standard for data storage, and Plant SCADA supports the standard dBASE format. You can use any database editor (that supports dBASE III files) to create a database, and to read and write database records.

To connect to a database, you need to define a Plant SCADA Device. Devices specify the format and location of the database, for example:

Name	Recipe
Format	{Name,16}{Water,8}{Sugar,8}{Flour,8} {Salt,8}{Yeast,8}{Milk,8}
Header	Name
File Name	[DATA]:RECIPE.DBF

Type	DBASE_DEV
Comment	Recipe Device (dBASE file)

## SQL Databases

SQL (Structured Query Language) also has become an industry standard. SQL is a command language that allows you to define, manipulate, and control data in SQL databases - and in other relational databases. Most database servers support SQL. SQL gives you direct access to database servers on other platforms, such as computers, mini-computers, and mainframe computers.

You can use the Plant SCADA Device functions to set up the format and locations of each of your SQL databases. Alternatively, use the SQL functions for direct control over SQL transactions.

You need to define a Plant SCADA Device to specify the format and location of the database, for example:

Name	Recipe

In the Format field, specify the field names in the SQL database, for example:

Format	{Name,16}{Water,8}{Sugar,8}{Flour,8} {Salt,8}{Yeast,8}{Milk,8}

The Header is the database connection string for ODBC connection, for example:

Header	DSN = ORACLEDATABASE

Enter the database table name in the File Name field:

File Name	RECIPE
Type	SQL_DEV
Comment	Recipe Device (SQL)

## See Also

[Using Structured Query Language](#)

## Using Structured Query Language

You can use Structured Query Language (SQL) functions for direct access to an SQL database, instead of accessing the database as a device. Using direct database access can provide greater flexibility.

The SQL functions provide access to SQL databases through any ODBC-compatible database driver, for example, MS Access, FoxPro or Paradox.

**NOTICE****PERFORMANCE DEGRADATION**

To avoid system and database performance degradation, please consider the following:

- Build queries that require an acceptable use of system resources (memory, CPU, threads).
- Limit scope of queries with parameter-driven WHERE clauses.
- Avoid using SELECT \* to return all columns.
- Do not perform queries with null values for date time parameters.
- Try to balance load between relational database management systems (RDBM) and SCADA, for example, consider sorting data on the client side rather than the server side.
- Consider using stored procedures to minimize the number of round trips to the server.

**Failure to follow these instructions can result in equipment damage.**

SQL functions provide absolute control and flexibility over connections and queries. Querying a database via the Device system is slower than constructing a query via a SQL function due to the generic nature of a device.

## ActiveX Data Objects

Plant SCADA 7.30 introduced the use of the ADO.NET library of SQL functions, which can be programmed using any of .NET managed languages, and is supported and further developed by its manufacturer. Further, the ADO.NET approach enables you to have multiple recordsets per connection, and multiple queries per recordset. Previous versions restricted you to 1 recordset per connection and 1 query per connection. You can also delegates connections, disconnections and query executions to separate application threads, meaning that SQL queries need no longer be blocking actions.

The technology facilitates connections to databases from various vendors and obtains data sets by executing either ANSI SQL commands or any database specific dialects of SQL (if a dedicated provider is used) such as T-SQL or PL/SQL.

Connections can be established to databases which:

- Have an ODBC driver
- Have an OleDB provider
- Use MS SQL Server.

Specifically, the Cicode SQL DB interface can be used to connect to either Historian or Historical Alarm databases as long as they use databases fulfilling one of the above conditions and store their data in types that can be read by the Cicode SQL interface.

[Limitations When Using Legacy SQL Functions](#)

[Database Connection Objects](#)

[Connecting to an SQL Database](#)

[Basic SQL Scenarios](#)

## Alarm Server Database Specification

### Limitations When Using Legacy SQL Functions

The SQL library used in Plant SCADA prior to release 7.30 had a number of limitations that are documented in Tech Note TN6222, available from the AVEVA Knowledge and Support Center. This library was not designed to handle large scale SQL data transactions. For large volumes of data it is recommended that CitectHistorian be used. Note that new functions using ADO.NET do not share these limitations.

If you intend to use the embedded SQL library in Plant SCADA, consider the following:

- Use "Simple" model for a SQL database to limit transaction information logging to transaction log file.
- Use the fixed size of transaction log to restrict the log file growing.
- Back up the database regularly to keep the transaction log size under control. When SQL Server finishes backing up a database or its transaction log, it automatically truncates the inactive portion of the transaction log. If the transaction log file is full, your database transactions will cease.
- Keep working tables as small as possible. When Plant SCADA SQL adds or appends a new row to data table, it uses SELECT \* first to get column information. If there are hundreds and thousands of records in the table, this action will certainly hinder the performance.
- Use SQL Server trigger to remove records from the working tables to the permanent tables. In this way, sizes of the working tables that are directly interfaced with Plant SCADA are not growing unrestricted.

### Database Connection Objects

The new implementation introduces database connection objects as containers for parameters describing SQL connections to the database.

Users can execute SQL queries via DB connection objects and return either disconnected SCADA recordsets or the connected SCADA recordset holding results of the queries.

Disconnected SCADA recordsets have no direct association to their DB connection objects and their lifetime is not limited by the DB connection objects' lifetime. They should be closed in Cicode when no longer necessary.

The connected SCADA recordset is directly associated to the DB connection object. The relation is 1-1 and there cannot be more than one connected recordset per one connection. The associated connected recordset is called further a default recordset.

SQL functions from the previous SCADA are kept and their functionality, from a user's point of view, is the same as before (see Cicode functions for minor exceptions).

A set of new Cicode SQL functions is introduced together with the new ADO interface. These new functions can be divided into four categories:

- Creation/connection – functions servicing separate creation of DB connection objects and separate connection initialization
- Multiple recordsets per connection – functions enabling users to obtain and use handles to disconnected recordsets (the old database access methods limited the number of recordsets per connection to one)
- Parameterization – functions helping to provide more secure way of building SQL queries
- Multiple queries per connection – functions enabling users to obtain and use handles to queries (the old database access methods limited the number of queries per connection to 1)

## See Also

[Basic SQL Scenarios](#)

## Basic SQL Scenarios

Two basic scenarios of using the Cicode SQL database interface are:

- **Accessing and analyzing data in a CCicode procedure**

The CCicode SQL database interface enables users to create a connection object, connect it to a database, execute SQL queries and step through records in either the default connected recordset, using legacy Cicode functions, or a disconnected recordset, using the new Cicode functions. See examples in SQLCreate and SQLConnect Cicode function descriptions.

In previous versions, this scenario could be problematic because connecting to databases and accessing data might hold SCADA Kernel's Tasks and temporarily block the entire application. The new implementation delegates connections, disconnections and query executions to separate application threads. The SCADA kernel thread, which initializes one of those actions, is suspended and waits for synchronization while other threads can continue processing their tasks.

- **Accessing and displaying data on a graphics page**

Typically, this scenario is used when the result of a query is displayed on a graphic page in the form of a table with the possibility of scrolling forward and backward through the data.

In this case the data from a disconnected SCADA recordset is displayed on a graphic page using the SQLGetField and SQLIsNullField SQL functions.

Data pertaining to the SQL query is copied to the disconnected SCADA recordset just after executing the query. This behavior means that there is no additional data fetching when you iterate through disconnected recordsets later.

---

**Note:** When executing queries, there is a direct relation between data size, execution time and memory consumption: the more data fetched the longer execution time and the larger amount of physical memory taken by the SCADA recordset. Take care to design your queries so that they return only amount of data compatible with available resources and performance expectations.

---

Since recordsets reside in memory while active, it is your responsibility to close unused SCADA recordsets when they are no longer required.

Disconnected SCADA recordsets will not depend on the existence of either the database connection object or the SQL connection to a database. The recordsets can therefore be seen as disconnected immediately after executing a query. They do not synchronize with the source database after that point. Subsequently, the SQL connection to a database can either stay open or be closed.

[Connecting to an SQL Database](#)

[Executing Legacy SQL Commands](#)

[Using a Transaction](#)

[Expressing Dates and Times in SQL](#)

## Connecting to an SQL Database

### Using Legacy Functions

Before you can use SQL commands, you need to connect to the SQL database. In previous versions of Plant SCADA you would use the SQLConnect function to provide the access. It has the format:

```
SQLConnect(sConnect);
```

where sConnect is the connection string, for example:

```
INT hSQL;  
hSQL = SQLConnect("DSN=DBASE_FILES;DB=C:\ODBC\EMP;LCK=NONE;CS=ANSI");  
! Connect to a dBASE Compatible Database File.
```

```
INT hSQL;  
hSQL = SQLConnect("DSN=EXCEL_FILE;DB=C:\ODBC\EMP;FS=10");  
! Connect to an Excel File.
```

```
INT hSQL;  
hSQL = SQLConnect("DSN=ORACLE_TABLES;SRVR=X:ACCTS;UID=SCOTT;PWD=TIGER");  
! Connect to an Oracle Database.
```

Refer to the documentation that accompanied your SQL server for details about connecting to an SQL database.

To close a legacy database connection, use the SQLDisconnect function with the handle to the connection object.

### Using ADO.NET Functions

The new interface requires two calls in order to open a connection to a database. The first call uses SQLCreate which prepares the database connection object. A second call SQLOpen establishes the SQL connection to the database.

SQLOpen can be used to reopen previously closed connections.

**Note:** SQL connections to databases can be closed sometimes by either databases or ADO.NET when certain conditions are fulfilled (for example through idle time expiration, active pooling mechanism logic).

To close an ADO.NET database connection, use the SQLClose function to close the connection and then the SQLQueryDispose with the handle to the connection object.

New functions can be used with the pre-existing ones. However, as a good programming practice, it is advised not to mix the old and the new interface. A hardware alarm will be generated if a SQLDisconnect is detected when there are connections opened with SQLCreate/SQLOpen, or if SQLClose/SQLDispose are detected and there are connections opened with SQLConnect.

### See Also

[Executing Legacy SQL Commands](#)

[Working with Recordsets](#)

### Working with Recordsets

ADO.NET uses disconnected recordsets to view data from a database. These are created by the function

SQLGetRecordset. A handle to the created recordset is returned and can be used in subsequent functions.

To access data from a specified column and row, use the SQLGetField function with a recordset handle. Null detection can be performed by using the SQLIsNullField function. See the code example in the SQLCreate function for a simple example.

ADO.NET allows you to create many queries per single database connection object. Queries are created using the function and disposed by the SQLQueryDispose function.

## See Also

[Parameterized Queries](#)

## Parameterized Queries

Parameterized queries are now possible with the new ADO.NET SQL interface. This provides the possibility to define queries with parameters which can be substituted later by concrete values (integers, reals or strings). This is especially useful when a query is built using end user data, such as user names and passwords, inserted via graphical pages (forms). When correctly applied, parameterized queries can prevent SQL injection attacks.

Parameters are defined for each DB connection object and concrete values are substituted into queries just before executing the function from the SQLExec family.

The parameters exist in DB connection objects as long as the objects exist. The function SQLParamsClearAll can be used to remove all parameters from a specified DB connection object. There is currently no way to iterate through all existing parameters in a DB connection object nor to remove a single selected parameter from the object's collection.

Each database provider (ODBC, OleDb, SQL Server) implements parameterized queries in different ways. As SQL queries can be very complicated, it is difficult to provide a generic converter for unifying the parameterization syntax. So to use parameterized queries, you should have knowledge of how they work on a particular provider and structure your Cicode accordingly.

See the examples in SQLParamsSetAsInt and SQLParamsSetAsString.

## Executing Legacy SQL Commands

SQL allows you to manipulate data in a non-procedural manner; you specify an operation in terms of what is to be done, not how to do it. SQL commands allow you to:

- Create tables in the database.
- Store information in tables.
- Select exactly the information you need from your database.
- Make changes to your data and to the structure of a table.
- Combine and calculate data.

The SQLExec() function executes any SQL command that your SQL server supports. For example, to create a database table, you would execute the SQL "CREATE TABLE" command:

```
SQLExec ( hSQL, "CREATE TABLE recipe ('Name' CHAR(16), 'Water' CHAR(8),
'Sugar' CHAR(8), 'Flour' CHAR(8), 'Salt' CHAR(8), 'Yeast' CHAR(8), 'Milk' CHAR(8))");
```

To add records into the database table, use the "INSERT INTO" command. The command has the following syntax:

```
INSERT INTO <filename> [(<col_name>, . . .)] VALUES (<expr>, . . .)
```

This command adds the values for each field in the table, for example:

```
SQLExec(hSQL, "INSERT INTO recipe VALUES ('Bread', '10', '5', '7', '1', '1', '2')");
```

Column names are optional; however, if you omit column (field) names, the values are inserted into the fields in the same order as the values.

To read data from an SQL database, use the SQL "SELECT" command. You can use the "SELECT" command to read an entire set of records, or a row, from the table. You can then use the SQLGetField() function to read the data in each field, for example:

```
SQLExec(hSQL, "SELECT * FROM recipe WHERE NAME = 'Bread'");  
If SQLNext(hSQL) = 0 Then  
PLC_Water = SQLGetField(hSQL, "WATER");  
PLC_Sugar = SQLGetField(hSQL, "SUGAR");  
PLC_Flour = SQLGetField(hSQL, "FLOUR");  
PLC_Salt = SQLGetField(hSQL, "SALT");  
PLC_Yeast = SQLGetField(hSQL, "YEAST");  
PLC_Milk = SQLGetField(hSQL, "MILK");  
END
```

To delete database records, use the SQL "DELETE" command. The command has the following syntax:

```
DELETE FROM <filename> [WHERE <conditions>]
```

This command deletes values from the table, for example:

```
SQLExec(hSQL, "DELETE FROM recipe WHERE NAME = 'Bread'");
```

## See Also

[Using a Transaction](#)

## Using a Transaction

You can use a database transaction for more sophisticated database operations. A database transaction allows you to execute a series of SQL commands and then either commit the changes to the database, or 'roll back' (cancel) the changes, for example:

```
SQLBeginTran(hSQL); ! Begin the transaction  
SQLExec(hSQL, "UPDATE recipe SET water = '12' WHERE NAME = 'Bread'");  
SQLExec(hSQL, "UPDATE recipe SET milk = '1' WHERE NAME = 'Bread'");  
IF . . . THEN  
    SQLCommit(hSQL); ! Commit the transaction  
ELSE  
    SQLRollBack(hSQL);! Cancel the transaction  
END  
Check the ODBC-compatibility level of your database driver if you cannot use transactions.
```

## See Also

[Expressing Dates and Times in SQL](#)

## Expressing Dates and Times in SQL

The way in which SQL dates are expressed depends upon the particular database system. With dBASE, you normally specify a date in braces, for example {02/18/95}. For Oracle, use the format: to\_date('02/18/95', 'MM/DD/YY'). Other ODBC drivers might require another format - a common ODBC format is: 'YYYY-MM-DD'.

---

**Note:** Date references in an external database have to be based on the Gregorian Calendar, or the database tables needs to be exported to text files before use in Plant SCADA. Dates in Microsoft Access database tables exported as text files are stored as Gregorian values.

---

### See Also

[Conversions between Database and Cicode Types](#)

### Database Independent Date-Time Syntax

For database independence, you can use the following syntax for dates and times:

[<format>'YYYY-MM-DD HH:MM:SS.FFFFFFF' ]

Where:

- <format> (the first character after the opening square bracket) needs to be one of the following:
  - d - date
  - t - time
  - dt - date and time.

Whether you are specifying a date, time, or date and time, you need to provide the complete 26 character string, for example:

[d'1995-02-18 00::00.000000' ]

Refer to the documentation that accompanied your SQL server for further information about SQL commands.

### Conversions between Database and Cicode Types

Any type of database field can be requested in statements. SCADA converts values of the fields to MBCS 8-bit strings which may not always be possible. For example:

- Single byte database strings or numbers can be converted to MBCS 8-bit strings, processed and displayed by SCADA
- Multi-byte strings can be converted to MBCS. Processing and displaying can be done as far as: SCADA supports MBCS and is properly parameterized, OS has Language packs installed and is properly parameterized
- Blobs (binary large objects) cannot be converted.

An error is returned when conversion to 8-bit strings is not possible.

**NOTICE****LACK OF DATA CONVERSION**

Ensure that all your database fields can be converted. Otherwise, when conversion is possible, some data may not be converted, but there is no indication that has occurred. For example when SCADA isn't properly parameterized.

**Failure to follow these instructions can result in equipment damage.**

There are a large number of custom DB types that need macros/functions to be called on the database side of the SQL connection for their proper conversion to strings.

**MS SQL Server DB types and only their subset**

MS SQL Server DB type	Format of the CiCode string returned by either SQLRecordsetGetField or SQLGetField*
CHAR(), NCHAR(), VARCHAR(), NTEXT, NVARCHAR(), TEXT, XML	The text is converted to MBCS 8-bit string.
BIT, BIGINT, INT, SMALLINT, TINYINT	Integer as a text string
DECIMAL(,), FLOAT, NUMERIC(,), REAL, MONEY, SMALLMONEY	Real as a text string.
UNIQUEIDENTIFIER	A unique id stored as a 16-byte binary value and usually converted to a GUID-like string
SQLVARIANT	The sqlvariant is a type which can encapsulate other types. The format of the resultant string depends on the encapsulated type and ability to convert it to a string.
DATE, DATETIME, DATETIME2(), DATETIMEOFFSET, SMALLDATETIME, TIME()	Date and time as a string. Only one format and UTC. If users wish to have date/time in a different format, have to use DB side conversion macros/functions in their SELECT queries.
BINARY(), VARBINARY(), IMAGE, GEOGRAPHY, GEOMETRY, HIERARCHYID, TIMESTAMP	No conversion possible. The returned string is empty. An error is set during the query execution by either SQLExec() / SQLNext() or SQLGetRecordset(). Moreover, Geography, Geometry and HierarchyID need additional CLR types not distributed with .NET platform. If need to use objects of those types in queries directly (without explicit conversions by macros), the CLR types need to be installed either separately or with SQL Server. Otherwise such queries return error 307. A separate setup with the CLR types can be downloaded from <a href="http://www.microsoft.com/">http://www.microsoft.com/</a>

<b>MS SQL Server DB type</b>	<b>Format of the CiCode string returned by either SQLRecordsetGetField or SQLGetField*</b>
	en-us/download/details.aspx?id=30440.

## MS Access types and only their subset

<b>MS Access DB type</b>	<b>Format of the CiCode string returned by either SQLRecordsetGetField or SQLGetField*</b>
Text, Memo, Hyperlink, Lookup Wizard	The text is converted to MBCS 8-bit string.
Yes/No, AutoNumber	Integer as a text string
Number, Currency	Integer as a text string or (if necessary) Real as a text string.
Date/Time	Date and time as a string. Only one format and UTC. If users wish to have date/time in a different format, have to use DB side conversion macros/functions in their SELECT queries.
OLE Object	No conversion possible. The returned string is empty. An error is set during the query execution by either SQLExec()/SQLNext() or SQLGetRecordset().

\* The string has to be shorter than 255 characters, otherwise an error is thrown.

The Cicode runtime engine tries to automatically convert strings to target data types when a cast operation is necessary. The following conversions are potentially allowed: STRING to INT and STRING to REAL.

## Exchanging Data with Other Applications

You can transfer data between Plant SCADA and other software for storage, analysis, and post processing, or to control and tune your Plant SCADA system.

Plant SCADA uses the following methods to exchange data:

- Using DDE (Dynamic Data Exchange) (DDE), where Plant SCADA can act as a:
  - **DDE server** providing tag values to requesting clients
  - **DDE client** to request data from other applications.
- Using ODBC Drivers (ODBC), where Plant SCADA functions as an ODBC server, allowing other applications to read Plant SCADA variables directly.
- By using a common [external database](#), where Plant SCADA and other applications use the same database to store and share information.

Plant SCADA also supports importing and linking variable tag data from external databases (see [Link Tags to an External Data Source](#)).

## Using DDE (Dynamic Data Exchange)

**Note:** Plant SCADA's DDE Server is disabled by default. To enable the DDE Server, set the parameter [\[DDE\]Enable](#) to 1 in the Citect.ini file. In addition, the Cicode function [DDEPost](#) is disabled on the DDE Server.

Microsoft Windows DDE allows the continuous and automatic exchange of data between different Windows applications on the same machine without the need for any user intervention. For example, your company's Production group might use a spreadsheet application to graphically represent plant-floor data (product output). This could be dynamically updated with the latest live data using DDE to read values directly from Plant SCADA.

Windows DDE uses the DDE protocol to send messages between applications that share data. Dynamic Data Exchange occurs between a DDE client application (which requests the data or service) and a DDE server application (which provides the data or service).

The DDE Client starts the exchange by establishing a conversation with the DDE server, and requesting data or services. The DDE server responds to these requests by providing the data or services to the DDE Client. The DDE Client terminates the conversation when it no longer needs the DDE server's data or services.

**Note:** As the DDE protocol is not designed for high-speed data transfer, the use of DDE is only appropriate when data communication speed is not critical.

- For information about DDE conversations, see [DDE Conversations and Client Syntax](#).
- To establish a DDE conversation between applications on the same computer, see [Setting up DDE Conversations](#).
- To establish DDE conversations between applications running on different computers over the same network, see [Network DDE](#).
- To establish DDE Conversations with the Plant SCADA tag database directly, see [Connecting to the Tag Database using DDE](#).

**Note:** When reading or writing to Plant SCADA tags using DDE, you might unknowingly add to your Plant SCADA license point count. Once the dynamic point count is greater than the license point count, the software protection mechanism will terminate Plant SCADA runtime. Therefore, when accessing tags via DDE, it's important to remain aware of how many points you have used. For details, see license point count in the Installation and Configuration Guide.

## DDE Conversations and Client Syntax

Two applications participating in Dynamic Data Exchange are said to be engaged in a **DDEconversation**. The application that initiates the conversation is the **DDE Client**, and the application that responds to the DDE Client is the **DDE server**.

An application can have several DDE conversations running at the same time. The application can be the DDE Client in some conversations (requesting data or services), and the DDE server (the data/service provider) in others. Each request or response in a DDE conversation specifies the data or service to be sent or received.

**Note:** A DDE conversation is sometimes referred to as a **channel** or a **link**.

The syntax sent by the DDE Client when it tries to establish a DDE conversation with the DDE server, consists of three parts:

- The name of the application to retrieve the data from.
- The file or topic name which contains the data to be retrieved.

- The cell range, value, field, or data item that's being requested.

These are combined in the format:

<DDE server application name> | <DDE Topic name>!<DDE Data item name>

Where:

- <**DDE server applicationname**> identifies the DDE server application.
- | (pipe character) separates the DDE server application name from the DDE Topic Name with no spaces between them.
- <**DDE Topic name**> identifies the context of the data. For DDE Servers that operate on file-based documents, DDE topic names are typically file names. For other DDE Servers, they are other DDE application-specific strings.
- ! (exclamation character) separates the DDE Topic Name from the DDE Data item name with no spaces.
- <**DDE Data item name**> is a string that identifies the data item that a DDE server can pass to a DDE Client during a DDE transaction. In some instances, the DDE Data item name is optional. Refer to the DDE application documentation for particulars.

---

**Note:** In the DDE Client syntax structure example above, every placeholder shown inside arrow brackets (<placeholder>) has to be replaced with the actual name of the item that it describes. Do not include the arrow brackets and the placeholder words they contain in the statement, and are shown here only for your information.

As the DDE protocol was designed in an era before long file names, DDE only supports the use of short (8 character) file names. To overcome this limitation, enclose the three parts of the DDE syntax within single quotes respectively. For example:

Citect|Variable! 'Process Variable 1'

This instructs DDE to treat the characters within the quotes as strings, thus permitting them to contain long file names, the space character ( ), the pipe character (|), the exclamation or bang character (!), or any other non alphanumeric character.

## See Also

[Setting up DDE Conversations](#)

### Setting up DDE Conversations

The DDE protocol itself does not support the launch of applications, so both the DDE Client application and the DDE server application needs to already be running before any DDE conversations can occur (unless the calling application is coded to detect and launch the DDE server application when necessary).

At the beginning of a DDE conversation, a DDE Client requests the services of a DDE server using DDE Client syntax (which contains the DDE server application name, topic or file name, and the data item name in the request). For DDE Client syntax details, see [DDE Conversations and Client Syntax](#).

To set up an application as a DDE Client, that is, to request data from a DDE server application, you need to use appropriate values in the DDE Client syntax as follows:

## DDE server application name

The DDE server name is usually the DDE server application name, for example the DDE server name for Plant SCADA is "Citect", the DDE server name for Microsoft Excel is "Excel", the DDE server name for Microsoft Word is "WinWord", and the DDE server name for Microsoft Access is "MSAccess". Most DDE Servers respond to only one name.

## DDE topic name

The DDE Topic name for Plant SCADA is either "**Data**" (if you use the Cicode DDE functions) or "**Variable**" (if you use Plant SCADA as the DDE server and want to access the variable tag database directly). The DDE Topic name for Microsoft Excel is the name of the worksheet (which may also include the workbook name enclosed in square brackets). The DDE Topic name for Microsoft Word is the document name. The DDE Topic name for Microsoft Access is the Database name and Table name, Query name or an SQL string as detailed in the following note:

---

**Note:** The proper DDE Client syntax of the DDE Topic name section for accessing a Microsoft Access database is constructed like this: "<DataBaseName>; TABLE <TableName>".

The < DataBaseName > placeholder is for the name of the Access database file followed by a semicolon ( ; ). You might have to include the file path; however this might not be the case (i.e. if it is known that Access will be running with the target file open). The .MDB suffix is optional (as .MDB is the default suffix for Access databases), unless the full path was included.

The **TABLE <TableName>** is the command string to instruct Access which table data you intend to converse with. DDE also supports the use of **QUERY <QueryName>** or **SQL <SQLString>** in place of **TABLE <TableName>**.

The use of the semi-colon ( ; ) after the '< DataBaseName >' placeholder, and the use of UPPERCASE for the 'TABLE', 'QUERY', and 'SQL' commands in the DDE string syntax are necessary. The whole section needs to be enclosed in quotes ( " ).

## DDE Data item name

The DDE Data item name for Plant SCADA depends upon the DDE Topic name being used. When using 'Variable' as the DDE Topic name to access the variable tag database directly, the DDE Data item name is the Plant SCADA variable tag name. When using 'Data' as the DDE Topic name to access a value posted using the Cicode DDEPost() function, the DDE Data item name is the posted name.

The DDE Data item name for Microsoft Excel is the cell range in Row number Column number format (for example R1C1). The DDE Data item name for Microsoft Word is a bookmark name. The DDE Data item name for Microsoft Access is dependant upon which topic name was used. Refer to the Microsoft Access Help for details.

---

**Note:** Microsoft introduced security measures with Office which, by default, block Office applications from being DDE Clients. For security details, see [Using DDE with Microsoft Office Applications](#).

Plant SCADA can perform as both a DDE server and as a DDE client as necessary. To set up Plant SCADA to use DDE, see [Exchanging Plant SCADA Data via DDE](#).

## DDE Function Types

There are two classes of DDE functions in Cicode, the original **DDE** functions and the later **DDEh** functions.

- **DDE functions**

The original Cicode DDE functions do not return a DDE Channel Number and were designed to insulate the user from the need to manage DDE Channels. The DDERead(), DDEPost(), DDEWrite(), and DDEExec() functions each perform a single exchange of data. Each of these functions starts a DDE conversation with the external application, sends or receives the data (or command), and ends the conversation - in one operation.

- **DDEh functions**

The Cicode **DDEh** functions were introduced to afford more control over DDE communications, especially for Network DDE and for circumstances where it is necessary to explicitly terminate and re-initiate a DDE Channel (after deleting rows from a table for example).

The DDE handle (*DDEh...*) functions return a handle to the conversation - a DDE channel number.

Use the DDEh handle functions for Network DDE and for Access DDE.

## See Also

[Exchanging Plant SCADA Data via DDE](#)

## Exchanging Plant SCADA Data via DDE

Plant SCADA runtime can exchange data as a DDE server or a DDE Client.

Plant SCADA behaves as a DDE server when providing other applications with access to its data. When acting as a DDE server, Plant SCADA runtime can:

- Provide DDE access to the complete variable tag database **automatically** with no further setup necessary
- Provide access to selected variable values by posting select Plant SCADA data using DDE

Plant SCADA behaves as a DDE client when requesting other applications to provide access to their data. When acting as a DDE Client, Plant SCADA runtime can:

- Read data directly from another application
- Write data directly to another application

---

**Note:** You can also execute commands in another application from Plant SCADA with the DDEExec() function.

Similarly, you can run Cicode functions from another application by passing the functions through that application's DDE Execute command.

---

## See Also

[Connecting to the Tag Database using DDE](#)

## Connecting to the Tag Database using DDE

Plant SCADA runtime behaves as a DDE server and automatically provides DDE access to the complete variable tag database with no further setup necessary.

To create DDE links to the Plant SCADA variable tags, use the DDE Client syntax. For syntax details, see [DDE Conversations and Client Syntax](#).

In the DDE Client call, the DDE Application name needs to be "Citect", the DDE Topic name needs to be

"Variable", and the DDE Data item name needs to be the Plant SCADA tag name.

For instance, the PV1 tag value can be accessed from a cell in Excel containing the following formula:

```
=Citect|Variable!PV1
```

If the Plant SCADA variable tag name contains spaces or non-alphanumeric characters, the DDE data item section of the DDE Client call syntax needs to be enclosed within single quotes. For example:

```
=Citect|Variable! 'Process Variable 1'
```

Plant SCADA runtime and the DDE Client application (for example Excel) need to both be running on the same computer. For information about DDE conversations, see [DDE Conversations and Client Syntax](#).

To establish a DDE conversation between applications on the same computer, see [Setting up DDE Conversations](#).

To establish DDE conversations between applications running on different computers over the same network, see [Network DDE](#).

## Posting Select Data using DDE

You might have a tag naming convention which is not DDE compatible, or inappropriate for use in a DDE call. Plant SCADA provides the ability to publish specific tags under different names in DDE. This involves using the DDEPost function.

To make selected Plant SCADA variable values or the results of calculations available to external DDE Client applications currently running on the same computer, use the Cicode DDEPost() function to have Plant SCADA runtime behave as a DDE server.

This conversation is one-way, which allows an external DDE Client application (like Excel, Word, etc.) to read the value from Plant SCADA using DDE. The Client application cannot change this value in Plant SCADA.

You can use this function to present data under a different name than its source. For instance, the following example presents the value of variable tag PV1 as "Process1".

The following Cicode example posts the value of variable PV1 using DDE:

```
DDEPost("Process1", PV1)
```

Once posted, this value can be accessed, for example, from a cell in Excel containing the following formula:

```
=Citect|Data!Process1
```

or from a field in Microsoft Word containing the following function:

```
{DDEAuto Citect Data Process1 }
```

### Notes:

- The name of the posted value (for example Process1) not to exceed 8 characters or contain spaces if you want to link to it via a Microsoft Word DDE field. Microsoft Excel, however, accepts long data item names if enclosed within single quotes (for example 'Process Variable 1').
- You need to use Data as the DDE Topic name when accessing posted values. See [Setting up DDE Conversations](#).

This method of DDE connection requires that both Plant SCADA runtime and the DDE Client application (for example Excel or Word) are running on the same computer at the same time. Once the DDE connection has been made, the DDE Client would normally display the updated value of the Plant SCADA DDE posting as soon as it becomes available, usually within milliseconds of the post.

Unfortunately, this posting method of DDE linking is subject to breakage whenever Plant SCADA runtime is closed, even if Plant SCADA runtime is subsequently restarted. The DDE Client application might not detect the

lack of connection, as updates to the data in the DDE Client (for example Excel) only occur after each post by the DDE server (Plant SCADA runtime). If no further posts occur, and in this scenario none will (as the DDE link is disconnected), the DDE Client application receives no update, and subsequently might display data which could be out of date. This disconnected state will remain until the DDE link in the DDE Client application is refreshed or the DDE Client application is restarted.

## See Also

[Writing Values to a DDE Application](#)

## Writing Values to a DDE Application

To write a Plant SCADA variable value directly to an external DDE server application currently running on the same computer as Plant SCADA, use the Cicode DDEWrite() function.

For example, writing data from Plant SCADA to a Microsoft Office Application (using Plant SCADA as the DDE Client and the Office application as the DDE server), could be done using the following Cicode DDEWrite() function examples:

```
! Write PV1 to Excel
! Assumes the existence of Sheet1
DDEWrite("Excel", "Sheet1", "R1C1", PV1);

! Write PV1 to Word
! Assumes the existence of TestDDE.doc already loaded in Word
! containing the bookmark named TagPV1
DDEWrite("Word", "TestDDE", "TagPV1", PV1);
! MS Access does not support direct DDE writes.
```

This DDE function is one-way, so to update the tag value in the remote DDE server application, this function will need to be called every time the value of this Plant SCADA variable changes.

Writing directly to a DDE server assumes a prior knowledge of the DDE server. In the above example, the spreadsheet or document needs to exist and Excel or Word (as appropriate) needs to be running for the DDE communication to be successful.

**Note:**

- Instead of using the once only DDEWrite(), you could use the multiple use DDE handle function DDEhPoke().
- Verify that remote requests are enabled in the other application. For example, in Excel, you need to verify the **Ignore other applications** check box is cleared (the default setting).
- The High security setting (if selected) on Microsoft Office does not appear to affect the use of remote DDE Client requests with those Office applications. See [Using DDE with Microsoft Office Applications](#).

## See Also

[Reading Values from a DDE Application](#)

## Reading Values from a DDE Application

To read a value into a Plant SCADA variable directly from an external DDE server application currently running on

the same computer as Plant SCADA, use the Cicode DDERead() function. For example:

```
PV1 = DDERead("Excel", "[Book1]Sheet1", R1C1);
```

The data from Row 1, Column 1 on Sheet 1 of Book 1 in Excel is read and stored in the Plant SCADA variable "PV1". This DDE function is one-way, and will need to be called whenever the value needs to be updated in Plant SCADA.

Reading from a DDE server assumes a prior knowledge of the DDE server. In the above example, Excel needs to be running and the appropriately named spreadsheet needs to exist. The Plant SCADA variable PV1 needs to also have been previously declared.

---

**Note:** Instead of using the once only DDERead(), use the multiple use DDE handle function DDEhRequest().

---

Verify that remote requests are enabled in the other application. For example, in Excel, you need to confirm that the **Ignore other applications** check box is cleared (the default setting).

The High security setting (if selected) on Microsoft Office does not appear to affect the use of remote DDE Client requests with those Office applications. See [Using DDE with Microsoft Office Applications](#).

## Using DDE with Microsoft Office Applications

Microsoft has introduced security measures with Office which, by default, block Office applications from being DDE Clients. See [Microsoft Office Security](#).

Microsoft Office applications appear to support varying degrees of long file names with DDE. See [Long File Names in DDE](#).

To enable DDE remote requests in Microsoft Excel, you need to verify the **Ignore other applications** check box is cleared (the default setting).

## Long File Names in DDE

According to MSDN Knowledge Base article Q109397, DDE does not support long file names, so DOS alias names needs to be used for directory and file names longer than eight characters (i.e. C:\mydocu~1\file.mdb).

Different Microsoft Office applications differ in their support for the use of long file names when used as DDE Clients. For instance, Microsoft Word does not appear to support the use of DDE data item names which exceed 8 characters, while Microsoft Excel however, accepts long data item names if enclosed within single quotes. See [Posting Select Data using DDE](#) for an example.

## Microsoft Office Security

In the interests of data security, Microsoft Office has its security settings set to high by default. To view or change your security level in Excel or Word, choose **Tools | Macro**, click **Security**, and click the **Security Level** tab.

- If you have your security level set to **High** (the default setting), then communication with external DDE Servers will not be available unless they are digitally signed and trusted. What you see in Excel cells that use the DDE function is #N/A , and with no additional explanation as to why the DDE functions aren't working. The High security setting (if selected) does not appear to affect the use of remote DDE Client requests with those Office applications as DDE Servers.
- If you set your security level to **Medium**, you are asked if you want to run any DDE Servers that are not digitally signed and trusted and that are referenced by DDE functions.

- If you set your security level to **Low**, external DDE Servers are run regardless of whether they are digitally signed and trusted, or not.

---

**Note:** If you need to manipulate another application's objects from Microsoft Office, consider using OLE Automation.

---

## Network DDE

Network DDE is a version of the DDE protocol for use across a network. For information about DDE, see [Using DDE \(Dynamic Data Exchange\)](#). For details about setting up Plant SCADA to use DDE, see [Exchanging Plant SCADA Data via DDE](#).

Just like the establishment of a DDE conversation between applications running on the same computer, a network DDE conversation uses the same DDE protocol to share data between applications running on separate computers connected to a common network.

Network DDE is a Windows Service used to initiate and maintain the network connections, security, and shared file space needed for using DDE over a network, and needs to be running on both computers at the same time. For startup details, see .

A network DDE trusted share needs to be manually created for the Network DDE server application on the Network DDE server application machine. This instructs the Network DDE Service (on the DDE server application machine), as to which application and topic to connect with. It is this share name which the Network DDE Client application can subsequently communicate with. For details, see [Setting up Network DDE Shares](#).

The Network DDE Client starts the Network DDE conversation by connecting to the Network DDE Share on the Network DDE server computer. For details, see [Using Network DDE](#).

## Starting Network DDE Services

For Network DDE to function, NetDDE.EXE needs to be installed and running on both machines before attempting to conduct a Network DDE conversation. NetDDE.exe is a Windows Service system file that is used to communicate the shared dynamic data exchange used by Network DDE. It has no graphical user interface (it runs as a background Windows service).

It is necessary to initiate the automatic activation of Network DDE Services, or manually run NetDDE.EXE on both machines before attempting connection.

### To manually start Network DDE services:

- On the Windows Start menu, click **Start | Run**, type in "netdde" (without the quotes) and press the **Enter** key. Do so on both machines.

### To automatically start the Network DDE Services on machine startup:

- Use the Windows Services Manager (select **Start | Control Panel | Administrative Tools | Services**) to set the **Network DDE** service from **Manual** to **Automatic**. To do so, right-click the service and select **Properties** from the pop-up menu. On the **General** tab select **Automatic** from the drop-down list of the **Startup type** field. Click **OK**. Close evry window and restart the machine.

**To verify that the NetDDE Services are running:**

- The Windows Task Manager lists NetDDE.exe on the **Processes** tab when running. To view the Windows Task Manager, press **CTRL+ALT+DEL**.
- The Service Administrative Tools also lists the status of Network DDE and Network DDE DSDM. To view the Windows Services Manager, select **Start | Settings | Control Panel | Administrative Tools | Services**.

---

**Note:** If you are using only the Microsoft Client Service for NetWare Networks, the NW IPX/SPX/NetBIOS compatible protocol needs to be enabled for NetDDE.exe to load.

---

**To test that Network DDE is operational between two machines on the same network**

Microsoft Windows ships with a network DDE application called Chat. It is installed in the system32 folder.

1. On the Windows Start menu, click **Start | Run**, type in "winchat" (without the quotes) and press the **Enter** key. Do so on both machines.
2. On one machine, select the Chat menu **Conversation | Dial** or click the dial button. The **Select Computer** dialog will display.
3. Select the other computer from the list, and click **OK**. Chat will attempt to establish a network DDE conversation between the computers.

---

**Note:** If Chat is not already running on the other computer, it times-out and states that the other computer didn't answer. If however, the other computer is already running Chat, it will keep dialling until answered.

---

4. On the other machine, (while it is being dialed), select the Chat menu **Conversation | Answer** or click the answer button. Type in a message and it will display in the Chat window on the other machine. The conversation will continue until either machine hangs up.

Once a Chat conversation is established, it proves that both machines are properly set-up and capable of handling network DDE conversations. You can view the share properties for Chat\$ by using the DDEShares.exe application as described in [Setting up Network DDE Shares](#).

You don't have to run Chat to use Network DDE with Plant SCADA. This Network DDE test only uses Chat as an example to confirm Network DDE functionality between two machines. Once you have established that Network DDE is functional, close the Chat windows, create the **Network DDE Trusted Share** for your Network DDE server application, and connect to the share using Network DDE. See [Connecting to a Network DDE Shared Application](#).

## Setting up Network DDE Shares

To be able to create a DDE link over a network, the computer serving as the Network DDE server needs to be setup to provide a **NetworkDDE Share** to establish a network DDE Channel.

---

**Note:** You only have to create a DDE Share if you intend to use DDE between two separate applications running on different machines, and you only have to create the DDE Share on the machine that contains the application which will be the DDE server.

---

The Windows DDESHARE.EXE utility enables users to manage DDE shares. The 32-bit version is shipped with each Microsoft operating system and is located in the Windows\System32 sub-directory.

**To manually launch the DDE Share utility:**

- On the Windows Start menu, click **Start | Run**, type in "ddeshare" (without the quotes) and press the **Enter** key.

When DDEShare.EXE is running, it displays the DDE Share utility window containing two icons which launch the DDE Shares dialog, and the DDE Trusted Shares dialog:

In the DDE Share utility, double-click the left icon (without the check mark) to display the DDE Shares dialog box:

The DDE Shares dialog is used to create, manage, and delete global DDE shares on your computer, and to view the DDE shares of any computer on the network. You can use this dialog to confirm the names of shares available on any machine on the same network. From the DDE Shares menu, select **Shares | Select Computer** and choose the computer name you're interested in from the list.

## DDE Shares

There are three types of DDE shares: old style, new style, and static. Plant SCADA only supports the static type. The names of static shares follow the convention

<ShareName>\$

so to set up a Plant SCADA server computer as a Network DDE share, use the name "Citect\$" as the sharename on that computer. To expose the Plant SCADA runtime variable tag database for suitable DDE linking, use the word "Variable" as the DDE Share Topic name.

**Note:** The trailing dollar sign (\$) is necessary as part of the DDE share name syntax.

### To create a DDE share:

1. In the DDE Shares dialog, click **Add a Share**. The **DDE Shares Properties** dialog appears. Verify that the fields are blank, or unchecked, except for the **Grant access to every item** radio button which needs to be checked.
2. Click **Permissions**. The DDE Share Name Permissions dialog appears.
3. **Read and Link** is the default permission setting. If you want to write data to the DDE Share application, change the permission to **Full Control**.
4. Click **OK**.
5. Click **OK** to save the Share, and return to the **DDE Shares** dialog.

## See Also

[Using DDE Trusted Shares](#)

## Using DDE Trusted Shares

When a network DDE Client user connects to a network DDE Share from a remote computer, Network DDE accepts the request only if both:

- The user who created the share has granted trusted status to the share.
- The user who created the share is currently logged on to the server computer.

To link to the Plant SCADA tag database, and permit write actions from an external application using Network DDE, the DDE Client computer needs to be granted appropriate Trusted status.

### To create a trusted share:

1. On the DDE Shares dialog, highlight the new 'Citect\$' share entry, and click **Trust Share to display the Trusted**

Share Properties dialog box.

2. Check **Initiate to Application Enable** to allow new connections to the DDE share.
3. Click **OK**.

#### To view the trusted shares:

1. In the DDESHARE utility double-click the right icon (with the check mark) to display the DDE Trusted Shares dialog.
2. The DDE Trusted Shares dialog lists the DDE shares that are trusted in the current user's context. You can view and modify trusted share properties and remove DDE shares from the list of trusted shares.
3. Once setup is completed, close the DDE Share utility dialog box.

## Using Network DDE

Microsoft Network DDE Service needs to be running on both computers to communicate using Network DDE. For startup details, see [Starting Network DDE Services](#).

Before a Network DDE Client can establish a DDE conversation with a Network DDE server application, the Network DDE server application computer needs to already have setup a **Network DDE Share**. For details, see [Setting up Network DDE Shares](#).

---

**Note:** You cannot connect using Network DDE to a shared application on the same machine. You can only connect using Network DDE to a shared application on another machine (which needs to also be on the same network).

---

To connect to a Network DDE shared application, you use an altered version of the DDE syntax, which replaces the "<ApplicationName>" with "<ComputerName>\NDDE\$" and replaces the "<TopicName>" with the Network DDE server Share "<ShareName>", and continues to use the "<DataItemName>" as normal.

At first glance, there appears to be no way to specify the DDE Application or Topic names in the Network DDE syntax call, and indeed, that is the case. However, the DDE Application and Topic names are defined in the DDE server Share settings. So, when the Network DDE server machine receives the call (from the Network DDE Client) containing the Share name, it knows which application and topic to connect with. See [Connecting to a Network DDE Shared Application](#).

## Connecting to a Network DDE Shared Application

The network DDE Client specifies the remote DDE server share in the normal DDE Client syntax by replacing the DDE Application name and DDE Topic name with the DDE server computer name and DDE server share name in the call. For DDE client syntax details, see [DDE Conversations and Client Syntax](#).

With Network DDE Client syntax, the DDE Application name is replaced with the following string enclosed in single quotes:

```
'\\<ComputerName>\NDDE$'
```

where "<ComputerName>" is the name of the computer running the DDE server application, and "NDDE\$" notifies Windows on the remote computer that the calling DDE Client wishes to establish a Network DDE channel. You cannot omit the NDDE\$ string, or it won't work.

The DDE Topic name is replaced with the following string also enclosed in single quotes:

```
'<ShareName>'
```

where "<ShareName>" is the name of the DDE Trusted Share previously set-up on the DDE server computer. The DDE Share on the DDE server machine contains the details of which application and topic to create the Network DDE link with. Most often, DDE server share names end with a \$ character.

---

**Note:** You need to use a separate DDE share name on the remote computer for each combination of DDE application name and DDE topic name you want to share. You can not declare the topic as a wild card (\*).

---

For example, to create a Network DDE link with the following criteria:

- Plant SCADA variable tag name: "PV1"
- Plant SCADA server computer name: "PlantSvr"
- Remote DDE Share name: "Citect\$"

you would construct a Network DDE Client call containing:

```
'\\PlantSvr\NDDE$' | 'Citect$' !PV1
```

In Excel, the following formula could be placed directly into a worksheet cell:

```
='\\PlantSvr\NDDE$' | 'Citect$' !PV1
```

If prompted for a username and password, use one that has appropriate permissions on the DDE server computer.

---

**Note:** You cannot omit the DDE syntax pipe character (|) or exclamation character (!), nor can you enclose those characters within quotes ('').

---

## Using ODBC Drivers

Plant SCADA supports the Open Database Connectivity (ODBC) standard. Many manufacturers of database packages also supply an ODBC database driver for their software. As well as these, there are independent parties manufacturing ODBC database drivers for various databases, such as Intersolv Q+E with their DataDirect ODBC Pack. Usually, any ODBC driver for your database will work.

### Installing the ODBC driver

You need to install and setup up your ODBC driver from the Windows Control Panel. To do this:

1. Open the Windows Control Panel.
2. Click the **ODBC** icon to start the ODBC setup utility (if you do not already have an ODBC icon in your control panel, you might need to install the icon. See the documentation provided with your ODBC driver).
3. Click **Add** to set up a DataSource.

---

**Note:** If your ODBC driver is not included in the list of Installed ODBC Drivers, return to the ODBC setup utility and install your driver (select the **Drivers...** button).

---

4. From the **Add Data Source** dialog box, select your ODBC driver. The Setup dialog is displayed.
5. Enter the Data Source Name of the driver that you used previously. For example, if you had used SQL with a dBASEIII database, then your connection string would have been "DRV=QEDBF". To avoid changing the connection strings throughout your project, use a Data Source Name of **QEDBF**.
6. Run your Plant SCADA project.

Some Cicode SQL functions will not work if your ODBC driver has limited functionality. This situation is not

frequently encountered, and in most cases affects only the ability to use transactions with the SQLBeginTran(), SQLCommit(), and SQLRollBack() functions. If you are using the Intersolv Q+E ODBC drivers, it is unlikely you will experience any loss of functionality.

You might need to change the data source in the Control Panel each time you switch from using one ODBC-compatible driver to another, for example from a dBASE file to an Access database. Click the ODBC icon and select from the list of available data sources. (Refer to the documentation supplied with your driver for more information.)

**Note:**

1. For maximum compatibility with the Cicode SQL functions, the ODBC driver has to provide a minimum of functions. For example, if your driver does not support the ODBC function SQLTransact, you cannot use the Cicode functions SQLBeginTran(), SQLCommit(), and SQLRollback().
2. Any functions you might have created in early versions are backward-compatible. Q+E drivers are now ODBC-compliant, so you need to upgrade your old Q+E database driver to a Q+E ODBC database driver.

## About the ODBC driver

Plant SCADA connects directly to the Microsoft Access ODBC driver, which allows applications to access information stored in MDB (Microsoft Access Database) files without actually running Microsoft Access. (Microsoft Access uses the "Jet Engine" DLL to access information stored in MDB files.)

ODBC normally implies heavy use of SQL statements to manipulate data. SQL statements can become quite complex and verbose. To implement them in Cicode they often have to be separated into sub-strings so that the maximum string length for Cicode variables is not exceeded.

With Access, it is possible to call queries that have been defined in Access so that the SQL statements become quite simple and straightforward. The Access tables & queries can be used to implement **RELATIONSHIPS** and **JOINS**, to **SORT** & **SELECT** only those rows (records) and return only those columns (fields) of particular interest at the time.

Developing queries in Access also has an advantage that the resulting Recordsets can be viewed in Access to test that they contain the data that is expected. The queries can incorporate SQL Functions (such as BETWEEN & AND).

The Jet Engine can also call upon the VBA Expression Service. This means that many non ANSI functions can also be used (both in SQL statements and Access Query Definitions) provided there is no need to migrate to a non Access system at a later date. Refer to VBA Functions Reference in the Access or Excel help system (only those functions with (VBA) after them and are appropriate to an SQL environment, are likely to work in an SQL statement).

## Setting up ODBC

To use ODBC, the Access ODBC Driver needs to be installed. This can be obtained from Microsoft and is included with Microsoft Office. The installation programme (for example, for Microsoft Office) will copy the necessary drivers and the Jet Engine DLL into the appropriate Windows directories when the appropriate Data Access/ODBC options are selected.

With the Driver installed on the PC the ODBC Icon can be selected from the Control Panel and a Data Service Name set up for the desired MDB. This is used in the DSN= part of the connect string.

The Jet Engine DLL is quite large (1 MB) and the execution speed of the runtime (and your application) can be impacted if the Windows Virtual Memory Manager (VMM) swaps it out of memory. The next time an SQL is

executed there will be short delay while the DLL is loaded back into memory. To force the VMM to keep the DLL in memory, design a simple dummy table with only one record and one field and set up a Cicode task that frequently (say every 10-15 seconds) calls a SELECT query based only on the dummy table. This has no significant effect on CPU load and keeps the DLL in memory.

## Getting the correct syntax with ODBC

The ODBC syntax for SQLs varies from the Access syntax in some ways. A good way to get the syntax correct and view the resulting Recordset is to use the query designer in **Microsoft Query** then copy the SQL text from it into Cicode. Because MS Query uses ODBC, any syntax that works in it will work when called via ODBC from Cicode. MS Query can also be used to confirm that the DSN is correct.

MS Query tends to create SQL text that is more complex than necessary. In particular it includes the path with the file name which is not necessary because the path is already defined in the DSN entry. It is considered bad practice to hard code file paths. MS Query also tends to prefix column (field) names with the table names to avoid any chance of ambiguity. Again this is not always necessary and it is desirable to keep the SQL text as brief as possible in your code.

The SQL statement text generated by the query designer can be pasted into Execute SQL window (under the File menu of MS Query), any surplus text removed and the SQL statement tested until the simplest syntax that works can be found. There is provision to save the SQL text if necessary. The final version of the SQL statement can be used with confidence in Cicode.

## Programming style with ODBC

Most of the sample code in the following topics do not include error checking and reporting:

1. Reading data from an access table with ODBC
2. Writing data to an access table with ODBC
3. Deleting rows from an Access table with ODBC
4. Calling action queries with ODBC
5. Parameter queries using ODBC

---

**Note:** These examples exclude error checking to keep them as simple as possible. However, both common sense and accepted programming practices mandate that you include error checking in your ODBC code.

Give consideration to implementing most of the complexity of queries in Access Query Definitions where they are easier to design and the results are easily viewed. A WHERE clause can be used when calling the query to select only the desired rows at run time. Where tables have many columns (fields), the Access Query Definitions can be used to restrict any particular call to view only the fields of interest.

It is helpful to build the SQL test up into strings. Firstly the ODBC function calls become simpler. Secondly the strings can be passed to TraceMsg() to make debugging simpler.

Remember that the Jet Engine runs on the same PC as Plant SCADA and that complex queries returning large Recordsets can have an adverse impact on CPU and memory resources. However, excessive impact on PC resources can be avoided by careful table, query and relationship design.

If there is a need to execute the queries on a **Remote Computer**, the code can set up on a Reports Server or an Event Server. This is especially relevant if the code is to be triggered by an event in a PLC. If the code is to be triggered by a User at a Display Station, and the query is considered too CPU intensive, the Display Station can be used to set the PLC bit that calls to code or call the Report using the Cicode Report() function. Another possibility

is to use the Cicode MsgRPC() function to call a Cicode function (with parameters, if necessary) on a remote computer. Each of these alternatives require Plant SCADA to be running on the remote computer.

## See Also

[Using Plant SCADA as an ODBC Server](#)

## ODBC Compatibility

This section describes the necessary and optional ODBC functions that your database driver needs to support:

### Essential functions

The Plant SCADA SQL devices and Cicode functions only work if the database driver supports the following ODBC functions:

Level 0	Level 1
SQLAllocConnect	SQLColumns
SQLAllocEnv	SQLDriverConnect
SQLAllocStmt	SQLGetData
SQLBindCol	SQLGetFunctions
SQLColAttributes	SQLGetInfo
SQLDescribeCol	SQLGetTypeInfo
SQLDisconnect	SQLParamData
SQLError	SQLPutData
SQLExecDirect	SQLSetConnectOption
SQLExecute	SQLSetStmtOption
SQLFetch	
SQLFreeStmt	
SQLGetCursorName	
SQLNumResultCols	
SQLPrepare	
SQLRowCount	
SQLSetParam	

## Optional functions

Plant SCADA SQL devices and Cicode functions also use the ODBC functions listed in the table below. While these functions are not necessary for operation, if they are absent in a driver, the error code 307 (SQL database error) will be returned if the ODBC driver does not support the necessary ODBC functions. To get the message associated with the error, call the Cicode function SQLErrMsg.

### Level 0

SQLTransact	If the driver does not support this function, the Cicode functions SQLBeginTran(), SQLCommit(), and SQLRollBack() are not supported.
-------------	--

### Level 1

SQLSpecial Columns	Plant SCADA uses this function if it is available. There is no loss of functionality otherwise.
SQLTables	(no effect on Plant SCADA)

### Level 2

SQLData Sources	The driver does not need to support this function. It is provided by ODBC.
SQLExtended Fetch	Without this function, Plant SCADA cannot take advantage of the native database's ability to fetch records at random.
SQLSetScroll Options	Without this function, Plant SCADA cannot take advantage of the native database's ability to fetch records at random.
SQLMore Results	(no effect on Plant SCADA)
SQLNativeSql	(no effect on Plant SCADA)
SQLProcedure Columns	(no effect on Plant SCADA)

## See Also

[Using Plant SCADA as an ODBC Server](#)

## Using Plant SCADA as an ODBC Server

ODBC server support allows Plant SCADA to function as an SQL database server. This will allow third-party applications that support ODBC to access data directly from Plant SCADA. This means that users can have direct access to data in Plant SCADA without having to develop Cicode or reports to export the data.

**Note:** A Plant SCADA ODBC Server is disabled by default. To enable an ODBC Server, you need to set the parameter [ODBC]Server to 1 in the Citect.ini file on the server computer.

Currently, the Plant SCADA ODBC server allows variable tags to be accessed. The table for the variable tags is named '**TAGS**' and the format is as follows.

NAME	Variable tag name	read only
VALUE	The current runtime value	read/write

Plant SCADA can only function as a database server at runtime. Using tags through ODBC at runtime can still add to your Plant SCADA License point count. Once the dynamic point count is greater than the license point count, the software protection mechanism will shutdown Plant SCADA runtime. Therefore, when accessing tags via the ODBC server, it's important to keep aware of how many points you have used. For details see License point count in the Installation and Configuration Guide.

### Setting up the Plant SCADA ODBC server:

You need to have TCP/IP installed on your computer first.

1. Choose **Start | Settings | Control Panel**.
2. Double-click the ODBC icon.
3. Click **Add** on the **User DSN** tab.

---

**Note:** If you select other tabs you will see that the Plant SCADA ODBC driver has been automatically installed.

---

4. Select the **Plant SCADA Driver** from the list and click **Finish**.
5. Enter "**Plant**" in the **Data Source** field. If you do not want to use this name, make sure the name you use is one word.
6. Enter the Computer Name in the **Host** field. The Computer Name is specified in the Network section of the Control Panel.
7. Click **OK**.

### Accessing the Plant SCADA ODBC server using MS Query (V2.00):

All ODBC capable applications use different ways to construct queries for accessing Plant SCADA tags. The example instructions for using MS Query, given here, show a simple implementation. MS Excel and MS Access use the same method.

1. Verify that you have MS Query installed on your computer.
2. Set up the Plant SCADA ODBC server.
3. Run Plant SCADA.
4. Run MS Query.
5. From the **File** menu (in MS Query) select **New Query**.
6. Select the Plant SCADA Data Source Name (DSN) from the Available Data Sources list. Click the **Use** button.
7. Select the **Tags** table. Click the **Add** button and then the **Close** button.
8. You can now run a query to extract the Tag data from Plant SCADA. The simplest way to see this is by double-clicking **Names** and **Tags**.

### Accessing the Plant SCADA ODBC server using MS Query (V8.00):

Unlike Version 2.00, User DSNS are not used by Version 8.00. Instead it uses File DSNS which by default are stored in **Program Files\Common Files\ODBC\Data** Source folder. File DSNS are not stored in the Windows registry,

they are text files given the .DSN extension. When you connect to an existing data source, only the available File DSNs that are stored on that PC are displayed. MS Query V8.00 does not display User or System DSNs. The simplest solution is to create a File DSN that points to a User DSN.

#### To create a file DSN that points to a user DSN:

1. Use a text editor (Notepad for example) and create a file containing the following two lines:

```
[ODBC]  
DSN=<MyUsrDSN>
```

where <MyUserDSN> is the name of an existing user DSN that you have created via the ODBC icon in the Control Panel.

2. Click **Save As** on the **File** menu and type a name that includes a .DSN file extension. For example, "Plant\_File.dsn" is a valid name. Include the quotation marks so that the .DSN file name extension is added correctly. Save it to the default File DSN directory listed above, then it will appear in the DSN list box.
3. Open the ODBC Manager from the Control Panel and verify that you can see your newly created File.DSN.
4. Open the ODBC Manager from the Control Panel and verify that you have created a User DSN called <MyUsrDSN>. For example:
  - Select Plant SCADA Driver and click **Finish**.
  - Type "Plant" in the **Data Source** field (i.e., <MyUsrDSN>).
  - Enter *Computer Name* in the **Host** field.

When you run MS Query, you can now select your File DSN from the list.

[Reading Data from an Access Table with ODBC](#)

### Reading Data from an Access Table with ODBC

You can use a SELECT query to read data from an Access table or to call an Access query.

A query is preferred over a table if there are many more columns in the table than are needed at the time, if the data needs to be sorted, or if you need to relate or join several tables. The Cicode necessary is as follows:

```
Function SQLTest  
    INT hSQL, iResult;  
    hSQL = SQLConnect("DSN=ODBCTest;UID=YourUID_C;PWD=YourPWD");  
    IF hSQL <> -1 Then  
        iResult = SQLExec(hSQL, "SELECT * FROM qryRecipes  
        WHERE Recipe Between '3000' And '6000'");  
        IF iResult = 0 Then  
            WHILE SQLNext(hSQL) = 0 DO  
                TraceMsg(">" + SQLGetField(hSQL, "Recipe")  
                + "<>" + SQLGetField(hSQL, "Flour")  
                + "<>" + SQLGetField(hSQL, "Water")  
                + "<>" + SQLGetField(hSQL, "Cocoa") + "<");  
            END  
            SQLDisconnect(hSQL);  
        ELSE  
            Message("SQL Error", SQLErrMsg, 48);  
        END
```

```
    END
ELSE
    Message("SQL Error", SQLErrMsg, 48);
END
END
```

## See Also

[Appending Data with ODBC](#)

## Appending Data with ODBC

To append data to an Access table using ODBC, you can use an SQL INSERT statement.

```
Function SQLInsert
    INT hSQL, iResult;
    hSQL = SQLConnect("DSN=ODBCTest;UID=YourUID;PWD=YourPWD");
    IF hSQL <> -1 Then
        iResult = SQLExec(hSQL, "INSERT INTO tblRecipes
        (Recipe, Flour, Water, Cocoa) VALUES ('X1234', 2, 3, 4)");
        SQLDisconnect(hSQL);
    END
END
```

To avoid having to deal with SQL statements, you can use the standard Cicode device functions to append records to an Access table. First configure an SQL device. If the table has many fields that do not need to be written to, define only those fields that are necessary in the device definition (this keeps the device definition simple and reduces the number of DevWrite instructions). DevOpen, DevWrite and DevClose can then be used to add records to the table.

Plant SCADA accepts successive DevWrites until they equal the number of fields in the device definition at which time it constructs an SQL INSERT statement. The DevWrites needs to contain data for fields in the same order as the device definition. Do a DevOpen followed immediately by successive DevWrites for as many records as are necessary then a DevClose to avoid data being out of context.

## See Also

[Editing Data with ODBC](#)

## Editing Data with ODBC

To edit data in an Access table there needs to be a unique (usually primary) key to identify the row (record) to be changed. This is to be able to provide a WHERE clause that will apply only to that row in an SQL UPDATE.

To edit data, read the data in the normal way, keeping track of the unique key. Any changed values can later be written to the same row using an UPDATE query with a WHERE clause.

```
Function SQLUpdate
    INT hSQL, iResult;
    hSQL = SQLConnect("DSN=ODBCTest;UID=YourUID;PWD=YourPWD");
    IF hSQL <> -1 Then
        iResult = SQLExec(hSQL, "UPDATE tblRecipes SET Flour = 20,
        Water = 30,Cocoa = 40 WHERE Recipe = 'X1234'");
```

```
SQLDisconnect(hSQL);
END
END
```

**Note:** The ODBC/SQL environment does not let you edit the "Current Record" (there is no current record). Consequently you cannot use DevAppend or DevSetField to add or modify records.

## See Also

[Deleting Rows from an Access Table](#)

## Deleting Rows from an Access Table

The DELETE keyword is used with a WHERE clause to delete the necessary row or rows. If the WHERE clause is not based on a primary key, more than one record may be deleted.

```
Function SQLDelete
    INT hSQL, iResult;
    hSQL = SQLConnect("DSN=ODBCTest;UID=YourUID_C;PWD=YourPWD");
    IF hSQL <> -1 Then
        iResult = SQLExec(hSQL, "DELETE FROM tblRecipes WHERE
        Recipe = 'X1234'");
        SQLDisconnect(hSQL);
    END
END
```

## See Also

[Calling Action Queries with ODBC](#)

## Calling Action Queries with ODBC

Access ACTION queries cannot be called in a SELECT query such as:

```
"SELECT * FROM qdeDeleteRecipe"
```

To call an Access ACTION via ODBC, use the Call statement in SQLExec:

```
{"{Call qdeDeleteRecipe}"}
```

The statement needs to be enclosed in {curly} braces.

The Call statement can be used to Call SELECT queries, the resulting Recordset being accessible in the normal way.

## See Also

[Parameter Queries](#)

## Parameter Queries

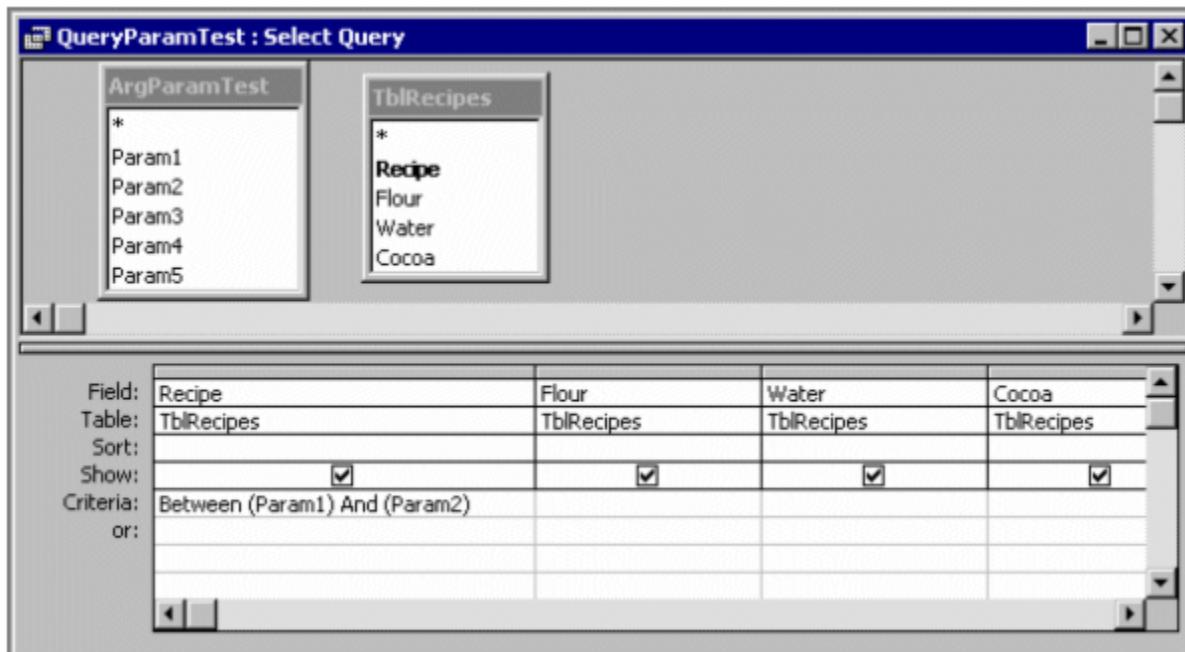

Many ODBC Servers will accept PARAMETERS in a Call statement so that PARAMETERS can be defined in a Query

Definition on the server and their values supplied by ODBC Clients at run time. Unfortunately, the Access Jet Engine uses Parameter Markers which are not supported in the standard Call statement. The method outlined here can be used as a work-around.

For each query that requires PARAMETERS, design a arguments table with the same name as the query but with a different prefix. For example, if the query is qryParamTest, the TABLE could be called argParamTest.

The TABLE could have, say, five fields called Param1, Param2, Param3, Param4, Param5.

Add this table to the Access Query Definition for qryParamTest. Then the field names can be used as PARAMETERS anywhere in the Query Definition.

A simple Cicode function can be written to which the query name (without the prefix) and PARAMETERS are passed. The function inserts "arg" in front of the query name and executes a DELETE from the TABLE (to verify that it is empty) and then performs an INSERT to leave the table containing ONE RECORD with the desired PARAMETERS in the appropriate fields. The function then prefixes the query Name with "qry" and calls the query.

```
Function SQLCall(INT hSQL, STRING sQueryName, STRING sArg1 = " ", STRING sArg2 = " ",
    STRING sArg3 = " ", STRING sArg4 = " ", STRING sArg5 = " ")
    STRING sTable, sQuery;
    sTable = "arg" + sQueryName;
    sQuery = "qry" + sQueryName;
    SQLExec(hSQL, "DELETE FROM " + sTable);
    SQLExec(hSQL, "INSERT INTO " + sTable + " (Param1, Param2, Param3, Param4,
    Param5) VALUES ('" + sArg1 + "', '" + sArg2 + "', '" + sArg3 + ',
    '" + sArg4 + "', '" + sArg5 + "')");
    SQLExec(hSQL, "{Call " + sQuery + "}");
END
```

Calling the Function from Cicode is then as simple as:

```
SQLCall(hSQL, "ParamTest", "2000", "4000");
```

The default parameters for SQLCall needs to be SPACES if "Allow Zero Length" is "No" in the Access table Definitions for fields Param1, Param2 etc.

The function can be used to call many different PARAMETER queries.

An advantage of this work-around is that, even after Plant SCADA has been shut down, the query can be called from Access and, because the PARAMETERS are still stored in the arguments table, the resulting Recordset can be viewed in Access.

Another method is to design queries that perform any necessary joins, sorting and field selection the call them using a WHERE clause to select the desired rows (records).

## See Also

[Access and Cicode Date/Time Conversions](#)

## Access and Cicode Date/Time Conversions

Access and Cicode have different Date/Time variables data types. Date references in an external database has to be based on the Gregorian Calendar.

You can convert between date and time in three ways:

- **Convert to real numbers** - In both Cicode and Access you can equate real numbers to data/time variables, like this:

```
AccessTime = 25568.66667 + (CicodeTime/86400);  
CitectTime = 86400*(AccessTime - 25568.66667);
```

- **Convert to strings** - The Data and/or Time are converted to and from text strings using the standard conversion functions available in each environment.
- **Use the #Date/Time# SQL syntax** - The Jet Engine will convert and Dates and Time strings enclosed in # markers. This date could be useful in a WHERE clause:

```
SELECT * FROM qryMyQuery WHERE 'Date' BETWEEN #3/20/96# AND #3/27/96#
```

The American Date format is used in this case, the Jet Engine DLL ignores the local Date and Time settings as set in Windows Control Panel.

## Integration with Historian

Plant SCADA supports the ability to automatically historize and publish variables within CitectHistorian. This capability offers a tightly integrated solution for collecting historical data, as variables can be passed to the Historian environment with minimal configuration. It is a particularly useful feature if your SCADA project has a large number of variables that need to be chronicled.

When a Plant SCADA project is added to Historian as a control system data source, the **Use SCADA Configuration To Historize and Publish** feature allows tags, trends and alarms to be imported and automatically configured within the Historian environment.

The automated configuration process will implement any equipment hierarchies defined in the source SCADA system, and apply the data acquisition method appropriate to the source variable type.

To prepare variables for automated configuration within Historian, you need to initially identify them within your Plant SCADA project. For more information, see [Preparing Variables for Historian Integration](#).

---

**Note:** CitectHistorian requires a valid license. Contact your local authorized AVEVA distributor for more information on the licensing options that are available.

## Preparing Variables for Historian Integration

To allow variables to be automatically configured in Historian, you initially need to identify the variables you would like included in this process within Plant SCADA. This involves adjusting the **Historize** property for each required variable to "true".

The following variable types are supported:

- Variable tags
- Trend tags
- Digital alarms
- Time-stamped alarms
- Analog alarms
- Advanced alarms
- Multi-digital alarms
- Time-stamped digital alarms
- Time-stamped analog alarms

For each variable you would like to be automatically configured in Historian, you need to set the **Historize** field to "true".

---

**Note:** If a variable has the Historian field set to "false", it will still be added to the Historian data sources directory when an import schema is run. You will still be able to manually historize and publish the variable within the Historian environment.

---

For more information, see the topic *Automating the configuration of SCADA attributes* in the CitectHistorian user documentation.

## Using Microsoft Excel to Edit DBF Tables

Plant SCADA allows you to edit and save .dbf files (tables) used in Plant SCADA by opening them in Microsoft® Office Excel®.

Microsoft Office Excel 2016 does not allow you to save files in .dbf format though you may open and edit them using the File > Open command. In order to overcome this limitation Plant SCADA includes an Add-In for Microsoft Excel called the **Plant SCADA Project DBF AddIn**. When this add-In is loaded into Excel, it allows you to browse, open, edit and save Plant SCADA .dbf files in the correct format.

The Project DBF AddIn is an optional component included in the installation of Plant SCADA and is accessed from the installer. If you did not select installation of the add-In during installation, you can install it at a later time by navigating to the ProjectDBFAddIn folder of your Plant SCADA installation and running the setup.exe in that folder.

## Compatibility

This add-In is specifically designed for use with Microsoft Excel 2016 or later. Earlier versions of Excel are not supported.

## Integration with Microsoft Excel

When you open Microsoft Excel, an additional toolbar, or an additional tab, called Project DBF Addin is available depending on the version of Excel that you are using.

The fields and buttons on this toolbar allow you to choose:

1. The path to the master.dbf.
2. A Plant SCADA project from the master.dbf .
3. A .dbf file (table) belonging to the selected project.
4. Save changes made to a .dbf file (table).
5. Save changes without re-indexing the table, or save and re-index.
6. Save a dbf file with a different name.
7. Open a dbf file in any location

However, you can also open .dbf files using the File > Open command.

## Protected Tables

The installation of the add-In incorporates a list of tables that by default are excluded from being opened using the add-In interface. This list is in a file called ExcludedProjectTables.xml and can be found in the add-In installation directory.

These tables are system tables that are maintained by Plant SCADA, and it is recommended that these files are not edited externally in Microsoft Excel. To minimize the likelihood of additional tables being edited with Microsoft Excel you can add their names to the ExcludedProjectTables file using a text editor. You can also view the default list of tables using a text editor, or an XML compliant browser.

## Read Only Tables

Projects which are read only, or contain read only tables, are displayed in the list of tables when selected from the Add-In buttons. If you try to open a read-only table (.dbf file) an alert (sometimes referred to as a "warning") message is displayed advising that the table is read only. You can still open and edit a read only table but you will not be able to save it.

A table could be read-only for the following reasons:

- The project is read-only.
- The table is open in the Plant SCADA Studio.
- The user trying to edit the file does not have read and/or write privileges.

If you attempt to save a read-only table an alert message is displayed advising that the table is read only.

## See Also

[Project DBF AddIn Functionality](#)

## Project DBF AddIn Functionality

The Project DBF Addin is automatically available to Excel when the add-in is installed by the Plant SCADA installation. When you open Microsoft Excel you will see a new toolbar called Project DBF Add-in, containing the following fields and buttons:

- Master.dbf location
- SaveDBF table
- SCADA project
- SCADA table
- Save DBF
- Save As
- Open DBF
- Save Only/Save and re-index

### To access the tables using the Add-In

1. If the location of the Master.dbf file is not displayed in the master.dbf location field, it will display Enter path to master.dbf. Click on this field to display a dialog box where you can enter the location. This populates the SCADA Project field.
2. Click the drop down arrow in the SCADA Project Field to select the Project in which the .dbf file (table) resides that you want to open. This populates the SCADA Table field.

---

**Note:** Any tables listed in the ExcludedProjectTables.xml are excluded from the list of tables.

3. Click the drop down arrow in the SCADA Table field to select the table. The table will open in Microsoft Excel as a new worksheet named with the table name. If the table is a read only table an alert (sometimes referred to as a "warning") message is displayed advising that it is read only.

Alternatively, if the dbf file that you wish to open is not the Master.dbf file, or is not located in the root dbf file location, click the Open DBF button and browse to the location of the dbf file that you want to open.

### To edit the contents of the table in Microsoft Excel

A table in .dbf format is displayed in Microsoft Excel in the following equivalent format:

- A field is displayed as a column.
- A record is displayed as a row.
- A field within a record (data) is displayed as a cell.

You may edit any of the data in the table, shown as cells within a row. You may delete a record shown as a row, and add a record. However you cannot change the structure of the table by modifying the name of any Field, shown as a column, add a column or delete a column. If you do change the structure an alert message will be displayed when you attempt to save the table.

If you edit a cell in the table take care not to exceed the maximum field length set for that field in the table.

### To save a table in Microsoft Excel

1. Select to Save and re-index the table, or Save Only, from the drop down control on the toolbar.

If you do not re-index an indexed table the table will be saved more quickly, but you will need to manually re-index the table when you have completed your edits. To re-index manually, in the **Project** activity, select **Home**, and then click **Pack** on the Command Bar. To pack included projects, click **Pack with Included Projects**.

2. Click the SaveDBF table button.

When you save the table the Add-In performs the following checks prior to saving the table:

- Verifies that the file type is .dbf.
- Checks for any changes in table structure that may have been made. For restrictions on changes to the table structure, refer to "To edit the contents of the table in Microsoft Excel".
- Updates the existing table according to the data in the Microsoft Excel worksheet.
- Re-indexes the updated table if it is was an indexed table (if Save and re-index was selected).

If the edited table in the Microsoft Excel worksheets does not pass every check, an alert (sometimes referred to as a "warning") message is displayed and the existing table on disk will not be affected until you correct the condition that caused any check to not pass.

You can also save a dbf file with a different name by clicking the Save As button on the toolbar and entering a name for the file. This method of saving also includes the option of saving the dbf file with or without re-indexing the table.

---

**Note:** If you attempt to save a table in .dbf format in Microsoft Excel using the Microsoft Excel File > Save command an alert message is displayed advising you that the file cannot be saved in the current format and that use the SaveDBF button on the Microsoft Excel toolbar.

---

## Using an OPC AE Server

OPC (OLE for Process Control) is a set of communication standards maintained by the OPC Foundation for the industrial automation industry. OPC provides a common platform for applications to share data from typically disparate sources, such as PLCs and databases, without the need to comprehend native protocols.

The OPC Alarms and Events (OPC AE) specification is similar to the original OPC Data Access specification, except that it addresses alarm and event data instead of real-time process control data. Plant SCADA supports a runtime OPC AE Server that supports the OPC AE interface specifications.

---

**Note:** To view Plant SCADA alarm information such as areas and privileges via OPC AE, your OPC AE client needs to support the capability to log on as specific user. This will implement the "IOpcSecurityPrivate" interface.

---

To get started, you need to register an OPC AE Server on a computer running a Plant SCADA alarm server. This is achieved via the General Options page of the Plant SCADA Setup Wizard (see [Setup Wizard - General Options Setup](#)).

You can then use a third-party OPC client application, such as Matrikon, to access your system and view alarm and event data. See the topic [Using a Third-party OPC Client to Access Alarm Server Data](#) for configuration details.

---

**Note:** The OPC AE Server does not support DCOM for remote communications. It is recommended that you run any connecting OPC client applications on the computer that is registered as the OPC AE Server.

---

## Using a Third-party OPC Client to Access Alarm Server Data

You can use a third-party OPC client application, such as Matrikon, to access your Plant SCADA system and view alarm server data. To do this, you need to initially register a Plant SCADA alarm server as a runtime OPC AE Server. This requires administrative privileges.

**Note:** The OPC AE Server does not support DCOM for remote communications. It is recommended that you run any connecting OPC client applications on the computer that is registered as the OPC AE Server.

### To connect a third-party client application to an OPC AE Server:

1. Run the Setup Wizard.
2. On the **General Options Setup** page, dialog select **Register**.  
The will register the alarm server as an OPC AE server and make it accessible to the third-party OPC applications.
3. Run the third party application.
4. From the list of available servers select the following:

Serck.ScxV6OPCAE.<AlarmServerName>.<IP address>

Where:

<Server Name> is the name of the registered alarm server.

<IP Address> is the address defined in the Network Address settings.

5. Connect to the OPC AE Server and create an event subscription within your third party application.

The events retrieved from the OPC AE Server will be listed. The information returned to the OPC client may differ slightly to what is presented on Plant SCADA's alarm pages.

**Note:** Do not attempt to connect an OPC DA application to a Plant SCADA alarm server. This is not supported and will not be enabled in any future releases. This is only intended for use with OPC AE clients.

## Using an OPC DA Server

OPC (OLE for Process Control) is a set of communication standards maintained by the OPC Foundation for the industrial automation industry. OPC provides a common platform for applications to share data from typically disparate sources, such as PLCs and databases, without the need to comprehend native protocols.

The OPC Data Access solution (OPC DA) provides specifications for client and server applications that are focused on the continuous communication of real-time data. To this end, Plant SCADA supports a runtime OPC DA server that implements the mandatory OPC DA v2.05 and OPC DA v3 interface specifications.

This allows Plant SCADA to provide real-time data to any compliant OPC DA clients, including applications such as AMPLA, OSI-PI and Historian.

In order to allow OPC DA Server to be accessed by the OPC DA Clients, the OPC DA Server process must be configured in the SCADA project. This behavior is different to releases 7.20 and earlier where no configuration

step was required.

**Note:**

- The OPC DA Server does not fully support WriteVQT functionality, as a Plant SCADA I/O server does not allow quality and timestamp changes that are generated from an external source.
- Connecting a Plant SCADA OPC DA client to an Plant SCADA OPC DA server is not recommended, as the client was not designed to be used in this way. This mode of operation has not been validated.
- The OPC DA server uses regular expressions. For example, if retrieving tags with 'bit' in the name, you need to define "bit.\*\*" instead of "bit\*".

---

To determine which OPC DA interfaces are supported by the Plant SCADA OPC DA Server, see the topic [Supported OPC DA Server Interfaces](#) in the reference section of this chapter.

## Configure an OPC DA Server

A Plant SCADA OPC DA Server is configured in the Topology activity.

**To add an OPC DA Server process:**

1. In the **Topology** activity, select **Edit**.
2. From the drop down menu below the Command Bar, select **OPC DA Server**.
3. Add a new row to the grid.
4. Type the required information in each column, or in the Property Grid (see [OPC DA Server Properties](#) for a description of each property).
5. Click **Save**.

You can configure as many OPC DA servers as required in a project, however you can only have one per computer.

---

**Note:** To successfully operate an OPC DA Server, you will need to correctly configure its DCOM settings based on your client requirements. See the topic [OPC DA Server DCOM Settings](#).

[OPC DA Server Properties](#)

## OPC DA Server Properties

An [Using an OPC DA Server](#) has the following properties:

## General Properties

Option	Description
Server Name	A unique name for the OPC DA server.
Comment	Any useful comment (optional).

## Communication Properties

Option	Description
Comment	Any useful comment (optional).
Network addresses	The IP address of the computer that will host the OPC DA server. You can only configure one server per computer.

## Other Properties

Option	Description
Browsing Hierarchy	<p>The field allows you to select the type of hierarchy to use for OPC item browsing. The options are:</p> <ul style="list-style-type: none"> <li>• Flat</li> <li>• Hierarchy</li> </ul> <p>Selecting <b>Flat</b> will present tags at a single level represented by their tag names. Selecting <b>Hierarchy</b> presents the tags in a directory structure that represents the clusters and equipment definitions that are used.</p> <p>No selection is the default, which is the equivalent of selecting <b>Flat</b>.</p> <p>For more information, see <a href="#">OPC Item Browsing</a>.</p>
Field	Selecting <b>True</b> will expose the Field tag extension as an OPC DA vendor-specific property of the OPC item. No selection is the default, which is the equivalent of selecting <b>False</b> .
Valid	Selecting <b>True</b> will expose the last valid value for the Valid tag extension as an OPC DA vendor-specific property of the OPC item. No selection is the default, which is the equivalent of selecting <b>False</b> .

Option	Description
OverrideMode	Selecting <b>True</b> will expose the OverrideMode tag extension as an OPC DA vendor-specific property of the OPC item. No selection is the default, which is the equivalent of selecting <b>False</b> .
Override	Selecting <b>True</b> will expose the Override tag extension as an OPC DA vendor-specific property of the OPC item. No selection is the default, which is the equivalent of selecting <b>False</b> .
ControlMode	Selecting <b>True</b> will expose the ControlMode tag extension as an OPC DA vendor-specific property of the OPC item. No selection is the default, which is the equivalent of selecting <b>False</b> .
Status	Selecting <b>True</b> will expose the Status tag extension as an OPC DA vendor-specific property of the OPC item. No selection is the default, which is the equivalent of selecting <b>False</b> .

## Project Properties

Option	Description
Project	The project in which the OPC DA server is configured.

## OPC DA Server DCOM Settings

To manage user access to an OPC DA Server, it is recommended that you create a Windows user group with appropriate DCOM settings on the host server rather than dealing with Windows user identities individually. You can then just add users to this group as required.

See the Windows documentation for information on how to create a user group. Once the required user group has been created, you need to configure the required DCOM settings.

**Note:** These settings do not apply to an OPC AE Server. Plant SCADA's OPC AE Server does not support DCOM.

## To configure the machine-wide user group DCOM settings

1. Launch the Windows Component Services manager. To do this, go to Control Panel, open **Administrative Tools** and then **Component Services**.

2. Expand the **Component Services** folder, and the **Computers** folder.
3. Right click on the **My Computer** folder, and select **Properties**.
4. Go to the **COM Security** tab.
5. In the **Access Permissions** section , click on the **Edit Limits** button. Make the following adjustments:
  - add the OPC DA Server users group you have created
  - allow both **Local Access** and **Remote Access** for the users group
  - click **OK**In the **Access Permissions** section, now click on the **Edit Default...** button. Make the following adjustments:
  - add the OPC DA Server users group you have created
  - allow both **Local Access** and **Remote Access** for the users group
  - click **OK**
6. In the **Launch and Activation Permissions** section, click on the **Edit Limits** button. Make the following adjustments:
  - add the OPC DA Server users group you have created
  - allow **Local Launch**, **Remote Launch**, **Local Activation** and **Remote Activation** for the users group
  - click **OK**
  - You can now exit the Properties dialog.

## To configure the OPC DA Server specific settings

1. Launch the Windows Component Services manager. To do this, go to Control Panel, then **System and Security, Administrative Tools** and then **Component Services**.
2. Expand the **Component Services** folder, the **Computers** folder, the **My Computer** folder, and the **DCOM Config** folder.
3. Locate the "AVEVA SCADA OPC DA Server" component and select **Properties**.
4. Go to the **Security** tab.
5. In the **Launch and Activation Permissions** section, select **Customize** and click on the **Edit** button. Make the following adjustments:
  - add the OPC DA Server users group you have created
  - allow **Local Launch**, **Remote Launch**, **Local Activation** and **Remote Activation** for the users group
  - click **OK**
6. Go to the **Identity** tab. This is where you define which user accounts can run the OPC DA Server. The setting you choose will have the following implications:
  - **The interactive user** is the default option. This means the OPC DA Server will run using the security context of the Windows user currently logged in to the local computer. If there is no active Windows user logged in, or if the current user identity doesn't have the launching and activation permissions for the OPC DA Server, a connection will be unsuccessful.
  - **The launching user** - Each login session invisibly spawns multiple instances of the Runtime Manager, the OPC DA Server and the client if multiple users connect at the same time. This setting is considered a resource consuming option.

- **This user** allows you to identify a specific user. A connection will not be successful if there is already an instance of the Runtime Manager running under the active Windows session. Similarly, launching the Runtime Manager using a local Windows login will be unsuccessful if an instance of the Runtime Manager has already been launched by a DCOM connection. However, this option does avoid the situation where multiple instances of the Runtime Manager and the OPC DA Server are launched.
7. Once you have selected an option, you can exit the Properties dialog.

## To configure the connectivity environment settings

The way you configure a server's connectivity settings depends on whether it is on a domain or part of a workgroup. The following points describe how you should set up different client/server combinations.

- **If the server is on a domain and the client is on a domain:**

On the server computer, add the domain login identity that the client uses to the OPC DCOM users group you have created.

- **If the server is on a domain and the client is part of a workgroup:**

Create a matching Windows login identity on the server with the same password as the Windows login identity on the client machine. Add this Windows login identity to the OPC DCOM users group you have created.

- **If the server is part of a workgroup and the client is on a domain:**

Create a matching Windows login identity on the server with the same password as the domain login identity on the client machine. Add this Windows logon identity to the OPC DCOM users group you have created.

- **If the server is part of the same workgroup as the client:**

Create a matching Windows login identity on the server with the same password as the Windows login identity on the client machine. Add this Windows login identity to the OPC DCOM users group you have created.

---

**Note:** The registry entry for OPC Client application needs to be configured to accept callbacks. An indication that this is not being done as required, is that all synchronous OPC DA APIs work as expected but data updates and other asynchronous operation never complete.

---

**Note:** If you intend to run your OPC DA server as a service, you will also need to specify the user account under which the service will operate. For more information , see [Running an OPC DA Server as a Service](#).

---

[OPC DA Server Properties](#)

## Operating the OPC DA Server at Runtime

An OPC DA Server operates as part of the Plant SCADA server management infrastructure, which means it can be controlled and monitored by the Runtime Manager.

The Runtime Manager will display the operational status and messages for the OPC DA Server as it does for other Plant SCADA processes. Be aware, however, that you will need to run the Runtime Manager locally on the OPC DA Server.

You can also configure an OPC DA Server to start in response to a client connection. See [Starting the OPC DA Server on a Client Connection](#).

## See Also

[OPC Item Browsing](#)

## Starting the OPC DA Server on a Client Connection

The OPC DA server can be configured to start when a request is received from a client.

When the parameter [OpcDaServer]AutoStartByClient is enabled, the Runtime Manager will start the OPC DA server process when a client request is received.

## See Also

[OPC DA Server Properties](#)

## OPC Item Browsing

When you create an OPC DA server in Plant SCADA, you can determine if it will present items to a client application as a hierarchy (representing the clusters and equipment definitions used), or as a flat structure.

The ability to use a flat structure allows the server to comply with the item browsing definitions supported by version 2.x of the OPC DA standard.

You can set the type of browsing supported by an OPC DA server via the **Browsing Hierarchy** field on the [OPC DA Server Properties](#) dialog. By default, the browsing hierarchy will be set to flat.

The browse position will be initially set as the root of the address space. After the initial call to browse items, the client will be able to continue browsing from the last browse point.

In the case where a SCADA project is configured with a large number of tags it is recommended to test browsing of OPC DA items to establish if excessive memory consumption occurs on IOservers or OpcDaServer processes running in the system. In general you should attempt to browse tags using third party OPC DA Client installed on the machine where the OPC DA Process is running.

---

**Note:**

1. Data Type filtering is not supported in the browsing function. This is due to the fact that Plant SCADA data types are not known until tags are subscribed to, if the user interface and other clients are subscribed at different points in time, clients could get a different list of tags for the same filter being applied. This is an accepted relaxation of the OPC Foundation CTT rule.

2. The actual "fully qualified" subscription name for an OPC DA Item might differ to the name returned by the OPC DA Browsing APIs, which is in accordance with OPC DA v2.05 and 3.0 specification. For example, in a multiclustered system "Tag1" might be defined in several clusters so its "fully qualified" item id might be "Cluster1.Tag1". Subscription to "Tag1" might still work where there is no ambiguity. In general it is recommended that OPC DA Clients obtain "fully qualified" ITEM ID via GetItemID if OPC DA v2.05 is used, or from OPCITEMPROPERTY structure if OPC DA v3.0 is used.

---

[Configure an OPC DA Server](#)

## OPC DA Server Diagnostics

There are two ways you can monitor the performance of your OPC DA server:

### OPC DA Server Logging

Logging for the OPC DA Server is enabled through the Citect.ini parameter [\[Debug\]CategoryFilter](#), which allows you to specify the messages that are sent to the tracelog.dat file.

In the case of an OPC DA server, the tracelog file will use a name based on the following:

tracelog.OpcServer.<OPC server name>.dat

[Debug]CategoryFilter will support the following category definitions:

- OpcDaServerComApi - enables traces on a COM API level. Only return status of each OPC DA COM API if logged
- OpcDaBrowse205 - enables tracing related to OPC DA v2.05 item browsing
- OpcDaBrowse300 - enables tracing related to OPC DA v3.00 item browsing
- OpcDaServer - enables extensive tracing of OPC DA server object APIs
- OpcDaGroups - enables extensive tracing of OPC DA group object APIs

### OPC DA Server Kernel Statistics

A Kernel page is available that displays low-level diagnostic information about the runtime status of the OPC DA server. It can be accessed from the main kernel window by typing "Page Table OPCServerConnections".

The information available from this table includes the following:

- OPC Handle - the handle which the OPC server uses to reference a particular OPC connection. This handle can be cross referenced with log file entries.
- Index - the server object index, which is incremented each time a new client connects.
- #Groups - the number of groups created within the OPC server instance (including both active and inactive groups).
- #Items - the number of items created within OPC server instances (including all active/inactive items in all groups).
- #Reads - the number of reads that have been requested for items.
- #Writes - the number of writes that have been request for items.
- #Updates - the number of updates that have been received for subscribed items.

For more information on using the Kernel's Table window, see the topic [Page Table](#) in the *Using The Kernel* section of the Plant SCADA help.

## OPC DA Server Reference Information

The available reference information for an OPC DA Server includes the following topics:

- [Supported OPC DA Server Interfaces](#)
- [Client Request Data Type Conversions](#)
- [OPC DA Server Mandatory Properties.](#)

### Supported OPC DA Server Interfaces

The following table indicates which OPC DA interfaces are supported by the Plant SCADA OPC DA Server. A highlighted field indicates that the particular OPC API is supported by the server.

<b>OPC DA Server required interfaces</b>	<b>Version 1.0</b>	<b>Version 2.0</b>	<b>Version 3.0</b>
<b>OPC Server</b>			
IUnknown	Required	Required	Required
IOPCServer	Required	Required	Required

# Plant SCADA Access Anywhere

Plant SCADA Access Anywhere enables you to remotely access a running Plant SCADA client from a mobile device (such as a tablet or smartphone) or a laptop computer.

You can view and control the client through a web browser without the need to install anything. This allows you to interact with the Plant SCADA client from anywhere in real-time.

The Access Anywhere documentation includes the following guides:

- [Access Anywhere Quick Start Guide](#) — an introductory guide to Access Anywhere that will get most users up and running with a basic configuration.
- [Access Anywhere Installation and Configuration Guide](#) — a more comprehensive description of the installation process that includes advanced configuration information.
- [Access Anywhere Secure Gateway Installation Guide](#) — provides instruction for installing Secure Gateway, a complementary component that provides encrypted remote access to Plant SCADA clients.
- [Access Anywhere Web Client User Guide](#) — describes how to use an HTML5-compatible web browser to remotely connect to a Plant SCADA client.

## Access Anywhere Quick Start Guide

Welcome to the AVEVA Plant SCADA Access Anywhere Quick Start Guide. This guide provides an overview of the steps that need to be carried out so that you can use your Plant SCADA Access Anywhere.

## About Plant SCADA Access Anywhere

Plant SCADA Access Anywhere enables you to remotely access a running Plant SCADA client with a mobile device including tablets, smart phones and laptop computers.

You can view and control the client through a web browser without needing to install it on your portable device. You can interact with the Plant SCADA client from anywhere in real-time.

---

**Note:** Availability of a Plant SCADA floating license is verified every time a user attempts to connect to a Plant SCADA client using Access Anywhere. For more information, see [Licensing](#).

---

## Getting Started

To use Plant SCADA Access Anywhere to remotely connect to Plant SCADA clients, you need to:

1. Install Plant SCADA and check that you are able to connect to the Plant SCADA client.
2. Install and configure the Access Anywhere Server on the computer where Plant SCADA is installed.  
See [Installing and Configuring the Access Anywhere Server](#).
3. Configure the Windows Firewall on the computer where the Access Anywhere Server is installed.  
See [Configuring Windows Firewall](#).
4. Configure Remote Desktop Service (RDS) on the computer where the Access Anywhere Server is installed.

See [Configuring Remote Desktop Service](#).

5. Configure user access to the Plant SCADA clients on the computer where the Access Anywhere Server is installed.

See [Configuring User Access to Plant SCADA Clients](#).

If your Plant SCADA Access Anywhere Server will be accessed by computers outside the operations network, it is recommended that you also install the **Access Anywhere Secure Gateway**.

For more information, see [Installing and Configuring the Access Anywhere Secure Gateway](#).

After you have completed the steps listed above, you will be able to connect to a Plant SCADA client using Plant SCADA Access Anywhere.

See [Connecting Access Anywhere to a Plant SCADA Client](#).

---

**Note:** This guide only provides an overview of the steps described above. Detailed information for each step is available in different guides, a reference to which is provided at the end of each section. Look for the heading *For more information*.

## Licensing

Plant SCADA Access Anywhere is licensed for use with the following Plant SCADA / Citect SCADA versions:

- 2018
- 2018 R2
- 2020 R2
- 2023
- 2023 R2.

In order to run Plant SCADA Access Anywhere, licenses are required for the following:

- **Microsoft Remote Desktop Service (RDS)**

Every remote desktop session opened with a browser using Plant SCADA Access Anywhere consumes an RDS license. Confirm that the required number of RDS licenses is available to users.

- **Plant SCADA License(s)**

Access Anywhere requires Plant SCADA to have a control/view-only client license available for each Access Anywhere client session.

## For more information...

Refer to the following topics in the *Plant SCADA Access Anywhere Server Installation and Configuration Guide*:

- [Overview](#)
- [Configuring the Plant SCADA Access Anywhere Server](#)

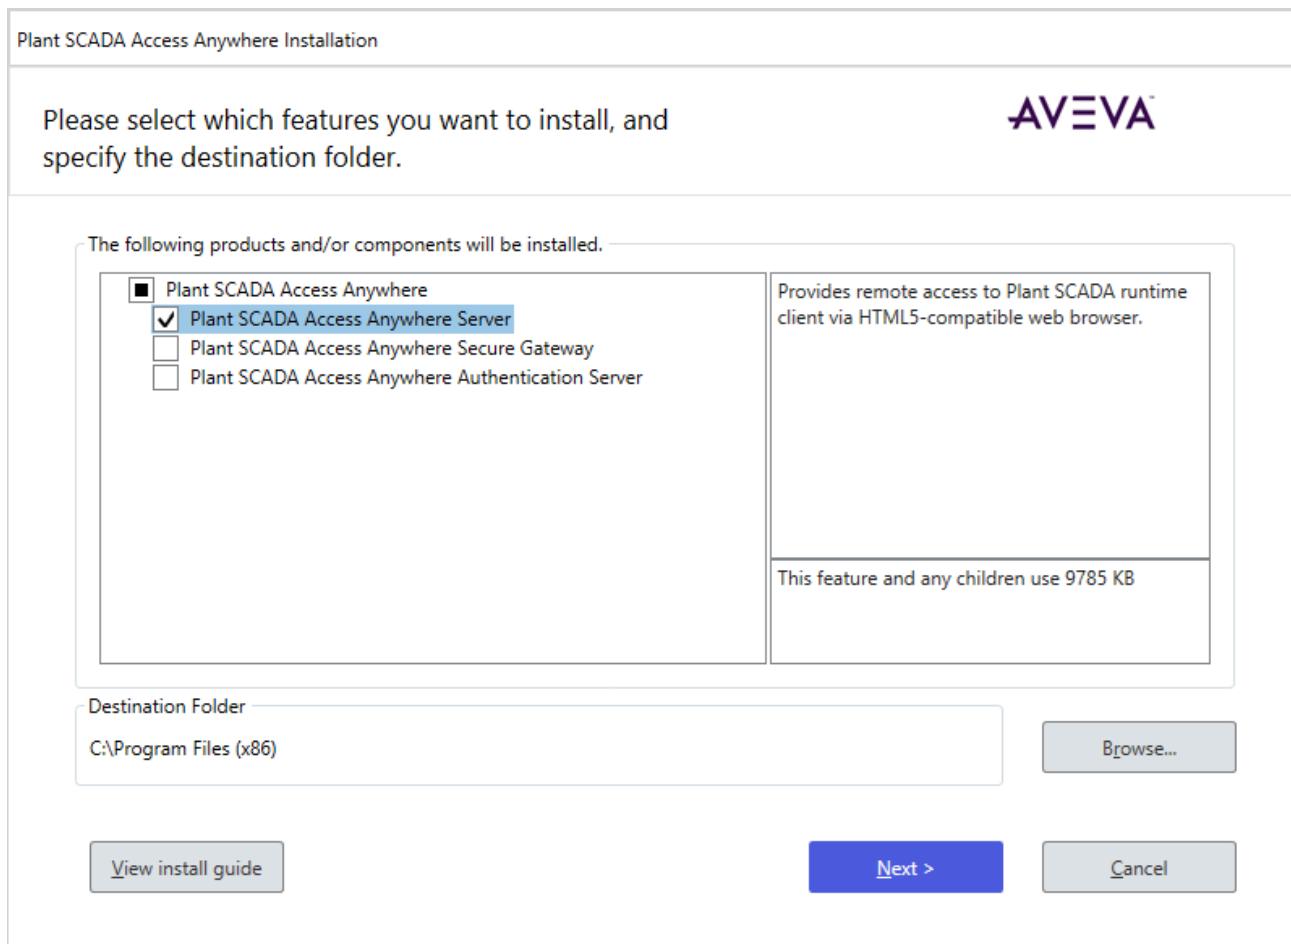

## Installing and Configuring the Access Anywhere Server

A basic installation of Plant SCADA Access Anywhere Server usually takes about five minutes. Check that all installation prerequisites have been met before starting the installation procedure.

**Note:** Before you install Plant SCADA Access Anywhere 2023, you need to uninstall any earlier versions. This means an existing server configuration file will no longer be available. If you want to migrate your existing server settings to the new version, see the topic [Migrate an Existing Configuration from an Earlier Version](#) in the *Plant SCADA Access Anywhere Server Installation and Configuration Guide* before you upgrade.

### To install a Plant SCADA Access Anywhere Server:

1. Run the Access Anywhere installer file setup.exe from your installation media.
2. Select **Plant SCADA Access Anywhere Server** when presented with the options to select the installation component.

3. Click **Next** through every dialog box, accept the EULA and then click **Finish**.
4. Configure the Plant SCADA Access Anywhere Server using the Configuration Console.

AVEVA Plant SCADA Access Anywhere Server 2.0 Configuration

General	Performance	Communication	Acceleration	Security	Logging	Advanced
---------	-------------	---------------	--------------	----------	---------	----------

Plant SCADA Access Anywhere Server service state: Running

Plant SCADA Access Anywhere Server status: Active

Number of sessions: 0

Started at: 16/11/21 21:29:38

Start Server

Stop Server

---

The Plant SCADA Access Anywhere Server and the Ericom Licensing Server run as a [Windows service](#). When the Plant SCADA Access Anywhere Server service is stopped, Plant SCADA Access Anywhere Clients will not be able to connect to this host with RDP acceleration. Any active accelerated connection will be dropped (sessions will be disconnected). Regular RDP connections to this host will not be affected.

Changing certain settings, such as **Communication** and **Logging** take effect only after the services are restarted. After changing such settings, apply the changes, stop the services and then start them again.

## For more information...

Refer to the following topics in the *Plant SCADA Access Anywhere Server Installation and Configuration Guide*:

- [Installation](#)
- [Configuring the Plant SCADA Access Anywhere Server](#)

## Configuring Windows Firewall

If the Windows Firewall is enabled on the computer where the Access Anywhere Server is installed, configure it to enable the Plant SCADA Access Anywhere client connection.

1. Open the **Windows Control Panel** and then **Windows Firewall**.
2. Select **Advanced Settings** and select **Inbound Rules**.
3. Click **New Rule**.
4. Select **Port** and click **Next**.
5. Enter the specific port: 8080. Click **Next**.
6. Select to apply the rule on the **Domain**, **Private** and **Public** networks. Click **Next**.
7. Assign a name for the rule.
8. Click **Finish**.

## For more information...

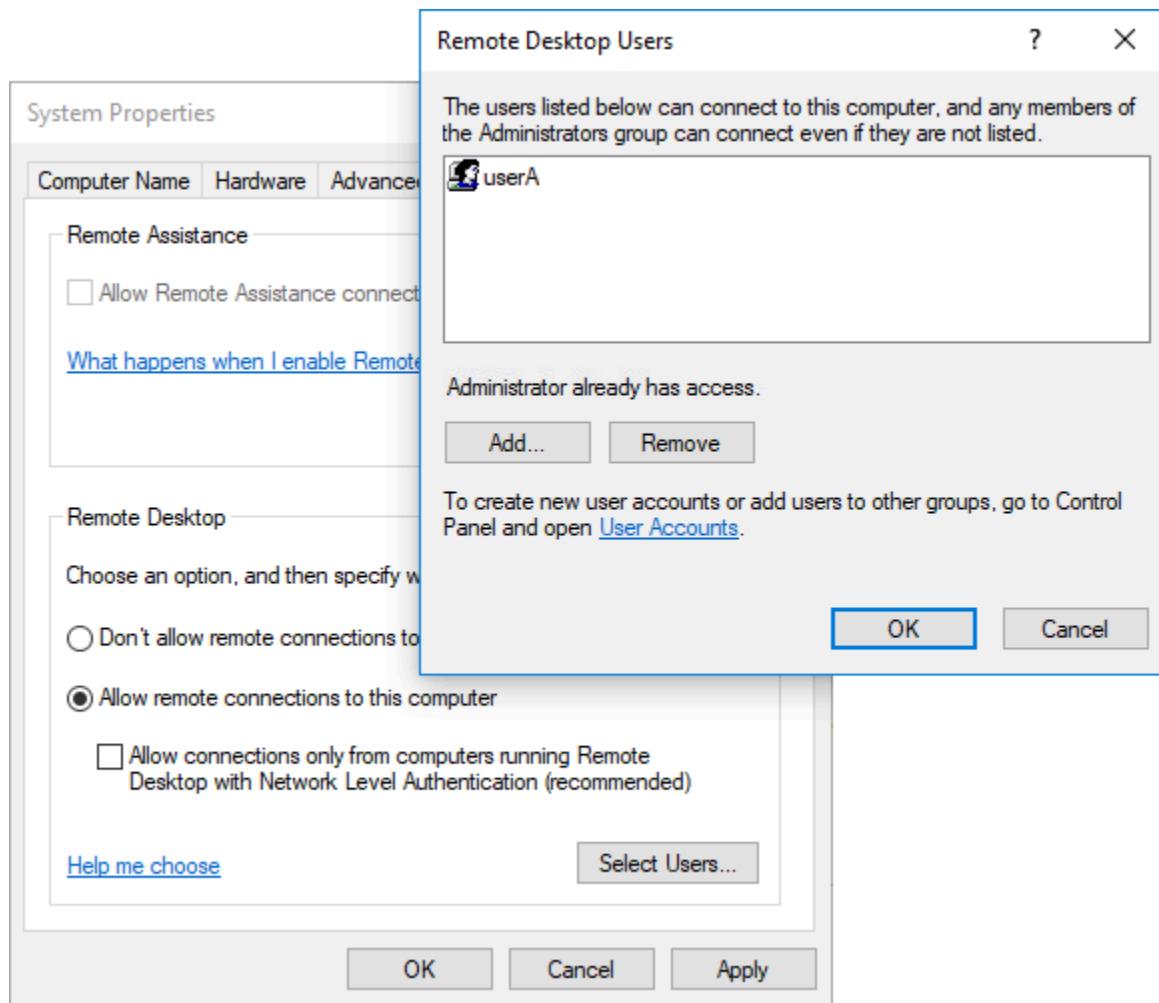

Refer to the following topics in the *Plant SCADA Access Anywhere Server Installation and Configuration Guide*:

- [Before You Install](#)

## Configuring Remote Desktop Service

Complete these steps on the computer on which the Plant SCADA Access Anywhere Server is installed:

1. Navigate to the Control Panel. Select **System and Security | System**.
2. Select the **Advanced system settings** option on the left. The System Properties dialog is displayed.
3. Click the Remote tab.
4. Select the **Allow remote connections to this computer** option.

5. Click **Select Users**. The Remote Desktop Users dialog is displayed.
6. Add the required users and click **OK**.

**Note:** For more details about configuring RDS, search for Tech Note TN000031136 on the Knowledge Base page of the AVEVA Knowledge and Support Center. You will need to register with the site before you can

---

access the document.

---

## For more information...

Refer to the following topics in the *Plant SCADA Access Anywhere Server Installation and Configuration Guide*:

- [Configuring the Plant SCADA Access Anywhere Server](#)

## Configuring User Access to Plant SCADA Clients

Add local users and domain groups to the Plant SCADA Access Anywhere groups to assign access privileges to the Plant SCADA client(view-only client or control client). To do this:

1. Add users to the Windows user groups added by the installer ('SCADA.AnywhereControl' or 'SCADA.AnywhereView').  
**Note:** If you have recently upgraded Plant SCADA Access Anywhere from a version earlier than 2020 R2, you will need to manually migrate the users in the existing "VjcaControl" and "VjcaView" Windows user groups to these new groups.
2. Navigate to the Control Panel. Select **Administrative Tools | Computer Management**. Locate the Plant SCADA Access Anywhere groups, right-click on the required group.
3. Select **Add to Group** from the context menu and add any users who require access to that group.

**Note:** If you are using Plant SCADA 2020 R2 (or later), the members of the Plant SCADA Access Anywhere user groups must also be included in Plant SCADA's SCADA.RuntimeUsers group to access the runtime display client.

---

## For more information...

Refer to the following topics in the *Plant SCADA Access Anywhere Server Installation and Configuration Guide*:

- [Configuring the Plant SCADA Access Anywhere Server](#)

## Installing and Configuring the Access Anywhere Secure Gateway

A basic installation of Plant SCADA Access Anywhere Secure Gateway usually takes about five minutes, similar to the Plant SCADA Access Anywhere Server. Check that the installation prerequisites have been met before starting the installation procedure.

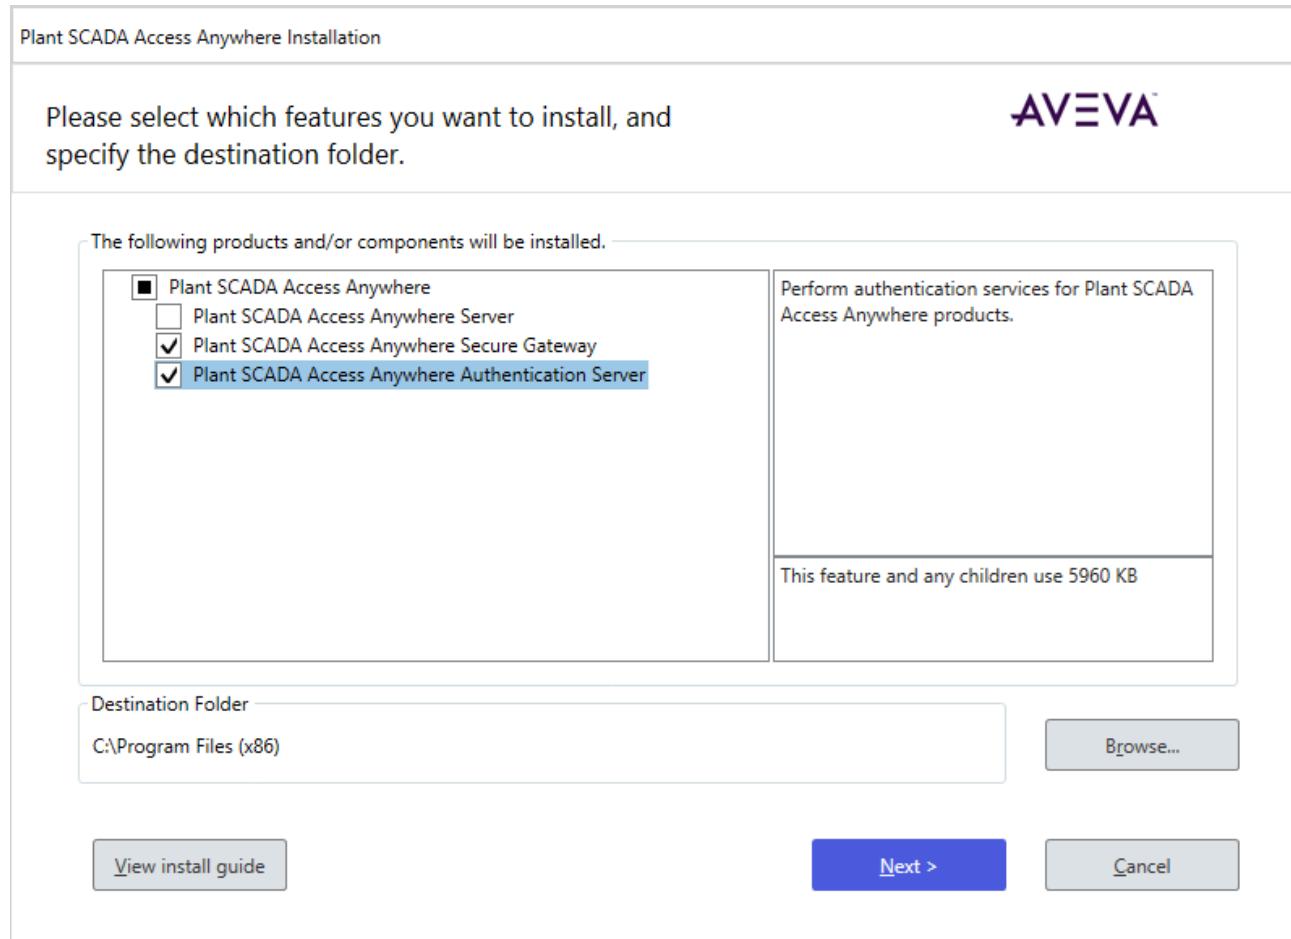

**Note:** Before you install Plant SCADA Access Anywhere 2023, you need to uninstall any earlier versions. This means an existing Secure Gateway configuration will no longer be available. If you want to migrate your existing Secure Gateway configuration to the new version, see the topic [Migrate an Existing Configuration from an Earlier Version](#) in the *Plant SCADA Access Anywhere Server Installation and Configuration Guide* before you upgrade.

---

### To install Plant SCADA Access Anywhere Secure Gateway:

1. Run the Plant SCADA Access Anywhere installer file setup.exe from your installation media.
2. Select Plant SCADA Access Anywhere **Secure Gateway** and/or Plant SCADA Access Anywhere **Authentication Server** when presented with the options to select the installation components.

These components can be installed on separate computers if required. If your Secure Gateway Server needs to be installed outside your operations network, it is recommended that the Authentication Server be installed separately within the operations network.

3. Click **Next** through the dialog boxes, accept the EULA and then click **Finish**.
4. Configure the Plant SCADA Access Anywhere Server using the Configuration Portal.

The screenshot shows the 'Server Information' page of the AVEVA Plant SCADA Secure Gateway. The left sidebar has a tree view with 'Administrator', 'Logout', 'Gateway Settings', 'Dashboard' (selected), 'Security', 'Web Server', 'Authentication Server', 'Log Settings', 'Download', 'Admin', and 'About'. The main area has sections for 'Server Status' and 'Server Activity'. 'Server Status' shows Start Time (Tuesday, 19 October 2021 4:56:44 PM), Up Time (1 Days, 18 Hours, 47 Minutes, 53 Seconds), and SSL Certificate (NOT Trusted. Has a private key). 'Server Activity' has two tables: 'Total Sessions' and 'Gateway Session Distribution'. The 'Total Sessions' table shows current and peak values for Connections under validation (0/5), Gateway Sessions (0/1), Web Server Connections (1/6), and Admins (1/1). The 'Gateway Session Distribution' table shows current and peak values for Native Sessions (0/1), HTTPS Sessions (0/0), and WebConnect Sessions (0/0). At the bottom are 'Restart Server' and 'Refresh' buttons.

	Current	Peak
Connections under validation	0	5
Gateway Sessions	0	1
Web Server Connections	1	6
Admins	1	1

	Current	Peak
Native Sessions	0	1
HTTPS Sessions	0	0
WebConnect Sessions	0	0

You can then connect the Secure Gateway to an Access Anywhere Server (see [Connecting to a Plant SCADA Access Anywhere Server](#)).

## For more information...

Refer to the following topics in the *Plant SCADA Access Anywhere Secure Gateway Installation and Configuration Guide*:

- [Installation](#)
- [Configuring the Secure Gateway](#)

## Connecting to a Plant SCADA Access Anywhere Server

The Secure Gateway needs to be configured to point to your Plant SCADA Access Anywhere Server in order to use SSL or accessing Plant SCADA. To do this:

1. Edit the config.js file located on the computer where the Secure Gateway is installed. This file is located in the following folder:

\Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Plant SCADA Access Anywhere Secure Gateway\WebServer\PlantAccessAnywhere\

2. Find the commented line:

```
// address:"", // Address of server
```

3. Uncomment the line by removing the initial "//".

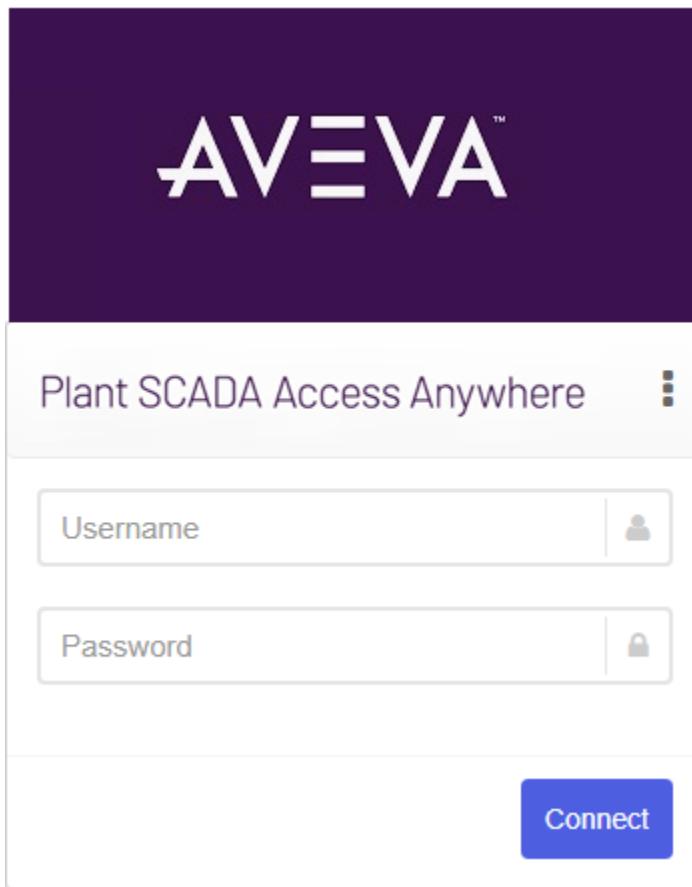

4. With the quotation marks, type the name or IP address of the computer on which the Plant SCADA Access Anywhere Server is installed.

For example:

```
address: "VD-CA-SRV", // Address of server
```

Access to the Plant SCADA Access Anywhere Server is routed through the Secure Gateway node. The following page appears when you navigate to the following address.

<https://<Name or IP Address of computer on which Secure Gateway is installed or IP Address>/>

The setup steps completed above will route the connection through to the Plant SCADA Access Anywhere Server using the supplied credentials.

**Note:** A page refresh and clearing the cookies on every client are required each time the **Address** property in the config.js is changed.

## For more information...

Refer to the following chapters in the *Plant SCADA Access Anywhere Secure Gateway Installation and Configuration Guide*:

- *Post-Installation*

## Connecting Access Anywhere to a Plant SCADA Client

Connection to a Plant SCADA client is achieved through a Plant SCADA Access Anywhere web client in the following ways:

- Through the Secure Gateway
- Directly to the Plant SCADA Access Anywhere Server.

### Connecting via the Secure Gateway

Open an HTML5 compliant browser and point it to the URL of the computer on which the Secure Gateway is installed:

`https://server:port/`

### Connecting Directly to the Plant SCADA Access Anywhere Server

If the web client is on the SCADA network, you can connect directly to the Plant SCADA Access Anywhere Server. Open an HTML5 compliant browser and point it to the URL of the Plant SCADA Access Anywhere Server:

`http://<computer name or IP Address>:8080/`

This URL will automatically redirect to the following URL:

`http://<computer name>:8080/PlantAccessAnywhere/start.html`

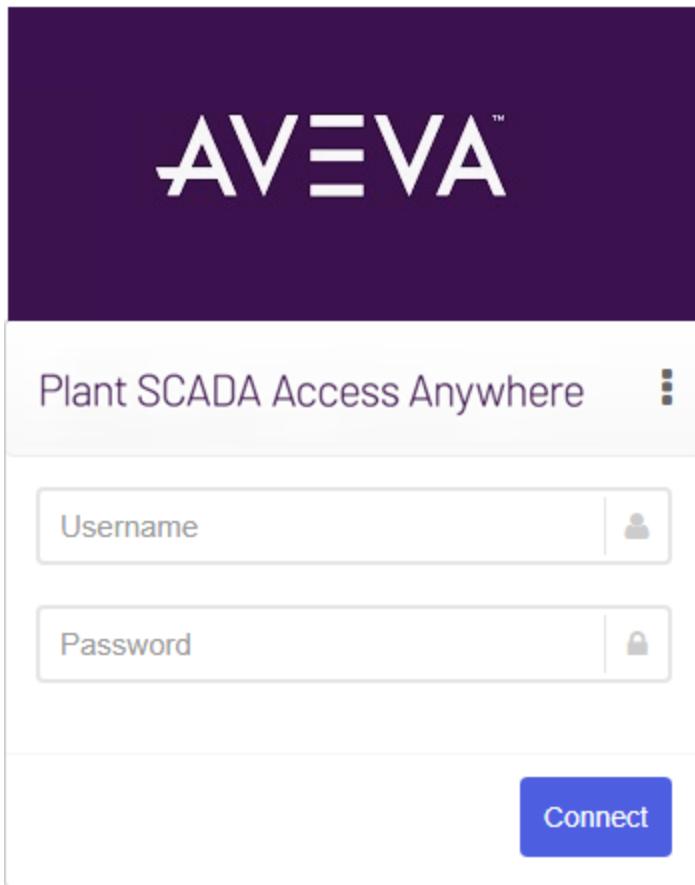

Specify the Plant SCADA Access Anywhere Server port in the URL to tell the browser to use the web server that is built-in to the Plant SCADA Access Anywhere Server service. HTTPS may also be used.

---

**Note:** If you are running Plant SCADA Access Anywhere on an IPv6 network and you attempt to connect to the Access Anywhere Server using an IPv6 address in Internet Explorer, the connection will not be successful. Use a different browser, or check with your system administrator if a hostname has been configured for the Access Anywhere Server.

### Logging on to Plant SCADA

1. After the Plant SCADA Access Anywhere Server web page appears, enter the user credentials. This user needs to belong to the 'SCADA.AnywhereControl' or 'SCADA.AnywhereView' Windows user group.

- Once you have entered your credentials, click **Connect**.

The connection dialog appears momentarily while the web browser connects to the RDP host where the Plant SCADA Access Anywhere Server is installed.

The Plant SCADA client is launched at the remote node.

---

**Note:** Once connected, closing the Plant SCADA client will log off and end the session. Closing the browser will close the Plant SCADA client, log off and end the Access Anywhere session.

---

## For more information...

Refer to the following chapters in the *Plant SCADA Access Anywhere Web Client User Guide*:

- [Viewing Plant SCADA with Plant SCADA Access Anywhere](#)

## Access Anywhere Installation and Configuration Guide

Use AVEVA Plant SCADA Access Anywhere to access AVEVA Plant SCADA clients hosted on Terminal Servers with HTML5 compatible web browsers. Follow the instructions in this guide to begin using AVEVA Plant SCADA Access Anywhere.

This guide assumes knowledge of the following:

- AVEVA Plant SCADA

- Enabling and configuring Remote Desktop Services (RDS) on Windows® operating systems
- Firewall configuration
- Web server administration.

Terminology used in this guide includes the following:

- **RDP** - Remote Desktop Protocol. A remote desktop protocol developed by Microsoft®. RDP is a standard component of Microsoft Windows.
- **RDP Host** - a Windows system that can be remotely accessed using Microsoft RDP, such as a Terminal Server (RDS Session Host) with remote access enabled.
- **RDS** - Remote Desktop Services is one of the components of Microsoft Windows that allow a user to take control of a remote computer or virtual machine over a network connection.
- **HTML5** - a new update to the HTML specification. Extends HTML with new features and functionality for communication, display, etc.
- **WebSocket** - a bi-directional, full-duplex communication mechanism introduced in the HTML5 specification.
- **SSL** - Secure Sockets Layer. A cryptographic protocol that provides encrypted communications over the Internet.

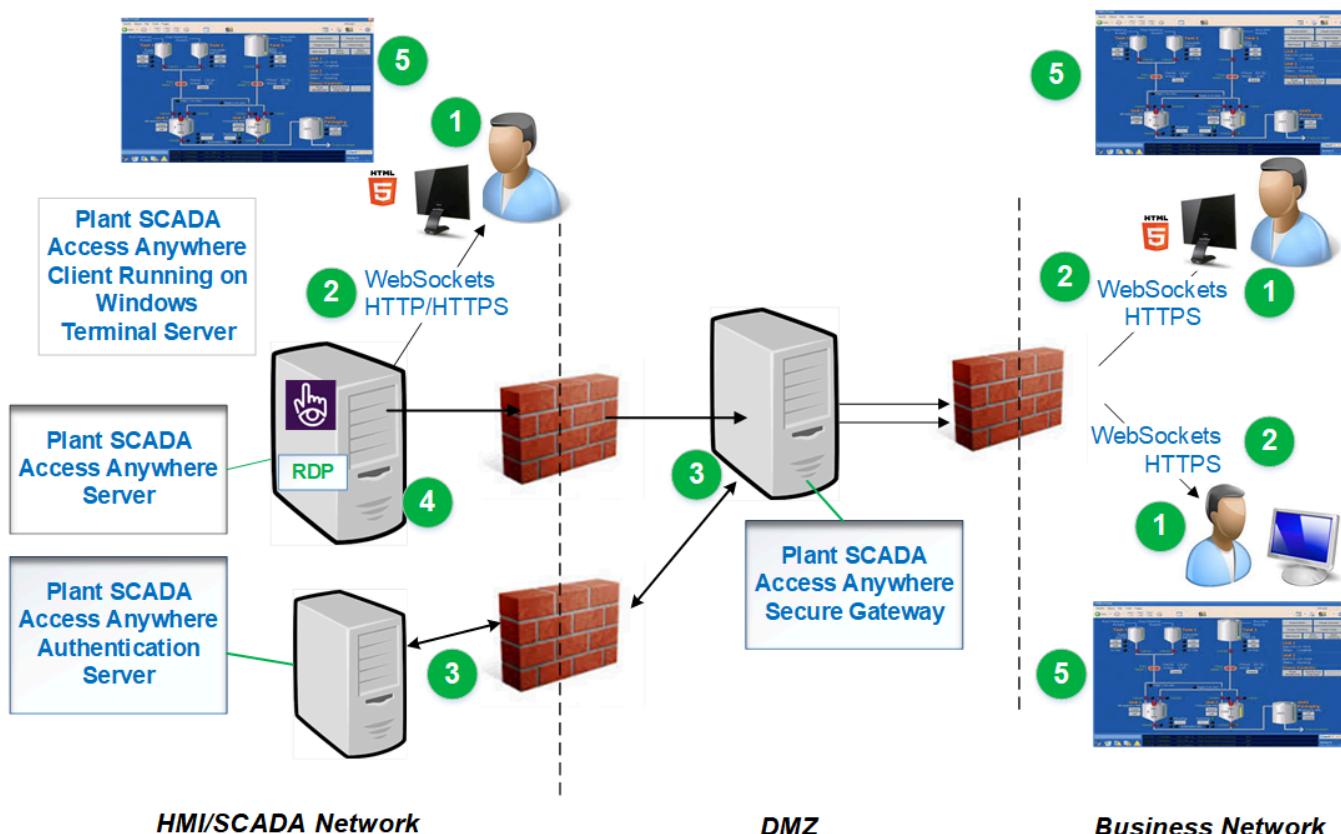

## Overview

Plant SCADA Access Anywhere provides remote access to Plant SCADA clients using any HTML5 web browser running on a desktop computer or a mobile device.

Any browser that supports an HTML5 canvas can be used as the client to view Plant SCADA. HTML5 WebSockets are typically required for Plant SCADA Access Anywhere.

## Architecture

The following diagram illustrates how the different components of Plant SCADA Access Anywhere work together:

Reference	Description
1	Initiate a connection from the client device by directing the browser to the Plant SCADA Access Anywhere start page hosted on the web server ( <a href="https://&lt;computer name&gt;:8080/">https://&lt;computer name&gt;:8080/</a> ). The <i>Start.html</i> page is displayed in the web browser using HTTP/HTTPS.
2	The browser opens a WebSocket connection to the Plant SCADA Access Anywhere Server, which is running on the RDP host itself.
3	If the optional Plant SCADA Access Anywhere Secure Gateway is installed, a Plant SCADA Access Anywhere Server browser session will connect through it. When the Secure Gateway is used, user access is managed by the Plant SCADA Access Anywhere Authentication Server.
4	The Plant SCADA Access Anywhere Server translates the WebSocket communication to and from RDP, thus establishing a connection from the browser to the RDP host itself.

Reference	Description
5	The browser then displays the content of the remote Plant SCADA client.

**Note:** Any Plant SCADA Access Anywhere Server browser sessions that originate from a location beyond the SCADA network will connect through the optional Plant SCADA Access Anywhere Secure Gateway. If the client is on the SCADA network, it can connect directly to the Plant SCADA Access Anywhere Server or via the Secure Gateway.

For more information about the Access Anywhere Secure Gateway, refer to the [Access Anywhere Secure Gateway Installation and Configuration Guide](#).

**Important:** Using the Secure Gateway to connect to your SCADA system from an external network may expose your SCADA system to unauthorized access. It is recommended that you use the Secure Gateway in conjunction with other measures to help protect your system.

This is the recommended architecture to remotely access Plant SCADA clients running on an HMI/SCADA network from an untrusted business network.

- The Plant SCADA Access Anywhere Server (WebSocket Server) is installed on the same RDP host where the AVEVA Plant SCADA client runs. The server includes a collection of web resources (HTML files, CSS, JavaScript, images, etc.).
- The Plant SCADA Access Anywhere Secure Gateway is an optional server installed separately on a computer in a DMZ to access Plant SCADA behind a firewall.
- The Plant SCADA Access Anywhere Authentication Server performs authentication services for Plant SCADA Access Anywhere. It is recommended that the Authentication Server be installed separately to the Secure Gateway within the SCADA network.

## RDP Compression and Acceleration

Plant SCADA Access Anywhere provides RDP compression and acceleration technology to improve remote client performance over a network and Internet. There are three main features of RDP technology:

- Image compression  
Images are compressed before they are transmitted to a browser for rendering. A higher compression value results in lower image quality, less impact to the network and faster update.
- Packet shaping  
Packet shaping is a computer network traffic management technique that delays some or all datagrams to reduce latency and increase usable network bandwidth.
- Whole frame rendering  
Whole frame rendering updates the display as a whole rather than in blocks, as performed by standard RDP. The benefit of whole frame rendering is especially noticeable when watching video over slow network connections. Coupled with the other optimization features, whole frame rendering results in a smoother video display on a browser.

## Before You Install

Prior to installing Plant SCADA Access Anywhere, confirm the following:

- The computer that will host the Plant SCADA Access Anywhere Server is running an operating system supported by Plant SCADA.
- The host computer's firewall is configured to permit inbound and outbound network traffic on port 8080.
- Remote Desktop Services is configured on the host computer.

---

**Important:** Plant SCADA Access Anywhere leverages RDP and translates RDP to WebSockets. RDP access needs to be enabled on the computer hosting Plant SCADA Access Anywhere. For more information, search for Tech Note 8956 on the **Tech Note, FAQ** page of the AVEVA Knowledge and Support Center. You will need to register with the site before you can access the document.

---

## Prerequisites

The Plant SCADA Access Anywhere Server has been tested on the following Microsoft® operating systems:

- Windows Server 2012 R2
- Windows Server 2016
- Windows Server 2019.

The Access Anywhere Server needs to be installed on the RDP server where Plant SCADA resides. It will have minimal impact on the RDP host's performance and scalability.

---

**Important:** Microsoft Windows Server should not be configured as a Domain Controller.

---

The Access Anywhere Server includes a built-in web server. This includes a copy of the Access Anywhere web components.

---

**Note:** If you are running Plant SCADA Access Anywhere on an IPv6 network, it is recommended you configure a hostname that refers to the Access Anywhere Server. A hostname ensures the server is compatible with all supported browsers. If you attempt to connect to the Access Anywhere Server using a standard format IPv6 address in Internet Explorer, the connection will not be successful.

---

## Configuring Firewalls

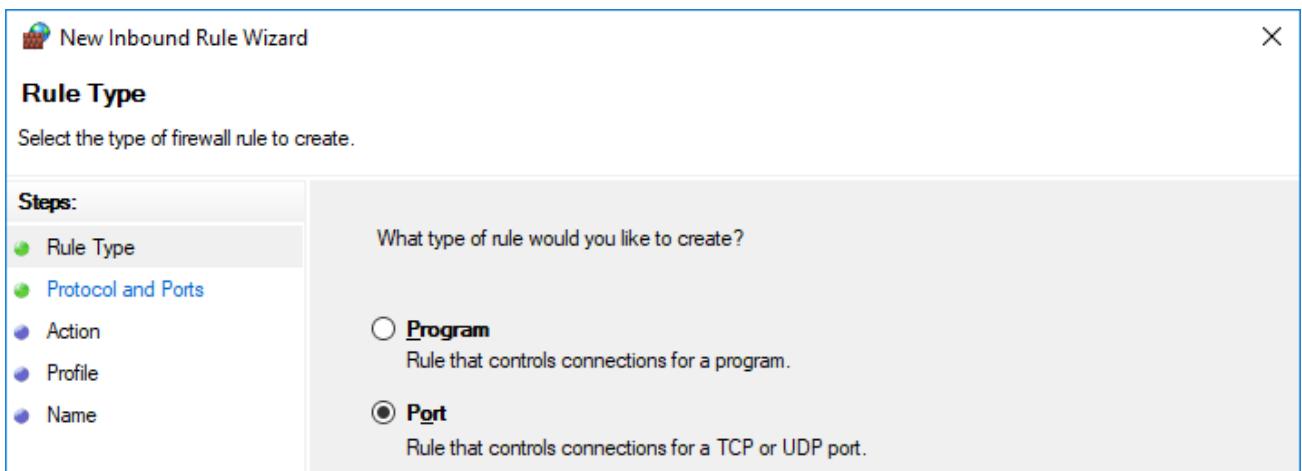

By default, a client (browser) connects to a Plant SCADA Access Anywhere Server using port 8080 for both encrypted and unencrypted WebSocket communication. This port number can be changed using the Plant SCADA Access Anywhere Server Configuration utility.

To enable direct connection from the client to the Plant SCADA Access Anywhere Server (without using the Secure Gateway), the server needs to be directly accessible from the client using port 8080.

If the Windows firewall is enabled on the same computer where the Plant SCADA Access Anywhere Server is installed, configure it to enable the Plant SCADA Access Anywhere client connection.

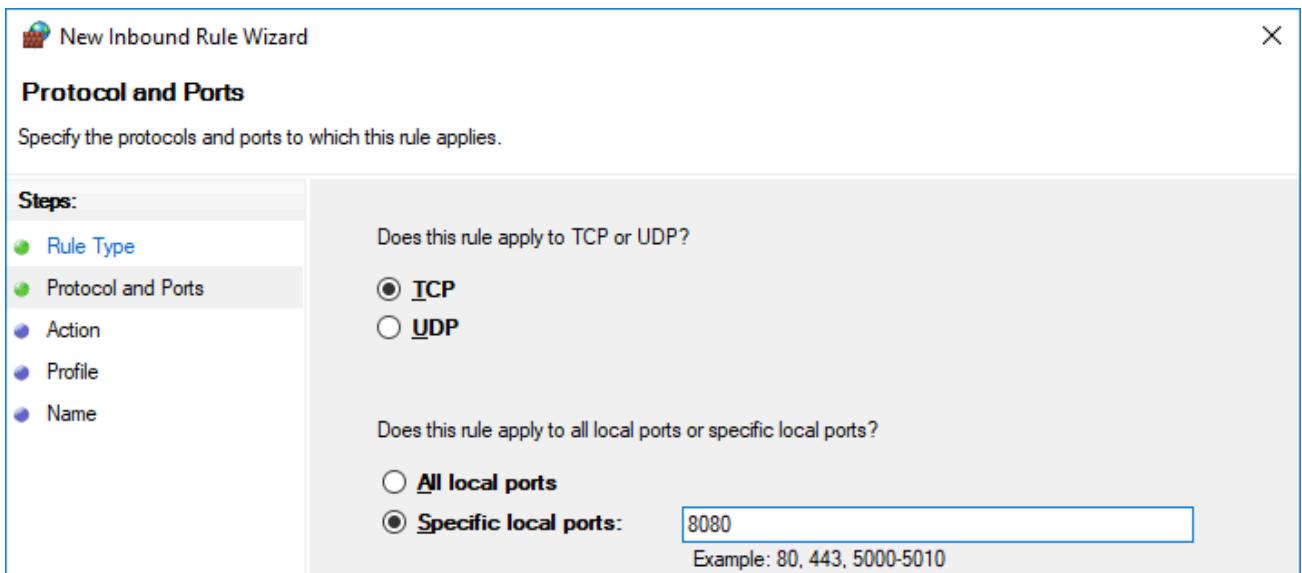

1. Open the **Windows Control Panel** and then **Windows Firewall**.
2. Select **Advanced Settings** and select **Inbound Rules**.

3. Click **New Rule**.

4. Select **Port** and click **Next**.

5. Enter the specific port: 8080.

6. Click **Next** and select **Allow the connection**.

 New Inbound Rule Wizard X

**Action**

Specify the action to be taken when a connection matches the conditions specified in the rule.

**Steps:**

- Rule Type
- Protocol and Ports
- Action**
- Profile
- Name

What action should be taken when a connection matches the specified conditions?

**Allow the connection**  
This includes connections that are protected with IPsec as well as those are not.

**Allow the connection if it is secure**  
This includes only connections that have been authenticated by using IPsec. Connections will be secured using the settings in IPsec properties and rules in the Connection Security Rule node.

[Customize...](#)

7. Click **Next** and select to apply the rule on the **Domain, Private** and **Public** networks.

 New Inbound Rule Wizard X

**Profile**

Specify the profiles for which this rule applies.

**Steps:**

- Rule Type
- Protocol and Ports
- Action
- Profile**
- Name

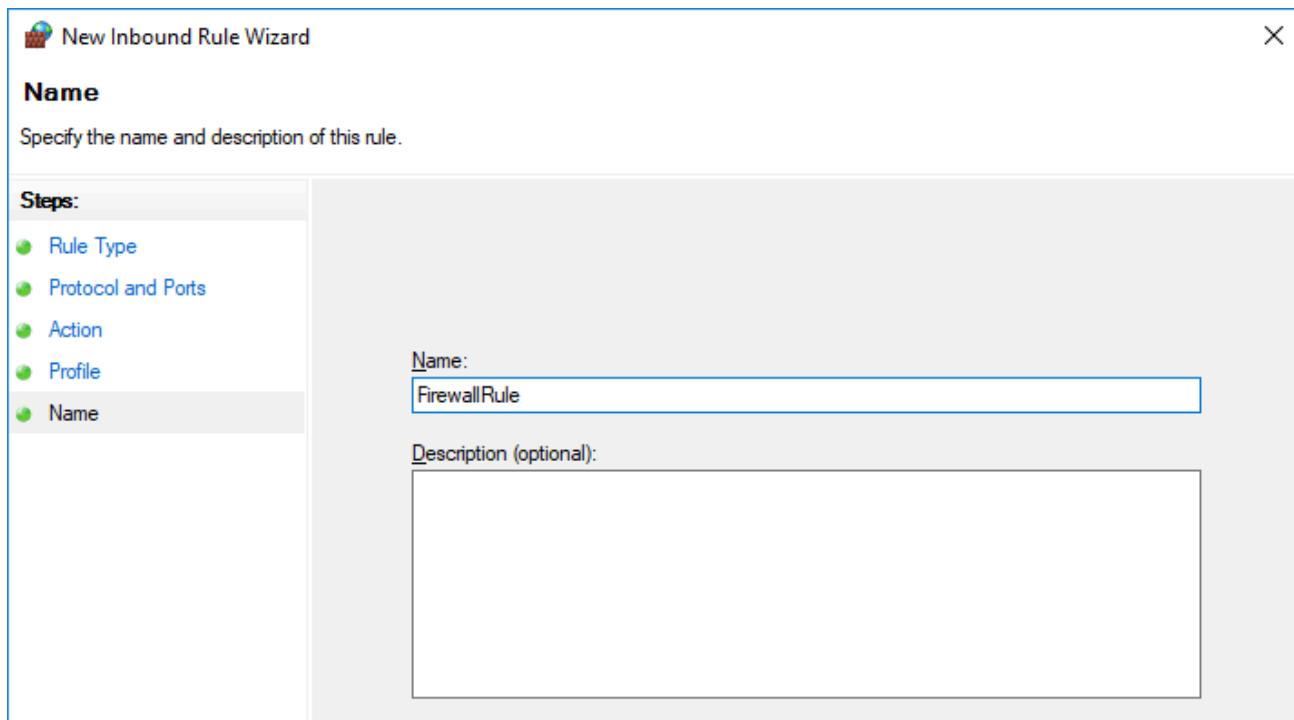

When does this rule apply?

**Domain**  
Applies when a computer is connected to its corporate domain.

**Private**  
Applies when a computer is connected to a private network location, such as a home or work place.

**Public**  
Applies when a computer is connected to a public network location.

8. Click **Next**, assign a name for the rule.

9. Click **Finish**.

## Binding Service to Every Network Interface

In a virtual network environment, Plant SCADA Access Anywhere Server should use every virtual network interface, rather than just one virtual Network Interface Controller (NIC). Network interfaces used by the Access Anywhere Server need to be accessible to the target group of users.

## Verifying the Current Network Interface Configuration

As a quick test of your current network configuration, run Microsoft PowerShell and enter the following command:

```
RESOLVE-DNSNAME dnsname
```

For example:

```
PS C:\Users\user1> resolve-dnsname itaatest
```

## Installation

Plant SCADA Access Anywhere Server is the server-side service that translates RDP into WebSocket communication. The Plant SCADA Access Anywhere Server is installed on the RDP host.

The Plant SCADA Access Anywhere client interface, running in the browser, connects to this service using WebSockets directly or through the Secure Gateway.

For more information about the Secure Gateway, refer to the [Access Anywhere Secure Gateway Installation and Configuration Guide](#).

**Note:** Plant SCADA Access Anywhere supports silent installation of its components using a response file. See

---

Unattended Silent Installation.

---

## Installing Plant SCADA Access Anywhere Server

The Plant SCADA Access Anywhere installer allows you to install the Plant SCADA Access Anywhere Server and the Access Anywhere Secure Gateway.

**Note:** The Access Anywhere Server and Access Anywhere Secure Gateway components **cannot** be installed on the same computer.

---

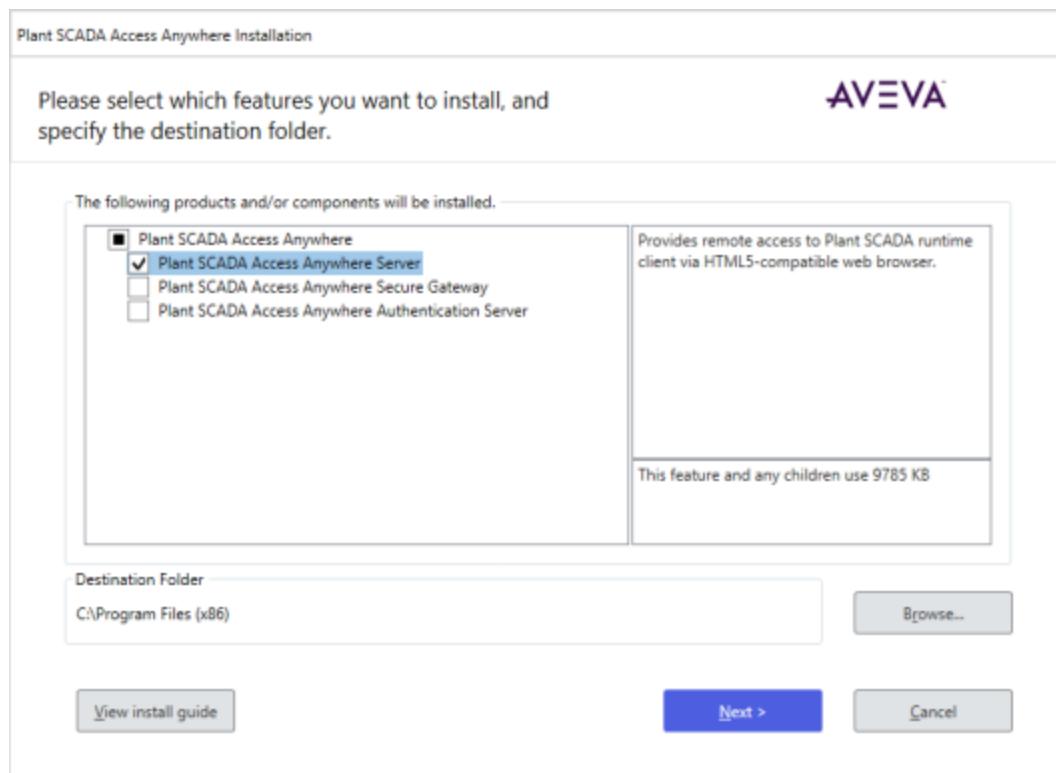

To install Plant SCADA Access Anywhere Server:

1. Run the *Setup.exe* file. The Plant SCADA Access Anywhere splash screen appears.

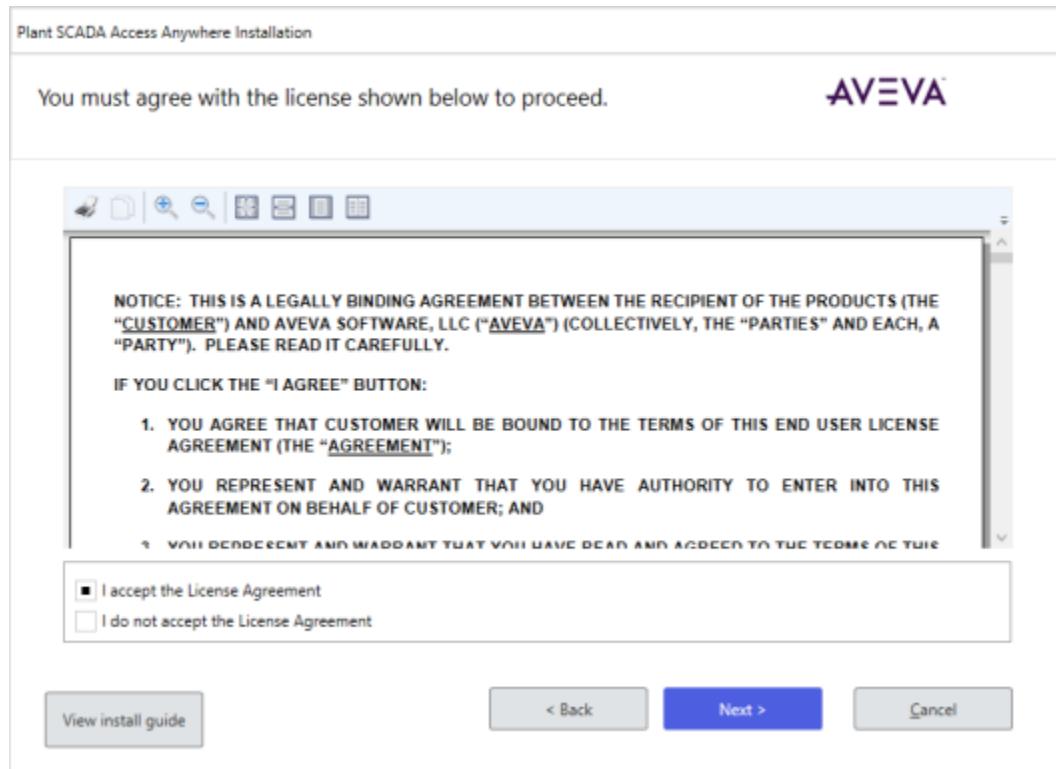

The message "Please wait for configuration to complete" appears as the installer prepares to start the installation.

2. Select the Plant SCADA Access Anywhere **Server** option.

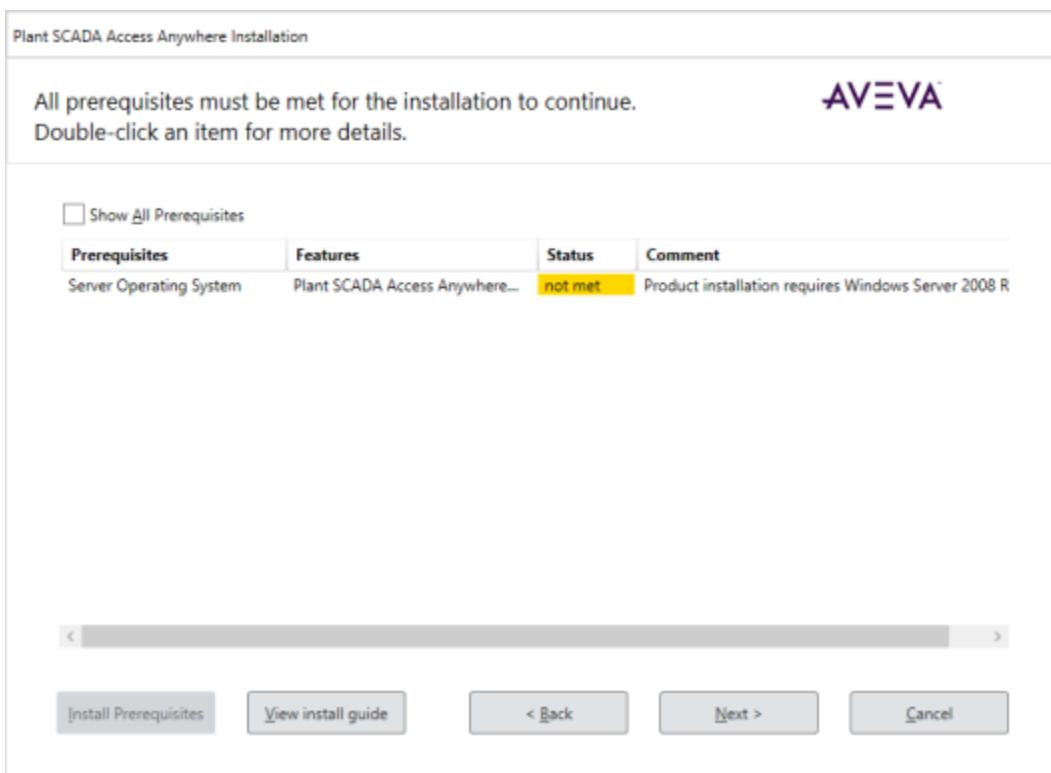

**Note:** A Plant SCADA Access Anywhere Server cannot be installed on the same computer as a Plant SCADA Access Anywhere Secure Gateway.

- Click **Next**. The License Agreement screen appears. Read the license agreement carefully, and select the **I accept the License Agreement** option to continue. Selecting **I do not accept the License Agreement** will stop you from proceeding with the installation.

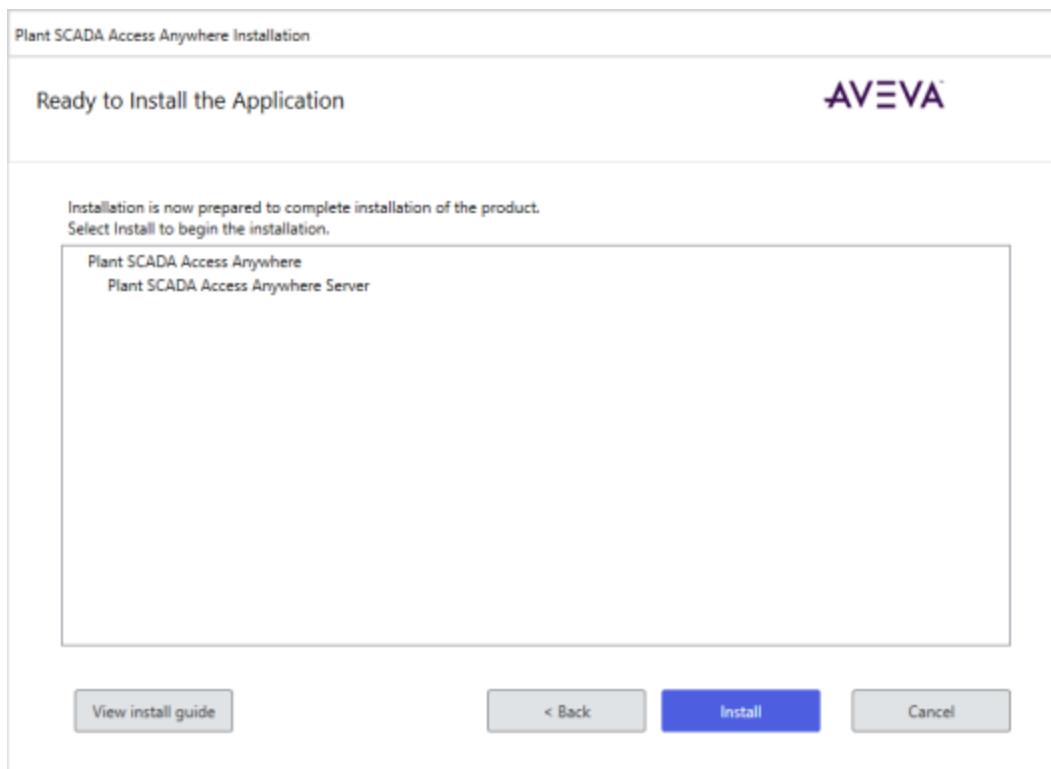

4. Click **Next**. The Installation Prerequisites screen appears.

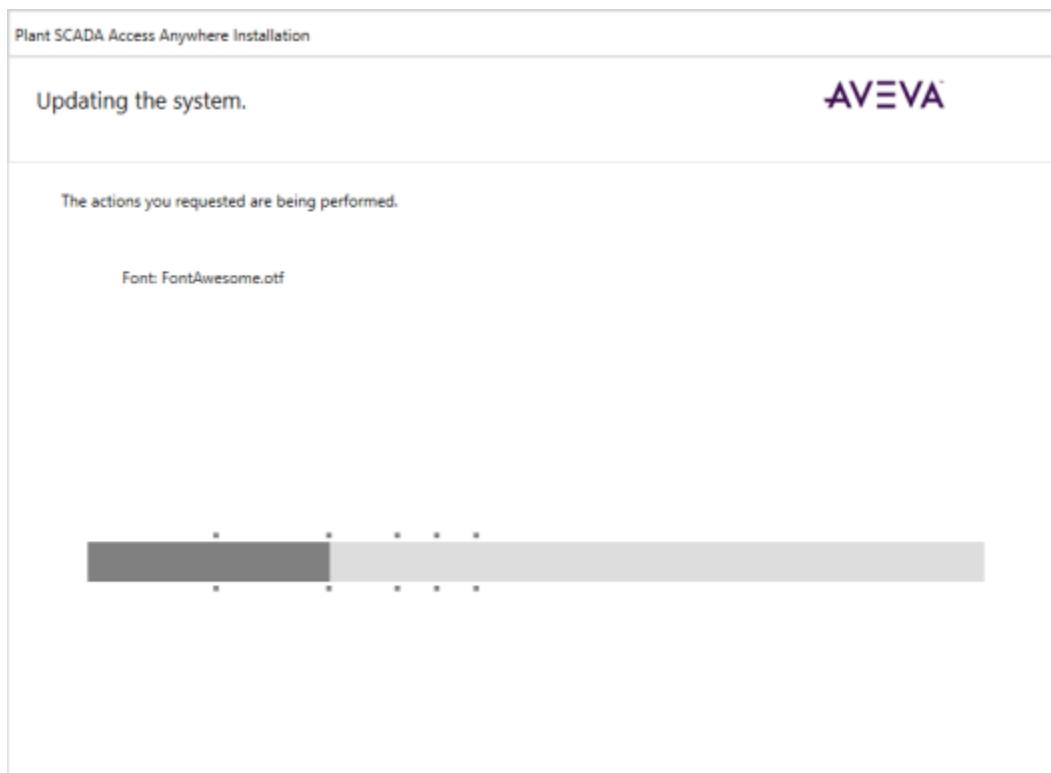

The installation program checks whether the installation prerequisites are met, and shows the missing prerequisites.

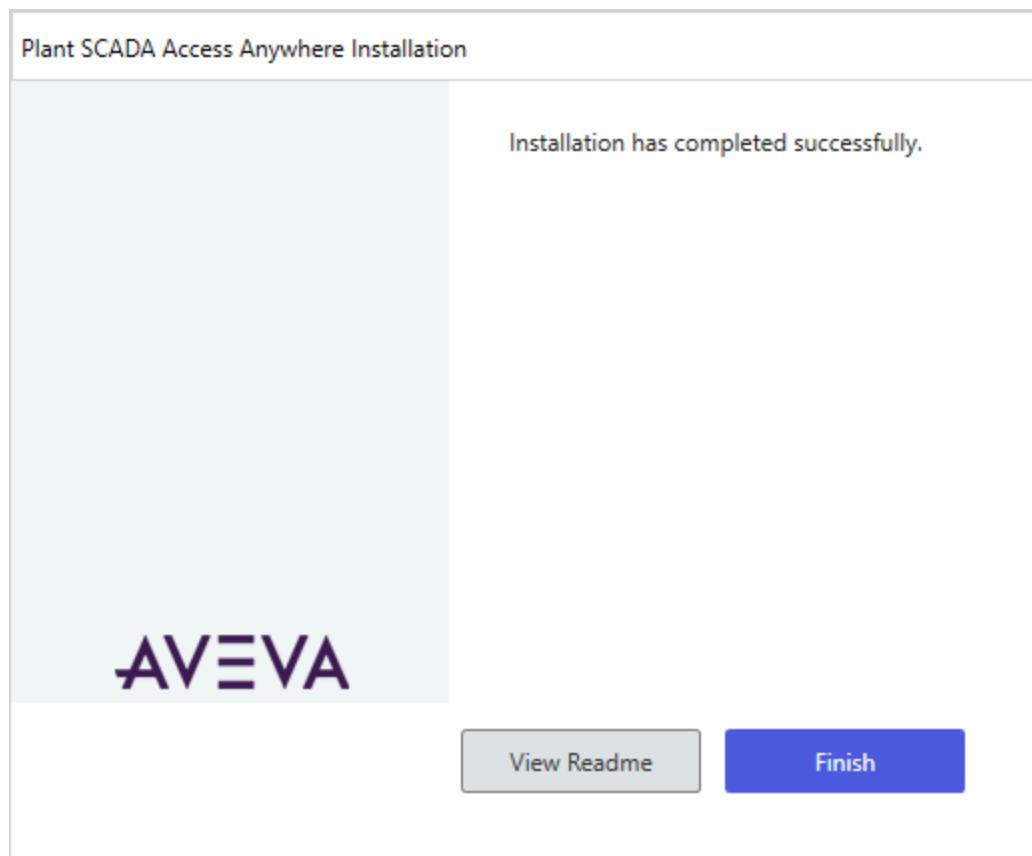

5. To view a complete list of prerequisites, select the **Show All Prerequisites** option.  
Click **Install Prerequisites** to install the missing prerequisites.
6. Click **Next**. The list of components selected for installation is displayed.

7. Click **Install**. The progress bar appears.

After the installation is complete, the Installation Complete dialog box appears. Click **View Readme** to open the *Readme.html* file, which contains details about Plant SCADA Access Anywhere features, or click **Finish**.

The Plant SCADA Access Anywhere Server service is configured to run automatically on system startup. If the service is stopped or is unable to listen on its default port (8080), clients will not be able to connect to that host.

Configure firewalls and proxies between the end-point devices and the server-side component to allow communication using port 8080, or use the Plant SCADA Access Anywhere Secure Gateway (see the [Access Anywhere Secure Gateway Installation Guide](#)).

---

**Note:** Plant SCADA Access Anywhere Server cannot be installed on systems where the host name contains non-English characters.

---

## Unattended Silent Installation

The installation of Plant SCADA Access Anywhere can be executed via a command line that calls a response file. A response file defines the components that will be installed during a silent installation. It can be used to install the following components:

- Plant SCADA Access Anywhere Server
- Plant SCADA Access Anywhere Secure Gateway
- Plant SCADA Access Anywhere Authentication Server (supports a Secure Gateway).

---

**Note:** The Access Anywhere Server and Access Anywhere Secure Gateway components should not be installed on the same computer. The Secure Gateway is an optional server installed separately on a computer in a DMZ to allow access to Plant SCADA from behind a firewall.

---

You can create your own response files as a simple text-based file (for example,

AccessAnywhereServerInstall.txt).

### Install Command

You can then execute a response file using the following command:

```
Setup.exe /silentnoreboot "<Complete path to Response File>"
```

A full absolute path needs to be provided. For example:

```
Setup.exe /silentnoreboot "C:\PlantSCADAAccessAnywhere\MyResponseFiles\AccessAnywhereServerInstall.txt"
```

### Uninstall Command

You can also use a command to run a silent uninstall of all Access Anywhere components:

```
Setup.exe /silentuninstall <Access Anywhere product ID>
```

For example:

```
Setup.exe /silentuninstall {XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX}
```

The product ID for Access Anywhere can be retrieved from the Setup.xml file, located in the InstallFiles directory within the installation media.

Search for the ID value within the <mainproduct> tags.

---

**Note:** Silent modification of an existing installation is not supported. You need to uninstall all previously installed Access Anywhere components (either using the silent uninstall command or Windows Control Panel) before you can use a response file to run a silent installation.

If you want to install the Access Anywhere Secure Gateway and the Access Anywhere Authentication Server on the same computer, you need to include both in the same response file. See the example below for a Secure Gateway including the Authentication Server.

## Examples

The following examples provide the text you can use to create a response file.

- **Plant SCADA Access Anywhere Server**

```
<responsefile>
<install>
  FeatureForm.SFeatureList=Plant SCADA Access Anywhere.HTML5_Server_Files
  FeatureForm.SInstallDir=C:\Program Files (x86)
</install>
</responsefile>
```

- **Access Anywhere Secure Gateway and the Authentication Server**

```
<responsefile>
<install>
  FeatureForm.SFeatureList=Plant SCADA Access Anywhere.SecurityServer_Files,Plant SCADA
  Access Anywhere.AuthenticationServer_Files
  FeatureForm.SInstallDir=C:\Program Files (x86)
</install>
</responsefile>
```

- **Access Anywhere Secure Gateway**

```
<responsefile>
<install>
FeatureForm.SFeatureList=Plant SCADA Access Anywhere.SecurityServer_Files
FeatureForm.SInstallDir=C:\Program Files (x86)
</install>
</responsefile>
```

- **Access Anywhere Authentication Server**

```
<responsefile>
<install>
FeatureForm.SFeatureList=Plant SCADA Access Anywhere.AuthenticationServer_Files
FeatureForm.SInstallDir=C:\Program Files (x86)
</install>
</responsefile>
```

## Repairing an Installation

You can use the installation program to repair corrupt files of installed Plant SCADA Access Anywhere components.

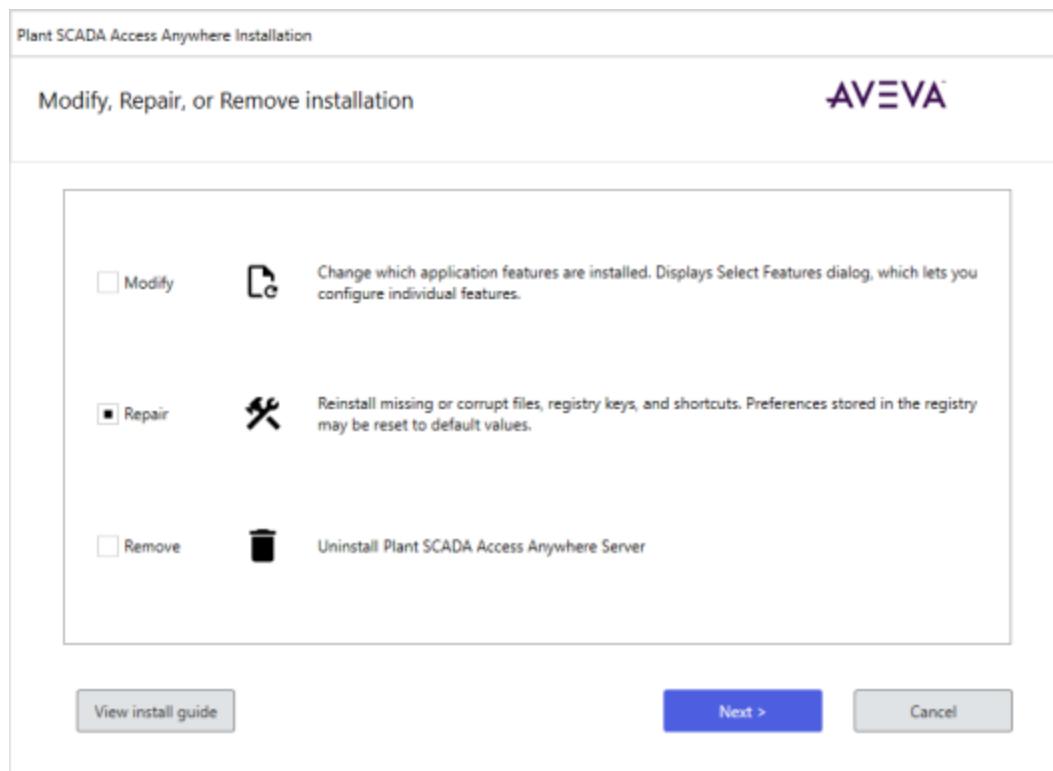

---

**Note:** Before you can repair an installation, you need to have access to the location where the installation files are stored.

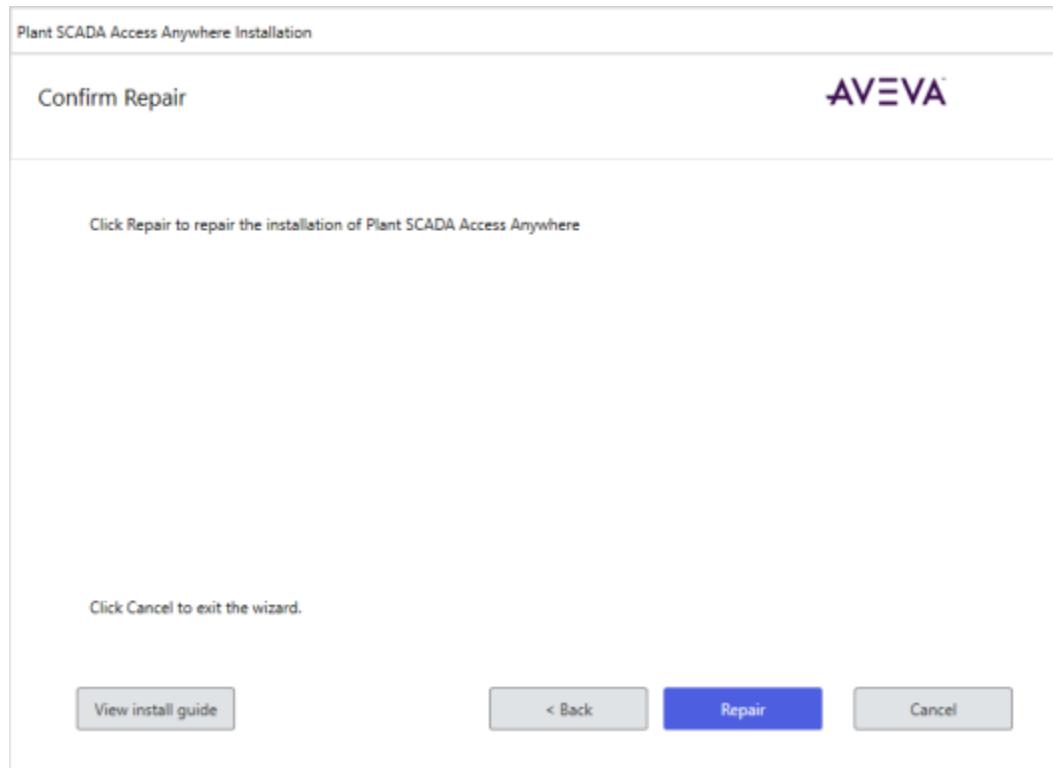

---

**To repair an installation:**

1. From the **Windows Start** menu, select **Control Panel | Programs | Programs and Features | Uninstall a Program**. The programs installed on your computer are listed.
2. Select the Plant SCADA Access Anywhere component you wish to repair. Click **Uninstall/Change**. The installer program appears.
3. Select **Repair**, and then click **Next**.

4. Click **Repair**.

5. Installed Plant SCADA Access Anywhere components are repaired, and a message confirming this appears.
6. Click **Finish** to close the dialog box.

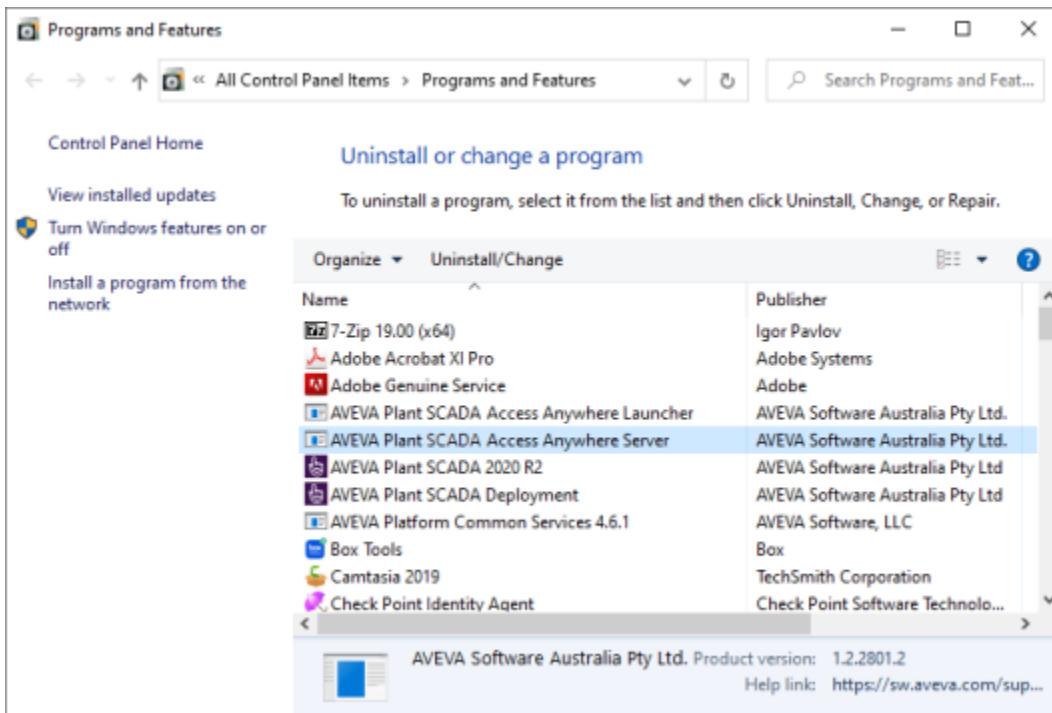

## Uninstalling Plant SCADA Access Anywhere

You may wish to remove Plant SCADA Access Anywhere components. This section provides instructions for uninstalling Plant SCADA Access Anywhere components.

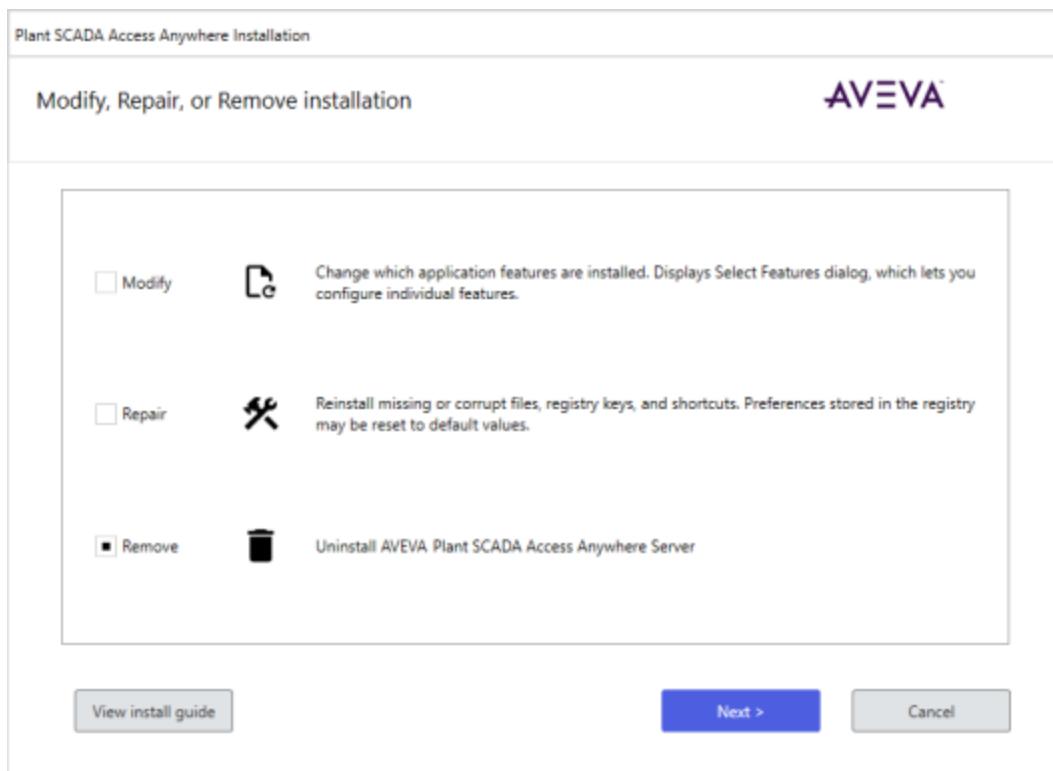

**Note:** Plant SCADA Access Anywhere supports silent uninstallation of its components using a response file. See [Unattended Silent Installation](#).

### To uninstall Plant SCADA Access Anywhere components:

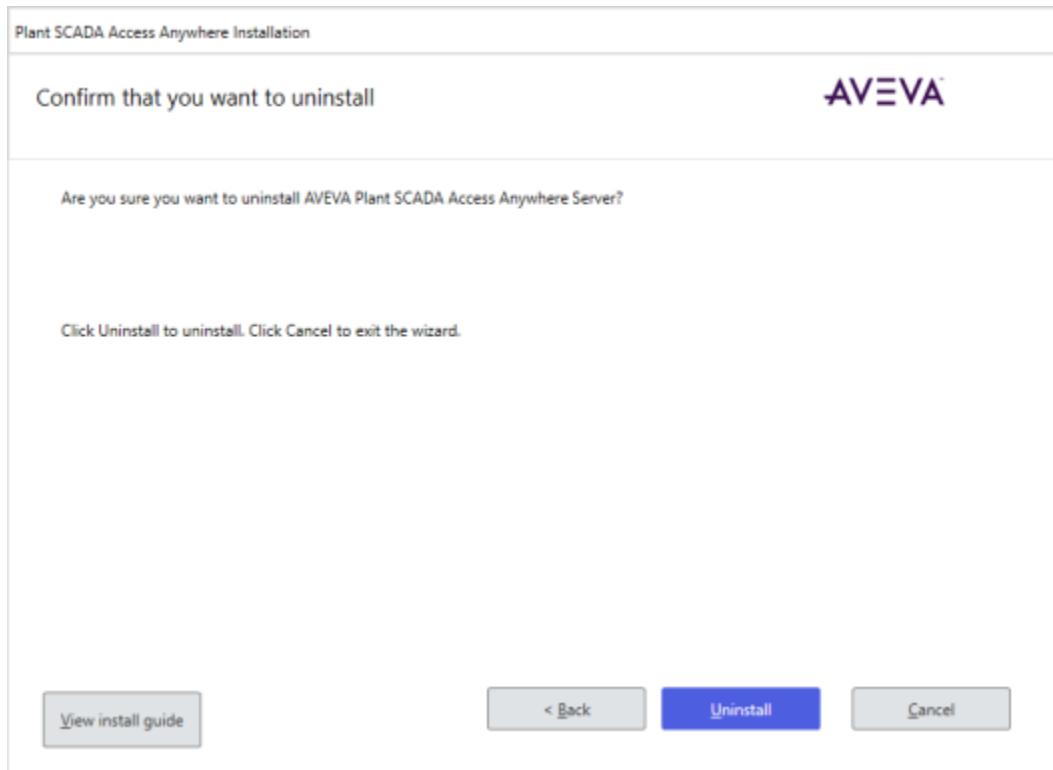

1. From the Windows Start menu, select **Control Panel | Programs | Programs and Features | Uninstall a Program**. The programs installed on your computer are listed.
2. Locate the Plant SCADA Access Anywhere Server component to uninstall, and click to select the component.

3. Click **Uninstall/Change**. The Modify, Repair or Remove Installation dialog box appears.
4. Select **Remove**.

5. Click **Uninstall** and then click **Next**. A screen confirming the uninstallation appears.

**Note:** This will remove only the selected component. To remove every component installed with the Access Anywhere Secure Gateway (the Access Anywhere Secure Gateway Client Components), run `setup.exe` again and perform a complete uninstall. Some files may still exist in the installation folders after the uninstallation.

## Upgrading to a New Version

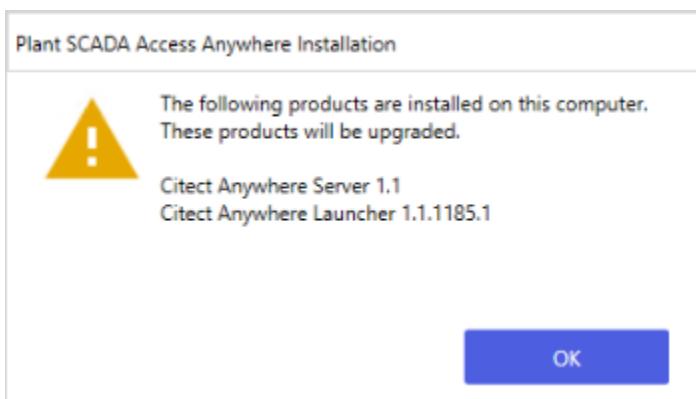

**Note:** When you upgrade Plant SCADA Access Anywhere, the existing server configuration is overwritten. If you want to migrate your existing server settings to the new version, see the topic [Migrate an Existing Configuration from an Earlier Version](#) before you upgrade.

To upgrade to the latest version of Plant SCADA Access Anywhere Server, follow these steps:

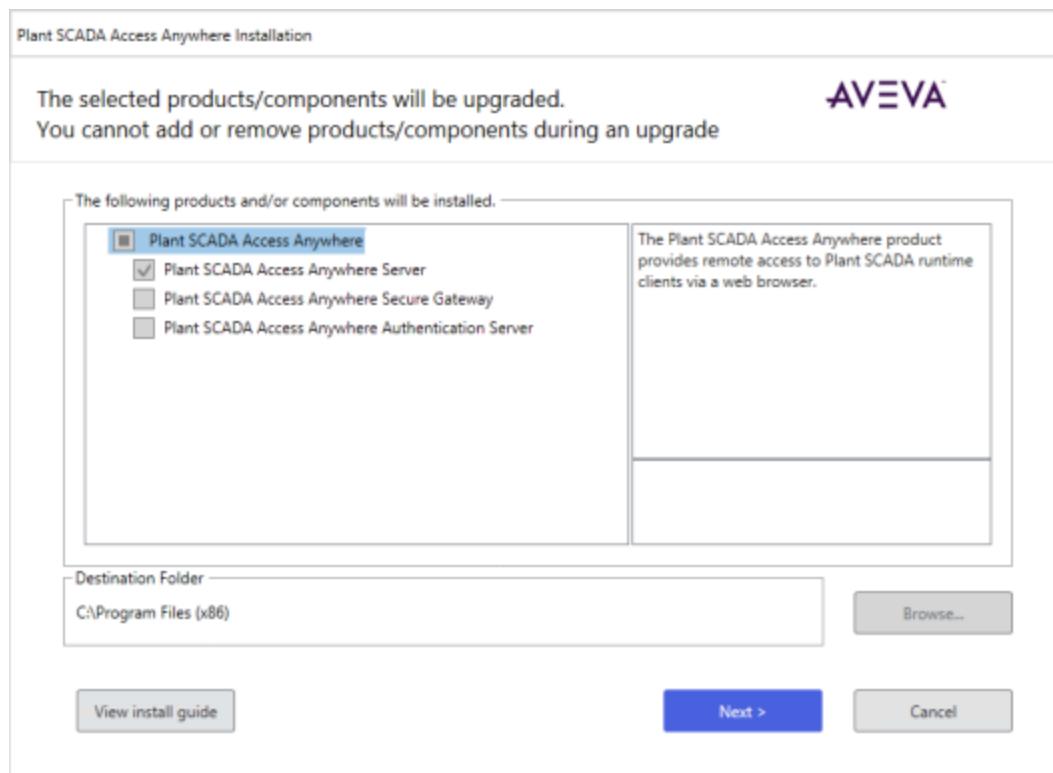

1. Run the *Setup.exe* file. The Plant SCADA Access Anywhere splash screen appears.

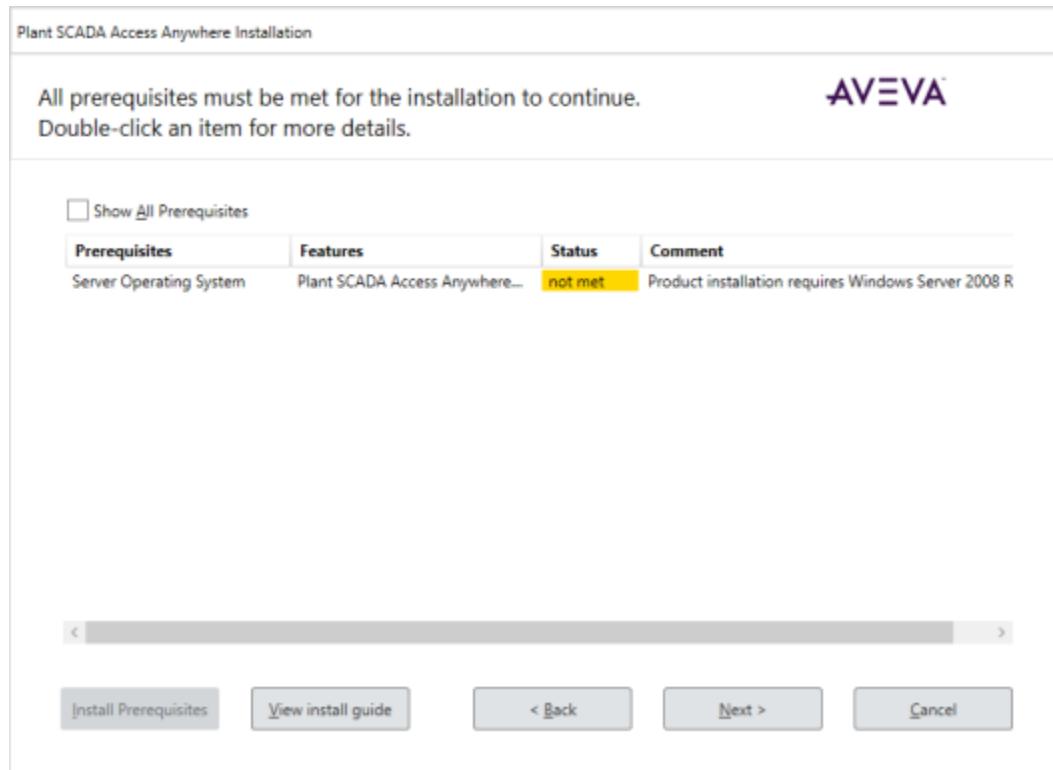

2. The following screen is then displayed.

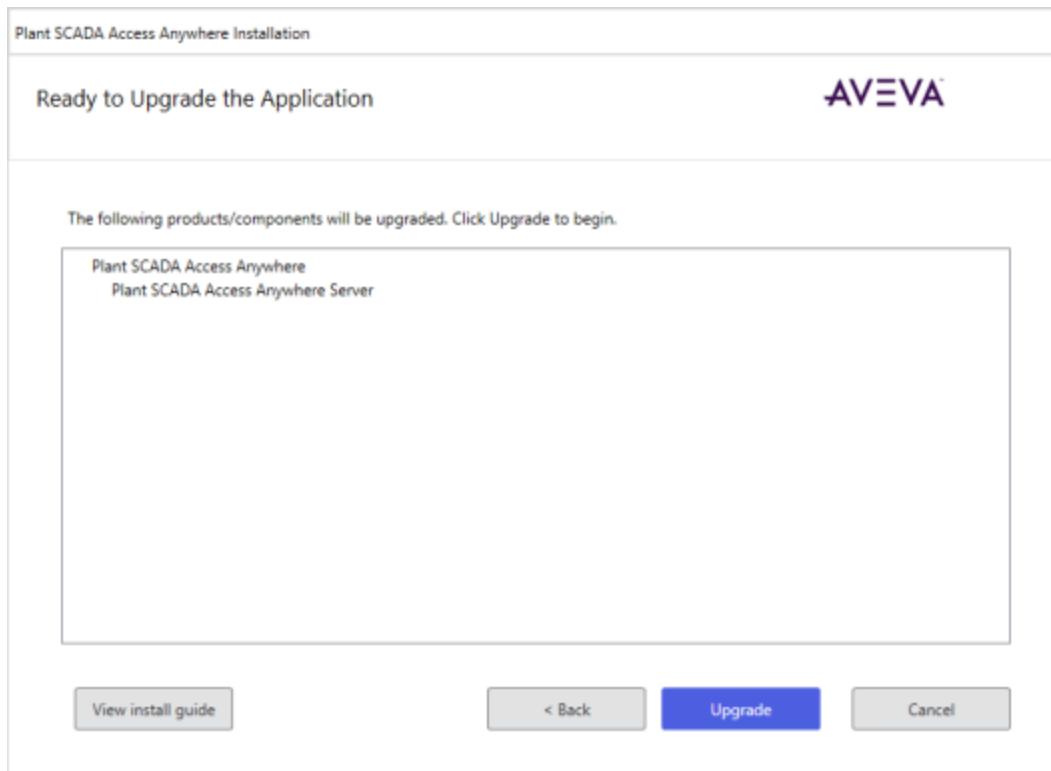

3. Click **OK**. The next screen appears with details of the Plant SCADA Access Anywhere components that will be upgraded.

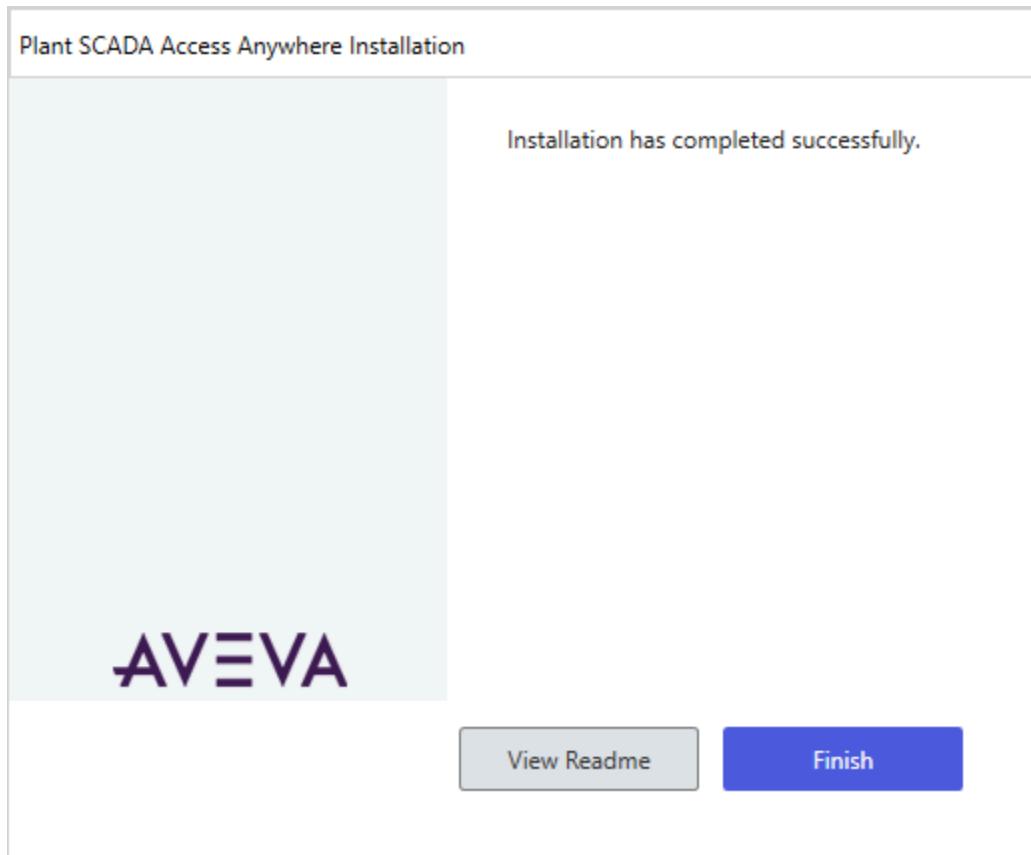

4. Click **Next**. If the prerequisites for the new version are not installed, the following screen appears.

5. Click **Install Prerequisites**. Once the prerequisites are installed, a screen with the list of the prerequisites is displayed. Click **Next** on that screen. The following screen is displayed.

6. Click **Upgrade**. The upgrade process starts, and a progress bar is displayed. The following screen appears when the upgrade completes successfully.

7. Click **Finish** to close the installer.

**Note:** Unexpected dialogs may appear the first time you log into the Web Client following an upgrade.

- If you see a "PowerTerm WebConnect Terminal Server Agent" dialog that states the system cannot find the file specified, you need to restart the Plant SCADA Access Anywhere Server.
- If an "Ericom URL Handler" dialog appears, click OK. A "How do you want to open this file?" dialog will appear. Select the option that includes a path to "PtTSAgent.exe". A third dialog will appear stating "Application not found". When you click OK on this dialog, the issue will be resolved.

## Migrate an Existing Configuration from an Earlier Version

When you upgrade, the existing Plant SCADA Access Anywhere Server configuration file is no longer used. If you want to migrate your existing server settings to the new version, you need to manually merge some information into the upgraded configuration files.

**Note:** With the release of Plant SCADA Access Anywhere 2.0, the default installation location changed from '\Program Files (x86)\Schneider Electric\Citect Anywhere' to '\Program Files (x86)\AVEVA Plant SCADA Access Anywhere'.

To migrate an existing Plant SCADA Access Anywhere Server configuration, perform the following steps.

1. Make a backup of the configuration files.

For the Plant SCADA Access Anywhere Server, this will include the following files:

- \Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Launcher\SE.Scada.AnywhereLauncher.exe.config
- \Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Server\WebServer\PlantAccessAnywhere\config.js

**Note:** If you have used a custom certificate for the Plant SCADA Access Anywhere Server, you will need to export a backup of the server configuration settings as a registry file as certificate information is not included in the configuration files listed above. You can view the current SSL certificate details on the **Security** tab of the [The Configuration Console](#). You can also export the configuration settings as a registry file (.reg) using the console's **Advanced** tab.

If you want to migrate an existing Access Anywhere Secure Gateway, you should also back up the following files before performing an upgrade:

- \Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Plant SCADA Access Anywhere Authentication Server\EricomAuthenticationServer.exe.config
- \Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Plant SCADA Access Anywhere Authentication Server\EricomAuthenticationServer\_Tenants.xml
- \Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Plant SCADA Access Anywhere Secure Gateway\WebServer\PlantAccessAnywhere\config.js
- \Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Plant SCADA Access Anywhere Secure Gateway\EricomSecureGateway.exe.config

The process for migrating the Secure Gateway configuration is explained in the [Access Anywhere Secure Gateway Installation and Configuration Guide](#).

2. Upgrade the software. Follow the procedure described in Upgrading to a New Version, then return to step 3.
3. Manually merge the settings from the files listed below into the new version.
4. Restart the affected services.

- **SE.Scada.AnywhereLauncher.exe.config**

Merge the 'applicationSettings' section from old config file to new config file, if applicable.

- **PlantAccessAnywhere\config.js**

Merge the defaults dictionary from the old config.js to new config.js file, if applicable.

- **"VjcaControl" and "VjcaView" Windows user groups**

Manually migrate any users in the existing "VjcaControl" and "VjcaView" Windows user groups to the new groups installed by Plant SCADA Access Anywhere 2.0 ('SCADA.AnywhereControl' or 'SCADA.AnywhereView').

## Plant SCADA Access Anywhere Web Component

The web component contains the resources that are used by the web browser to display an interface for users to use to connect to their remote application. These resources include HTML pages, JavaScript and CSS files and graphic images. Review the chapter on [Advanced Configuration](#) to modify the appearance and behavior of the web component interface.

---

**Note:** If you are running Plant SCADA Access Anywhere on an IPv6 network, it is recommended you configure a hostname that refers to the Access Anywhere Server. A hostname ensures the server is compatible with all supported browsers. If you attempt to connect to the Access Anywhere Server using a standard format IPv6 address in Internet Explorer, the connection will not be successful.

---

## Installing the Web Component

The Plant SCADA Access Anywhere web component is automatically installed along with the Access Anywhere Server. The web component may be found in the Access Anywhere Server folder:

**\Program Files (x86)\AVEVA Plant SCADA Access Anywhere\ Server\WebServer\PlantAccessAnywhere**

## WebSocket Connections

This section describes connection communication between WebSockets to both remote desktops and to the Plant SCADA Access Anywhere Secure Gateway.

## WebSocket Communication to Remote Desktops

The Plant SCADA Access Anywhere Server installation includes a self-signed certificate for SSL connections. It is recommended self-signed certificates are only used for testing purposes within a domain. Self-signed certificates will result in insecure connection warning messages in the user's web browser. They will also stop iOS devices from connecting to the Secure Gateway.

For production systems, use either a trusted certificate purchased from a certificate authority (for example, DigiCert), or a domain-issued trusted certificate provided by your IT administrator. When using a domain-issued certificate, the domain trusted root certificates need to be distributed to every device that connects to Plant SCADA Access Anywhere.

---

**Important:** A signed certificate needs to have a private key associated with it. A .CER file may not have a private key. Use a signed certificate that includes a private key, which usually has a .PFX extension.

---

**Note:** The DNS address of the Plant SCADA Access Anywhere Server or Secure Gateway server needs to match

the certificate name. If a wildcard certificate is being used, the domain needs to match. For example, if the certificate is for \*.example.com the server name needs to end with example.com.

To use a trusted certificate on to the Plant SCADA Access Anywhere Server, perform the following procedures.

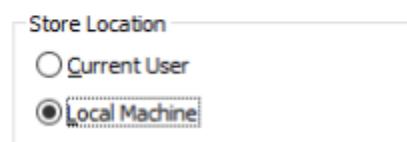

### Import the Certificate on to the Plant SCADA Access Anywhere Server

1. Locate the certificate file provided by your Plant SCADA Access Anywhere or domain administrator.
2. Double click the certificate file, or right-click and select **Import**. The Certificate Import Wizard is displayed.

#### Welcome to the Certificate Import Wizard

This wizard helps you copy certificates, certificate trust lists, and certificate revocation lists from your disk to a certificate store.

A certificate, which is issued by a certification authority, is a confirmation of your identity and contains information used to protect data or to establish secure network connections. A certificate store is the system area where certificates are kept.

To continue, click **Next**.

3. Select **Local Machine** and click **Next**.
4. On the next screen, check that the path to the certificate is correct.

#### File to Import

Specify the file you want to import.

File name:

D:\Certificates\my-ca-server.pfx

[Browse...](#)

Note: More than one certificate can be stored in a single file in the following formats:

Personal Information Exchange- PKCS #12 (.PFX,.P12)

Cryptographic Message Syntax Standard- PKCS #7 Certificates (.P7B)

Microsoft Serialized Certificate Store (.SST)

5. Click **Next**.
6. On the next screen, enter the password for the certificate's private key.

**Private key protection**

To maintain security, the private key was protected with a password.

Type the password for the private key.

Password:

\*\*\*\*\*|

Display Password

7. Click **Next**.

8. On the next screen, specify the location where the certificate will be stored.

**Certificate Store**

Certificate stores are system areas where certificates are kept.

Windows can automatically select a certificate store, or you can specify a location for the certificate.

Automatically select the certificate store based on the type of certificate

Place all certificates in the following store

Certificate store:

Browse...

9. Click **Next**.

10. On the next screen, click **Finish** to import the certificate.

### Configure the Certificate on the Plant SCADA Access Anywhere Server

1. On the Plant SCADA Access Anywhere Server, open Windows Control Panel.

2. Search for "Certificates".

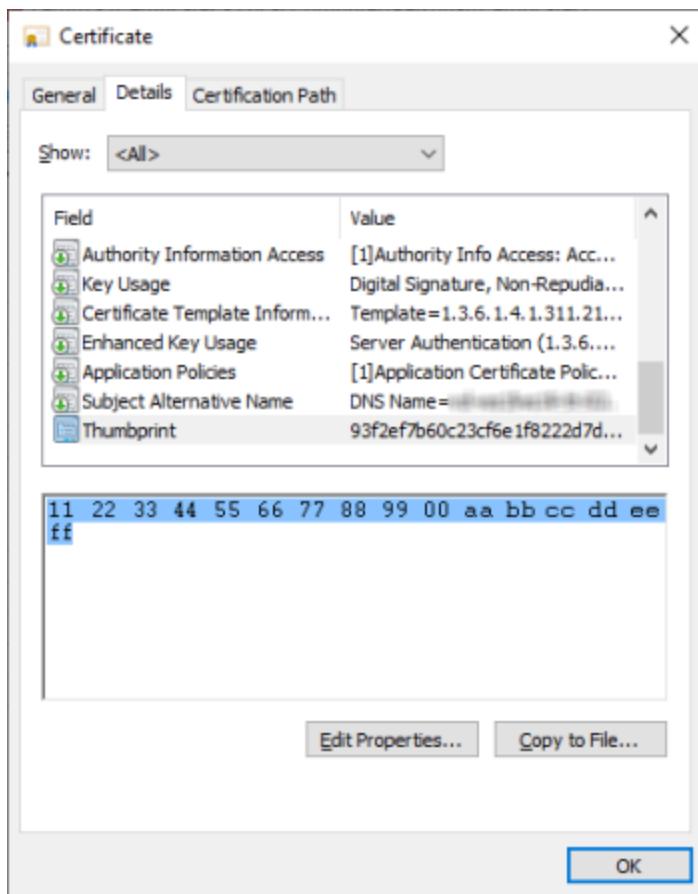

3. Select **Manage computer certificates** under Administrative Tools.

4. Locate the correct certificate in the Certificate Manager.

This will depend on where the certificate was imported. Typically this will be under 'Personal\Certificates'.

5. Double click the certificate, then select the **Details** tab.

6. Locate the **Thumbprint** property, then select the value and copy it to the clipboard.

7. Launch the Plant SCADA Access Anywhere Server Configuration tool.
8. Go to the **Security** tab.
9. Paste the thumbprint from step 6 into the **Certificate Thumbprint** field.

#### SSL Certificate

**Friendly Name:** Anywhere Signed Certificate  
**SAN:** DNS Name=localhost, DNS Name=<REDACTED>, DNS Name=<REDACTED>  
**Thumbprint:** 11 22 33 44 55 66 77 88 99 00 aa bb cc dd ee ff  
**Issued By:** CN=<REDACTED>  
**Valid From:** 2019/07/25 10:00:00

**Issued To:** <REDACTED>  
**Valid To:** 2021/07/24 10:00:00

#### Change Certificate

To change the above certificate, enter a new certificate's thumbprint below (eg: f5 a8 e6 a2 a8 9c 55 2a 8d f6 b7 d7 e7 22 ...).

Certificate Thumbprint:

Note: this change will only take effect after you click apply AND restart Access Server.

10. Click **OK** or **Apply**.
11. Restart the Plant SCADA Access Anywhere Server.

## WebSocket connections via Plant SCADA Access Anywhere Secure Gateway

When using the Plant SCADA Access Anywhere Secure Gateway, the connection between the Plant SCADA Access

Anywhere Server browser client and the Plant SCADA Access Anywhere Secure Gateway can be encrypted. Refer to the [Access Anywhere Secure Gateway Installation and Configuration Guide](#) for instructions.

## Configuring the Plant SCADA Access Anywhere Server

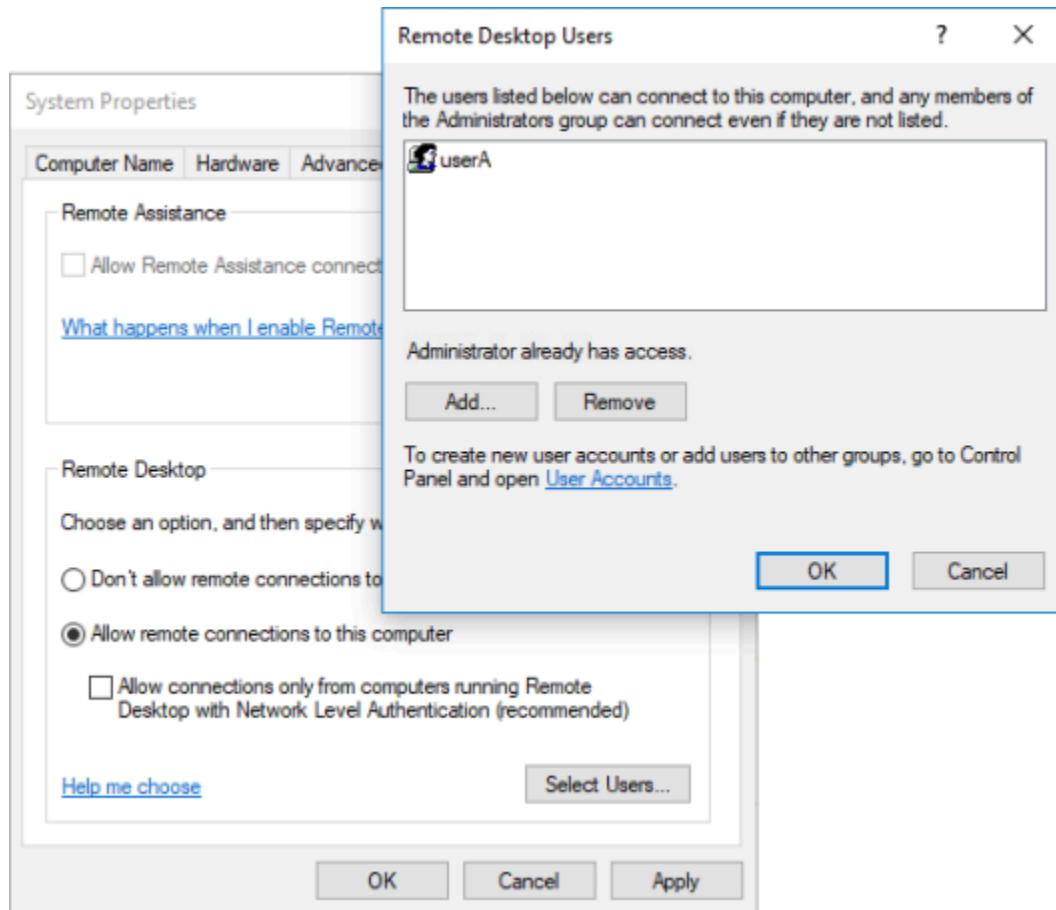

This chapter provides detailed information about configuring your Plant SCADA Access Anywhere Server. This involves the following tasks:

- Configure settings for the Plant SCADA Access Anywhere Server service in the [Configuration Console](#).
- [Configuring User Access](#) for Plant SCADA.

## Configuring Remote Desktop Services

To sign in remotely, users or groups to which users belong need to be added to the Remote Desktop Users group. Complete these steps on the computer on which the Plant SCADA Access Anywhere Server is installed:

1. Navigate to the Control Panel. Select **System and Security | System**.
2. Select the **Advanced system settings** option on the left. The System Properties dialog is displayed.
3. Click the **Remote** tab.
4. Select the **Allow remote connections to this computer** option.

5. Click **Select Users**. The Remote Desktop Users dialog is displayed.
6. Add the required users and click **OK**.

**Note:** For more details about configuring RDS, search for Tech Note 8956 on the [Tech Note, FAQ](#) page of the [AVEVA Knowledge and Support Center](#). You will need to register with the site before you can access the document.

## Configuring User Access

Depending upon their access, users can launch a AVEVA Plant SCADA view-only client or a control client.

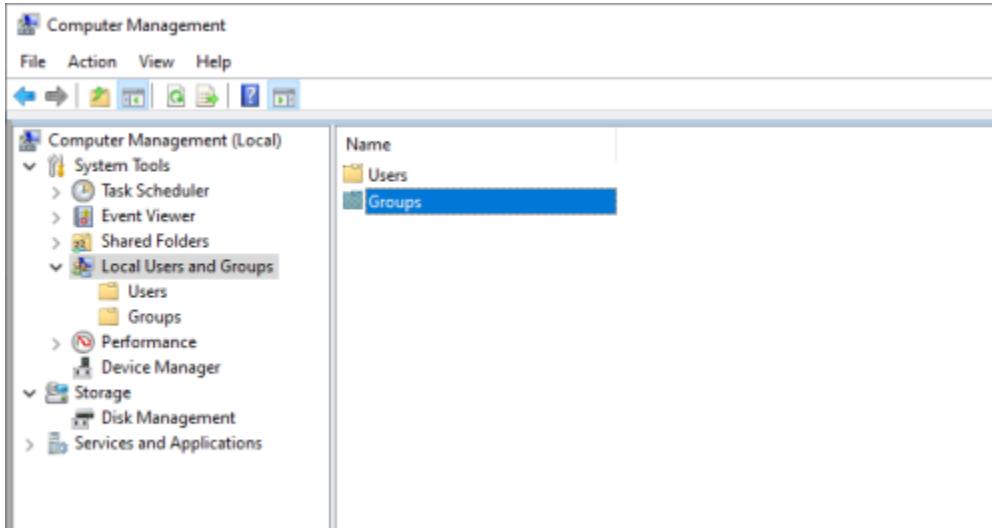

- **View-only client** - a computer configured with view-only access to the AVEVA Plant SCADA runtime system. No control of the system is possible, but access to data monitoring is available.
- **Control client** - an interface between the AVEVA Plant SCADA runtime system and an operator. If you are using AVEVA Plant SCADA on a network, every AVEVA Plant SCADA computer (on the network) is a control client.

Access to the client type is granted through two special Windows user groups ('SCADA.AnywhereControl' or '[SCADA.AnywhereView') created by the installer on the computer where the Plant SCADA Access Anywhere Server is installed.

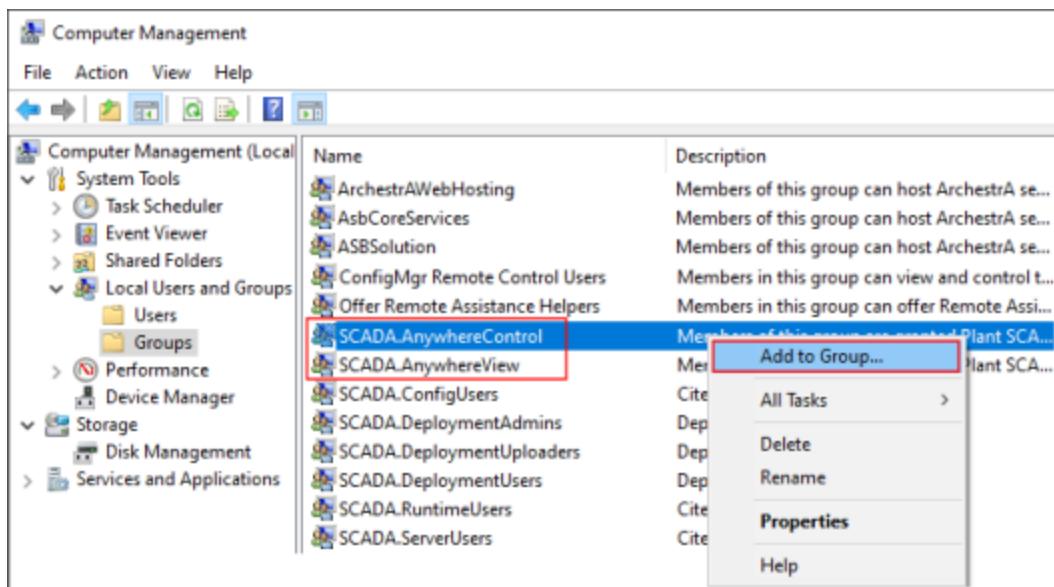

**Note:** If you have recently upgraded to Plant SCADA Access Anywhere 2.0, you will need to manually migrate the users in the existing "VjcaControl" and "VjcaView" Windows user groups to the new 'SCADA.AnywhereControl' and 'SCADA.AnywhereView' groups.

Local users and domain groups need to be added to the required group manually. To do this:

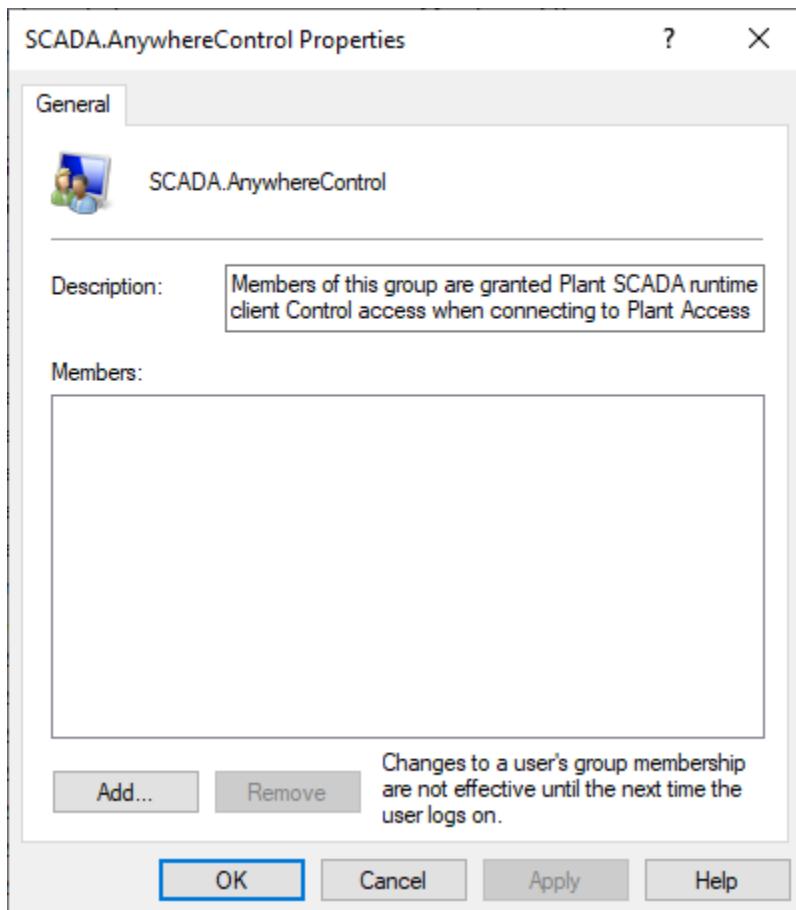

1. Navigate to the Control Panel. Select **Administrative Tools | Computer Management**.
2. In the left pane, navigate to **System Tools | Local Users and Groups**.

3. In the right pane, double-click on **Groups** to expand the node.
4. Locate the Plant SCADA Access Anywhere groups, and right-click on the group to which you want to add a user.

5. Select **Add to Group** from the context menu. The group properties dialog box appears.

6. Click **Add**. The Select User dialog box appears.
7. In the **Enter the object name to select** box, type the name of the user you want to add.
8. Click **Check Names**. Once the user name is verified, click **OK**. The group properties dialog box appears.
9. Click **Apply**. The user is added to the selected group.

---

**Note:** If you are using Plant SCADA 2020 R2 (8.30), the members of the Plant SCADA Access Anywhere user groups must also be included in Plant SCADA's SCADA.RuntimeUsers group to access the runtime display client.

---

## The Configuration Console

The Server Configuration console presents a series of tabs that enable an administrator to configure various settings for the server service.

Double-click *ServerConfiguration.hta* file, located in the following folder:

\Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Server

Alternatively, select AVEVA Plant SCADA Access Anywhere | Plant SCADA Access Anywhere **Server Configuration** from the list of programs on the Windows Start menu.

In general, changing Access Anywhere Server configuration is not required. The default settings are recommended.

---

**Important:** It is recommended that end users are not given access to the computer on which the Access Anywhere Server is installed.

---

The following sections describe the different configuration tabs of the Access Anywhere Server.

- [General Tab](#)
- [Performance Tab](#)
- [Communication Tab](#)
- [Acceleration Tab](#)
- [Security](#)
- [Logging Tab](#)
- [Advanced \(for Administrator User Only\)](#).

### General Tab

This page provides functions to start and stop the Plant SCADA Access Anywhere Server service. For certain configuration changes, a service restart is required. This page also displays the number of active Plant SCADA Access Anywhere Server client sessions connected to this computer.

AVEVA Plant SCADA Access Anywhere Server 2.0 Configuration

General Performance Communication Acceleration Security Logging Advanced

Plant SCADA Access Anywhere Server service state: **Running**

Plant SCADA Access Anywhere Server status: **Active**

Number of sessions: **0**

Started at: **16/11/21 21:29:38**

**Start Server**

**Stop Server**

The Plant SCADA Access Anywhere Server and the Ericom Licensing Server run as a [Windows service](#). When the Plant SCADA Access Anywhere Server service is stopped, Plant SCADA Access Anywhere Clients will not be able to connect to this host with RDP acceleration. Any active accelerated connection will be dropped (sessions will be disconnected). Regular RDP connections to this host will not be affected.

Changing certain settings, such as **Communication** and **Logging** take effect only after the services are restarted. After changing such settings, apply the changes, stop the services and then start them again.

Whenever the Plant SCADA Access Anywhere Server service is restarted, every session on the server will be disconnected.

## Performance Tab

The Performance tab displays current performance statistics related to Plant SCADA Access Anywhere connections.

AVEVA Plant SCADA Access Anywhere Server 2.0 Configuration

General Performance Communication Acceleration Security Logging Advanced

### Server to Client communication

Number of sessions: **0**

Average compression ratio: **61 %**

Total data received from host: **12 MB**

Total data sent to client: **4 MB**

Real-time cumulative performance information for all sessions since Plant SCADA Access Anywhere Server was started. Counters are reset when the Plant SCADA Access Anywhere Server service is restarted. Display is automatically updated approximately once every 10 seconds.

## Communication Tab

This tab provides options to change the Plant SCADA Access Anywhere Server port and the address of the host computer running RDP.

When using a Plant SCADA Access Anywhere Server listening port other than the default (8080), the port number needs to be explicitly specified in the client address field (i.e., `http://<computer name>:5678/`).

When running Plant SCADA Access Anywhere Server on a computer with multiple network cards, change the

RDP host address from localhost to the IP or DNS address of the network card that has RDP access to the system. A change to either setting requires a service restart. This can be done via the General tab or using the Windows Service Manager.

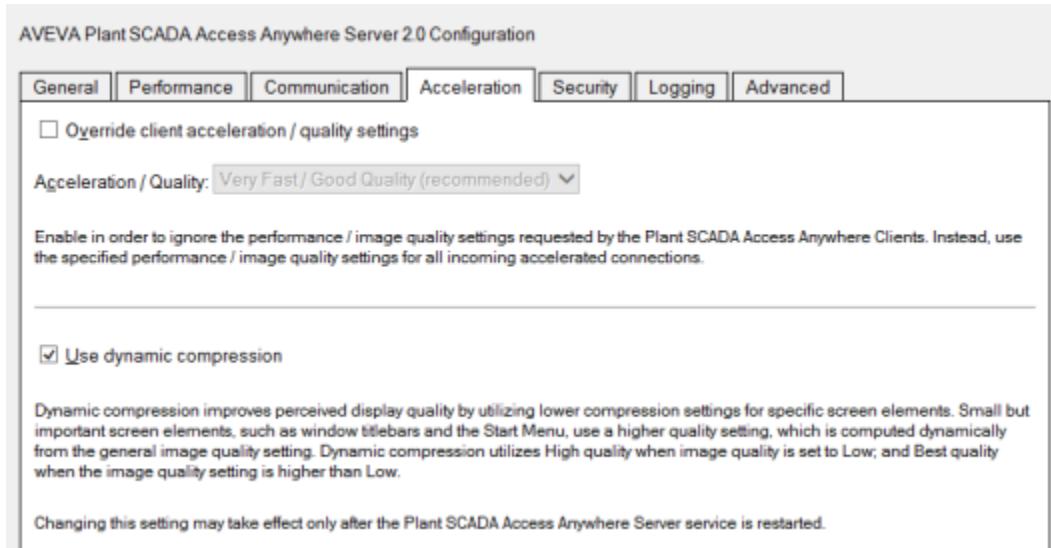

## Acceleration Tab

This tab provides options to change the Acceleration/Quality level and disable dynamic compression. When the **Override client acceleration / quality settings** option is selected, every session using the configured settings, and every client setting are ignored. When selecting or clearing this setting, the service needs to be restarted for the change to take effect. When the setting is enabled, changing the acceleration level does not require a service restart, but active users need to reconnect to use the new setting.

Dynamic Compression identifies small graphical objects on the screen (such as toolbar icons, task bar icons, Start Menu icons, etc.) and compresses them. Setting the image quality to low will result in maximum compression, minimizing the impact on the network. Other graphical objects are compressed at the selected quality. This provides the visual impression of a high quality remote desktop session.

By default, this feature is enabled. To disable, clear the **Use dynamic compression** box.

## Security

This page configures the Plant SCADA Access Anywhere Server security settings.

AVEVA Plant SCADA Access Anywhere Server 2.0 Configuration

General Performance Communication Acceleration Security Logging Advanced

## Plant SCADA Access Anywhere supports strong SSL encryption

Encrypt Plant SCADA Access Anywhere communication:

By default Plant SCADA Access Anywhere uses the same security settings as Microsoft RDP - if RDP is encrypted then Plant SCADA Access Anywhere will be encrypted. If RDP is not encrypted then Plant SCADA Access Anywhere will not be encrypted either. Set to **Always** for Plant SCADA Access Anywhere to always encrypt regardless of the RDP settings.

**Data transmitted from the clients to the server, including user credentials, is always encrypted regardless of Plant SCADA Access Anywhere and RDP security settings.**

For best performance and lowest load on the server set the RDP Security Level to Low (for 2003/XP also set the Security Layer to RDP Security Layer). This setting can be changed using the RDS (TS) Session Host Configuration or using Local Computer / Group Policies. After performing this change, modify setting above to **Always** if encryption is required.

**Note:** Plant SCADA Access Anywhere provides integrated 128-bit SSL encryption. For optimal performance, set the host's RDP Security Encryption level to Low and change the **Encrypt Plant SCADA Access Anywhere communication** to **Always**. Using this configuration, Plant SCADA Access Anywhere SSL encryption will be used instead of the RDP encryption. Avoid setting this if users will be connecting directly to RDP regularly, as those sessions will end up using Low encryption.

## Logging Tab

This tab provides options to enable/disable certain logging features. Technical Support may request a debugging log for diagnostic purposes. The debugging log is enabled here.

AVEVA Plant SCADA Access Anywhere Server 2.0 Configuration

General Performance Communication Acceleration Security Logging Advanced

Log level:

Maximum log file size:  MB

Maximum number of log file backups to keep:

Changing this setting may take effect only after Plant SCADA Access Anywhere Server service or/and Ericom Licensing Server service are restarted.

Log files will be generated in a subfolder called *Logs* under the Plant SCADA Access Anywhere installation folder. The current log files are called *AccessAnywhere.log* and *LicenseManager.log*. When a log file reaches its maximum allowed size it will be backed up, and new log file will be created.

For Plant SCADA Access Anywhere Server, Backups of previous logs will have the format *AccessAnywhereServer.bck-xxx.log*, where an *xxx* value of *007* is the most recent backup.  
 For Ericom Licensing Server, Backups of previous logs will have the format *LicenseManager.xxx.log*, where an *xxx* value of *000* is the most recent backup.

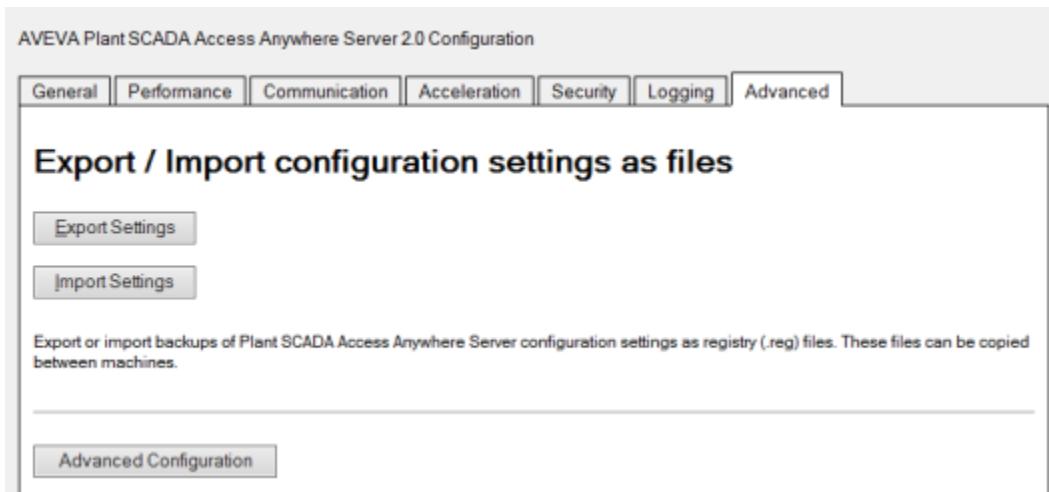

Generate debugging log (for AVEVA support)

Changing these settings may take effect only after Plant SCADA Access Anywhere Server service or/and Ericom Licensing Server service are restarted.

## Advanced

This page provides access to advanced Server settings that are stored in the system's Registry.

- **Export Settings:** Exports the Plant SCADA Access Anywhere Server Registry key to the user's home folder (i.e., My Documents).
- **Import Settings:** Imports previously saved Plant SCADA Access Anywhere Server Registry settings.
- **Advanced Configuration:** Adds every configurable Registry key setting to the Registry. By default, only settings that are changed from the default value are saved into the Registry.

## Configuring Mobile Devices

This chapter contains information about using Plant SCADA Access Anywhere on mobile devices. The following information is covered here:

- [Supported Browsers](#)
- [Logging On to Plant SCADA Access Anywhere](#)
- [Automatic Display Resize](#)

## Supported Browsers

With Plant SCADA Access Anywhere, users can access remote AVEVA Plant SCADA from HTML5 compatible web browsers on any device including smart phones, tablets, and laptop computers. To start a session, navigate to the *start.html* file that is installed on the Plant SCADA Access Anywhere Server. To do this, point a browser to the Plant SCADA Access Anywhere Server URL:

*http://machineaddress:8080*

## Browsers Tested with Plant SCADA Access Anywhere

- Internet Explorer 11
- Microsoft Edge

- Google Chrome
- Safari on Apple iOS

Multiple Plant SCADA Access Anywhere sessions can be opened in different tabs within the web browser, or in different browser windows. When a session is not in use (its tab or window is not displayed) it will reduce its CPU and memory utilization.

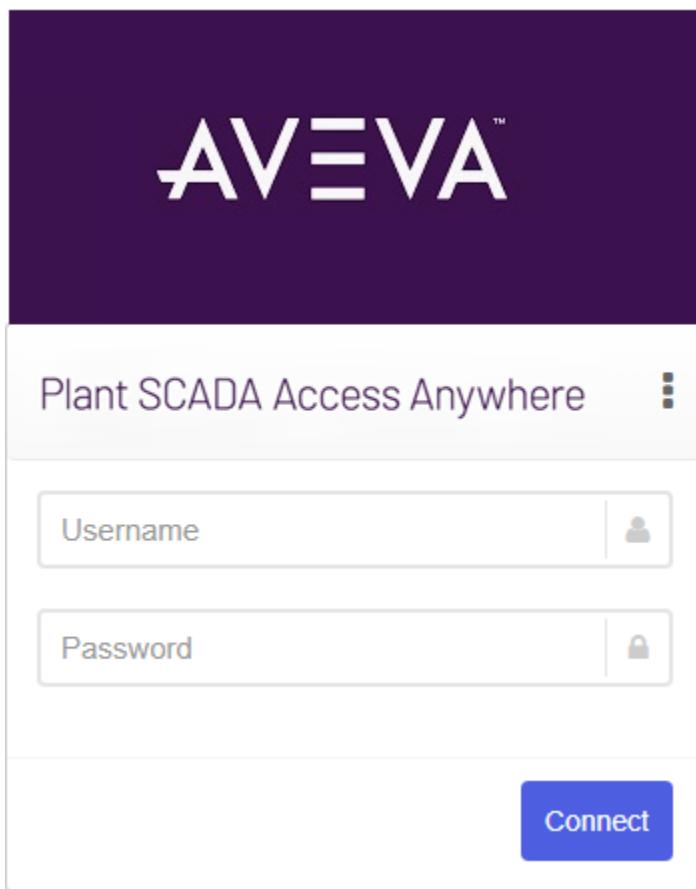

**Note:** If you are running Plant SCADA Access Anywhere on an IPv6 network and you attempt to connect to the Access Anywhere Server using an IPv6 address in Internet Explorer, the connection will not be successful. Use a different browser, or check with your system administrator if a hostname has been configured for the Access Anywhere Server.

## Logging On to Plant SCADA Access Anywhere

To log on to the Plant SCADA Access Anywhere Connection Web Page, follow these steps:

**Note:** If you have any trouble remotely connecting to the Plant SCADA Access Anywhere environment, see [Checking Connectivity](#) in the *Plant SCADA Access Anywhere Web Client User Guide* for more information.

1. Navigate to `http://<Access Anywhere Server Node Name>:8080/`. The logon dialog appears.

2. Enter the connection parameters (see the table below).
3. Tap or click **Connect** to initiate the connection. The progress indicator is displayed before connection is established.

If the Plant SCADA session does not start, and any notification appears, then contact the Access Anywhere Administrator.

Connection Parameters	Description
User Name	Credentials to log on to the RDP host. It can optionally contain domain specification, for example, domain\user. If it is not specified, you will be prompted for credentials by the RDP host. The user needs to be a Windows user and a member of the 'SCADA.AnywhereControl' or '[SCADA.AnywhereView] Windows group. They also need to be a valid Plant SCADA user.
Password	Corresponding password for the user name. This value should not be saved for future connections. If it is not specified, you will be prompted for credentials by the RDP host.

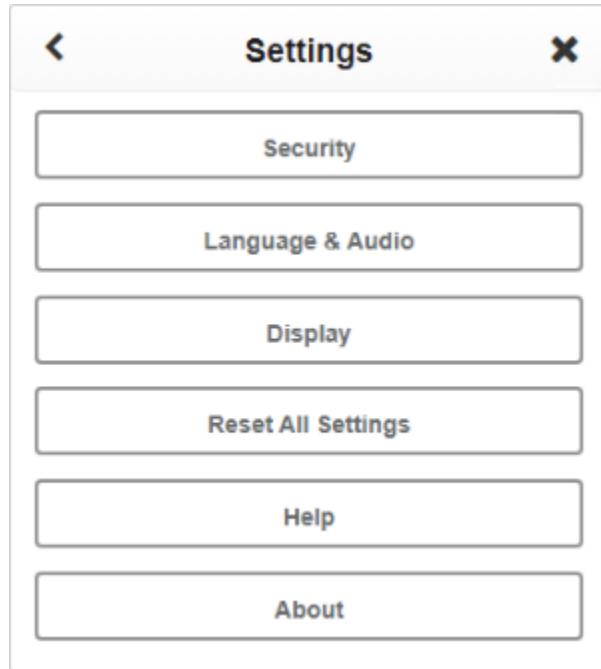

**Note:** When using a Secure Gateway, the **User Name** and **Password** fields are mandatory, otherwise they are optional.

## Configuring Advanced Settings

To configure advanced settings:

- Click the icon. The following tabs appear as shown below:

- Click on each tab to view the settings available for configuration. For example, to view Display settings, click the **Display** tab.

To return to the settings dialog, click . To close the Settings dialog and return to the Logon dialog, click .

3. Complete the required settings.

## Security Settings

Option(s)	Description
Enable SSL encryption for remote session	Select this option to allow the client to use Secure Socket Layer (SSL) encrypted WebSocket communication to the Plant SCADA Access Anywhere Server. As a default, this option is selected.

## Language & Audio Options

Option(s)	Description
Display Language	Select the language in which you wish to view the Plant SCADA Access Anywhere interface. The Display Language only applies to the logon web page, and is not propagated to the Plant SCADA client.
Keyboard Locale	Select the keyboard region to be used in the session (keyboard_locale). If you select a non-English keyboard locale, your computer will need to be configured to use a matching keyboard in the Windows <b>Region &amp; Language</b> settings. Some keyboards may not work correctly with Internet Explorer or Edge browsers.
Use keyboard scan-codes	Enables scan codes. Certain applications use scan codes and will require this setting to be enabled.
Remote Audio Playback	Configure where the session's sound will play: local computer, remote computer, or do not play. Audio playback is not supported with Internet

Option(s)	Description
	Explorer version 11.

## Display Options

Option(s)	Description
Acceleration / Quality	The acceleration, or degree of quality can be specified by selecting options from a drop down list. Faster acceleration will result in lower quality images.
Screen Resolution	Sets the resolution size of the Plant SCADA Access Anywhere session. Select a value from the drop down list of values. For example: "800 x 600". Select a screen resolution that matches your AVEVA Plant SCADA project. The default may be configured by the administrator to already match your AVEVA Plant SCADA Project.
Automatic session resize	Enables/disables automatic display resizing. By default, automatic resizing is selected (enabled). This means whenever the browser window is resized, the Plant SCADA Access Anywhere session will automatically adjust itself to the new dimensions. See <a href="#">Automatic Display Resize</a> .

**Note:** For details about the version of Plant SCADA Access Anywhere you are running, click the **About** tab in the Settings dialog.

Click **Reset All Settings** to revert to the default settings.

Depending upon the privileges your administrator has assigned, a Plant SCADA View-only client or Control client will be launched. A View-only client is a computer configured with view-only access to the AVEVA Plant SCADA runtime system. No control of the system is possible, but access to data monitoring is available. A Control client is the interface between the Plant SCADA runtime system and an operator. If you are using Plant SCADA on a network, every AVEVA Plant SCADA computer (on the network) is a control client.

Access to either client depends upon the permissions granted to you by your administrator. For more information, refer to the Plant SCADA Access Anywhere Installation and Configuration Guide.

**Note:** Click the **Help** tab in the Settings dialog to view the [Plant SCADA Access Anywhere Web Client User Guide](#).

## Automatic Display Resize

By default, Plant SCADA Access Anywhere supports automatic display resize. Whenever a browser window is resized, the Plant SCADA Access Anywhere session automatically adjusts itself to the new dimensions (assuming the AVEVA Plant SCADA Runtime window is set to full screen).

To resize a browser window, drag any corner of the browser window and release it when the desired dimensions are reached. If a browser is placed into full screen mode, the Plant SCADA Access Anywhere session will automatically expand to the full screen. Be aware that resizing is subject to the display limitations of the Plant SCADA runtime system.

You can enable/disable automatic resizing via the **Display** settings for the Plant SCADA Access Anywhere Web Client, accessible via the advanced settings on the Logon dialog.

## Using Gestures on Client Portable Devices

### Google Chromebooks

Plant SCADA Access Anywhere operates on Google Chromebook and Chromebox just like it does with a Google Chrome browser. Here are some tips to keep in mind when using Access Anywhere with a Chromebook or Chromebox.

Function	Description
Mouse Left-click	Click the Chromebook trackpad with one finger.
Mouse Right-click	Click the Chromebook trackpad with two fingers
Scrolling a document or website	Drag two fingers on the Chromebook trackpad up or down to scroll
Configure Chromebook	In the address field: <i>chrome://settings</i>

### Chrome Keyboard

The Chromebook keyboard lacks several keys that are used by Windows. ChromeOS provides standard mappings that use existing keys with the ALT button to represent certain missing keys. Plant SCADA Access Anywhere supports these key combinations:

Command	Key Combination
Delete (DEL)	ALT+Backspace
Page Up	ALT+Up
Page Down	ALT+Down
Home	CTRL+ALT+Up
End	CTRL+ALT+Down

In addition, Plant SCADA Access Anywhere provides special non-standard mappings for additional key combinations on ChromeOS.

Command	Key Combination
F1	CTRL+1
F2, ...	CTRL+2, ...
ALT+TAB	ALT+`
ALT+SHIFT+TAB	ALT+SHIFT+`
CTRL+Home	CTRL+ATL+Left
CTRL+End	CTRL+ALT+Right

## Tablet and Smartphones

Plant SCADA Access Anywhere can operate on tablets or smartphones with an HTML5 compliant browser (see list of browsers in Plant SCADA Access Anywhere Readme). Browser versions that have been tested and their specific behaviors are detailed in the *Plant SCADA Access Anywhere Web Client User Guide*.

When you design Plant SCADA clients for use with Plant SCADA Access Anywhere, remember that touch devices have different interface requirements and capabilities than a keyboard and mouse. For example, input animations should not invoke a Plant SCADA or Windows keyboard, as mobile devices have their own.

With existing AVEVA Plant SCADA clients that make use of mouse events and keys or key combinations without a supported equivalent, you may want to modify your application to use alternate application events.

The following list provides gestures available when using Plant SCADA Access Anywhere from a tablet or smartphone device where a physical keyboard and mouse is not available. Functionality will vary across different devices and certain commands may not be available.

- Single Tap performs a left click.
- Single long Tap performs a right-click.
- Tap + Hold + Drag performs a select then drag/scroll function.
- Double Tap, or tapping once with two fingers, performs double-click.
- Tap with three fingers sends Back command to a remote browser.
- Swipe down with three fingers is Page Up.
- Swipe up with three fingers is Page Down.
- Drag left or right with three fingers performs a left arrow and right arrow respectively.
- Tap the keyboard icon (upper right-hand corner of window) to open/close the virtual keyboard.
- Swipe and pinch gestures will apply to the Plant SCADA Access Anywhere session (i.e. zoom in with pinch in).
- (iOS only) When saving a Plant SCADA Access Anywhere icon to the iOS desktop, the shortcut will open the Plant SCADA Access Anywhere session full-screen mode. The browser's toolbar will be hidden and there will be more remote desktop area available.

## HTTPS Mode

For environments where WebSockets support is not available, Plant SCADA Access Anywhere can work in HTTPS

mode so that communication will be sent via HTTPS only. HTTPS mode will only be used if WebSockets is not available. WebSockets will be used when available as it will provide better performance. HTTPS mode is required when using SSL VPNs that only proxy HTTPS traffic.

To enable HTTPS Mode, the Plant SCADA Access Anywhere Secure Gateway is required. The Plant SCADA Access Anywhere Server web pages need to be delivered using the web server built into the Plant SCADA Access Anywhere Secure Gateway (files are located under the Webserver/PlantAccessAnywhere folder). Carry out the following steps to enable Plant SCADA Access Anywhere for HTTPS support.

1. Install Plant SCADA Access Anywhere Server on the desired RDP Host.
2. Install the Secure Gateway in a separate machine located in a DMZ. The Secure Gateway needs to be installed on a server that is accessible by the target end-user group(s).
3. To connect to the Plant SCADA Access Anywhere Server using HTTPS - enter the Plant SCADA Access Anywhere URL of the Secure Gateway (the Secure Gateway includes the Plant SCADA Access Anywhere web component)  
`https://<securegatewayaddress>/PlantAccessAnywhere/start.html`
4. Enter the parameters for the target Plant SCADA Access Anywhere Server in the start.html page.
5. Upon connection, if HTTPS mode is active a '-' symbol will then be shown as a prefix to the address in the browser tab.

## Advanced Configuration

Plant SCADA Access Anywhere also easily integrates with other web pages and portals. The application can accept configuration settings from other pages or directly from a web server. These settings can also be displayed in the Plant SCADA Access Anywhere start page for the user to view and modify, or trigger an automatic connection.

### Static Configuration of Config.js

An administrator can modify configuration settings for Plant SCADA Access Anywhere by editing the config.js file that is installed as part of the Plant SCADA Access Anywhere web component. This is a JavaScript file that can be modified using any text editor. It is located in the following directory:

**\Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Server\WebServer\PlantAccessAnywhere\config.js**

---

**Note:** Create a backup of the original *config.js* file before making any changes. This will make it easy rollback to the original configuration.

Many of the settings in the file have the following format:

*name: value*

A value can be a number, a flag (true or false), or text enclosed in quotes. Some settings are prefixed by a double slash // which means they are disabled. Remove the double slash in order to set a value for the setting. Javascript rules apply in this file, certain characters need to be escaped (i.e. backslash). Once the settings are configured, save the file and the next user will have the new settings applied.

Refer to the [Settings Table](#) for a description of each setting.

## Settings Table

The *config.js* file contains the following configuration settings. Setting names are case sensitive. When settings are specified using cookies, their name are prefixed by *EAN\_*.

Setting Name	Description
overrideSaved	<b>False</b> (default), settings that the user changes are preserved between sessions and override values set in <i>config.js</i> . Change to <b>True</b> for <i>config.js</i> to override preserved settings.
onlyHTTPS By	By default, Plant SCADA Access Anywhere first attempts to connect using WebSockets. If the Secure Gateway is used with Plant SCADA Access Anywhere, the connection will fall back to HTTPS when WebSockets is not available. If this setting is true, HTTPS is used immediately.
noHTTPS	By default, Plant SCADA Access Anywhere first attempts to connect using WebSockets. If the Secure Gateway is used with Plant SCADA Access Anywhere, the connection will fall back to HTTPS when WebSockets is not available. If this setting is true, only WebSockets will be used and HTTPS fallback will be disabled.
hidden	A comma- or space-separated list of field names as they appear in <i>config.js</i> . For example "username, password, domain". The listed fields will be hidden so that the user will not be able to modify them. To hide a button, such as the Advanced button, prefix the button text with the word show. For example, "showAdvanced, showAbout" hides both the Advanced and About buttons. Hidden variables ignore previously saved settings.
settings (URL parameter only)	Name of a Configuration Group to be used.
wsport	The default WebSocket port that will be used by the client. The value specified in the file (8080 by default) will be used for both encrypted and unencrypted WebSocket communication. The user can override this value by explicitly specifying a port address in the client UI. For backward compatibility with older versions of Plant SCADA Access Anywhere Server, this behavior can be modified. If singlePort is set to false then the port value specified is only for encrypted communication. The value specified in the file plus

Setting Name	Description
	one (8081 by default) will be used for unencrypted WebSocket communication.
gwport	The default gateway port that will be used if it is not explicitly specified in the address field.
dialogTimeoutMinutes	Timeout period, in minutes, after which an inactive dialog is automatically closed and the session is logged off. This is only relevant for dialogs that have a logoff button.
sessionTimeoutMinutes	Timeout period, in minutes, after which an inactive session is disconnected. This timeout is reset whenever user clicks on the keyboard or a mouse button. The default value is 0, which disables this feature.
specialkeys	Enables support for special RDP key combination commands, such as CTRL+ALT+END which starts the Windows NT Security dialog box (similar to local CTRL+ALT+DEL).
chromeKeys	<b>true</b> (default) support special ChromeOS keys combinations
showDownload	<b>true</b> displays a link in the connection dialog to download the Plant SCADA Access Anywhere Server installer.
clipboardSupport	<b>true</b> (default) enables clipboard functionality; <b>false</b> disables it.
clipboardTimeoutSeconds	The delay duration before the clipboard image automatically fades out.
clipboardUseFlash	<b>true</b> (default) uses Flash when available for one-click copy into local clipboard.
clipboardKey	Key to open clipboard paste dialog, set to <b>false</b> to disable.
console	<b>false</b> (default) set true to enable RDP console mode.
settingsURL	<b>false</b> (default) set <b>true</b> to enable RDP console mode.
endURL	URL to open to after the Plant SCADA Access Anywhere session has ended (# value closes window). If there is a prefix with the symbol ^ then this sets the value of window.location instead of top.location. This

Setting Name	Description
	is useful when the Plant SCADA Access Anywhere session is embedded in a frame.
address	Address of Plant SCADA Access Anywhere Server. Leave blank for the standard configuration.
fulladdress	Address of RDP host. Leave blank for the standard configuration.
username	Username to pass into the Plant SCADA Access Anywhere session.
password	Password to pass into the Plant SCADA Access Anywhere session (entered as clear text in <i>config.js</i> file)
domain	Domain to pass into the Plant SCADA Access Anywhere session.
remember	<b>False</b> (default) determines whether the user's password will be saved in the Plant SCADA Access Anywhere page for future use. Set to <b>true</b> to enable password saving (not recommended for kiosk usage).
encryption	<b>False</b> determines if encryption will be enabled from the Plant SCADA Access Anywhere client to the server
blaze_acceleration	<b>True</b> determines if RDP acceleration will be used
blaze_image_quality	Sets the quality level using a numeric For example: 40 (fair quality), 75, 95 (best).
resolution	Sets the resolution size of the Plant SCADA Access Anywhere session. The value set needs to be a valid option under the Plant SCADA Access Anywhere screen resolution setting. For example: "1024,768" For Full Screen, use: screen.
use_gateway	<b>False</b> (default), set to true to use a Secure Gateway for remote access.
gateway_address	Defines the address and port of the Secure Gateway For example: secure.acme.com:4343
useScancodes	No longer in use, see <i>convert_unicode_to_scancode</i> .
convert_unicode_to_scancode	<b>False</b> (default), set to <b>True</b> when using certain applications that send characters as scancodes (i.e. VMware vSphere Client, any application where you

Setting Name	Description
	may have face challenges typing text). This setting will generate scancodes based on the selected locale.
leaveMessage	The message displayed to the user after they navigate away from an active session.
audiomode	0, enables audio redirection (default) 1, play audio on remote computer 2, disables audio redirection
name	Defines a custom string for the connection name. By default, the RDP Host address is used.
minSendInterval	Specifies the minimum duration between mouse position messages sent from the client when the mouse button is pressed. Units is milliseconds.

**Note:** In some cases, the local browser needs to be closed and reopened before changes take effect. The local browser cache may also need to be cleared.

## Defining Configuration Groups

Every user shares the configuration settings defined in the *config.js* configuration file. It is possible to specify special settings that will override the global settings for certain groups of users. Multiple configuration groups are defined in the configuration file.

For example, if the Marketing group will have clipboard redirection and printing enabled, change *config.js* as follows:

```
var defaults = { //this already exists in the file
...
  "Marketing":{ //Bold text are new additions
remember:false,
audiomode:0
},
};
```

**Note:** The double quotes surrounding Marketing needs to be identical. It may be necessary to delete them and re-type them if the text was copied from another source.

Also, the last setting of the configuration group should not have a ',' at the end. This comma will be placed after the closing bracket '}'.

In the URL to be used by the Marketing group, add the **settings** parameter:

<http://<computer name>:8080/PlantAccessAnywhere/start.html? settings=Marketing>

## Settings Precedence

When a Plant SCADA Access Anywhere client starts, it reads configuration information from a variety of sources. If two or more sources contain different values for the same setting, the value that Plant SCADA Access Anywhere will use is determined by the following precedence order:

### Highest precedence to Lowest precedence

- URL parameters
- Cookies
- Saved settings from previous session
- *config.js*

For example, if the gateway\_address is specified to be "server1" in config.js but "server2" in a cookie (EAN\_gateway\_address), then the value "server2" will be used.

If the setting override Saved is set to true in *config.js*, then any settings predefined in the config.js file will override previously used settings, and the precedence order will change slightly:

### Highest Precedence to Lowest Precedence

- URL parameters
- Cookies
- Saved settings from previous session
- *config.js*

---

**Note:** These settings become effective only after the user starts a new session. In some cases, the local browser needs to be closed and reopened before changes become effective. The local browser cache may also need to be cleared.

---

## Passing Credentials using Form POST

User credentials may be passed to Plant SCADA Access Anywhere using the form POST method. This functionality is used to provide SSO (single sign-on) from an outside source that has already authenticated the user (such as an SSL VPN).

The Plant SCADA Access Anywhere Secure Gateway is required in order to use form POST with Plant SCADA Access Anywhere. Refer to the [Access Anywhere Secure Gateway Installation Guide](#) manual for detailed instructions.

## Embedding Plant SCADA Access Anywhere in an iFrame

To embed Plant SCADA Access Anywhere within a third-party web page using the iframe mechanism, simply place an iframe tag within the containing page, and have the iframe's SRC attribute reference the Plant SCADA Access Anywhere URL.

For example:

```
<body>
  <h1>Embedded Plant SCADA Access Anywhere</h1>
  <iframe src="http://127.0.0.1:8080/PlantAccessAnywhere/start.html" style="width:1024px;
  height:768px"></iframe>
</body>
```

When a Plant SCADA Access Anywhere session ends, it can be configured to send the browser to a specified URL using the endURL setting.

- Specify a simple URL to redirect the iframe.

- Prefix the URL with ^ to redirect the iframe's parent (container).
- Prefix the URL with \$ to redirect the top-most container.
- Specify # and the URL will close the browser tab.

## SSL VPN Configuration

Plant SCADA Access Anywhere is compatible with many SSL VPNs. An SSL VPN that does not support WebSockets will require the Secure Gateway as well. Juniper IVE version 7.4 supports WebSockets, so the Secure Gateway is not required.

Plant SCADA Access Anywhere has been tested with Juniper's SA SSL VPNs and the documentation in this section will be based off Juniper's administration pages. Configuration with other third-party SSL VPN appliances will be similar to the procedures described here (difference are mostly in terminology).

### Web Proxy with Juniper 7.4 (or later)

Juniper version 7.4 (or later) supports WebSockets. Plant SCADA Access Anywhere links are published in the Juniper's web interface as web applications. To publish a new Access Anywhere connection, go to the Juniper Admin page and do the following:

1. Go to **Resource Profiles | Web | New Web Application Resource Profile**.
2. Enter the **Name** of the Plant SCADA Access Anywhere connection that the users should see.
3. Enter the Plant SCADA Access Anywhere URL in the **Base URL** box.
4. Click **Save and Continue**.
5. In the Roles dialog add every role that should have access to the Plant SCADA Access Anywhere link and click **Save Changes**.
6. In the Bookmarks tab, enter the desired label for the connection.
7. When you log into Juniper, a Plant SCADA Access Anywhere link will be displayed under the Web bookmarks section (i.e. Plant SCADA Access Anywhere). Click on the link to connect to a Plant SCADA client published with Plant SCADA Access Anywhere.

### Web Proxy with Older Juniper Versions

Juniper versions prior to 7.4, and many other SSL VPNs will not support native WebSockets. Such SSL VPNs require HTTPS Mode (see HTTPS Mode chapter in this guide) to run Plant SCADA Access Anywhere. HTTPS mode is enabled by installing the Secure Gateway.

To use Plant SCADA Access Anywhere and the Secure Gateway:

1. Go to **Resource Profiles | Web | New Web Application Resource Profile**.
2. Enter the **Name** of the Plant SCADA Access Anywhere connection that the users should see.
3. Enter the Gateway's Plant SCADA Access Anywhere URL address as the Base URL. Click **Save**.
4. Go to **Autopolicy: Web Access Control**.
5. Edit the automatically entered address and delete the subfolder "Plant SCADA Access Anywhere".

Instead of [https://GWaddress.com:443/PlantAccessAnywhere/\\*](https://GWaddress.com:443/PlantAccessAnywhere/*) the correct resource is

[https://GWaddress.com:443/\\*](https://GWaddress.com:443/*)

6. Click **Save and Continue**
7. In the Roles dialog, add every role that should have access to the Plant SCADA Access Anywhere link and click **Save Changes**.
8. When you log into Juniper - the Plant SCADA Access Anywhere link will be displayed under the Web bookmarks section (i.e. Plant SCADA Access Anywhere Connection to RDP Host). Simply click on the link to connect to an application or desktop published with Plant SCADA Access Anywhere.

**Note:** If the link is not translating properly, check that there is not a Passthrough Proxy policy defined for the Gateway Server (where the web component is hosted).

## Network Connect

Juniper's Network Connect mode opens a VPN tunnel to the private network. When using Network Connect, simply enter the Plant SCADA Access Anywhere parameters as if they were on the private network.

## Access Anywhere Secure Gateway Installation Guide

AVEVA Plant SCADA Access Anywhere can be used to access AVEVA Plant SCADA clients hosted on Terminal Servers with HTML5 compatible web browsers. Plant SCADA Access Anywhere connects to Plant SCADA remotely via the Plant SCADA Access Anywhere Secure Gateway. This guide provides information about installing and configuring the Secure Gateway.

This guide assumes knowledge of the following:

- AVEVA Plant SCADA
- Enabling and configuring RDP on Windows operating systems
- Firewall configuration
- Web server administration

Terminology used in this guide includes the following:

- **DMZ** (demilitarized zone) - physical or logical subnetwork that contains and exposes an organization's external services to a larger untrusted network.
- **HTML5** - a new update to the HTML specification. Extends HTML with new features and functionality for communication, display, etc.
- **RDP** - Remote Desktop Protocol. A remote desktop protocol developed by Microsoft. RDP is a standard component of Microsoft Windows.
- **RDP Host** - a Windows system that can be remotely accessed using Microsoft RDP, such as a Terminal Server (RDS Session Host) with remote access enabled.
- **RDS** - Remote Desktop Services is one of the components of Microsoft Windows that allow a user to take control of a remote computer or virtual machine over a network connection.
- **SSL** - Secure Sockets Layer. A cryptographic protocol that provides protected communications over the Internet.
- **VPN** - Virtual Private Network. It enables a computer to securely send and receive data across shared or

public networks as if it were directly connected to the private network.

- **WebSocket** - a bi-directional, full-duplex communication mechanism introduced in the HTML5 specification.

## Introduction

Plant SCADA Access Anywhere Secure Gateway is a complementary component of Plant SCADA Access Anywhere that provides encrypted remote access to Plant SCADA clients.

Secure Gateway provides the following benefits.

- Accesses Plant SCADA clients running on an internal network using a single port.
- Provides access without the need to purchase, install, configure, and manage a VPN.
- Located in a perimeter network, also known as a DMZ, while other resources reside behind an internal firewall.
- Installs a single SSL digital certificate on the Secure Gateway node instead of requiring a certificate for every host that needs to be accessed.
- Compatible with HTML5 client browsers supported by Plant SCADA Access Anywhere.

## Architecture

Secure Gateway acts as a gateway between users in remote locations and Plant SCADA clients running in a control network. The server component can be installed in a DMZ to route traffic between an external business network and an internal HMI SCADA network.

---

**Important:** Using the Secure Gateway to connect to your SCADA system from an external network may expose your SCADA system to unauthorized access. It is recommended that you use the Secure Gateway in conjunction with other measures to improve the overall protection for your system.

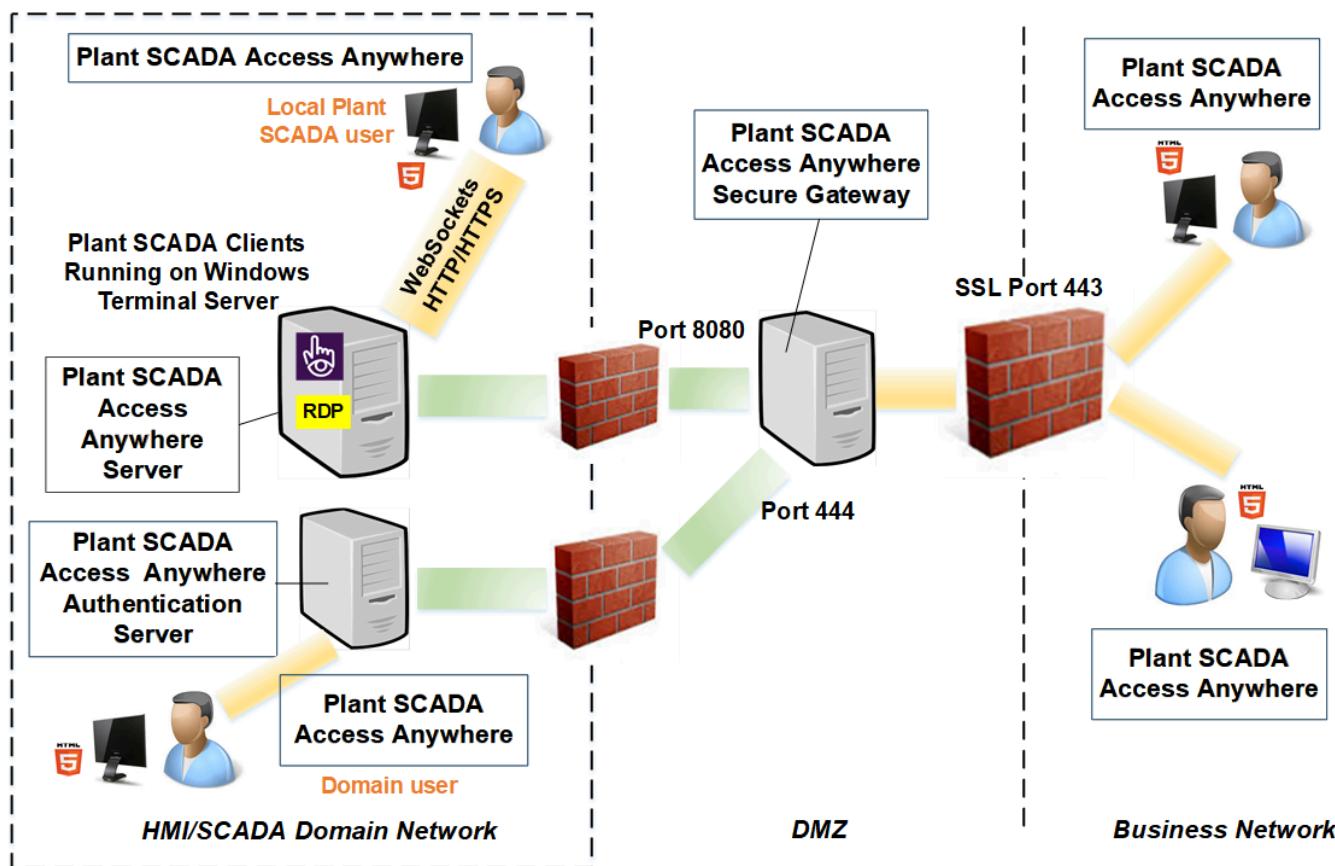

---

The Access Anywhere Secure Gateway comprises of two installed components:

- Secure Gateway Server — provides encrypted access to the Plant SCADA Access Anywhere Server
- Authentication Server — performs authentication services for Plant SCADA Access Anywhere.

These components can be installed on separate computers if required. If your Secure Gateway Server is going to be exposed to computers outside your SCADA domain network, it is recommended that the Authentication Server be installed separately within the SCADA domain network.

The following diagram illustrates how a Secure Gateway Server provides remote access to Plant SCADA clients.

Web traffic from an external business network is tunneled through an SSL-based Secure Gateway connection. User authentication occurs on the Authentication Server within the operations network.

## Installation

This chapter describes how to install the Access Anywhere Secure Gateway. It describes installation prerequisites, a step-by-step installation procedure, configuration details, and instructions to uninstall a Secure Gateway.

---

**Note:** Plant SCADA Access Anywhere supports silent installation of the Secure Gateway components using a response file. See the topic [Unattended Silent Installation](#) in the *Access Anywhere Installation and Configuration Guide*.

---

## Installation Prerequisites

The computer hosting the Secure Gateway needs to meet the following prerequisites.

- The Secure Gateway needs to be installed on a computer running one of the following Microsoft® operating systems:
  - Windows Server 2012 R2
  - Windows Server 2016
  - Windows Server 2019

- Windows 8.1
- Windows 10 (check the Microsoft website for currently supported versions).
- The following ports need to be configured on the computer where the Secure Gateway will be installed:
  - Port 443 is required between an external network and the Secure Gateway server. This is a common port that is also used by Microsoft Internet Information Services (IIS). Check for port conflicts. The port can be changed.
  - Port 8080 is required between the Secure Gateway Server and the Plant SCADA Access Anywhere Server. The port can be changed.
  - The Secure Gateway includes an HTTP proxy that listens on port 80 by default. The port can be disabled after installing the Secure Gateway.

---

**Note:** If you are running Plant SCADA Access Anywhere on an IPv6 network, it is recommended you configure a hostname that refers to the Plant SCADA Access Anywhere Server. A hostname ensures the server is compatible with all supported browsers. If you attempt to connect to the Plant SCADA Access Anywhere Server using a standard format IPv6 address in Internet Explorer, the connection will not be successful.

---

## Installing the Secure Gateway

The Plant SCADA Access Anywhere installer allows you to install the Plant SCADA Access Anywhere Secure Gateway and the Plant SCADA Access Anywhere Authentication Server. These are both required to setup a Secure Gateway, however they can be installed on separate computers.

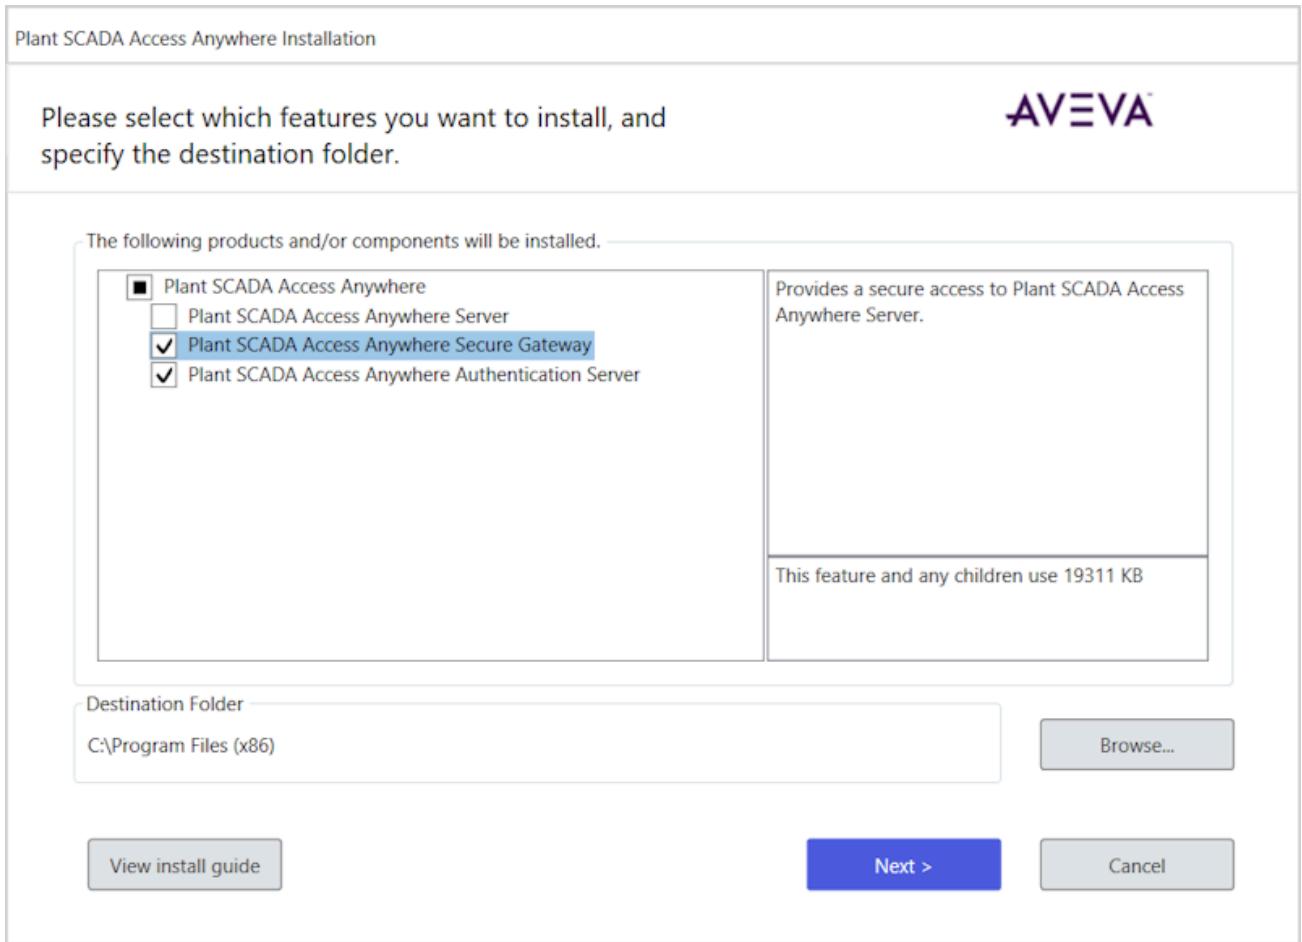

---

**Note:** Before you install Plant SCADA Access Anywhere, you need to uninstall any earlier versions. This means the existing Secure Gateway configuration will no longer be available. If you want to migrate your existing settings to the new version, see the topic [Migrate an Existing Configuration from an Earlier Version](#) before you upgrade.

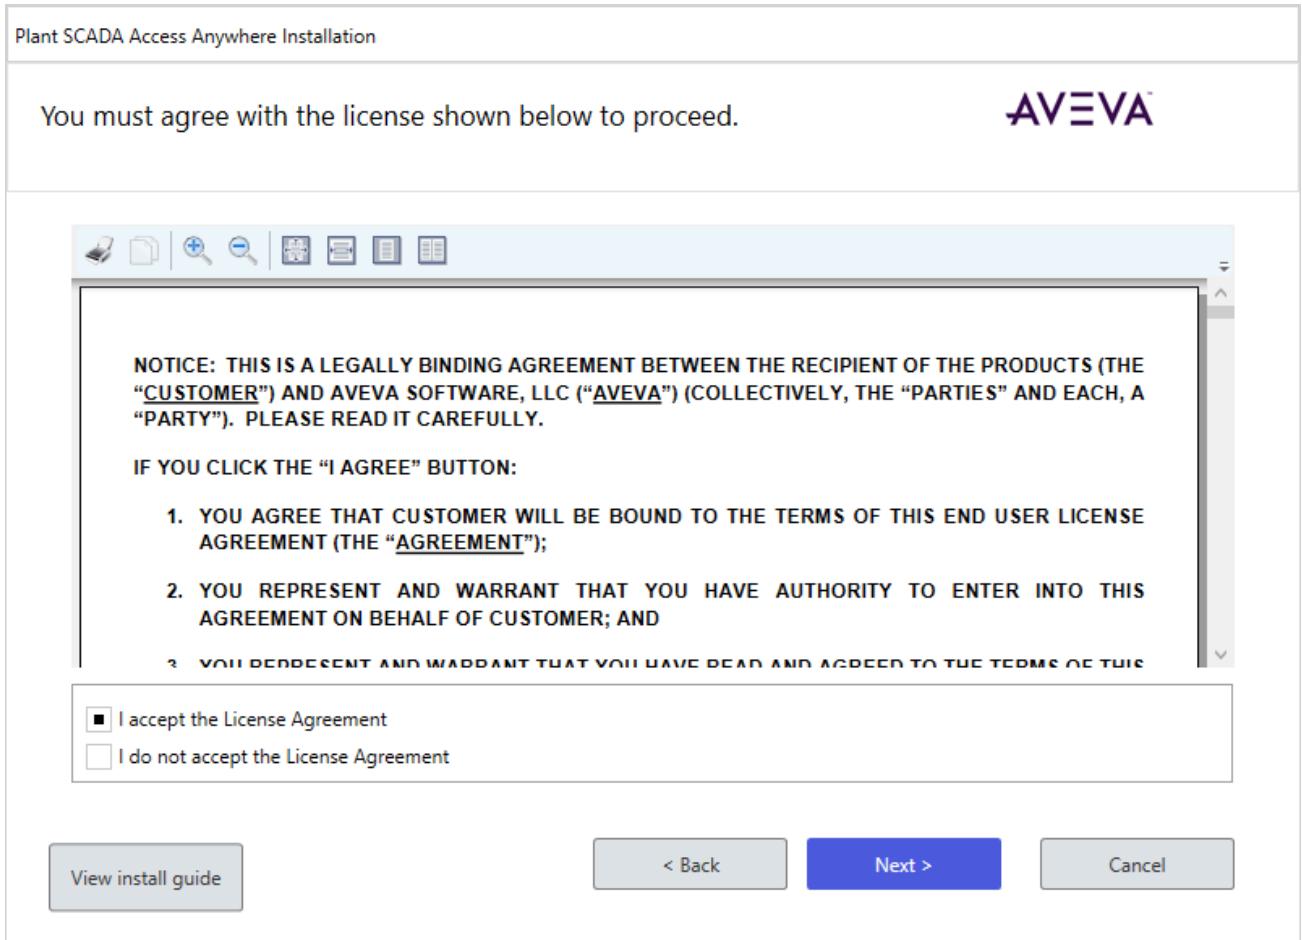

---

### To install the Plant SCADA Access Anywhere Secure Gateway components:

1. Run the *Setup.exe* file.  
The message "*Please wait for configuration to complete*" appears as the installer prepares to start the installation.
2. Select the Plant SCADA Access Anywhere **Secure Gateway** option, and/or the Plant SCADA Access Anywhere **Authentication Server** option.

3. Click **Next**. The License Agreement screen appears. Read the license agreement carefully, and select the **I accept the License Agreement** option to continue. Selecting **I do not accept the License Agreement** will stop you from proceeding with the installation.

4. Click **Next**. The Installation Prerequisites screen appears.  
The installation program checks whether the installation prerequisites are met, and shows the missing prerequisites.

Plant SCADA Access Anywhere Installation

All prerequisites must be met for the installation to continue. Double-click an item for more details.

Show All Prerequisites

Prerequisites	Features	Status	Comment
Microsoft .NET Framework...	Plant SCADA Access Anywhere	met	Product installation requires Microsoft .NET Framework
Operating System	Plant SCADA Access Anywhere...	met	Product installation requires Windows Server 2008 R

< >

[Install Prerequisites](#) [View install guide](#) [Back](#) [Next >](#) [Cancel](#)

To view a list of every prerequisite, select the **Show All Prerequisites** option.

5. Click **Install Prerequisites** to install the missing prerequisites.
6. Click **Next**. The component selected for installation is displayed.

## Plant SCADA Access Anywhere Installation

Ready to Install the Application

Installation is now prepared to complete installation of the product.  
Select **Install** to begin the installation.

Plant SCADA Access Anywhere

Plant SCADA Access Anywhere Secure Gateway

Plant SCADA Access Anywhere Authentication Server

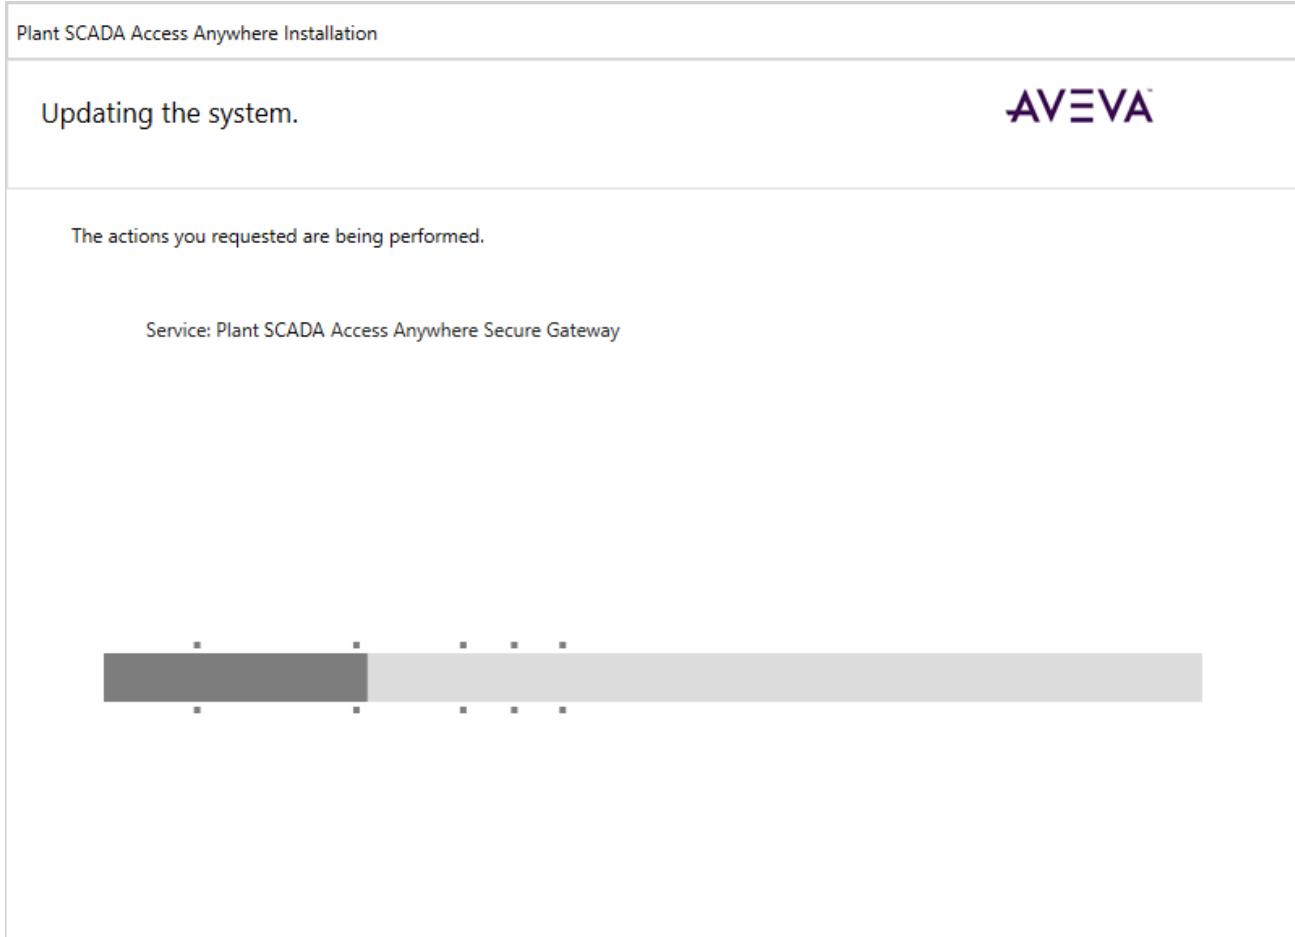

[View install guide](#)

< [Back](#)

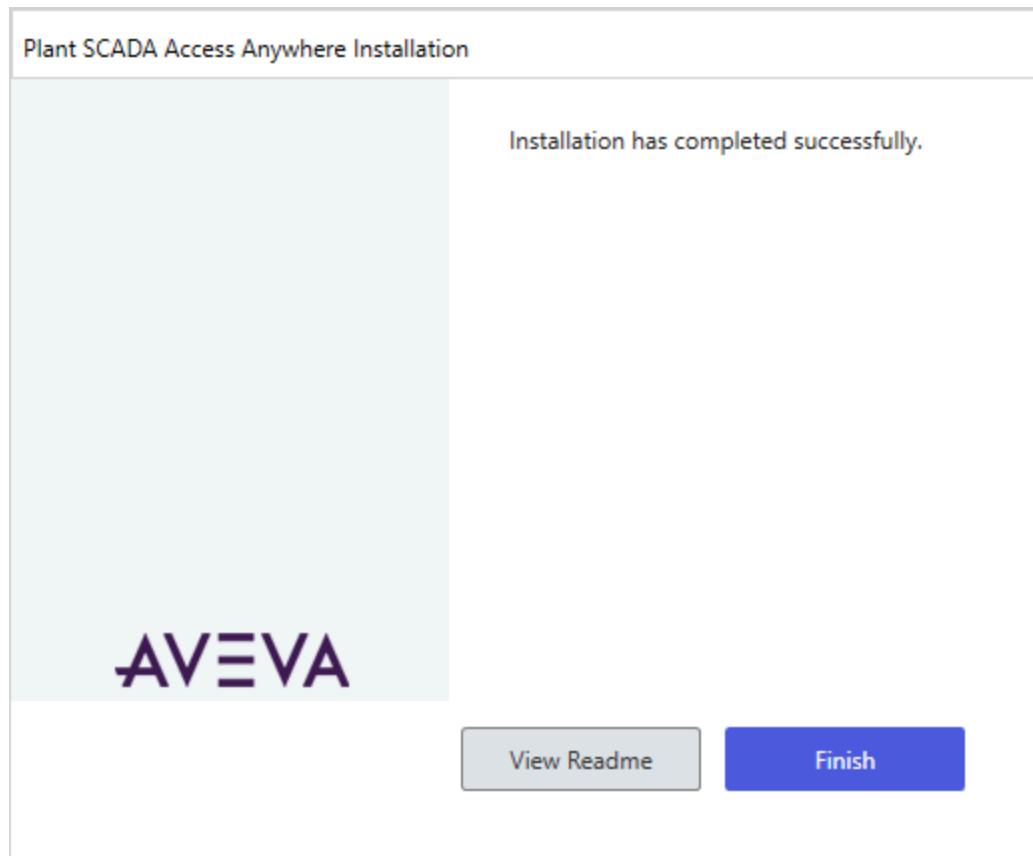

[Install](#)

[Cancel](#)

7. Click **Install**. The progress bar appears.

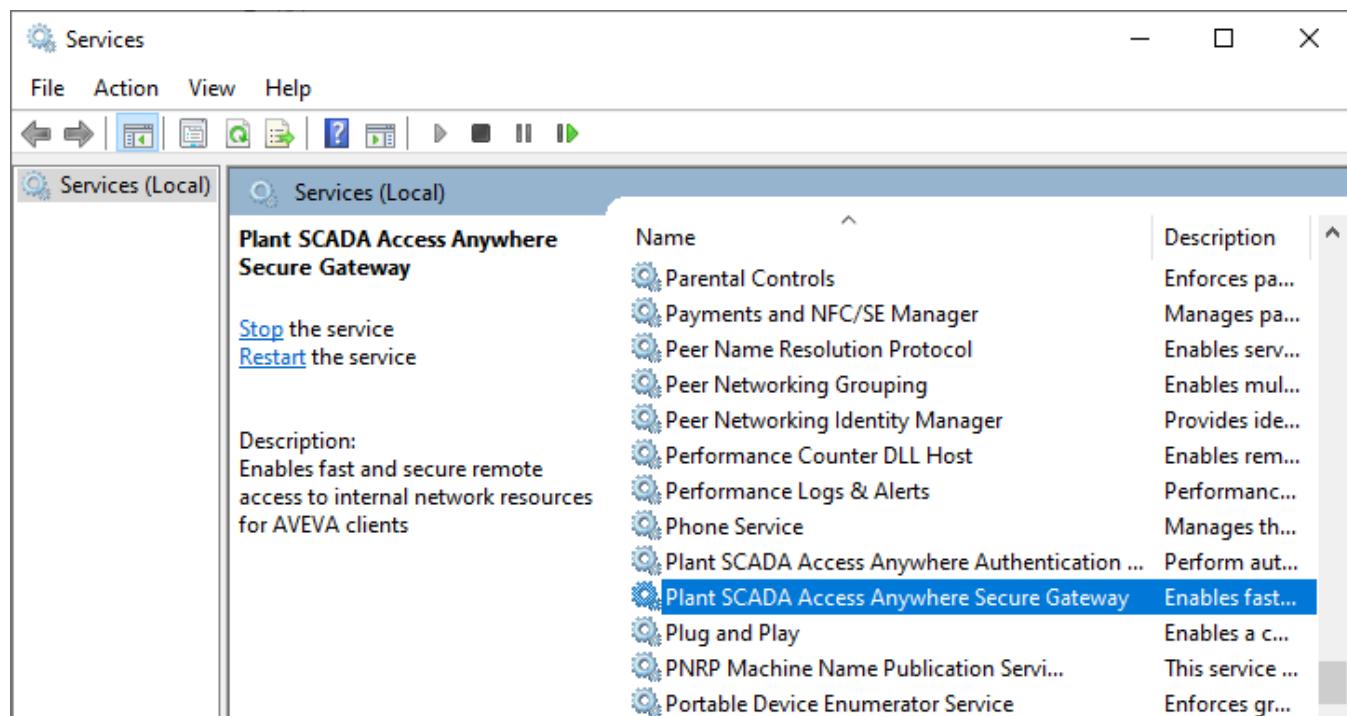

8. After the installation is complete, the Installation Complete dialog box appears. Click **View Readme** to open the *Readme.html* file, which contains details about Plant SCADA Access Anywhere features, or click **Finish**.

## Completing the Installation

The Secure Gateway runs as a service and can be stopped and restarted from the Microsoft Windows Services Manager:

The Secure Gateway service is configured to run automatically on computer startup. If the service is stopped or is unable to listen on its configured port, clients will be unable to connect to hosts through the gateway. An error message will be written into the Windows application event log.

**Important:** If Microsoft IIS or Plant SCADA are running on the same server as the Secure Gateway, check that there are no port conflicts. Change the IIS ports and/or the port on Plant SCADA's System Management Server to values other than 80 and 443. Or change the Secure Gateway port to a value other than 443 and disable the HTTP auto redirect feature after the installation. If there is a port conflict on either the HTTP or HTTPS port, the Secure Gateway cannot operate properly. For more information, see the sections [Built-In Web Server](#) on page and [HTTP Redirect](#) on page .

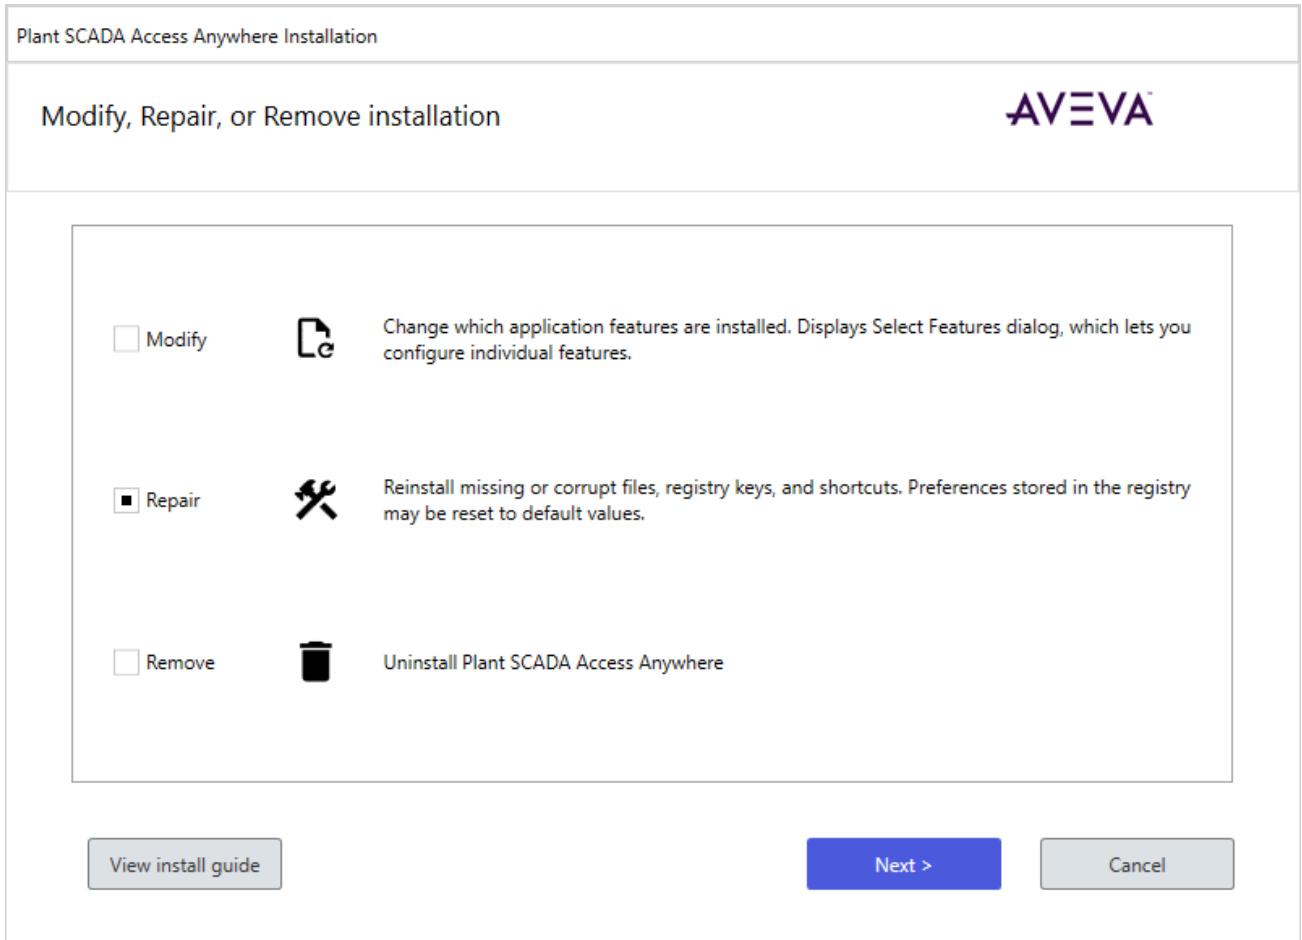

## Repairing an Installation

You can use the installation program to repair corrupt files of installed Plant SCADA Access Anywhere components.

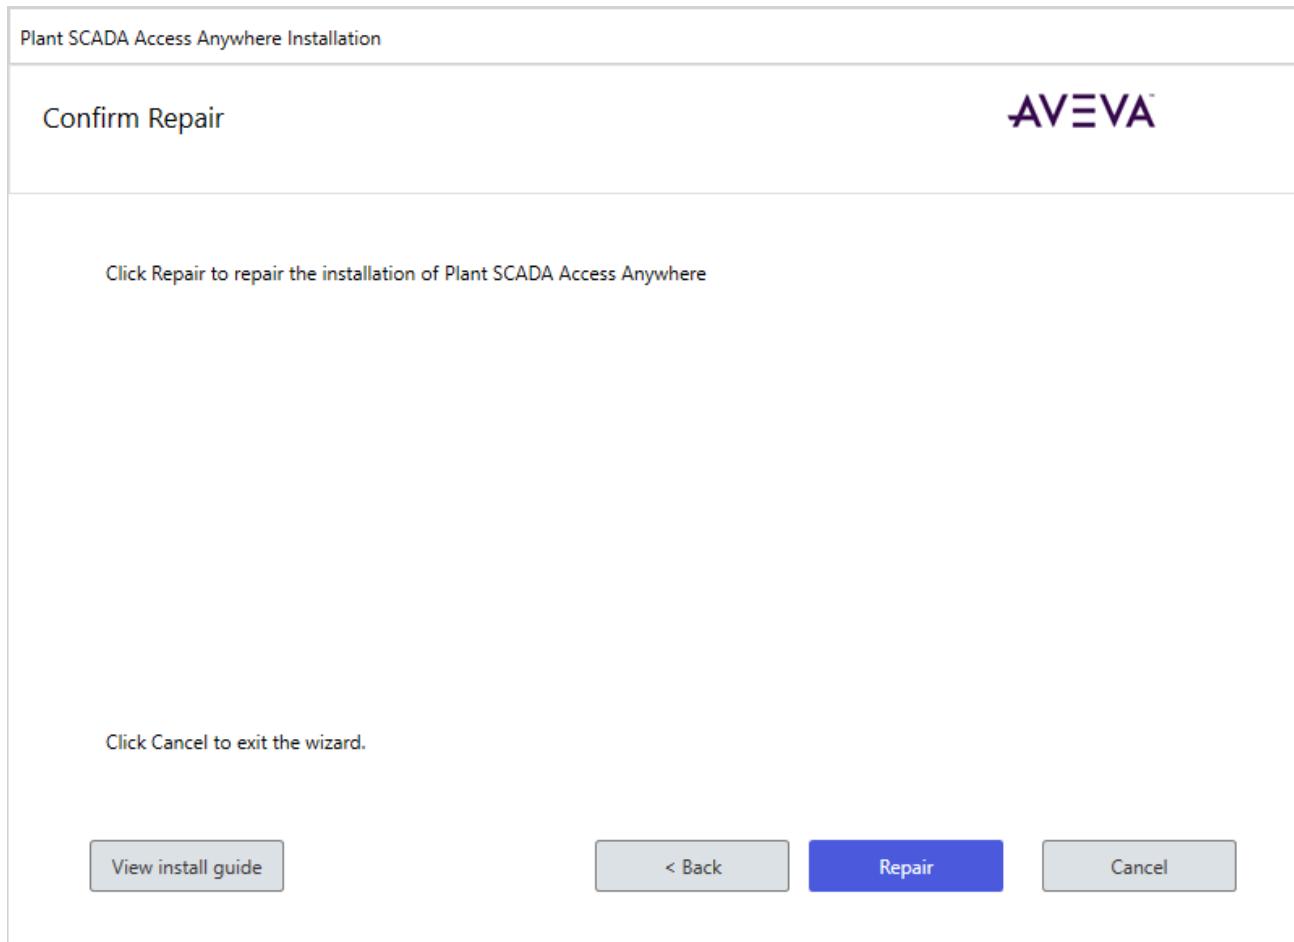

**Note:** You need to have access to the installation files before you can repair an installation.

To repair an installation:

1. From the **Windows Start** menu, select **Control Panel | Programs | Programs and Features | Uninstall a Program**. Every program installed on your computer is listed.
2. Select the Plant SCADA Access Anywhere component you wish to repair. Click **Uninstall/Change**. The installer program appears.
3. Click **Repair**, and then click **Next**.

4. Click **Repair**.

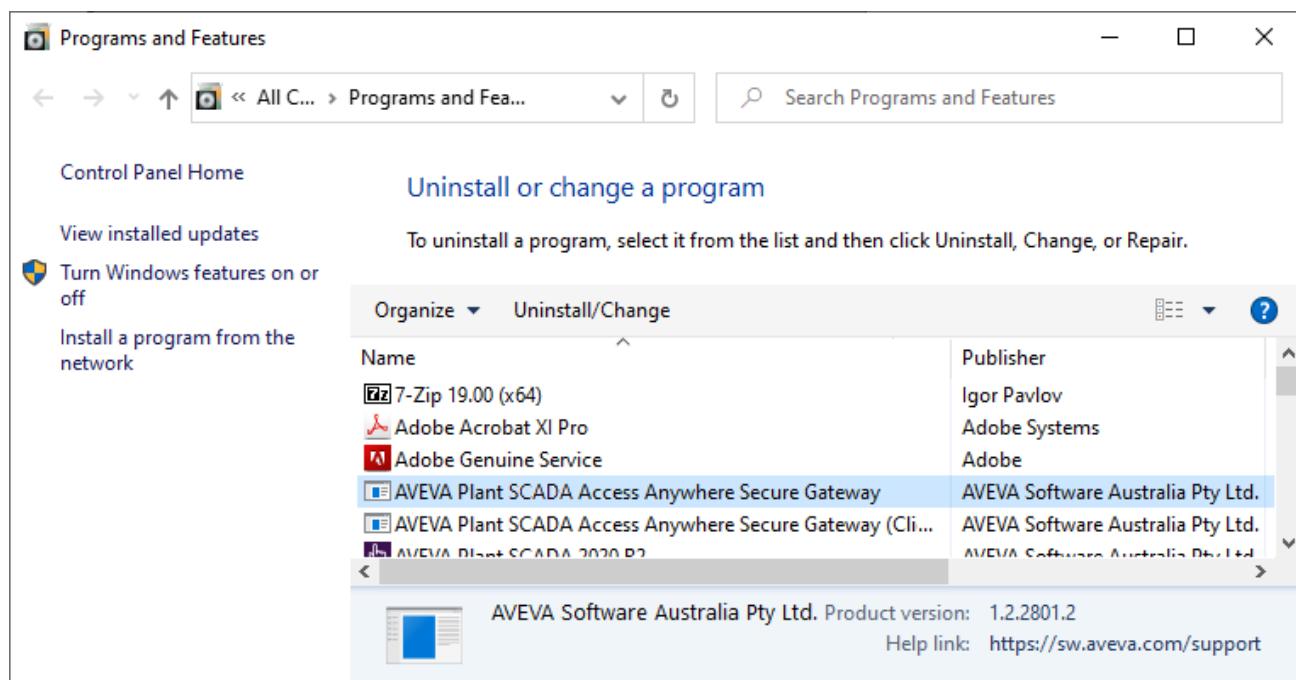

5. Installed Plant SCADA Access Anywhere components are repaired, and a message confirming successful repair appears.
6. Click **Finish** to close the dialog box.

## Uninstalling the Secure Gateway

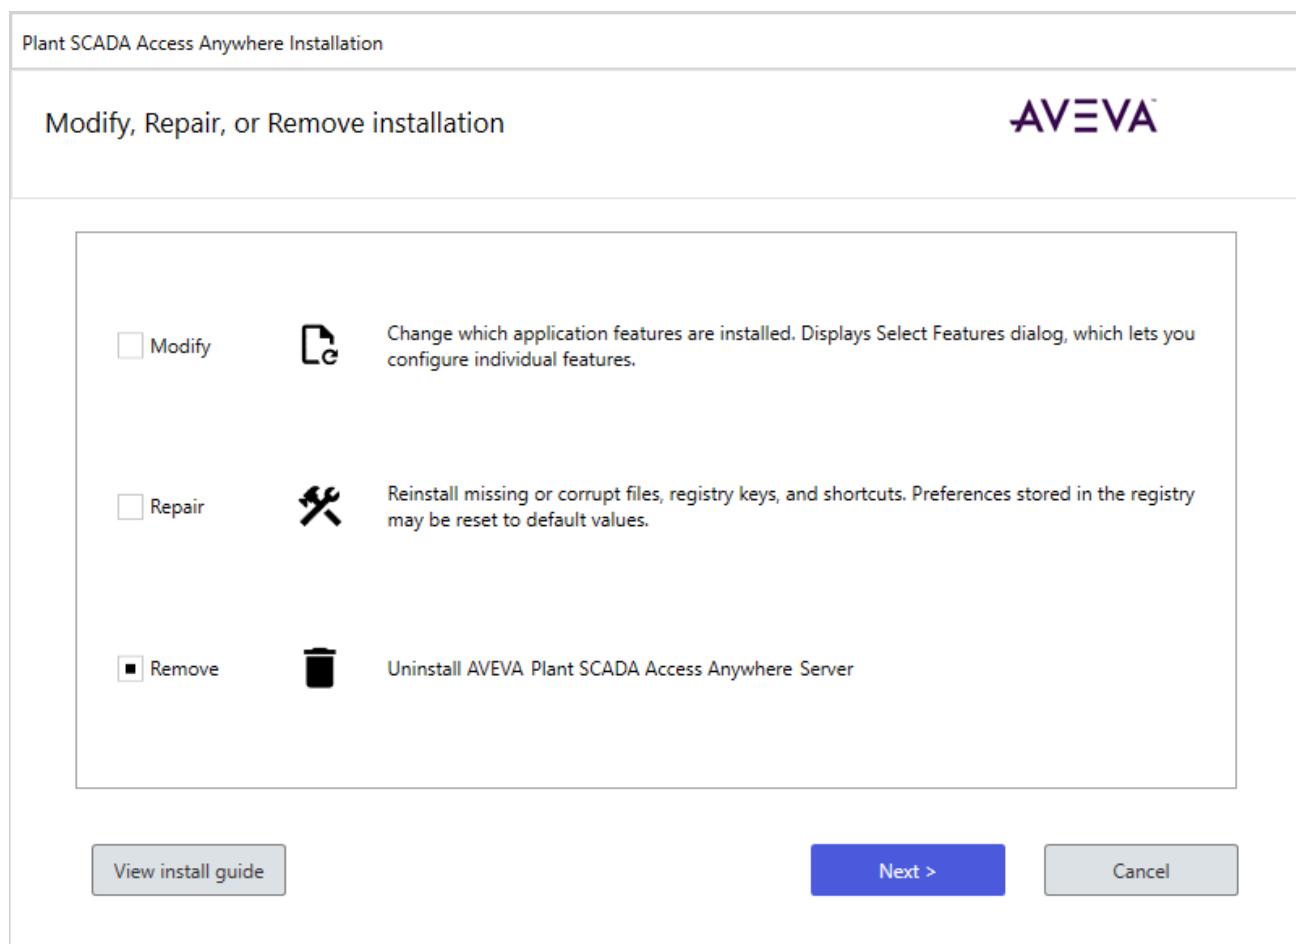

You may wish to remove Plant SCADA Access Anywhere components. This section provides instructions for uninstalling Plant SCADA Access Anywhere components.

### To uninstall Plant SCADA Access Anywhere components:

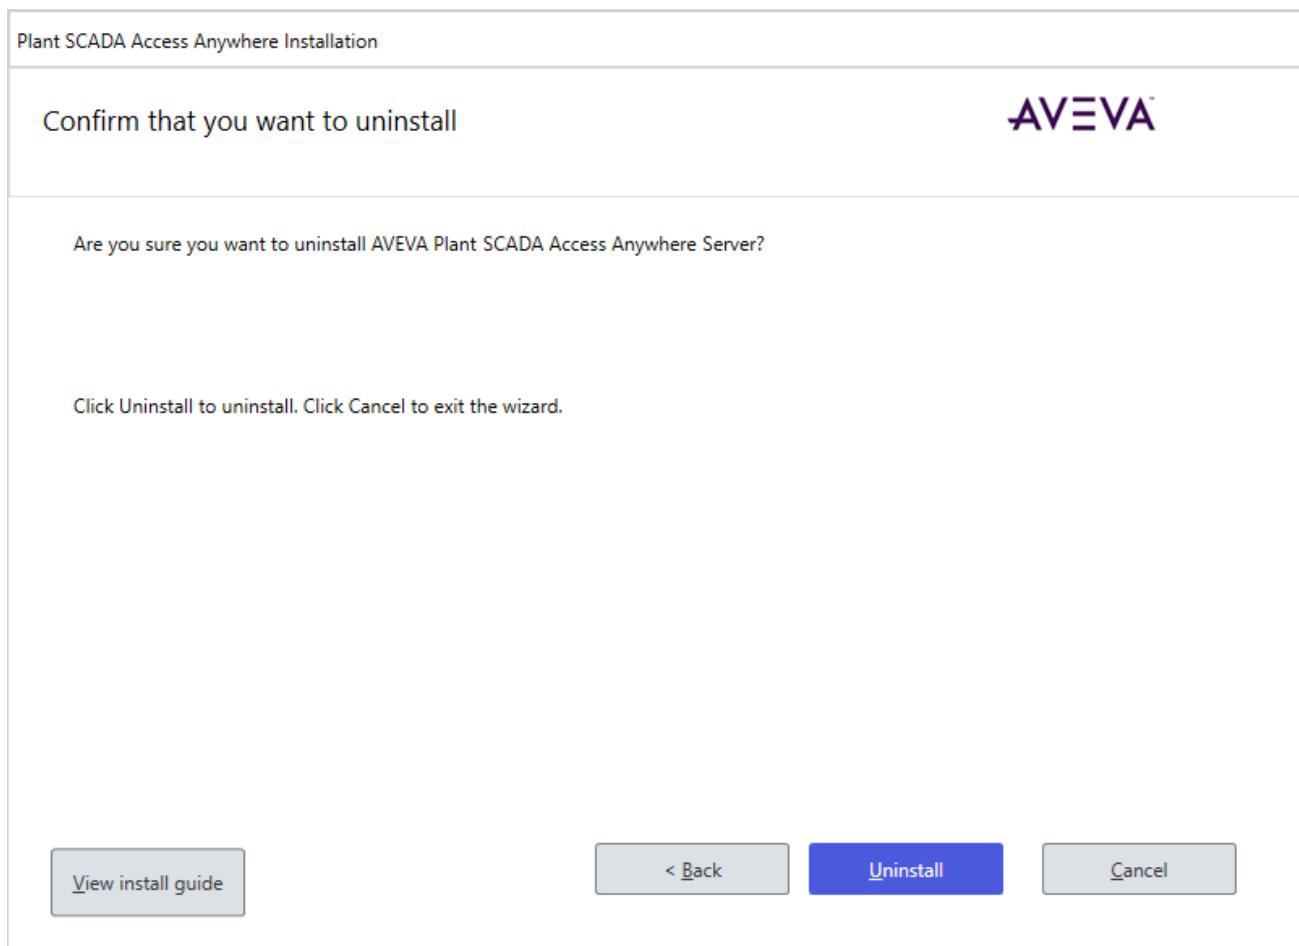

1. From the Windows Start menu, select **Control Panel | Programs | Programs and Features | Uninstall a Program**. All programs installed on your computer are listed.
2. Locate the Plant SCADA Access Anywhere Secure Gateway component to uninstall, and click to select it.

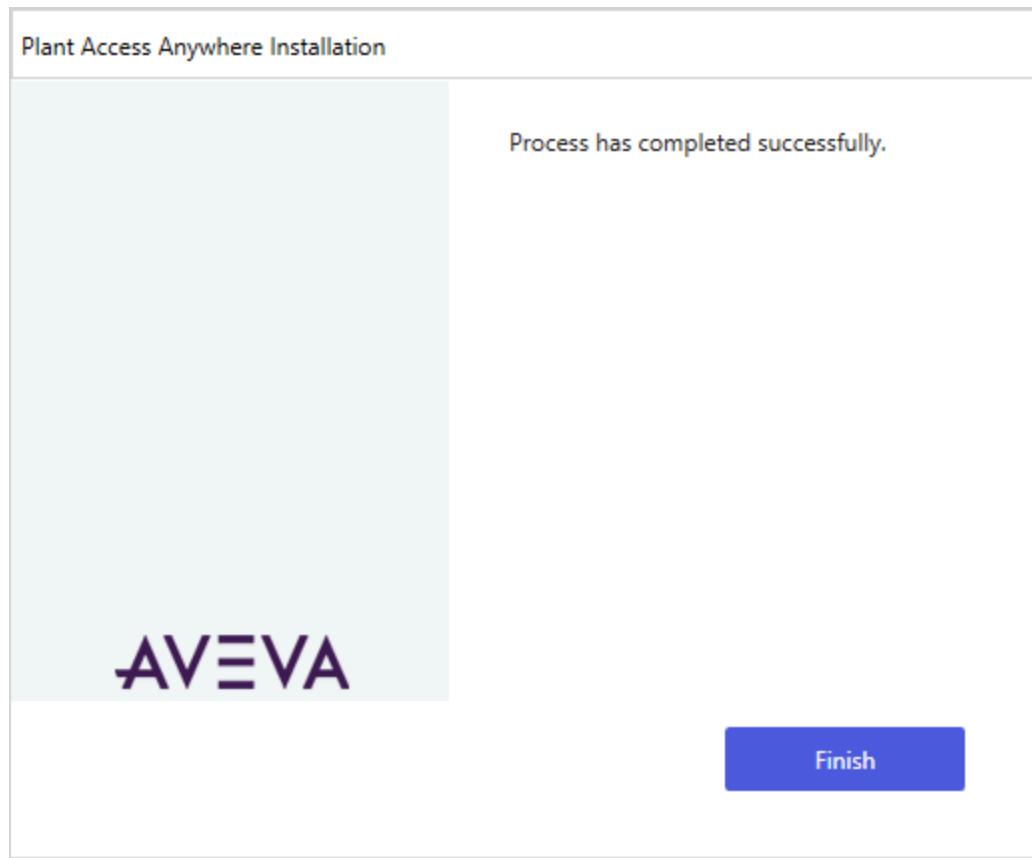

3. Click **Uninstall/Change**. The Modify, Repair or Remove Installation dialog box appears.
4. Select the **Remove** option.

5. Click **Next**. A message prompting you to confirm the uninstallation appears.

6. Click **Uninstall** and then click **Next**. A screen confirming successful uninstallation appears.

**Note:** This will remove only the selected component. To remove every component installed with the Plant SCADA Access Anywhere Secure Gateway (the Plant SCADA Access Anywhere Secure Gateway Client components), run *setup.exe* again and perform a complete uninstall. Some files may still exist in the installation folders after the uninstallation.

## Migrate an Existing Configuration from an Earlier Version

When you install a new version of Plant SCADA Access Anywhere, the existing Secure Gateway configuration file is no longer available. If you want to migrate your existing settings to the new version, you need to manually merge some information into the newly installed configuration files.

### To migrate an existing Secure Gateway configuration:

1. Make a backup of the configuration files.

For the Secure Gateway, this will include the following files:

- \Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Plant SCADA Access Anywhere Authentication Server\EricomAuthenticationServer.exe.config
- \Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Plant SCADA Access Anywhere Authentication Server\EricomAuthenticationServer\_Tenants.xml
- \Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Plant SCADA Access Anywhere Secure Gateway\WebServer\PlantAccessAnywhere\config.js
- \Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Plant SCADA Access Anywhere Secure Gateway\EricomSecureGateway.exe.config

If you also want to migrate an existing Plant SCADA Access Anywhere Server, you should also back up the following files before performing an upgrade:

- \Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Launcher\SE.Scada.AnywhereLauncher.exe.config
- \Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Server\WebServer\PlantAccessAnywhere\config.js

**Note:** If you have used a custom certificate for the Plant SCADA Access Anywhere Server, you will need to export a backup of the server configuration settings as a registry file as certificate information is not included in the configuration files listed above. You can view the current SSL certificate details on the **Security** tab of the Access Anywhere Server Configuration console. You can also export the configuration settings as a registry file (.reg) using the console's **Advanced** tab.

The process for migrating the Plant SCADA Access Anywhere Server is explained in the *Plant SCADA Access Anywhere Installation and Configuration Guide*.

2. Install the new version of the software, then return to step 3.
3. Manually merge the settings from the files listed below into the new version of each file.
4. Restart the affected services.

**Note:** With the release of Plant SCADA Access Anywhere 2020 R2, the default installation location changed to '\Program Files (x86)\AVEVA Plant SCADA Access Anywhere'.

- **EricomAuthenticationServer.exe.config**

Merge the following sections into the new configuration file, if applicable.

- <appSettings /> - except the key 'CertificateThumbprint' if a self-signed certificate is used.
- <logSettings />
- <translatorSettings />

- **EricomAuthenticationServer\_Tenants.xml**

Merge every section across to the new xml file, if applicable.

- **PlantAccessAnywhere\config.js**

Merge every section across to the new xml file, if applicable.

- **EricomSecureGateway.exe.config**

For the EricomSecureGateway.exe.config file, the file format has been changed. The relevant sections have been moved to a file called **EricomSecureGateway.config** (without the '.exe' extension).

To migrate applicable settings, merge the following sections to the new EricomSecureGateway.config file based on the mappings in the table below. For example, if you had specified a **Session Inactivity Timeout** of 15 minutes in the Secure Gateway **Administration** settings, it will appear in the version 1.1 "EricomSecureGateway.exe.config" file as follows:

```
<configuration>
  ...
  <sessionsSettings>
    <Admin>
      <add key="InactivityTimeoutMinutes" value="15" />
    ...
  </Admin>
  ...
</configuration>
```

To migrate the setting, copy the value of the "InactivityTimeoutMinutes" key to the following section in the new "EricomSecureGateway.Config" file:

```
<PropertySet name="ESG Configuration Parameters" version="1.0">
<Section name="">
...
<Section name="Admin">
<Property name="InactivityTimeoutMinutes" type="int" value="15" />
...
</Section>
...
</Section>
</PropertySet>
```

V 1.1 EricomSecureGateway.exe.config	V2.0 EricomSecureGateway.config
configuration.externalServersSettings.AuthenticationServer	PropertySet["ESG Configuration Parameters"].Section[""].Section["AuthenticationServer"]
configuration.externalServersSettings.WebConnectServer	PropertySet["ESG Configuration Parameters"].Section[""].Section["WebConnectServer"]
configuration.externalServersSettings.VMwareViewServer	PropertySet["ESG Configuration Parameters"].Section[""].Section["VMwareViewServer"]
configuration.sessionsSettings.Visitor	PropertySet["ESG Configuration Parameters"].Section[""].Section["Visitor"]

V 1.1 EricomSecureGateway.exe.config	V2.0 EricomSecureGateway.config
configuration.mailAlertsSettings.Mail	PropertySet["ESG Configuration Parameters"].Section[""].Section["MailAlert"].Section["Mail"]
configuration.mailAlertsSettings.Alerts	PropertySet["ESG Configuration Parameters"].Section[""].Section["MailAlert"].Section["Alerts"]
configuration.logSettings.Roles	PropertySet["ESG Configuration Parameters"].Section[""].Section["Log"].Section["Level"].Section["Role"]
configuration.logSettings.HttpDataWatch	PropertySet["ESG Configuration Parameters"].Section[""].Section["Log"].Section["Level"].Section["HttpDataWatch"]
configuration.logSettings.SessionRecording	PropertySet["ESG Configuration Parameters"].Section[""].Section["SessionRecording"]
configuration.advancedSettings	PropertySet["ESG Configuration Parameters"].Section[""].Section["Advanced"]
configuration.appSettings	PropertySet["ESG Configuration Parameters"].Section[""].Section["Network"]

## Post-Installation

Before proceeding further, the Secure Gateway needs to be manually configured to point to your Plant SCADA Access Anywhere Server. To do this:

1. Edit the *config.js* file located on the computer where the Secure Gateway is installed. This file is located in the following folder.

**\Program Files (x86)\AVEVA Plant SCADA Access Anywhere\Plant SCADA Access Anywhere Secure Gateway\WebServer\PlantAccessAnywhere\**

2. Find the commented line:

```
// address:"", // Address of server
```

3. Uncomment the line by removing the initial "//".

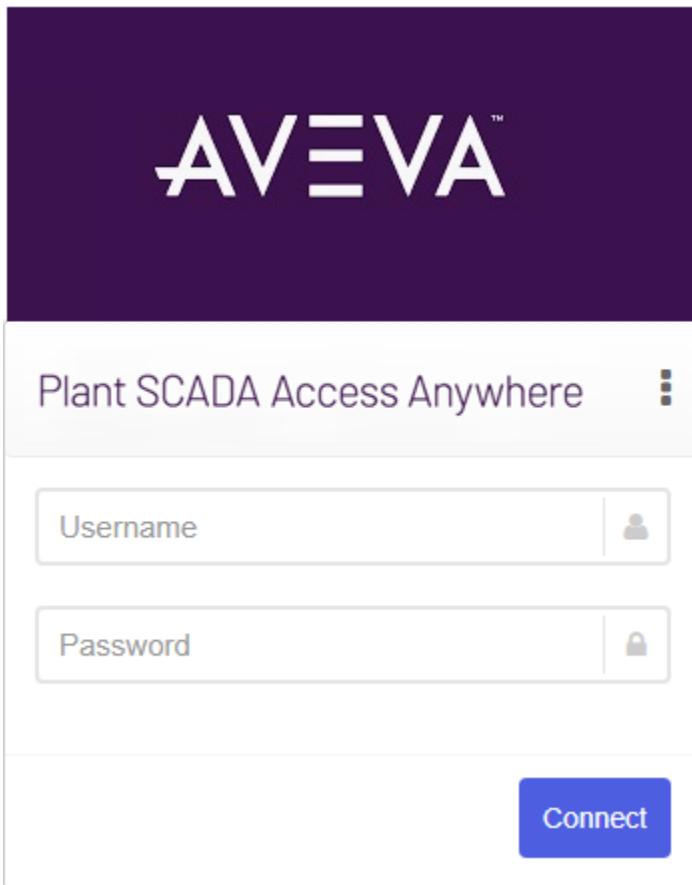

4. Within the quotation marks, type the name or IP address of the computer on which the Plant SCADA Access Anywhere Server is installed.

For example:

```
address: "VD-CA-SRV", // Address of server
```

Access to the Plant SCADA Access Anywhere Server is routed through the Secure Gateway node. When you navigate to the *https://<Name or IP Address of the computer where the Secure Gateway is installed>/*, the

following page appears:

This login dialog will function differently depending on the value of the 'Authentication Server' settings, discussed in more detail later.

In brief, if the Secure Gateway is configured to use an Authentication Server, it will authenticate users before passing the credentials on to the Plant SCADA Access Anywhere Server.

If the Secure Gateway is not configured to use an Authentication Server, the credentials will be passed directly to the Plant SCADA Access Anywhere Server for authentication.

Although subtle, these settings may make a big difference if the Secure Gateway and Plant SCADA Access Anywhere Servers are located in different domains, or have other differences in their authentication capabilities.

When logging in, you will need to prefix your username with your domain name, or, if there is a common domain name, you can enter it in the config.js file, under the 'Domain' entry, for example:

DOMAIN: "domain.com", // Optional domain for RDP Session...

The Administration page for the Authentication Server, showing the current status, and the domain name that it is authorizing against, can be viewed at <https://localhost:7443/Admin> with a local administrator login.

---

**Note:** A page refresh and clearing cookies on every client are required each time the **Address** property in the config.js is changed.

---

## Configuring the Secure Gateway

The Plant SCADA Access Anywhere Secure Gateway can be configured via the included Configuration Portal, or by manually editing the *EricomSecureGateway.exe.config* file. Both of these methods are detailed below.

## Configuration Portal

To access the Configuration Portal page, go to Windows **Start** menu | AVEVA Plant SCADA Access Anywhere | **Administration Portal**.

Alternatively, use a web browser and navigate to the Secure Gateway's configuration URL:

<https://localhost/admin/login.html>

Logging on to the Configuration Portal is accessible only to members of the local Administrators group of the Plant SCADA Access Anywhere Secure Gateway server. Logons are audited in the Secure Gateway log file.

Administrators are strongly encouraged to enforce a strong password policy for Secure Gateway administrators.

## Security

The Security section shows which **Secured Port** is being used by the Secure Gateway and which **SSL Certificate** is in use. There are also additional SSL configuration options.

For production systems, it is recommended that you use either a trusted certificate purchased from a certificate authority (for example, DigiCert), or a domain-issued trusted certificate provided by your IT administrator. For more information refer to [SSL Certificates](#).

The screenshot shows the 'Security' configuration page. On the left, a sidebar menu includes 'Administrator', 'Logout', 'Gateway Settings' (selected), 'Dashboard', 'Security' (selected), 'Web Server', 'Authentication Server', 'Log Settings', 'Download', 'Admin', and 'About'. The main content area has a heading 'Security' and a note: 'By forcing SSL policy errors on clients you might lock yourself out of the admin. Use with care!'. It states that fields marked with \* are mandatory. Configuration options include a 'Secured Port' set to 443, an 'SSL Certificate' dropdown set to 'Ericom Secure Gateway self-signed certificate', and several checkboxes for SSL handshake ignore errors. At the bottom are 'Save' and 'Cancel' buttons.

## Web Server

The Secure Gateway has a built-in web server to host web pages for Plant SCADA Access Anywhere. The built-in Web server cannot be disabled and listens on the Secure Gateway port.

---

**Note:** If you are running Plant SCADA Access Anywhere on an IPv6 network, it is recommended you configure a hostname that refers to the Access Anywhere Server. A hostname ensures the server is compatible with all supported browsers. If you attempt to connect to the Access Anywhere Server using a standard format IPv6 address in Internet Explorer, the connection will not be successful.

---

Refer to the chapter [Built-In Web Server](#) for more information.

## Log Settings

In this section, the Log Settings can be configured. Consult with a support engineer on which settings to enable.

The screenshot shows the 'Basic Log Settings' configuration page. On the left, a sidebar menu includes 'Administrator', 'Logout', 'Gateway Settings' (selected), 'Dashboard', 'Security', 'Web Server', 'Authentication Server', 'Log Settings' (selected), 'Download', 'Admin', and 'About'. The main content area has a title 'Basic Log Settings' and a subtitle 'Change gateway log level to fine-tune the amount of information written to the log per functionality.' It lists five log levels with dropdown menus: Visitor (Info), Session (Info), WebServer (Info), Admin (Info), and Statistics (Info). Below the list are 'Save' and 'Cancel' buttons.

## Built-In Authentication Server

The Secure Gateway includes an Authentication Server that provides a layer of protection by authenticating end-users before they can access any internal resource.

The Authentication Server can be enabled / disabled from the Configuration Portal. The Authentication Server is installed locally and is employed to authenticate users.

---

**Note:** In order to use the Authentication Server, you need to restart your computer after you install the Secure Gateway.

---

**Note:** The Authentication Server can only be configured for one domain at a time.

Use the Configuration page to modify settings for the Authentication Server:

The screenshot shows the 'Authentication Server' configuration page. The sidebar menu is identical to the previous screenshot. The main content area has a title 'Authentication Server' and a subtitle 'When enabled and both address and port are specified, the gateway will use the Authentication Server to authenticate the user before connecting the client to a resource inside the organization.' It shows a checked checkbox 'Enabled', an 'Address' input field containing 'localhost', and a 'Port' input field containing '444'. Below the form are 'Save' and 'Cancel' buttons.

The configuration settings are stored in the file *EricomSecureGateway.exe.config*. The user configurable settings are located under the <ExternalServerSettings><AuthenticationServer> section and defined in the following table.

Setting	Description
Address	The address that the Authentication Server will bind to.
Port	This is the numerical value of the port that the Authentication Server listens over. Check that no other services on the system are using the same port. A port conflict will interfere with the operation of the Authentication Server.

Any configuration of the Authentication Server itself needs to be done through its Web-Portal, which is by default located at <https://localhost:7443>.

The configuration settings are stored in the file *EricomAuthenticationServer.exe.config*. The user configurable settings are located under the <appsettings> section.

## Download - Obtaining Log Files

This is the section from where you can download the current log file. It also contains a link to the Viewer application that is required to read the log files.

The screenshot shows the 'Download' section of the Admin interface. On the left, there's a sidebar with links: Administrator, Logout, Gateway Settings, Dashboard, Security, Web Server, Authentication Server, Log Settings, Download (which is highlighted with a blue background), Admin, and About. The main area has a title 'Download' and three links: 'Plant SCADA Access Anywhere Secure Gateway Log File', 'Plant SCADA Access Anywhere Secure Gateway Log viewer', and 'Ericom Secure Gateway Administration Manual'.

## Admin

This section allows you to set Inactivity Timeout settings, and define a whitelist of allowed client IP addresses.

The screenshot shows the 'Administration Settings' page. On the left, a sidebar menu includes 'Administrator', 'Logout', 'Gateway Settings' (with 'Dashboard', 'Security', 'Web Server', 'Authentication Server', 'Log Settings', 'Download'), 'Admin' (which is selected), and 'About'. The main content area has a heading 'Administration Settings' and a note about enabling Admin lockdown. It includes fields for 'Session Inactivity Timeout (Minutes)' (set to 5), 'Enable Admin Whitelist By IP Address' (checkbox checked), and two input fields for 'Allowed IPv4 Addresses' and 'Allowed IPv6 Addresses'.

Admin

About

## Administration Settings

By enabling Admin lockdown and setting the IP addresses below you restrict the ability to login and configure gateway. Use with care!

If you lock yourself out of the admin by failing to add your own IP address, you must edit gateway configuration directly.

Allowed address list items can either be an IP address or an IP range (from-to) of networks allowed to access the gateway Admin, separated by semicolons (';').

Lockdown-related changes will only take effect on the next Admin login operation.

Fields marked with \* are mandatory.

Session Inactivity Timeout (Minutes)\*

Enable Admin Whitelist By IP Address.

Allowed IPv4 Addresses

Allowed IPv6 Addresses

## SSL Certificates

The Plant SCADA Access Anywhere Secure Gateway installation includes a self-signed certificate for SSL connections. It is recommended self-signed certificates are only used for testing purposes within a domain. Self-signed certificates will result in insecure connection warning messages in the user's web browser. They will also attempt to prevent iOS devices from connecting to the Secure Gateway.

For production systems, use either a trusted certificate purchased from a certificate authority (for example, DigiCert), or a domain-issued trusted certificate provided by your IT administrator. When using a domain-issued certificate, the domain trusted root certificates need to be distributed to every device that connects to Plant SCADA Access Anywhere.

**Important:** The signed certificate needs to have a private key associated with it. A .CER file may not have a private key. Use a signed certificate that includes a private key, which usually has a .PFX extension.

**Note:** The DNS address of the Plant SCADA Access Anywhere Server or Secure Gateway server needs to match the certificate name. If a wildcard certificate is being used, the domain needs to match. For example, if the certificate is for \*.example.com the server name needs to end with example.com.

## Configuring the SSL Certificates

To use a trusted certificate on to the Plant SCADA Access Anywhere Secure Gateway Server and the Authentication Server, perform the following procedures.

## Import the Certificate on to the Secure Gateway Server

1. Locate the certificate file provided by your Plant SCADA Access Anywhere or domain administrator.
2. Double click the certificate file, or right-click and select **Import**. The Certificate Import Wizard is displayed.

### Welcome to the Certificate Import Wizard

This wizard helps you copy certificates, certificate trust lists, and certificate revocation lists from your disk to a certificate store.

A certificate, which is issued by a certification authority, is a confirmation of your identity and contains information used to protect data or to establish secure network connections. A certificate store is the system area where certificates are kept.

Store Location

Current User

Local Machine

To continue, click **Next**.

3. Select **Local Machine** and click **Next**.
4. On the next screen, make sure the path to the certificate is correct.

#### File to Import

Specify the file you want to import.

File name:

D:\Certificates\my-ca-server.pfx

[Browse...](#)

Note: More than one certificate can be stored in a single file in the following formats:

Personal Information Exchange- PKCS #12 (.PFX,.P12)

Cryptographic Message Syntax Standard- PKCS #7 Certificates (.P7B)

Microsoft Serialized Certificate Store (.SST)

5. Click **Next**.
6. On the next screen, enter the password for the certificate's private key.

**Private key protection**

To maintain security, the private key was protected with a password.

Type the password for the private key.

Password:

\*\*\*\*\*|

Display Password

7. Click **Next**.

8. On the next screen, specify the location where the certificate will be stored.

**Certificate Store**

Certificate stores are system areas where certificates are kept.

Windows can automatically select a certificate store, or you can specify a location for the certificate.

Automatically select the certificate store based on the type of certificate

Place all certificates in the following store

Certificate store:

Browse...

9. Click **Next**.

10. On the next screen, click **Finish** to import the certificate.

**Note:** If you are using a separate Plant SCADA Access Anywhere Authorization Server, you will need to repeat these steps to import the certificate on the computer where the Authorization Server is installed.

### Configure the Certificate on to the Secure Gateway Server

1. Browse to the Secure Gateway Administration Portal at '<https://localhost/Admin/Login.html>'.
2. Log in to the Administration Portal.
3. Go to the **Security** page.
4. Choose the certificate in the SSL Certificate drop-down.

## Security

By forcing SSL policy errors on clients you might lock yourself out of the admin.  
Use with care!

Fields marked with \* are mandatory.

Secured Port \* 443

SSL Certificate \* Ericom Secure Gateway self-signed certificate

Ignore certificate errors while doing SSL handshake with a client.

Ignore certificate errors while doing SSL handshake with a host.

Ignore certificate errors while doing SSL handshake with a HTTP Web host (External Web Server / VMware View Server).

Enable Draining Mode.  
New connections will be disabled on the server.

Save Cancel

5. Click **Save**.

### Configure the Certificate on to the Plant SCADA Access Anywhere Authentication Server

1. Browse to the Secure Gateway Administration Portal at '<https://localhost:7443/Admin/Login.html>'.
2. Log in to the Administration Portal.
3. Go to the **Security** page.
4. Choose the certificate in the SSL Certificate drop-down.

### Security Settings » Ports and SSL certificates

Select your SSL certificate

Secured Port 7443

SSL Certificate Ericom Authentication Server self-signed certificate

Save Test Connection Discard Changes

5. Click **Save**.

## Built-In Web Server

The Secure Gateway has a built-in web server to host web pages for Plant SCADA Access Anywhere. The built-in Web server cannot be disabled and listens on the Secure Gateway port.

To configure the Web server, open the Configuration tool and navigate to the Web Server page.

The screenshot shows the AVEVA Configuration tool interface. On the left is a navigation sidebar with the following items:

- Administrator
- Logout
- Gateway Settings
- Dashboard
- Security
- Web Server** (selected)
- Authentication Server
- Log Settings
- Download
- Admin
- About

The main content area is titled "Web Server". It contains a single configuration option:

Enable non-secured port for HTTPS auto-redirect

At the bottom right of the content area are two buttons: "Save" and "Cancel".

For example, if Plant SCADA Access Anywhere is selected, when the user navigates to `https://<sg-server-address>:<port-number>/` the URL will automatically redirect to:

`https://<sg-server-address>:<port-number>/PlantAccessAnywhere/start.html`

**Note:** Using the Secure Gateway to proxy to pages other than Plant SCADA Access Anywhere is not supported.

## Connecting to the Web Server

To connect to a Plant SCADA Access Anywhere server available through the Secure Gateway Web server, open a browser and navigate to the desired URL. If a port other than 443 is being used by the Secure Gateway, it needs to be explicitly stated in the URL. For example: `https://myserver:4343/PlantAccessAnywhere/start.html`.

**Note:** If you are running Plant SCADA Access Anywhere on an IPv6 network and you attempt to connect to the Access Anywhere Server using an IPv6 address in Internet Explorer, the connection will not be successful. Use a different browser, or check with your system administrator if there is a configured hostname available for the Access Anywhere Server.

The following URLs are available by default:

`https://server:port/` OR `https://server:port/PlantAccessAnywhere/start.html`

## HTTP Redirect

The Plant SCADA Access Anywhere Secure Gateway Web server listens on port 80 by default. This way, HTTP references to the server will automatically redirect to the HTTPS URL.

**Note:** This feature only works if the Secure Gateway is listening on port 443. If it is configured to use any other port, the HTTP automatic redirect is not supported.

To enable this feature, select the option: **Enable non-secured port for HTTPS auto-redirect**.

The screenshot shows the AVEVA Web Server configuration interface. On the left is a navigation sidebar with links: Administrator, Logout, Gateway Settings, Dashboard, Security, Web Server (which is selected and highlighted in blue), Authentication Server, Log Settings, Download, Admin, and About. To the right of the sidebar, the main panel title is "Web Server". Underneath the title, there is a configuration setting: "Enable non-secured port for HTTPS auto-redirect" with a checked checkbox. At the bottom right of the main panel are two buttons: "Save" and "Cancel".

Configure this feature in the *EricomSecureGateway.exe.Config* file using:

```
<add key="EnableNonSecuredPortForHttpsAutoRedirect" value="false" />
```

## Disabling HTTP Filtering

Certain types of network traffic are blocked by firewalls. Port 443 on many firewalls is initially reserved for HTTP and HTTPS based communication. Many firewalls have a rule to filter out any non-HTTP data. Depending on what the Secure Gateway will be routing, HTTP filtering may need to be disabled on the firewall.

The Secure Gateway can proxy various types of traffic. Some are HTTP based and some are not.

## Advanced Configuration

Back up the existing *EricomSecureGateway.config* file before making any changes.

To configure the settings of the built-in Web server, open the *EricomSecureGateway.config* using a text editor. Each folder in the WebServer directory may have a default document assigned for it, and may also be restricted so that end users cannot access it.

## Access Anywhere Web Client User Guide

This guide describes how to use AVEVA Plant SCADA Access Anywhere to remotely connect to a Plant SCADA client by means of an HTML5-compatible web browser.

### About Plant SCADA Access Anywhere

Plant SCADA Access Anywhere enables you to remotely access a running Plant SCADA client with a mobile device including tablets and smartphones, and laptop computers.

You can view and control the client through a web browser without needing to install it on your portable device. You can interact with the Plant SCADA client from anywhere in real-time.

Plant SCADA Access Anywhere provides the following features:

- Provides user access and interaction with Plant SCADA clients from any device that has an HTML5-compatible web browser (see [Supported Browsers](#)).
- Provides access without the need to install, configure, update, or patch any software on a portable device.
- Works on platforms that support only web applications such as the Google Chrome operating system.

Plant SCADA Access Anywhere Secure Gateway provides the following alternative functions with Access Anywhere Server:

- Provides access without the need to purchase, install, configure, and manage a VPN.
- Accesses internal resources using a single Secure Gateway that is installed in a perimeter network, while other resources reside securely behind an internal firewall.
- Installs a single Secure Socket Layer (SSL) digital certificate on the Secure Gateway node instead of installing on every host that needs to be accessed.

### Supported Browsers

With Plant SCADA Access Anywhere, users can access remote Plant SCADA from HTML5 compatible web browsers on any device including smart phones, tablets, and laptop computers.

To start a session, navigate to the *start.html* file that is installed on the Access Anywhere Server. To do this, point a browser to the Access Anywhere Server URL:

*https://<computer name or IP address>:8080*

## Browsers Tested with Plant SCADA Access Anywhere

- Microsoft Edge
- Google Chrome
- Safari on Apple iOS

---

**Note:** Browser extensions and toolbars may inject JavaScript code into web pages, which can adversely impact the behavior of certain web pages. If Plant SCADA Access Anywhere is not working properly, disable or uninstall any active browser extensions or tool bars. Restart the web browser after uninstalling or disabling an extension to confirm that it is no longer active.

---

**Note:** If you are running Plant SCADA Access Anywhere on an IPv6 network and you attempt to connect to the Plant SCADA Access Anywhere Server using an IPv6 address in Internet Explorer, the connection will not be successful. Use a different browser, or check with your system administrator if there is a configured hostname available for the Plant SCADA Access Anywhere Server.

---

## Important Notes

Certain versions of the above listed browsers, such as Safari and Chrome, are in theory functionally compatible with Access Anywhere. You may be able to use them, but specific behaviors are unknown because different browser versions have not been tested with Access Anywhere. We strongly recommend that you upgrade to the most recent version.

Although Plant SCADA Access Anywhere supports the listed browsers, you should review the [Running Access Anywhere on Different Web Browsers](#) for behaviors and alternatives specific to each browser.

Multiple Access Anywhere sessions may be opened in different tabs within the web browser, or in different browser windows. When a session is not in use (its tab or window is not displayed), it will reduce its CPU and memory utilization on the server.

## Viewing Plant SCADA with Plant SCADA Access Anywhere

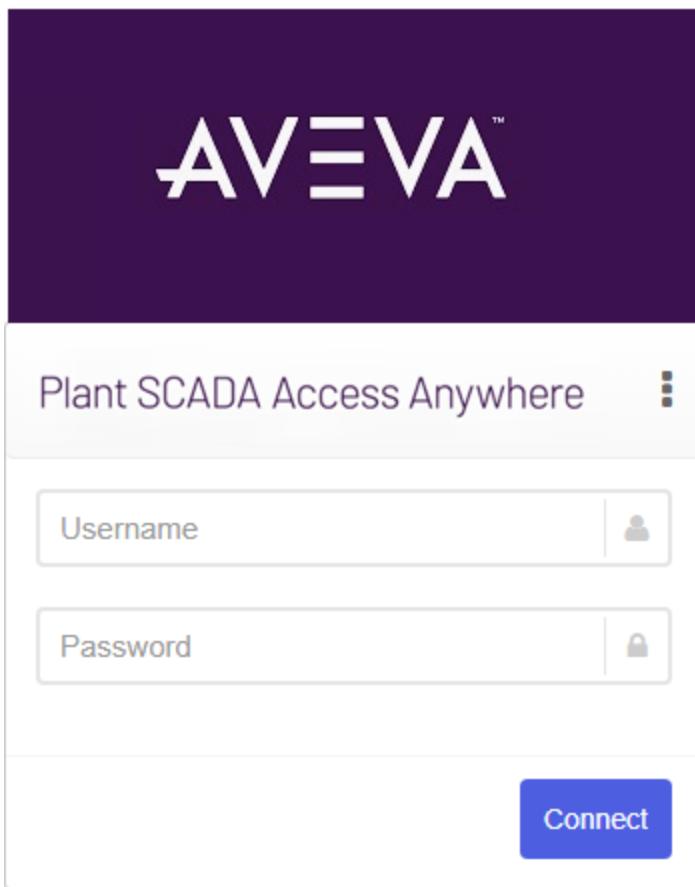

This chapter describes how to log on to Plant SCADA Access Anywhere from any device with an HTML5-compatible web browser. It includes:

- A step-by-step procedure to log on (see [Logging On to Plant SCADA Access Anywhere](#))
- How to securely connect to Access Anywhere (see [Securely Connecting to Plant SCADA Access Anywhere](#))
- Advanced connection settings.

## Logging on to Plant SCADA Access Anywhere

To log on to the Plant SCADA Access Anywhere Connection Web Page, follow these steps:

1. Navigate to <https://<Plant SCADA Access Anywhere Server Node Name>:8080/>. The Logon dialog appears.

2. Enter the connection parameters (see the table below).
3. Tap or click **Connect** to initiate the connection. The progress indicator is displayed before connection is established.

Connection Parameters	Description
User Name	Credentials to log on to the RDP host. If the Secure Gateway is in a different domain to the Authentication Server/Plant SCADA Access Anywhere Server, the domain needs to be specified (for example, domain\user).
Password	Corresponding password for the user name. This value should not be saved for future connections.

If the Plant SCADA session does not start or any notifications appear, confirm your details with your Access Anywhere Administrator. You can also check your connectivity using the Plant SCADA Access Anywhere demonstration site. See [Checking Connectivity](#).

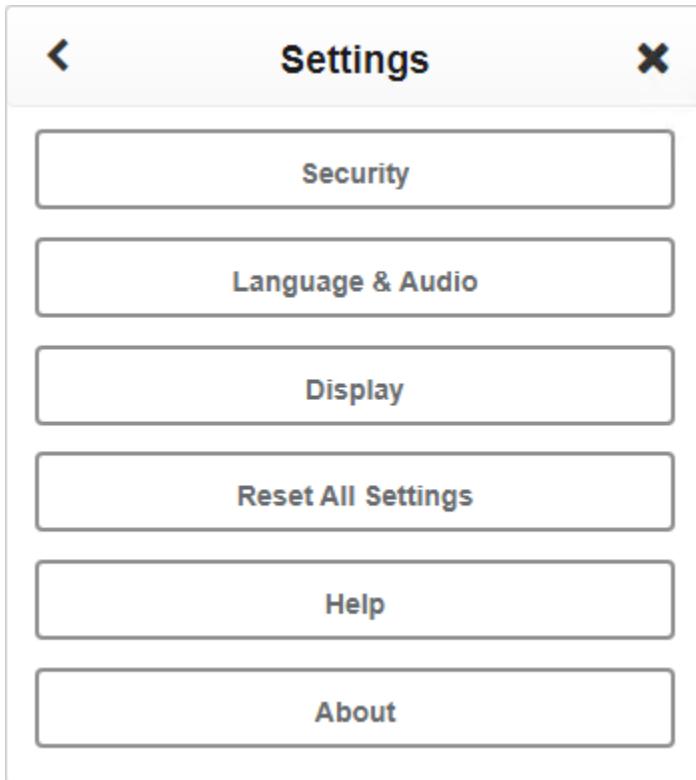

**Note:** If you are running Plant SCADA Access Anywhere on an IPv6 network and you attempt to connect to the Plant SCADA Access Anywhere Server using an IPv6 address in Internet Explorer, the connection will not be successful. Use a different browser, or check with your system administrator if there is a configured hostname available for the Plant SCADA Access Anywhere Server.

## Configuring Advanced Settings

To configure advanced settings:

1. Click . The following tabs appear as shown below:

2. Click on each tab to view the settings available for configuration. For example, to view Display settings, click the **Display** tab.

To return to the Settings dialog, click the following icon.

To close the Settings dialog and return to the Logon dialog, click the close icon.

3. Complete the required settings.

## Security Settings

Option(s)	Description
Enable SSL encryption for remote session	Select this option to allow the client to use Secure Socket Layer (SSL) encrypted WebSocket communication to the Plant SCADA Access Anywhere Server. As a default, this option is selected.

## Language & Audio Options

Option(s)	Description
Display Language	Select the language in which you wish to view the Plant SCADA Access Anywhere interface. The Display Language only applies to the logon web page, and is not propagated to the Plant SCADA client.
Keyboard Locale	Select the keyboard region to be used in the session (keyboard_locale). If you select a non-English keyboard locale, your computer will need to be configured to use a matching keyboard in the Windows <b>Region &amp; Language</b> settings. Some keyboards may not work correctly with Edge browsers.
Use keyboard scan-codes	Enables scan codes. Certain applications use scan codes and will require this setting to be enabled.
Remote Audio Playback	Configure where the session's sound will play: local computer, remote computer, or do not play. Audio playback is not supported with Internet Explorer version 11.

## Display Options

Option(s)	Description
Acceleration / Quality	The acceleration, or degree of quality can be specified by selecting options from a drop-down list. Faster acceleration will result in lower quality images.
Screen Resolution	Sets the resolution size of the Plant SCADA Access Anywhere session. Select a value from the drop-down list of values. For example: "800 x 600". Select a screen resolution that matches your Plant SCADA project. The default may be configured by the administrator to already match your Plant SCADA Project.
Automatic session resize	Enables/disables automatic display resizing. By default, automatic resizing is selected (enabled).

Option(s)	Description
	This means whenever the browser window is resized, the Plant SCADA Access Anywhere session will automatically adjust itself to the new dimensions. See "Automatic Display Resize" in the Plant SCADA Access Anywhere Server Install Guide for more information.

**Note:** For details about the version of Plant SCADA Access Anywhere you are running, click the **About** tab in the Settings dialog.

Click the **Reset All Settings** tab to revert to the default settings.

Depending upon the privileges your administrator has assigned, a Plant SCADA view-only client or control client will be launched. A view-only client is a computer configured with view-only access to the Plant SCADA runtime system. No control of the system is possible, but access to data monitoring is available. A control client is the interface between the Plant SCADA runtime system and an operator. If you are using Plant SCADA on a network, every Plant SCADA computer (on the network) is a control client.

Access to either client depends upon the permissions granted to you by your administrator. For more information, refer to the Plant SCADA Access Anywhere Installation and Configuration Guide.

**Note:** Click the **Help** tab in the Settings dialog to view the *Plant SCADA Access Anywhere Web Client User Guide*.

## Securely Connecting to Plant SCADA Access Anywhere

Plant SCADA Access Anywhere is compatible with most VPNs. SSL and VPNs that will not support WebSockets require the Secure Gateway as well. Juniper IVE version 7.4 (and later) supports WebSockets, so the Secure Gateway is not required.

Access Anywhere has been tested with Juniper's SA SSL VPNs. For more information about Juniper's VPNs, see the [SSL VPN Configuration](#) section in the *Access Anywhere Server Installation and Configuration Guide*. Configuration with other third-party SSL VPN appliances will be similar to the procedures described here (differences are mostly in terminology).

## Obtaining a Plant SCADA Runtime License

Plant SCADA requires a license to run as a display client in Plant SCADA Access Anywhere. By default, the display client will obtain the Plant SCADA license it requires from a server to which it is connected (an alarm, trend, report or I/O server).

If you want the display client to use a Plant SCADA license that is hosted locally on the computer where Plant SCADA Access Anywhere is running, you need to check the following:

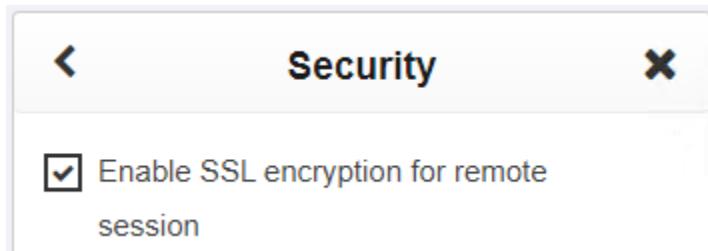

- The license needs to be configured locally on the Plant SCADA Access Anywhere computer.
- The Citect.ini file on the Plant SCADA Access Anywhere computer needs to have the [Client]UseLocalLicense parameter set to 1.
- Plant SCADA needs to be running as a Windows Service.

## Checking Connectivity

If you have any trouble connecting remotely to Plant SCADA Access Anywhere, you can connect to a Plant SCADA Access Anywhere demonstration on the following site:

<https://engage.aveva.com/operations-control-demonstrations-thank-you.html>

After registration, locate the Plant SCADA demonstration page and use the Plant SCADA Access Anywhere link to navigate to the demo site. Before you login, you will need to go to the Plant SCADA Access Anywhere client settings and turn off **Enable SSL encryption for remote session**.

If the demo site appears and you can successfully launch Plant SCADA, the browser is compatible with Plant SCADA Access Anywhere.

If the demo site works, verify that the following are true for your own system:

- You can locally connect at the Plant SCADA Access Anywhere node itself by using a browser listed in the [Supported Browsers](#) section.
- The Plant SCADA Access Anywhere service is running.
- Windows Firewall is configured correctly.
- The Plant SCADA Access Anywhere port between your browser and the Access Anywhere environment is available. The default port is 8080.
- A trusted certificate may be required for the Plant SCADA Access Anywhere Secure Gateway or the Plant SCADA Access Anywhere Server.
- Verify network connectivity.
- Verify that the client device can reach the Access Anywhere Server or the Access Anywhere Secure Gateway node. The Ping and Traceroute commands are useful in a Windows-based system. Third party tools exist for certain mobile devices to provide equivalent functionality. If you cannot reach a node by name, try using its IP address.

## Viewing a Plant SCADA Access Anywhere Session

After successfully logging on, an RDP session is launched and Plant SCADA starts at the remote machine. The Plant SCADA client appears within a browser window.

While it is connected, Plant SCADA Access Anywhere intercepts the mouse, button, and keyboard events, and transmits them to the RDP host. As a result, various keyboard keys and mouse buttons that are usually handled by the browser will behave differently. For example, clicking the F5 button normally causes the browser to reload the current page, but when using Plant SCADA Access Anywhere F5 will not reload the page. Instead, the keyboard command will be transmitted to and handled by the remote Plant SCADA client.

**Note:** In most browsers, clicking the **Back**, **Forward**, or **Reload** browser buttons will cause Plant SCADA Access Anywhere Server to display a message asking if you wish to leave the current page. If you decide to proceed, the

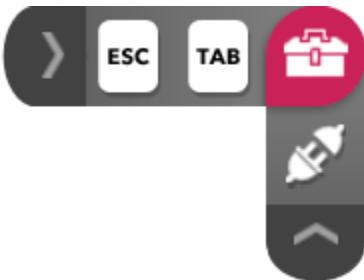

---

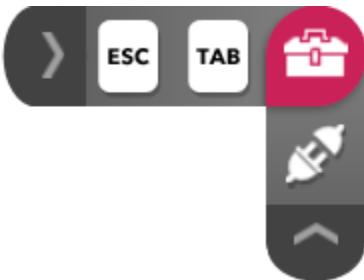

remote session will be disconnected. (Some browsers may not prompt for confirmation).

When accessed by Plant SCADA Access Anywhere, a Plant SCADA client cannot be minimized. If the remote Plant SCADA client is shut down at the server end, your session will be terminated automatically in approximately three seconds. Closing the browser in your remote session will end the RDP session.

## Plant SCADA Access Anywhere Toolbar

After connection to a Plant SCADA client is established, click  to view the Plant SCADA Access Anywhere toolbar.

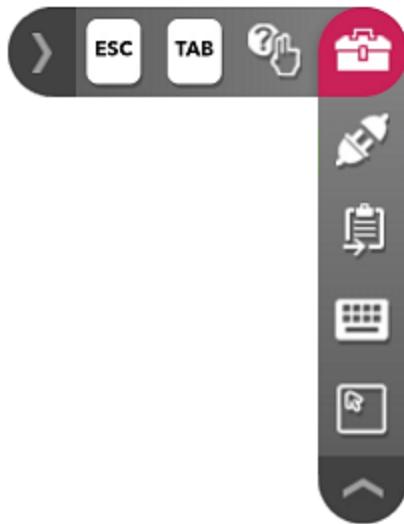

You can show or hide the branches of the toolbar by clicking the arrows at the end of each branch.

The Plant SCADA Access Anywhere toolbar includes the following buttons:

Button	Description
	Closes the Plant SCADA client
	Navigates to the next element in the tab order
	Ends the Plant SCADA Access Anywhere session

If the toolbar appears on a mobile device (such as an Android tablet or iPad), it will include additional buttons.

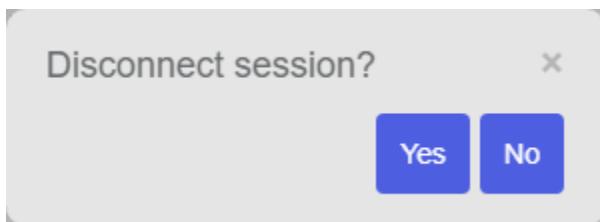

Button	Description
	Displays instructions for using gestures
	Allows you to copy text to the remote clipboard
	Displays the on-screen keyboard
	Changes the cursor operation from tap mode to drag-and-select mode.

## Ending a Plant SCADA Access Anywhere Session

To log out or disconnect, click the following:

A message appears prompting you to confirm the action.

The browser returns to the connection dialog after you click **Yes**.

No trace of a session remains on your device after ending a session. For additional protection, close the browser tab or window that previously ran the Plant SCADA Access Anywhere Server session.

## Session Auto-logoff

A session is logged off when you close the Plant SCADA client. Plant SCADA Access Anywhere Server includes an auto-logoff feature that automatically logs off the session if nothing is displayed on the screen for a specified period.

## Automatic Reconnect

Active Plant SCADA Access Anywhere sessions automatically attempt to recover from temporary network outages by reconnecting to your session. You may experience a slight delay during the reconnect attempt, but after the session is re-established, you can continue working without having to log back on to the session.

# Using Plant SCADA Access Anywhere on Portable Devices

This chapter describes the behavior and functionality of Plant SCADA Access Anywhere on different mobile devices, web browsers, and operating systems.

## Tablet and Smartphones

Plant SCADA Access Anywhere can operate on portable devices with an HTML5-compliant browser (for example, Safari on iPad). For the list of supported browsers, see [Supported Browsers](#).

**Note:** Plant SCADA Access Anywhere is supported on Android versions 4.2.2 and higher.

Mobile devices enable you to remotely access and interact with Plant SCADA clients. Touch gestures are used to perform the tasks normally done by a mouse using a desktop or laptop computer. Built-in software keyboards are used instead of physical keyboards. Certain mouse events will not have an equivalent on a touch device.

Software keyboards in mobile devices will not have F1-F12, CTRL, or ALT keys. In addition, mouse hover and tool tips are not supported on touch devices.

Be aware of these differences when using Plant SCADA Access Anywhere to remotely view the Plant SCADA client. Also, become familiar with the way your device implements touch interfaces. Keep this in mind for the design of Plant SCADA projects for use with Plant SCADA Access Anywhere. For example, Input animations should not need to invoke a Plant SCADA or Windows keyboard as mobile devices have their own.

For existing Plant SCADA clients that make use of mouse events, keys, and/or key combinations without a supported equivalent in a touch environment, you may want to modify your client to use alternate events that will work in a touch environment.

The following list provides tips on using Plant SCADA Access Anywhere on a tablet or smartphone device without a physical keyboard or mouse. Functionality will vary across different devices and some commands may not be available.

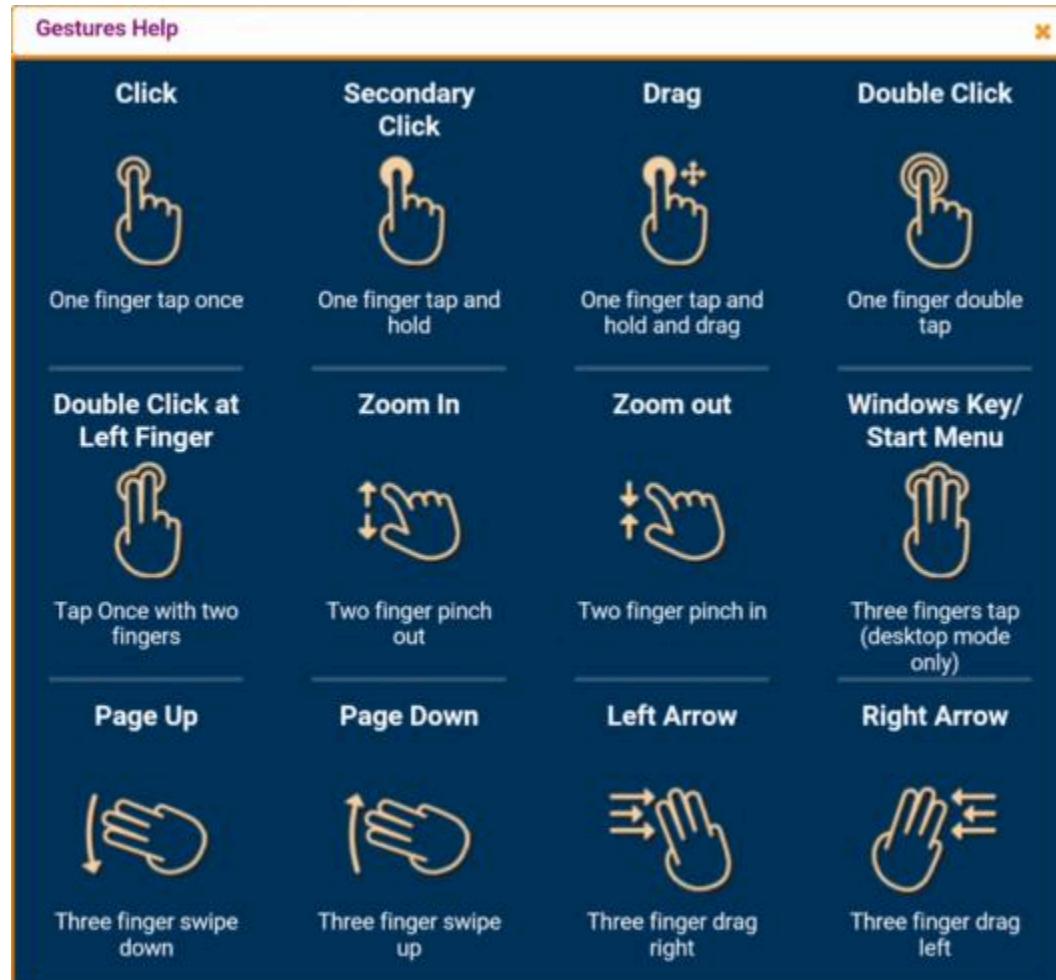

- Single Tap performs a left click.
- Single long Tap performs a right-click.
- Tap + Hold + Drag performs a select then drag/scroll function.

- Double Tap, or tapping once with two fingers, performs double-click.
- Tap with three fingers sends Back command to a remote browser.
- Swipe down with three fingers is Page Up.
- Swipe up with three fingers is Page Down.
- Drag left or right with three fingers performs a left arrow and right arrow respectively.
- Tap the keyboard icon (upper right-hand corner of window) to open/close the virtual keyboard.
- Swipe and pinch gestures will apply to the Plant SCADA Access Anywhere session (i.e. zoom in with pinch in).

**Note:** (For iOS only) when saving a Plant SCADA Access Anywhere icon to the iOS desktop, the shortcut will open the Plant SCADA Access Anywhere session in full-screen mode. The browser's toolbar will be hidden and there will be more remote desktop area available.

## Gestures Support

Plant SCADA Access Anywhere supports many different gestures when used on a touch device, such as a tablet. Tap the Gestures help icon in the Toolbar to see the complete list of supported gestures.

## Automatic Display Resize

Plant SCADA Access Anywhere supports automatic display re-size. Whenever a browser window is re-sized, the Plant SCADA Access Anywhere session automatically adjusts itself to the new dimensions (assuming the Plant SCADA Runtime window is set to full screen).

To re-size a browser window, drag any corner of the browser window and release it when the desired dimensions are reached. If a browser is placed into full screen mode, the Plant SCADA Access Anywhere session will automatically expand to the full screen. Be aware that resizing is subject to the display limitations of the Plant SCADA runtime system.

You can enable/disable automatic resizing via the **Display** settings for the Access Anywhere Web Client. See [Logging on to Plant SCADA Access Anywhere](#).

## Running Access Anywhere on Different Web Browsers

This section describes browser-specific behaviors in Plant SCADA Access Anywhere. The behaviors are grouped by operating systems. Alternative solutions are provided when available.

- [Android Operating System](#)
- [Google Chromebook](#)
- [iOS](#)

### Android Operating System

This table shows the behavior of different Android browsers.

Browser(s)	Behavior Type	Description
All	Drag and drop	You may experience difficulty dragging and dropping pop-up windows on the Android operating system. As a workaround, using a stylus to perform the drag and drop operations may improve the functionality.
Chrome	Scroll bars	Scroll bars in Plant SCADA cannot be scrolled by tapping or pressing and dragging the scroll button. Tapping on the gray area of the scroll bar itself will provide scroll functionality.
Chrome	Text display	When an Android tablet runs low on memory, text in a window can appear blurred. As a workaround, you should close the running applications and restart the device.

Browser(s)	Behavior Type	Description
Chrome	Text input	Typing double-byte language characters using the native Android software keypad are rendered as the question mark character (?) in a Plant SCADA data entry field. As a workaround, configure Plant SCADA Access Anywhere Server to use the Windows Keyboard option. Double-byte language characters can be entered correctly from the Android keypad OR by using a paired Bluetooth hardware keyboard.

## Google Chromebooks

Plant SCADA Access Anywhere operates on Google Chromebook and Chromebox just like it does with a Google Chrome browser. Here are some tips to keep in mind when using Plant SCADA Access Anywhere with a Chromebook or Chromebox.

Function	Description
Mouse Left-click	Click the Chromebook trackpad with one finger.
Mouse Right-click	Click the Chromebook trackpad with two fingers
Scrolling a document or website	Drag two fingers on the Chromebook trackpad up or down to scroll
Configure Chromebook	In the address field: <i>chrome://settings</i>

## Chromebook Keyboard

The Chromebook keyboard lacks several keys that are used by Windows. ChromeOS provides standard mappings that use existing keys with the **ALT** key to represent certain missing keys. Plant SCADA Access Anywhere supports these key combinations:

Command	Key Combination
Delete (DEL)	ALT+Backspace
Page Up	ALT+Up
Page Down	ALT+Down
Home	CTRL+ALT+Up
End	CTRL+ALT+Down

In addition, Plant SCADA Access Anywhere provides special non-standard mappings for additional key combinations on ChromeOS.

Command	Key Combination
F1	CTRL+1
F2, ...	CTRL+2, ...
ALT+TAB	ALT+`
ALT+SHIFT+TAB	ALT+SHIFT+`
CTRL+Home	CTRL+ATL+Left
CTRL+End	CTRL+ALT+Right

## iOS

This table shows the specific behavior of Safari browsers running on the iOS operating system.

Behavior	Description
Accessing Plant SCADA Access Anywhere	You may experience difficulty accessing Plant SCADA Access Anywhere. This can occur if the Private Browsing option is left in Enabled state. Private browsing is enabled if Safari bars appear black or dark instead of blue or gray. As a workaround, navigate to Settings, then Safari, and disable private browsing.
Refresh current page	When you click to refresh or navigate away from the current page while connected to the Plant SCADA Access Anywhere server, you will not be prompted to confirm your action, which may result in unwanted page navigation. There is no workaround.
Invoking Plant SCADA keyboard	A user input animation may not bring up the Plant SCADA keyboard and the alphabetic re-sizeable keyboard is not functional. The recommended workaround is to use the device's built-in keyboard.
Moving between text boxes	The Next and Previous buttons are not enabled to move between text boxes on dialog boxes with multiple text boxes. As a workaround, use a touch gesture to transfer focus.
Certificates	When connecting through the Secure Gateway, self-signed certificates are not supported on iOS. They will result in the error message "Gateway: HTTP sessions are disabled".

Behavior	Description
	This error message will also be shown when using domain-issued certificates if the domain root certificate is not installed on your device. Contact your system administrator to install the root certificate.

# AVEVA Cloud Services

AVEVA offers a range of cloud services through its common cloud platform CONNECT. You can access CONNECT online at <https://connect.aveva.com/>.

For Plant SCADA users, CONNECT provides access to AVEVA Integration Studio, an infrastructure-as-a-service virtual development environment.

Integration Studio allows you to add Plant SCADA nodes to a project template. These nodes can be used to create multiple instances of virtual machines with a fully licensed version of Plant SCADA installed.

For more information, see [Plant SCADA and AVEVA Integration Studio](#).

## Plant SCADA and AVEVA Integration Studio

AVEVA Integration Studio is an infrastructure-as-a-service virtual development environment that is delivered on AVEVA's cloud services platform CONNECT.

Integration Studio lets you run and manage software applications without the complexity of building and maintaining the physical infrastructure typically required when developing and launching software. You can create templates for virtual machines and deploy multiple instances on demand.

AVEVA Integration Studio offers the following benefits:

- Provides virtual infrastructure for AVEVA servers and software that is pre-installed, configured, and licensed
- Enables management of your projects from one consolidated virtual dashboard
- Provides a fully virtual environment for training your staff and customers
- Simplifies IT overheads, thereby delivering efficiencies and reduced costs.

For more information, see the [AVEVA Integration Studio](#) documentation.

---

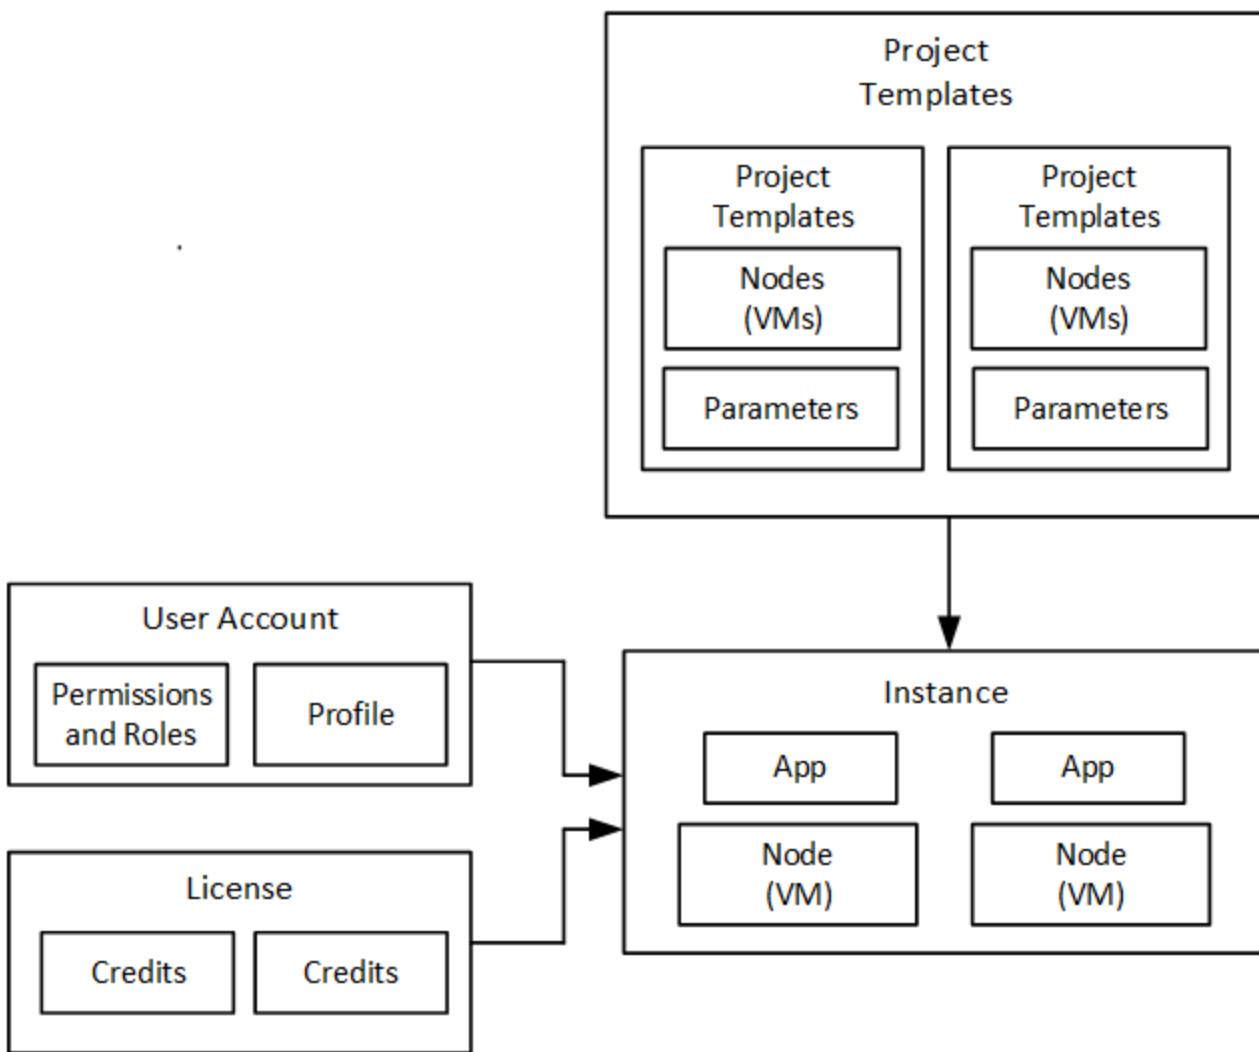

**Note:** Integration Studio is intended for use as a platform to develop and test software applications. It should not be used to operate a live production facility.

You can create collaborative simulation systems using the following components:

- **Project templates** include all of the settings needed to launch a simulation system. They define the different types of virtual machines required for a system as a set of "Nodes".
- **Instances** are the virtual machines generated from the Nodes defined in a project template. They form the simulation system accessed by your end users.
- **User accounts** give people access to AVEVA Integration Studio. Accounts are created and managed by administrators on your team.
- **Licenses and Credits** are applied to your AVEVA Integration Studio subscription. They control the number of nodes that can be created, however every node is equipped with a full unlimited license for the installed application. There is no need to apply or reconfigure licenses, and you do not need to use the AVEVA's License Manager.

---

**Note:** AVEVA Enterprise Licensing pages will still appear in Configurator on the virtual machines created by Integration Studio. You do not need to use these pages. See [Known Issues](#).

To manage AVEVA Integration Studio, you need a CONNECT account with administrative privileges and a paid subscription to Integration Studio. See [Access AVEVA Integration Studio](#).

**Note:** The following Plant SCADA features are currently not supported by Integration Studio:

- If you use the Setup Wizard to assign the role **HMI (Standalone, no networking)** to a virtual machine, it will not be able to acquire an HMI license and will run in demo mode.
- Dual network interface cards are not supported.

Installing and using Plant SCADA Access Anywhere is also not supported by Integration Studio.

## See Also

[Use Plant SCADA with AVEVA Integration Studio](#)

## Access AVEVA Integration Studio

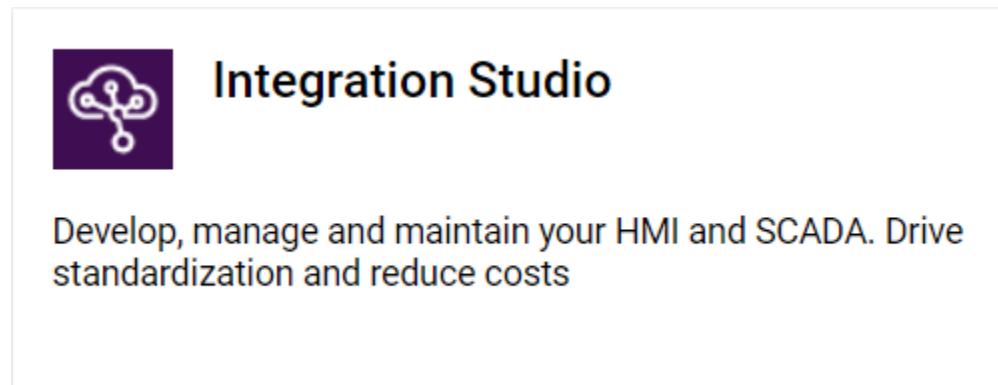

You can access AVEVA Integration Studio through CONNECT, AVEVA's common cloud platform. It is located online at <https://connect.aveva.com/>.

When you log in to CONNECT, you will see a set of folders that host the cloud services you can access (referred to

as "solutions"). This will be set up for you by the CONNECT administrator within your organization.

You will receive an email from AVEVA informing you that you have been invited to join CONNECT. You can use the link in this email to access the login page.

Your CONNECT account should provide administrator privileges and include a paid subscription to AVEVA Integration Studio. If this is the case, the following will appear when you select an appropriate host folder.

You can click on this tile to launch AVEVA Integration Studio.

**Note:** Popups need to be enabled in your browser to launch Integration Studio using this button.

## See Also

[Use Plant SCADA with AVEVA Integration Studio](#)

## Use Plant SCADA with AVEVA Integration Studio

AVEVA Integration Studio allows you to include Plant SCADA nodes in a project template. These nodes can be used to create multiple instances of virtual machines with a fully licensed version of Plant SCADA installed.

Two types of Plant SCADA nodes can be configured:

- Development Workstation
- Runtime Client.

A node based on a **Development Workstation** will install the following Plant SCADA components:

- AVEVA Common Components
- Configuration environment
- Runtime
- Deployment Server
- OPC UA Server
- Industrial Graphics Web Server
- Communications Drivers.

All installed Plant SCADA drivers are included, except for BACNET. If the BACNET driver is required, you can install it by modifying your Plant SCADA installation via the Programs and Features page in Control Panel. You can also download and install a BACNET driver pack from the Communication Drivers page at the [AVEVA™](#)

## Knowledge & Support Center.

A **Runtime Client** will only include the runtime components. You cannot run a server on this type of node.

The node types you require in a template will depend on the purpose of the simulation system you would like to create.

- **Example 1 - Virtual training room**

If you want to introduce Plant SCADA to a number of trainees, you could create a template with a single node based on a Development Workstation. This could be used to create an instance of a virtual machine for each trainee. This would provide access to Plant SCADA's development environment, and allow each trainee to build and run a project as a standalone system.

- **Example 2 - System test environment**

If you want to use a virtual simulation to test a project update for a distributed production environment, you can create a set of nodes that represent the computers included in the system you would like to test. This could include a development workstation, multiple runtime servers, a deployment server, a System Management Server and runtime display clients.

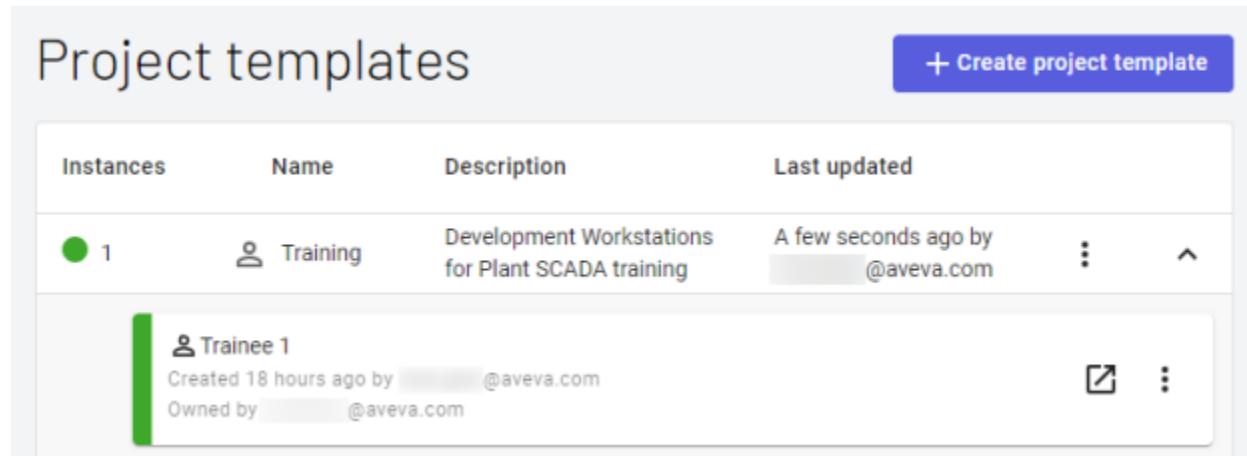

In this case, you would use the Development Workstation node type for the development machines, the deployment server, and any runtime servers. You would use the Runtime Client node type for pure runtime-only clients. You could then use these nodes to create a virtual simulation of a physical plant, providing a safe environment to deploy and test a Plant SCADA project.

---

**Note:** If you create a distributed simulation system that includes a set of redundant servers, they will not be able to operate as a redundant pair by default. If this is required, see [Configure Server Redundancy](#).

---

When you have completed the configuration of your template, you can create and launch instances from the [Project templates](#) page.

The screenshot shows a table titled "Project templates" with a "Create project template" button at the top right. The table has columns: Instances, Name, Description, and Last updated. There are two entries:

Instances	Name	Description	Last updated
1	Training	Development Workstations for Plant SCADA training	A few seconds ago by @aveva.com
	Trainee 1	Created 18 hours ago by @aveva.com Owned by @aveva.com	 

When you launch an instance, you have the option to use a **Browser** or **RDP**.

- Select **Browser** to launch the instance as a virtual machine running on a new tab in your browser.

Integration Studio will generate a unique user name and password for each virtual machine it creates. When you select the Browser option, you will be automatically logged in using this generated profile.

- Select **RDP** to view the credentials required to access the virtual machine via a remote desktop application.

## Credentials for Training

Username: [REDACTED]

Password: \*\*\*\*\* 

Before you connect to Training using RDP, make sure the firewall remote desktop protocol rules allow access from your IP address. [More information](#)

[Download RDP](#)

 OK

If you are using the Browser option and need to know your user name or password, you can go back to Integration Studio and select the RDP option to view your user credentials.

---

**Note:** An Integration Studio instance of one or more nodes is configured as a Windows workgroup. Individual instances are isolated within their own workgroups and can only communicate with nodes included within their workgroup.

---

An explanation of the steps required to create a project template is included in the Integration Studio documentation. Click on the help icon on the Integration Studio title bar to access this information.

For information that is specific to Plant SCADA node types, see [Add Plant SCADA Nodes to a Project Template](#).

---

**Note:** Virtual machines based on a Plant SCADA node will be secured by default. This has implications for the setup of both single node and distributed simulations. For example, a System Management Server is setup on each instance of a development workstation node with encryption enabled. See [Security Implications for Plant SCADA Simulations](#) for more information.

---

## See Also

[Known Issues](#)

## Add Plant SCADA Nodes to a Project Template

The process required to add nodes to a project template is described in the Integration Studio documentation. Click on the help icon on the Integration Studio title bar and search for the topic *Add a Project Template*.

The following is additional information that will help you add Plant SCADA Nodes to a template. It aligns with the steps you progress through when you create a new template.

- **Project template information**

In the **System Suite definition** field, select **2023**. This suite contains AVEVA products with 2023 branding that

are supported by Integration Studio.

- **Node Configuration**

When you add a node, select **2023-PlantSCADAR2** as the node type.

## Add a node

Node name  
Training workstation

2023-PlantSCADAR2

▼ 2023

SystemPlatform

SystemPlatformR2

PlantSCADAR2

Add

You also have the option to select a **Machine type**. This determines the level of performance supported by an instance.

## Add a node

Node name

2023-PlantSCADAR2

ⓘ Machine type  
HighPerformance - Standard\_DS3\_v2

Cancel Add

Be aware that the level of performance you select for a node will directly impact the cost of running an instance. The higher the performance, the more it will cost per hour to run.

**Note:** You should confirm which Machine Type is appropriate for a node with your CONNECT administrator.

- **Launch parameters**

Indicate if you want a node to create instances based on a **Development Workstation** or a **Runtime Client**.

See [Use Plant SCADA with AVEVA Integration Studio](#) for a description of each.

Be aware that a Development Workstation includes a Runtime Client. If you are setting up a Development Workstation there is no need to select both, though there is no implications if you do.

## See Also

[Security Implications for Plant SCADA Simulations](#)

## Security Implications for Plant SCADA Simulations

Virtual machines based on a Plant SCADA node are secured by default. This has the following implications:

- **Encryption Enabled**

Instances generated from a Development Workstation node will include a configured System Management Server (SMS) with encryption enabled. Connections to non-encrypted systems have been disabled by default.

For multi-node systems, you will need to decide which virtual machine will act as your SMS. All other development nodes will then need to be configured to point to your nominated SMS. To do this:

1. Open Configurator and go to the **System Management Server** page.
2. Select **No System Management Server connection**, then the **Configure** button.
3. When the changes have been confirmed, reconnect the virtual machine nominated as your System Management Server.

Select **Connect to an existing System Management Server** and enter the virtual machine name of the SMS.

---

**Note:** Integration Studio uses Windows workgroups. This means the limitations that apply to Plant SCADA when using workgroups will also apply here. For example, the Deployment Server must be on the same node as the SMS, and IPV6 is not supported.

- **Runtime clients in a multi-node system**

If your multi-node system includes a runtime client, the connection to the SMS will not be configured. Under these circumstances, you will need to:

1. Connect the client to your nominated SMS on a Development Workstation node.  
You will need to type in the name of the node, it will not appear in the browse list.
2. When prompted for credentials, you will need to specify the name and password of the user that connects to your nominated SMS. You can determine this by viewing the RDP connection dialog in Integration Studio.

To connect a runtime client to the Deployment Server, you will need to go through the Deployment Client page in Configurator.

When prompted for the username and password, use the credentials displayed on the RDP dialog of the node that hosts the Deployment Server. The required format of the username will be:

<node name>\<username>

If you only specify the username, the connection will not be successful.

- **Server Passwords**

The Server Authentication password is preconfigured with an automatically generated unique strong

password.

If you are running a multi-node system, you will need to set this to the same password on every node. To do this, go to the **Plant SCADA | Computer Setup** page in Configurator.

The **Deployment Server** is also preconfigured with an automatically generated unique strong password.

As an administrator, you can change the password without needing to know the generated password.

## Configure Server Redundancy

If you have used Integration Studio to create a distributed simulation system that includes a set of redundant alarm servers, they will not be able to operate as a redundant pair by default. Both will function as a primary server.

If you specifically need to enable alarm server redundancy in your simulation system, you need to perform the following steps on both virtual machines within a redundant pair.

1. Open the Command Prompt and use the **IPConfig** command to display the **Connection-specific DNS Suffix**.
2. Copy this value to the clipboard.
3. In **Control Panel**, open the **System** page.
4. Select **Change Settings** to display the System Properties dialog.
5. On the **Computer Name** tab, click the **Change** button.
6. On the **Computer Name/Domain Changes** dialog click the **More** button.  
The DNS Suffix and NetBIOS Computer Name dialog will appear.
7. In the field **Primary DNS suffix of this computer**, paste the address you copied to the clipboard.
8. Restart the virtual machine to implement these changes.

You will then need to reset the connection to the System Management Server. To do this:

1. Open Configurator.
2. Go to the **System Management Server** page.
3. Select **No System Management Server connection**, then the **Configure** button.
4. When the changes have been confirmed, reconnect the virtual machine to the System Management Server used by your simulation system.
  - If the System Management Server is on a different virtual machine, select **Connect to an existing System Management Server** and enter the required virtual machine name.
  - If the System Management is hosted locally on the same virtual machine, select **This machine is the System Management Server**.

You then need to repeat these steps for the second virtual computer in a redundant pair and reset its connection to the System Management Server.

## See Also

[Known Issues](#)

## Known Issues

### **Plant SCADA starts in demo mode following a reboot**

If you restart a virtual machine, Plant SCADA will go into demo mode the first time you launch runtime. This is because the AVEVA Plant SCADA Runtime Manager service does not pick up a license after a reboot. If you open Runtime Manager, you will see that the status of the System Services process is "Running (Demo)".

If you restart the System Services process, Plant SCADA will pick up a license correctly.

### **Uninstalling the Plant SCADA Project DBF AddIn**

Plant SCADA includes an add-in for Microsoft Excel called the **Plant SCADA Project DBF AddIn**. By default, this is installed by Integration Studio on a development workstation node.

If you modify the Plant SCADA installation on a virtual machine and remove the DBF AddIn, you cannot install it a second time. It is recommended that you do not attempt to remove the Plant SCADA Project DBF AddIn from a development workstation node.

### **Applying Monthly Updates**

Monthly updates to Plant SCADA are not automatically included in the version installed on a virtual machine by Integration Studio.

To apply an update to Plant SCADA, you will need to manually install it on each virtual machine. See [Manage Updates](#).

### **Server Redundancy**

If you create a distributed simulation system that includes a set of redundant servers, they will not be able to operate as a redundant pair by default.

If this is required, additional configuration is needed. See [Configure Server Redundancy](#).

### **AVEVA Enterprise Licensing pages in Configurator**

Licenses are managed through your AVEVA Integration Studio subscription. Every node is equipped with a local unlimited license which means you do not need to connect to a License Server or use AVEVA's License Manager.

Despite this, **AVEVA Enterprise Licensing** pages will still appear in **Configurator** on the virtual machines created by Integration Studio. This has the following impact on the functionality of these pages:

- The **Test Connection** button will not work.
- The **Secure** page will indicate that a secure connection to the License Server is not configured.

As there is no License Server, these issues will not impact your simulation system. You do not need to use these pages.

# Reference

This section includes the following reference information:

- [Cicode Reference](#)
- [Parameters](#)
- [VBA Programming Reference](#).

---

**Note:** For information regarding other methods you can use to extend Plant SCADA, see the topic [Extensibility](#).

---

## Cicode Reference

Cicode is a programming language designed for use in Plant SCADA to monitor and control plant equipment. It is a structured language similar to Visual Basic or 'C'. You need no previous programming experience to use it.

For more information see [About Cicode](#).

To access a full list of available Cicode functions, see [Cicode Function Categories](#).

## About Cicode

Cicode is a programming language designed for use with Plant SCADA. It is a structured language similar to Visual Basic or 'C'.

You can use Cicode to access real-time data (variables) in a Plant SCADA project and Plant SCADA facilities: variable tags, alarms, trends, reports, and so on. You can also interface to various components on a computer, such as the operating system and communication ports. Cicode also supports advanced features including pre-empted multitasking, multi threads, and remote procedure calls.

To access a full list of available Cicode functions, see [Cicode Function Categories](#).

Use the following sections as a quick start to using Cicode in your Plant SCADA projects:

- [Using Cicode Files](#) — Cicode can be stored in procedures called functions for multiple reuse and centralized maintenance.
- [Using Cicode Commands](#) — Cicode can be typed directly into command fields in online Plant SCADA forms.
- [Using Cicode Expressions](#) — Cicode expressions are used to display and log data for monitoring and analysis, and to trigger various elements in your system, such as alarms, events, reports, and data logging.
- [Using Cicode Functions](#) — A Cicode function is a small program, a collection of statements, variables, operators, conditional executors, and other functions. A Cicode function can perform complex tasks and give you access to Plant SCADA graphics pages, alarms, trend data, and so on.
- [Working with Commonly Used Functions](#) — Cicode has many pre-defined functions that perform a variety of tasks. The functions you will use most often are described in this topic.
- [Writing Functions](#) — Where system functionality cannot be achieved with built-in functions, you can write your own functions.

- [Cicode Editor](#) — The Cicode Editor is the code editing tool provided with Plant SCADA for writing, editing and debugging Cicode.

## See Also

[Performing Advanced Tasks](#)  
[Using Cicode Programming Standards](#)

## Using Cicode Files

Write your Cicode functions in Cicode source files, stored on your hard disk. Cicode files have a \*.CI extension.

To minimize potential future difficulties with maintaining your Cicode files, adopt a programming standard as early as possible (see [Using Cicode Programming Standards](#)). Maintain structured Cicode files, by logically grouping your Cicode functions within the files, and by choosing helpful descriptive names. For details about modular programming methods, see [Modular Programming](#).

For details about using and debugging Cicode functions, see [Formatting Functions](#) and [Debugging Cicode](#) respectively.

When you compile your Plant SCADA project, the compiler reads the functions in your Cicode source files. Your system can then use these functions in the same way as it uses built-in functions. You can use as many Cicode files as required. Cicode files reside in the same directory as your Plant SCADA project. When you back up your project, the Cicode source files in the project directory are also backed up.

## See Also

[Creating Cicode Files](#)  
[Opening Cicode Files](#)

## Restricted Cicode Keywords

The following keywords have specific function in the operation of Cicode and should not be used for function names, variable names, and so on. They are reserved for use as mathematical operators, condition executors, or as part of a function definition.

and	global	quality
bitand	if	real
bitor	int	return
bitxor	is	select
case	mod	string
cicode	module	then
CiVBA	nop	timestamp

do	not	to
else	object	var
end	or	while
for	private	
function	public	

If you use any of these words inappropriately in your Cicode, it will not be allowed by the compiler.

## Using Cicode Commands

Cicode commands extend the control element of a Plant SCADA control and monitoring system. You use commands to control your Plant SCADA system and therefore the processes in your plant.

Each command has a mechanism to activate it. Commands can be issued manually, through an operator typing a key sequence, or by clicking on a button (or object) on a graphics page. You can also configure commands to execute automatically:

- When an operator logs into or out of the runtime system
- When a graphics page is displayed or closed
- When an alarm is triggered
- In a report
- When an event is triggered

To define a Cicode command, you enter a statement (or group of statements) in the command field (Input category) for an object.

Each statement in a command usually performs a single task, such as setting a variable to a value, calculating a value, displaying a message on the screen, or running a report. For information on using variables, see the section titled [Using Variables](#).

If you want to evaluate a condition, like checking the state of your plant rather than perform an action or command upon your plant, use an expression instead. See the section titled [Using Cicode Expressions](#).

## See Also

[Setting Variables](#)

[Performing Calculations](#)

[Using Multiple Command Statements](#)

[Using Include \(Text\) Files](#)

[Getting Runtime Operator Input](#)

## Setting Variables

You can set a Variable in Plant SCADA within a Command field, an Expression field, or in a Cicode Function, by

using the mathematical 'equals' sign (=) assignment operator. The value on the right is assigned (set) to the variable on the left, as shown in the following Cicode example :

```
<VAR_TAG> = Val;
```

Where:

- <VAR\_TAG> is the name of the variable, and
- Val is the value being assigned to the variable.

## Examples

To set a digital variable (named BIT\_1) to ON (1), use the command:

```
BIT_1 = 1;
```

To set a digital variable (named BIT\_1) to OFF (0), use the command:

```
BIT_1 = 0;
```

To set a digital variable (named B1\_PUMP\_101\_M) to ON (1), use the command:

```
B1_PUMP_101_M = 1;
```

To set a digital variable (named B1\_PUMP\_101\_M) to OFF (0), use the command:

```
B1_PUMP_101_M = 0;
```

To set an analog variable (named B1\_TIC\_101\_SP) to a value of ten (10), use the command:

```
B1_TIC_101_SP = 10;
```

You can copy a variable to another by assigning (setting) the value of a variable to the value of another variable, for example:

```
B1_PUMP_101_COUNT = B1_PUMP_101_CLIMIT;
```

The value of B1\_PUMP\_101\_COUNT is set to the value of B1\_PUMP\_101\_CLIMIT only when that command is issued.

---

**Note:** The value of B1\_PUMP\_101\_CLIMIT could change immediately after, but B1\_PUMP\_101\_COUNT remains unchanged and storing the original value, until this command is issued again.

---

## See Also

[Using Cicode Commands](#)

## Performing Calculations

Mathematical calculations can be performed between variables in a Cicode statement. For example:

```
B1_TIC_101_SP = B1_TIC_101_PV + B1_TIC_102_PV - 100;
```

When this command is executed, the variable B1\_TIC\_101\_SP is set to a value that is the sum of variables B1\_TIC\_101\_PV and B1\_TIC\_102\_PV minus 100.

## See Also

[Using Cicode Commands](#)

## Using Multiple Command Statements

A single statement in a Cicode command usually performs a single task. When the Plant SCADA runtime system is in operation, the statement executes whenever the command is requested. For example, if the statement is linked to a keyboard command, the task is performed when an operator presses the keyboard key defined as that command.

To perform several tasks at the same time, you combine statements in a command property:

```
B1_PUMP_101_COUNT = B1_PUMP_101_CLIMIT;  
BATCH_NAME = "Bread";  
B1_TIC_101_SP = 10;
```

The example above uses three statements, separated by semi-colons ( ; ). The first statement sets the variable B1\_PUMP\_101\_COUNT to the value of the variable B1\_PUMP\_101\_CLIMIT; the second statement sets the variable BATCH\_NAME to the string "Bread"; and the third statement sets the variable B1\_TIC\_101\_SP to 10. Each statement is executed in order.

---

**Note:** You should separate each statement in a command with a semicolon (;). However, there are exceptions where this is not required. See [End of Line Markers](#).

The number of statements you can enter in a command property is limited only by the size of the field. However, for clarity, don't use too many statements; enter the statements into an Include File or write a Cicode Function. You then refer to the include file or call the function in the command property field.

## See Also

[Using Cicode Commands](#)

## Using Include (Text) Files

There is a maximum number of characters that you can type in a Command or Expression field (usually 128). If you need to include many commands (or expressions) in a property field, you can define a separate include file that contains the commands or expressions.

An include file is a separate and individual ASCII text file containing only one sequence of Plant SCADA commands or expressions that would otherwise be too long or complicated to type into the Command or Expression field within Plant SCADA. The include file name is entered instead, and the whole file is activated when called.

When you compile the project, the commands (or expressions) in the include file are substituted for the property field, just as if you had typed them directly into the field.

Use a text editor such as Notepad to create the text file.

Enter the name of the include file (either upper- or lower case) in the property, in the following format:

```
@<filename>
```

where *<filename>* is any valid DOS file name. Be aware that the bracket characters (< >) are part of the syntax.

You can use include files with many properties (except record names), but they are commonly used for commands and expressions, for example:

- Key sequence: F5 ENTER
- Command: @<setvars.cii>

In the above example, the `setvars.cii` include file would contain commands to be substituted for the Command property when you compile your project, for example:

```
PV12 = 10;  
PV22 = 20;  
PV13 = 15;  
PV23 = 59;  
PageDisplay("Mimic");
```

**Note:**

- Include files can not be used for genie properties.
- Do not confuse *include files* and *included projects*. Include files contain Plant SCADA commands and/or expressions and are used as substitutions in a Plant SCADA command or expression property field. Included projects are separate (usually smaller) Plant SCADA projects that can be included in another Plant SCADA project so that they appear together as one project.
- The include file name can contain a maximum of 64 characters, or 253 characters including a path, and can consist of any characters other than the semi-colon (;) or the single quote('). There is no need to include the `.cii` extension, but if the file is not in the project directory, you need to enter the full path to the file. If the file is not in the project directory, it will not be backed up with the Backup facility.
- If modifying an Include file with the Cicode Editor, when you save your changes a `.ci` file extension will be appended to the file name. Change this to a `.cii` file extension in Windows Explorer.

## See Also

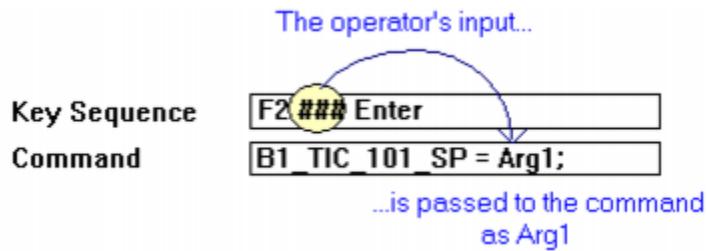

[Using Cicode Commands](#)

## Getting Runtime Operator Input

You can define a keyboard command as a key sequence, to perform a specific task each time the key sequence is pressed, for example:

- Key sequence: F2 ENTER
- Command: B1\_TIC\_101\_SP = 10;

A key sequence can include provision for the operator to enter data. In the following example, the operator can set the value of the variable B1\_TIC\_101\_SP:

The operator sends out the command by pressing the F2 key, up to three characters, and the Enter key. The three character sequence (identified by the three hash (#) characters) is called an *argument*. The argument is passed into the command (as Arg1) when the command is completed (when the operator presses the Enter key).

The operator might type:

The value 123 is passed to the command, and B1\_TIC\_101\_SP is set to 123.

It is recommended that you use a specific key (for example, Enter) to signal the end of a key sequence. If, for example, you use the key sequence F2 ####, the operator **needs to** enter 4 characters for the command to be executed - Plant SCADA waits for the fourth character. But if you use F2 #### Enter, the operator can enter between one and four characters as necessary. The command executes as soon as the Enter key is pressed.

To use more than one argument in a command, separate the arguments with commas ( , ):

- Key sequence: F2 ####,## Enter
- Command: B1\_TIC\_101\_SP = Arg1; B1\_TIC\_101\_PV = Arg2;

To set both variables, the operator can type:

The values 123 and 18 are passed to the command. B1\_TIC\_101\_SP is set to 123 and B1\_TIC\_101\_PV is set to 18.

[Using Cicode Commands](#)

## Using Cicode Expressions

Cicode expressions are the basic elements of the Cicode language. An expression can be a constant, the value of a variable tag, or the result of a complex equation. You can use expressions to display and log data for monitoring and analysis, and to trigger various elements in your system, such as alarms, events, reports, and data logging.

You can enter a Cicode expression in any Plant SCADA editor form or graphic object that contains an expression property. Unlike a command, an expression does not execute a specific task - it is evaluated. The evaluation process returns a value that you can use to display information on the screen (for example, as a bar graph) or to make decisions. The following expression returns a result of 12:

- Numeric expression: 8 + 4

In the above example, the value of the expression is a constant (12) because the elements of the expression are constants (8 and 4).

## Displaying Data Using Expressions

In the following example, the value of the expression is the value of the variable B1\_TIC\_101\_PV. As its value changes, the value of the expression also changes. You can use this expression to display a number on a graphics page.

- Numeric expression: B1\_TIC\_101\_PV

As the expression changes, the number also changes.

Expressions can also include mathematical calculations. For example, you can add two variables together and display the combined total:

- Numeric expression: B1\_TIC\_101\_PV + B1\_TIC\_102\_PV

In this case, the value of the expression is the combined total. As the value of one variable (or both variables) changes, the value of the expression changes.

## Decision-Making

Some expressions return only one of two logical values, either TRUE(1) or FALSE(0). You can use these expressions to make decisions, and to perform one of two actions, depending on whether the return value is TRUE or FALSE. For example, you can configure a text object with appearance as follows:

- On text when: B1\_PUMP\_102\_CMD
- ON text: Pump Running
- OFF text: "Pump Stopped"

In this example, if B1\_PUMP\_102\_CMD is a digital tag (variable), it can only exist in one of two states (0 or 1). When your system is running and the value of B1\_PUMP\_102\_CMD changes to 1, the expression returns TRUE and the message "Pump Running" is displayed. When the value changes to 0, the expression returns FALSE and the message "Pump Stopped" is displayed.

## Logging Expression Data

You can log the value of an expression to a file for trending, by defining it as a trend tag:

Trend Tag Name	B1_TIC
Expression	B1_TIC_101_PV + B1_TIC_102_PV
File Name	[log]:B1_TIC

When the system is running, the value of the expression B1\_TIC\_101\_PV + B1\_TIC\_102\_PV is logged to the file [log]:B1\_TIC.

## Triggering Events Using Expressions

Logical expressions - those that return either TRUE (1) or FALSE (0) -can be used as **triggers**.

For example, you might need to log the expression in the above example only when an associated pump is running.

Trend Tag Name	B1_TIC
Expression	B1_TIC_101_PV + B1_TIC_102_PV
File Name	[log]:B1_TIC
Trigger	B1_PUMP_101_CMD

In this example, the trigger is the expression B1\_PUMP\_101\_CMD (a digital variable tag). If the pump is ON, the result of the trigger is TRUE, and the value of the expression (B1\_TIC\_101\_PV + B1\_TIC\_102\_PV) is logged. If the pump is OFF, the result is FALSE, and logging ceases.

## Using Cicode Functions

A Cicode function can perform more complex tasks than a simple command or expression allows. Functions give you access to Plant SCADA graphics pages, alarms, trend data, and so on.

Plant SCADA has several hundred built-in functions that display pages, acknowledge alarms, make calculations, and so on. You can also write your own functions to meet your specific needs.

The following topics describe ways you can use Cicode functions.

- [Calling Functions from Commands and Expressions](#)
- [Triggering Functions via Runtime Operator Input](#)
- [Evaluating Functions](#)
- [Combining Functions with Other Statements](#)
- [Passing Data to Functions \(Arguments\)](#)
- [Using String Arguments](#)
- [String Assignment](#)
- [Using the Caret Escape Sequence Character](#)
- [Using Multiple Arguments](#)
- [Using Numeric Arguments](#)
- [Using Variable Arguments](#)
- [Using Operator Input in Functions](#)
- [Returning Data from Functions.](#)

To access a full list of available Cicode functions, see [Cicode Function Categories](#).

## Calling Functions from Commands and Expressions

You can call a function by entering its name in any command or expression property. The syntax is as follows:

Command	FunctionName ( Arg1, Arg2, ... );
---------	-----------------------------------

Where:

- *FunctionName* is the name of the function
- *Arg1, Arg2, ...* are the arguments you pass to the function

### Triggering Functions via Runtime Operator Input

In the following command, the PageNext() function displays the next graphics page when the Page Down keyboard key is pressed by the Runtime operator.

<b>Key Sequence</b>	Page_Down
<b>Command</b>	PageNext();

### Evaluating Functions

You can use a function in any expression. For example, the AlarmActive() function returns TRUE (1) if any alarms are active, and FALSE (0) if no alarms are active. In the following text object, either "Alarms Active" or "No Alarms Active" is displayed, depending on the return value of the expression.

<b>ON text when</b>	AlarmActive(0)
<b>ON Text</b>	"Alarms Active"
<b>OFF Text</b>	"No Alarms Active"

**Note:** Functions return a value that indicates the success of the function, or provides information on an error that has occurred. In many cases (for example, when used in a command) the return value can be ignored. You need to use the parentheses () in the function name, even if the function uses no arguments. Function names are not case-sensitive: PageNext(), pagenext() and PAGENEXT() call the same function.

### Combining Functions with Other Statements

In expressions and commands you can use functions alone or in combination with other functions, operators, and so on.

The following example uses three statements:

<b>Command</b>	Report("Shift"); B1_TIC_101_PV = 10; PageDisplay("Boiler 1")
----------------	---

Each statement is executed in order. The "Shift" report is started first, the variable B1\_TIC\_101\_PV is set to 10

next, and finally, the "Boiler 1" page is displayed.

Functions combine with operators and conditional executors to give you specific control over your processes, for example, you can test for abnormal operating conditions and act on them.
