6. Click **Configure**. A message is displayed when encryption setup is completed.

The following table indicates the encryption mode that will align successfully across server and client.

		Encryption mode on server		
		Unencrypted	Mixed Mode	Encrypted
Encryption mode on client	Unencrypted	Communication OK	Communication OK	Communication unsuccessful
	Mixed Mode	Communication OK	Communication OK	Communication OK
	Encrypted	Communication unsuccessful	Communication OK	Communication OK

**Note:** If you do not select **Enable Encryption** before you click **Configure**, the following message is displayed:  
"Encryption is currently disabled. It is recommended that you enable encryption."

[Runtime System Security](#)

[Connect a Computer to a System Management Server](#)

## Configure a Runtime Computer for Encryption

To prepare a computer for encryption, you need to confirm the following runtime environment settings.

These settings can be adjusted using the **Configurator's Computer Setup** page under Plant SCADA. You can launch Configurator at the completion of the installation procedure, or go to the Windows® **Start** menu and locate **AVEVA | Configurator**.

### Runtime Manager Configuration

This setting instructs Runtime Manager to run as a service. This is required under the following circumstances:

- You are running with encryption enabled. This includes running in mixed mode.
- You want to connect an OPC UA server to your system.
- You want to connect an Industrial Graphics Server to your system.

---

**Note:** If your Plant SCADA server processes are not running as a service, you will not be able to establish an encrypted connection between the server and your clients.

---

#### To run Runtime Manager as a service:

1. In the panel on the left side of the **Configurator**, select Plant SCADA | **Computer Setup**. The **Computer Setup** page appears. Navigate to the **Runtime Manager Configuration** section of the dialog.

##### Runtime Manager Configuration

*The Runtime Manager can be configured to run as a service or as a standard process. When run as a service, Runtime Manager allows projects to be deployed to the machine without having to change any other settings.*

Run Runtime Manager as a service

2. Select **Run Runtime Manager as a Service**.

---

**Note:** If you are using Deployment to run a project and do not select the **Run Runtime Manager as a Service** option, you will need to manually start the Plant SCADA Runtime Manager before deploying the project.

---

3. To apply your settings, click the **Configure** button.

---

**Note:** If you have configured a Plant SCADA OPC DA server on a computer that is running Plant SCADA as a Windows service, you will need to make the additional configuration changes. See the topic *Running an OPC DA Server as a Service* in the *Runtime* section of the Plant SCADA documentation.

---

[Troubleshooting Certificate Error Messages](#)

## Advanced Configuration for a System Management Server

The System Management Server page in Configurator includes an **Advanced** button that provides access to the Advanced Configuration dialog.

If you have already configured a **System Management Server**, you can use the tabs on this dialog to adjust the following settings.

### Certificates

By default, the System Management Server is configured to generate its own certificates for distribution to any connecting computers.

You can verify this setting on the Advanced Configuration dialog; the **Certificate Source** field will be set to "Automatically Generated".

However, you may need to enable encryption using certificates provided by a system administrator, a corporate IT department, or a certified third-party vendor. You can use this section of the Advanced Configuration dialog to achieve this. For more information, see [Use Externally Provided Certificates for Encryption](#).

---

**Note:** Automatically generated certificates are renewed automatically. An externally provided certificate will need to be renewed by the provider.

If you are on a computer that has **Connect to an existing System Management Server** selected, the **Certificates** tab will include a field labeled **System Management Server**. This field will display the name of the computer that hosts the active System Management Server. The **Port** field to the right is automatically populated with the port number that the System Management Server is configured to use.

If required, you can connect the local computer to a different System Management Server. From the drop-down list in the **System Management Server** field, select the computer you would like to use to generate and host your certificates.

---

**Note:** You should only specify a computer name or a fully-qualified domain name for a System Management Server. Specifying the name in a different format, for example an IP address, may not be successful.

### Ports

The **Ports** tab on the Advanced Configuration dialog shows the current setting for the following ports:

- **HTTP Port** (not used by Plant SCADA)
- **HTTPS Port**.

These represent the local ports that are used by web services and clients connecting to the computer you are currently using. In the case of Plant SCADA, only the **HTTPS Port** value is considered.

The default value used for an HTTPS Port it is 443. If you need to change the port that is currently being used (for example, you are seeing a "Port number conflict" error message), you can enter a new port number.

#### To enter a new port value:

1. In the **HTTPS Port** field, enter any port number that has not been blocked or is currently in use. HTTPS ports can range from 0 to 65535.
2. Click **OK** to save your settings. The Configurator's main screen will display.

3. Click **Configure** to apply your changes.

The Configuration Messages area displays the steps in the configuration process and the progress. If the configuration is unsuccessful, refer to the error messages in the System Management Console.

See [Troubleshooting Certificate Error Messages](#).

---

**Note:** The functionality described on the **Authentication** tab of the Advanced Configuration dialog is not supported by Plant SCADA.

---

## See Also

[Use SMS Certificates with Web Applications](#)

[Enable Encryption](#)

## Use SMS Certificates with Web Applications

Some of the features supported by Plant SCADA use web-based applications that host content in a web browser. These applications need to trust certificates that have been generated by the System Management Server (SMS).

---

**Note:** The information provided in this topic is intended for a scenario where SMS certificates are used on computers contained within your SCADA system network. If you want to deliver information across multiple domains or externally via the internet, we recommend you seek professional advice on setting up an external web server.

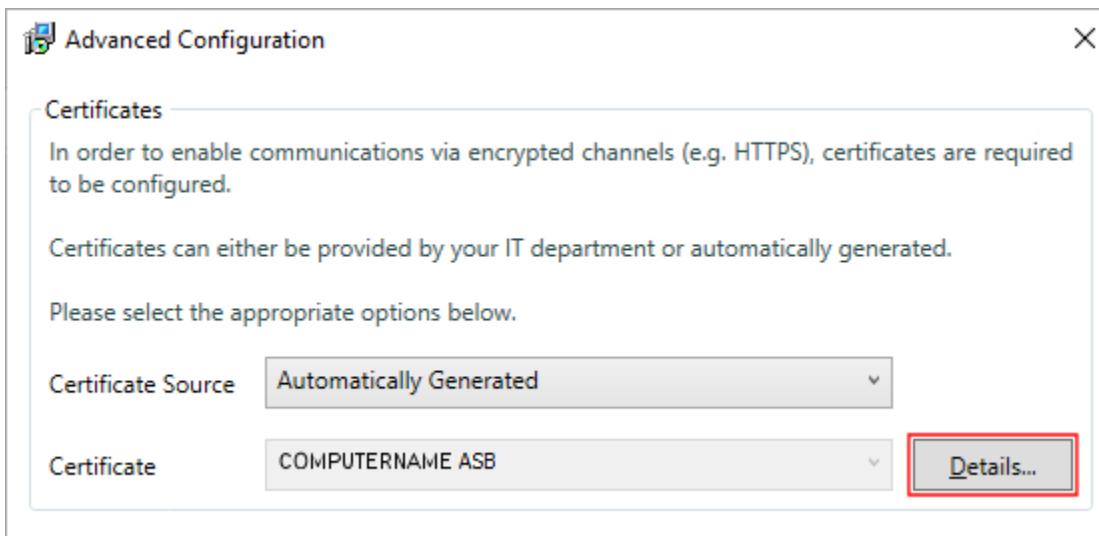

---

The following procedures are required to use SMS certificates with a web-based application.

### Export Certificates from the SMS

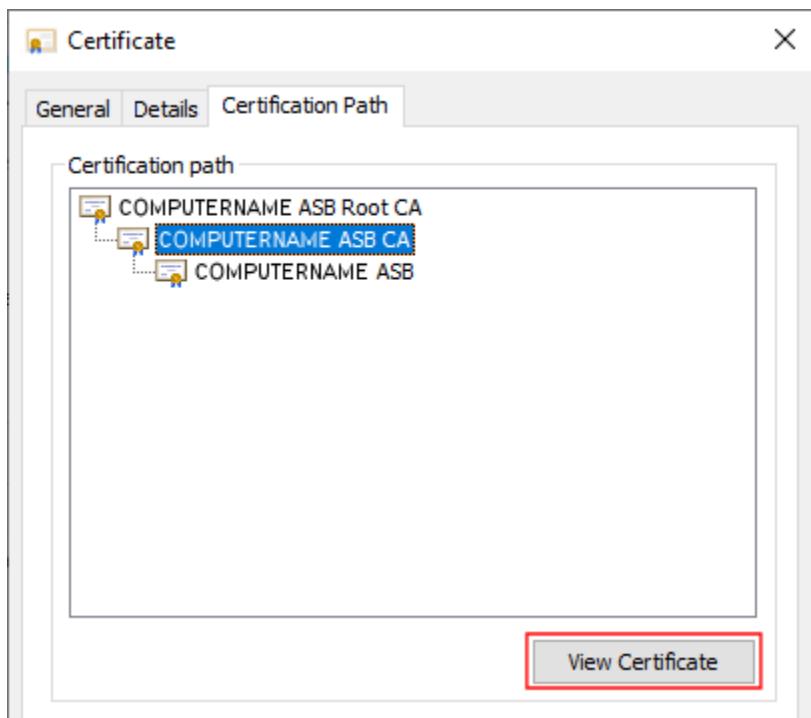

You initially need to export a copy of two certificates created by the SMS.

1. Open Configurator and display the **System Management Server** page.
2. Confirm that the SMS is set up and operational (if required, see [Configure a System Management Server](#)).
3. Click on the **Advanced** button. The Advanced Configuration dialog will appear.
4. Confirm that the required certificate is selected, then click on the **Details** button.

The Certificate dialog will appear.

5. Go to the **Certification Path** tab and select the entry "<computer name> ASB CA", then click the **View Certificate** button.

Another dialog will appear specifically for the "<computer name> ASB CA" certificate. This is the dialog you use to export the certificate to a file.

6. On the **Details** tab, click **Copy to File**. This will open the Certificate Export Wizard.
7. Use the following settings to export the certificate as a CER file.
  - On the **Export Private Key** page, select **No, do not export the private key**.
  - On the **Export File Format** page, select **DER encoded binary X 509 (.CER)**.
  - On the **File To Export** page, enter a path and file name (for example, "c:\temp\<machine name> ASB CA.cer").
8. When you reach the Finish page, review the settings and click **Finish** to export a copy of the certificate. You then need to repeat this process to export a copy of the "<computer name> ASB Root CA" certificate.
9. Go back to step 4 and select "<computer name> ASB Root CA" on the **Certification Path** tab.
10. Repeat steps 5—7.

### Import Certificates on a Client Computer

To complete this process, you need the two CER files exported from the ASB CA and the ASB Root CA certificates.

1. Copy the two CER files to an appropriate location on the client computer.
2. Right click on the CER file created from the ASB Root CA certificate and select **Install Certificate**. This will open the Certificate Import Wizard.
3. Use the following settings.
  - Under **Store Location**, select **Local Machine**.

- On the **Certificate Store** page, select **Trusted Root Certification Authorities Store**.
4. When you reach the last page, review the settings and click **Finish**.  
You then need to repeat this process for the CER file created from the ASB CA certificate.
  5. Right click on the ASB CA file and select **Install Certificate**.
  6. Use the following settings in the Certificate Import Wizard.
    - Under **Store Location**, select **Local Machine**.
    - On the **Certificate Store** page, select **Intermediate Certification Authorities Store**.
  7. When you reach the last page, review the settings and click **Finish**.

## See Also

[Enable Encryption](#)

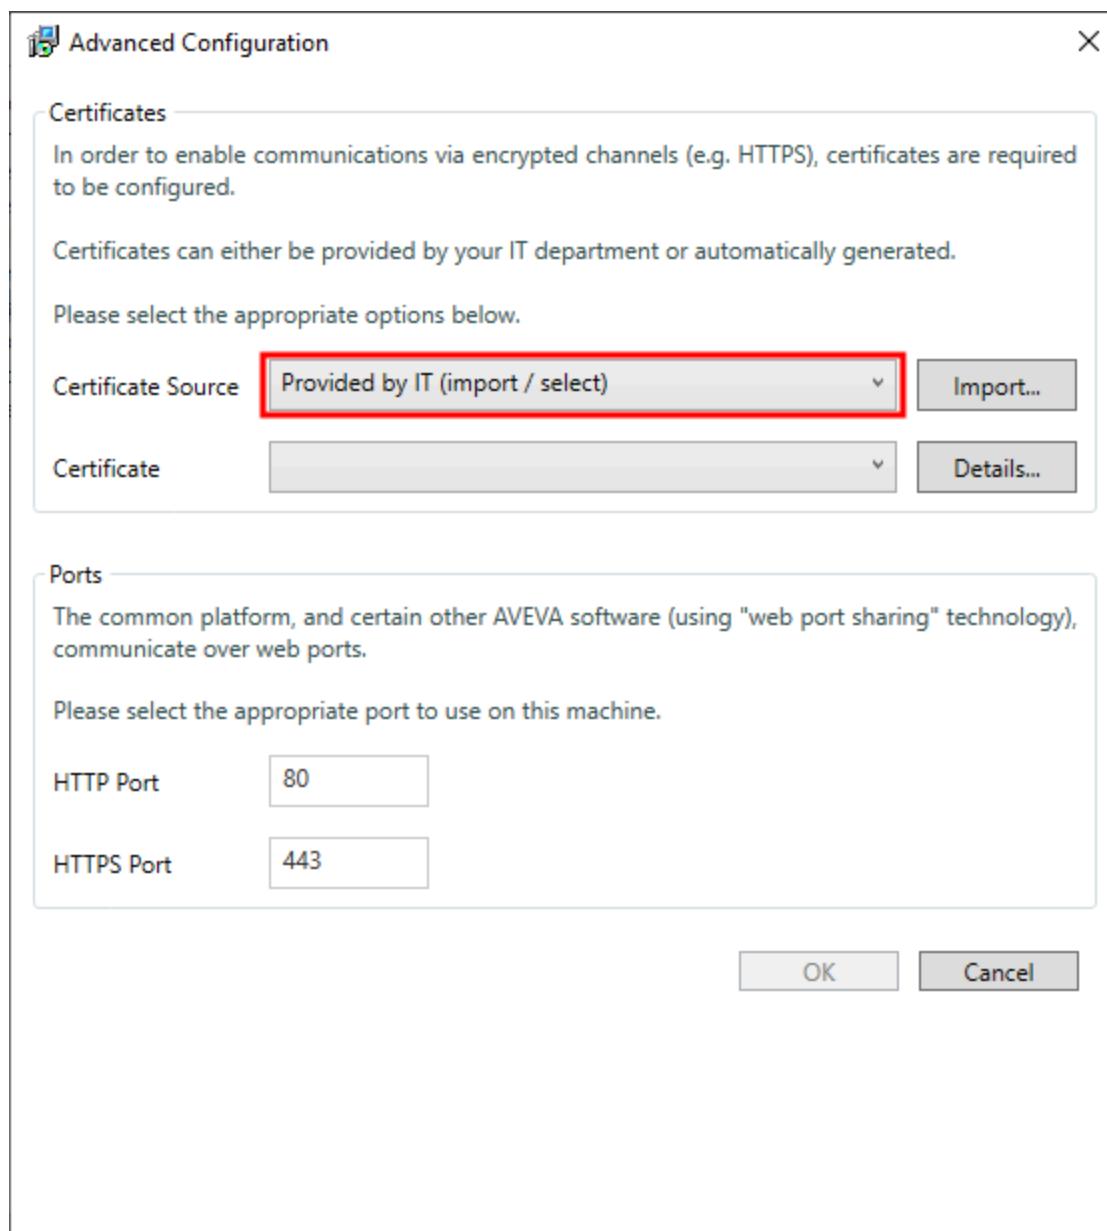

## Use Externally Provided Certificates for Encryption

By default, the System Management Server is configured to generate its own certificates for distribution to any connecting computers. However, you may need to enable encryption using certificates provided by a system administrator, a corporate IT department, or a certified third-party vendor.

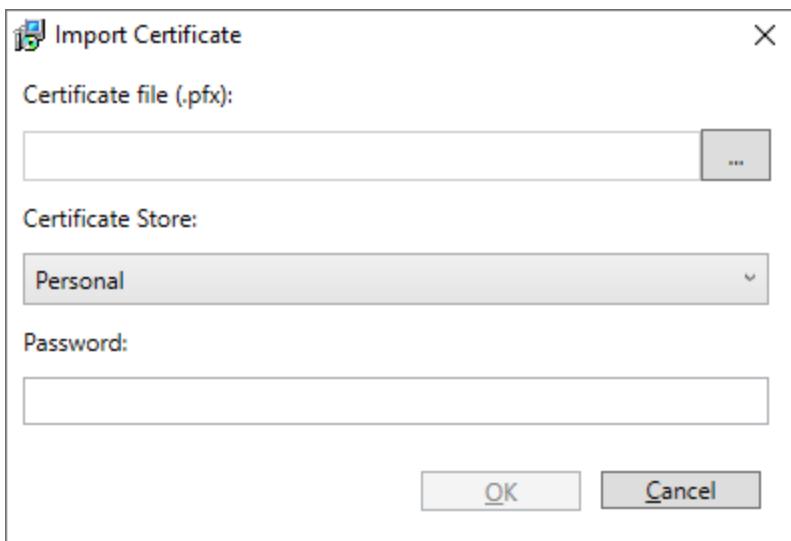

**Note:** If you are provided with a certificate file, it needs to be a .pfx file.

### To use externally provided certificates for encryption:

1. In Configurator, open the System Management Server page.
2. Click on the **Advanced** button. The Advanced Configuration dialog will appear.
3. In the **Certificate Source** field, select "Provided by IT (import / select)".

4. In the **Certificate** field, select the certificate you want to use from the drop-down list.  
To use a certificate that is not included in the list, click **Import**. The **Import Certificate** dialog is displayed.

To import a certificate:

- a. In the **Certificate file** field, browse to the location of the .pfx certificate file you want to import and select it.
- b. In the **Certificate Store** field, select the type of certificate to create; Root, Intermediate or Personal. The certificate will be stored in the Certificate Store associated with the selected type.
  - a. Root Certificate - Local Computer Trusted Root Certification Authorities store
  - b. Intermediate Certificate - Local Computer Intermediate Certification Authorities store
  - c. Personal Certificate - Local Computer Personal store.

If you have only been provided with one certificate, select "Personal". However, check with your certificate provider about where the certificate needs to reside.

Also see [Personal Certificates Requirements](#).

If you have been provided with three certificates (a Root, Intermediate and Personal certificate), repeat this process three times to import each one and place them in the appropriate certificate store.

- In the **Password** field, type the password for the selected **Certificate Store**.
- Click **OK** to save your settings and close the **Import Certificate** dialog.

---

**Note:** The certificate provider will need to renew the certificates they generate as required.

5. To view the information about the selected certificate, click **Details**.
6. Click **OK** to save your settings. The Configurator's main screen will display.
7. Click **Configure** to apply your changes.

The Configuration Messages area displays the steps in the configuration process and the progress. On successful configuration, the Certificate is generated on the selected **System Management Server** and its name is displayed in the Certificate field on the Advanced Configuration dialog.

If the configuration is unsuccessful, refer to the error messages in the System Management Console.

8. Click **Close** to exit the **Configurator**.

### Setting permissions on the binding certificate

To complete the setup of an IT-managed certificate, the "ArchestrAWebHosting" user group needs read access to the certificate's private key.

1. Open the certificates manager (certmgr) in Microsoft Management Console.
2. In the tree view, select **Personal**, then **Certificates**.
3. Locate your IT-managed certificate.
4. Right-click and select **All Tasks**, then **Manage Private Keys**.
5. On the **Security** tab, use the **Add** button to allow read access to the "ArchestraWebHosting" group.

## See Also

[Use Externally Provided Certificates with Web Applications](#)

[Troubleshooting Certificate Error Messages](#)

## Use Externally Provided Certificates with Web Applications

Some of the features supported by Plant SCADA use web-based applications to host content in a web browser. The following procedure is required to enable encryption for a web-based application when the certificates have been provided by a system administrator, an IT department, or a certified third-party vendor.

This procedure also assumes that Plant SCADA's Configurator is not available. If it is, you should follow the procedure described in [Use SMS Certificates with Web Applications](#).

---

**Note:** The information provided in this topic is intended for a scenario where externally-managed certificates are used on computers contained within your SCADA system network. If you want to deliver information across multiple domains or externally via the internet, we recommend you seek professional advice on setting up an external web server.

### To import externally provided certificates on a client computer

To complete this process, you need to be provided an Intermediate Certificate and a Root Certificate.

1. Copy the two CER files to an appropriate location on the client computer.
2. Right click on the Root Certificate, and select **Install Certificate**. This will open the Certificate Import Wizard.
3. Use the following settings.
  - Under **Store Location**, select **Local Machine**.
  - On the **Certificate Store** page, select **Trusted Root Certification Authorities Store**.
4. When you reach the last page, review the settings and click **Finish**.
5. You then need to repeat this process for the Intermediate Certificate.
6. Right click on the file and select **Install Certificate**.
7. Use the following settings in the Certificate Import Wizard.
  - Under **Store Location**, select **Local Machine**.
  - On the **Certificate Store** page, select **Intermediate Certification Authorities Store**.
8. When you reach the last page, review the settings and click **Finish**.

## See Also

[Use Externally Provided Certificates for Encryption](#)

## Personal Certificates Requirements

If you are using certificates from a system administrator, an IT department, or a certified third-party vendor to enable encryption, the personal certificate provided to you needs to meet the following requirements.

Field	Value	Comment
Key Usage	Digital Signature, Key Encipherment, Data Encipherment (b0)	Required.
Enhanced Key Usage	Server Authentication (1.3.6.1.5.5.7.3.1)	Required.
Subject Alternative Name	DNS Name=localhost	Optional. Only required when your client accesses your web applications via localhost.
	DNS Name=[machine name]	Required. Used by your client to access web applications via the machine name. For example: <code>DNS Name=mymachineName</code>
	DNS Name=[fully qualified domain name]	Required if you are using AVEVA Industrial Graphics. The framework uses the FQDN as the endpoint identity to authenticate the web service. This item needs to be the last entry in the SAN list due to a known Microsoft .Net Framework issue. For example: <code>DNS Name=mymachine.mydomain.com</code>
Friendly name	A friendly display name	Required. Configurator displays the friendly name in the certificate drop-down list.

## See Also

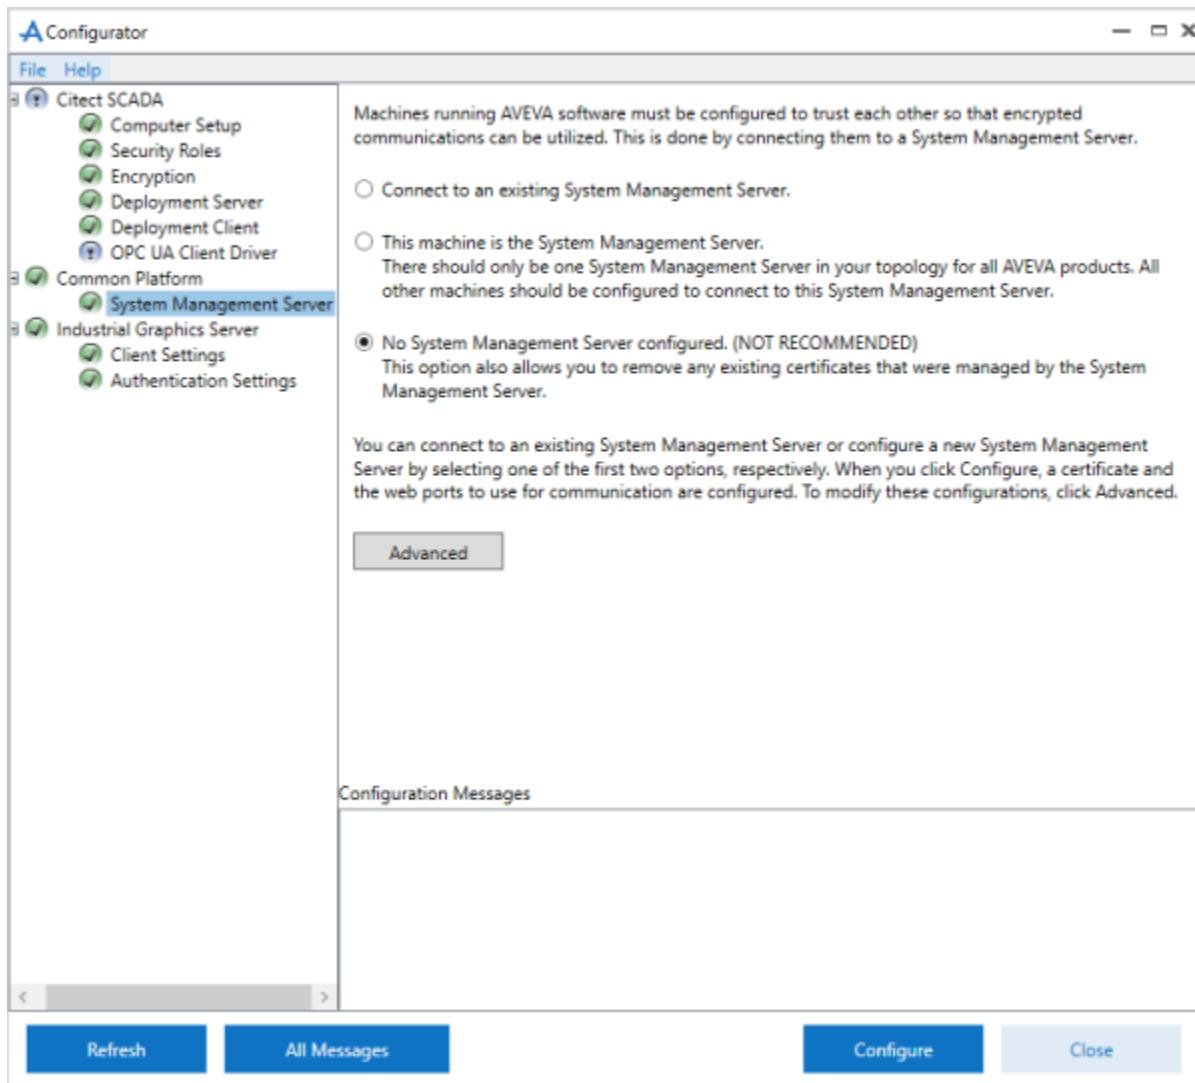

[Use Externally Provided Certificates for Encryption](#)

## Running Products without a System Management Server

**Note:** Running AVEVA products without a **System Management Server** is not recommended.

### To run your products without a System Management Server:

1. Start the **Configurator**.
2. In the left pane, click **Common Platform | System Management Server**.
3. Select **No System Management Server configured**. Selecting this option will result in the application managing trust relationships.

## Troubleshooting Certificate Error Messages

This topic lists some common error messages you might encounter when using encrypted communications.

## Use of IP address instead of machine name

Encrypted communications cannot be configured if you specify an IP address on the CtAPI client for the Plant SCADA machine you want to connect to. Connection will not be established in this case. Specify the machine name, which needs to match the machine name on the certificate. Other reasons for connection errors could be failure to resolve the machine name. You will see the message "Failed to secure connection and unsecured connection is not permitted" in the trace log.

## Unable to establish connection between server and client

The following combination of modes of encryption can be used for a secure connection.

Server	Display Client/CtAPI Client	Communications Occur?	Encrypted Communications?
No Encryption	No Encryption	Yes	No
No Encryption	Mixed	Yes	No
No Encryption	Encryption Enabled	No	No
Mixed	No Encryption	Yes	No
Mixed	Mixed	Yes	Yes
Mixed	Encryption Enabled	Yes	Yes
Encryption Enabled	No Encryption	No	No
Encryption Enabled	Mixed	Yes	Yes
Encryption Enabled	Encryption Enabled	Yes	Yes

**Note:** It is recommended that you enable encryption on both the server and the client.

---

If either machine is not in the mode combination for encrypted communications, you will see the message "**No connection could be made because the target machine actively refused it**" in the trace log.

---

**Note:** For CtAPI clients, you need to restart the CtAPI server if you change the encryption mode from encrypted to mixed in the Configurator.

## Runtime Manager not running as a service

If the **Run Runtime Manager as a service** option is not selected on the Configurator's **Computer Setup** page, you may encounter certificate errors. The syslog will display messages that indicate that the certificate is invalid, while the tracelog displays the message "**Certificate Private key is not accessible**". This will also be displayed on the hardware alarm page with the description "**Cert private key is unreadable**".

You need to configure Runtime Manager to run as a service if you are running any server processes, or if you are running a display client that has been configured to accept CtAPI connections (that is, the [CtAPI]Remote parameter is set to 1).

---

**Note:** The syslog and tracelog also display messages relating to expired certificates.

## Thumbprint errors

If the thumbprint is incorrect, you will see a hardware alarm with the description "**Certificate not found**". Details of this can be viewed in the syslog as well as the tracelog. The syslog will display "**Server thumbprint invalid**", while the tracelog will display "**Certificate not found. Failed to find certificate for thumbprint**".

## Remote client does not connect and generates "TLS Exchange Failed" hardware alarm

A remote client will use a DNS name to validate the certificate it receives from a server in a TLS exchange. The client will attempt to validate the name specified as the "Subject Alternative Name" in the certificate that it receives.

You can find the Subject Alternative Name by going to Configurator on the server and displaying the System Management Server page. To open the certificate properties, click on the **Advanced** button and select **Details**. On the Details tab, scroll down and find the "Subject Alternative Name" property. This will have three entries:

DNS Name=localhost

DNS Name=<computer name>

DNS Name=<FQDN>

As part of the TLS exchange, the computer name in the certificate is validated against the project. If the DNS name field is configured for the computer the server process is running on, the client will resolve the Subject Alternative Name against that field. If this is blank, the address field of the network address is used instead.

You should only use "localhost" when running a standalone server with no remote clients.

If the address from the network address on the server is a computer name, then the easiest way to configure this is to leave the DNS name blank. You will only need to set this to the actual computer name of the server if the network address is an IP Address.

If required, you can use the Plant SCADA Kernel to diagnose runtime connections using Page Table commands. See Page Table Platform.Sessions and Page Table Tran.

## Encrypt Plant SCADA Folders using SMB3

You can use the SMB3 network protocol to protect your Plant SCADA data from eavesdropping occurrences on untrusted networks. This can be achieved by enabling SMB encryption on the Microsoft™ Windows Server that hosts your Plant SCADA data. Encryption can be enabled on Windows Server on a per-share basis, or for the entire file server.

If you are using any features that require you to specify a directory path, you should consider using SMB3. This could include the use of the following parameters:

- [Path Parameters](#)
- [\[CtEdit\]Copy](#)

To use SMB3 encryption with Plant SCADA you need to follow procedures in both Windows Server (2016 or 2019), and Plant SCADA.

## Enable File Server on Microsoft Windows Server

File Server is used to manage shared folders on a Windows Server. You can access it via the **Add Roles and**

### Features Wizard.

Confirm that **File Server** is selected on the **Select server roles** page of the Wizard, then work your way through the wizard to install the required components.

Refer to the Windows Server documentation provided by Microsoft for more information.

## Enable SMB Encryption

You can enable SMB encryption for the entire files server, or only for specific file shares.

### To enable encryption for the entire file server:

You can create a procedure in Windows PowerShell. For example, you could use:

```
Set-SmbServerConfiguration -EncryptData $true
```

You could also confirm the status of the server with the following:

```
Get-SmbServerConfiguration | Select EncryptData
```

---

**Note:** You should confirm the correct usage for PowerShell procedures in the documentation provided by Microsoft.

### To enable encryption for a specific file share:

You can configure file shares in Windows Server using **Server Manager**. Locate **File and Storage Services** in Server Manager to access the **Shares** page.

The Shares page provides access to a **New Share Wizard**. This can be used to configure the following:

- A **Share Profile** for the file share (for example, "SMB Share - Quick").
- The **Share Location** (for example, "C:\ProgramData\AVEVA\Plant SCADA <VersionNumber>\User").
- A **Share Name** (for example, "Plant SCADA Users").
- **Share Settings** including a required option to **Encrypt Data Access**.
- **Permissions** that allow access to the shared files.

When the share is successfully created, it will appear on the Shares page in Server Manager. From here, you can access the properties for the share and make any required adjustments.

You should confirm the correct procedures for configuring shares in the documentation provided by Microsoft.

---

**Note:** You can also use PowerShell to add a new file share and enable SMB encryption. For example, you could use

```
"New-SmbShare -Name User -Path C:\ProgramData\AVEVA -EncryptData $true".
```

## Connect Plant SCADA to a File Share

When you have finished configuring a file share in Windows Server you can access it across an encrypted connection from Plant SCADA.

---

**Note:** The file share you use needs to be high-performance and resilient as any delays (such as network latency) will affect the performance of Plant SCADA's configuration and runtime tools.

For example, you can add a new project link in Plant SCADA Studio that connects to the file share (see [Link to an Existing Project](#)). You can then run the Plant SCADA project directly from the shared folder.

---

**Note:** You need to confirm that you are using the correct version of SMB (SMB3) on the server and client

---

machines. A PowerShell cmdlet is available that can tell you which version of SMB a client has negotiated with the File Server. You can access a remote file server (or create a new mapping to it) and use "Get-SmbConnection" to determine the SMB version that is currently being used. Refer to the PowerShell documentation provided by Microsoft for more information.

---

## Security Roles

To restrict access to Plant SCADA's sensitive components, only users with relevant permissions can perform certain security-related operations. To help manage these permissions, Plant SCADA uses a set of security roles. Each role provides a different level of access to features, applications and project resources.

The following security roles are used on all Plant SCADA computers.

Security Role	Description
Configuration Users	<p>Members of this role can run configuration tools (such as Plant SCADA Studio or Computer Setup Wizard) and start the runtime display client and server processes.</p> <p><b>Note:</b> It is recommended that members of this role only start runtime for development purposes and not in a production system environment.</p>
Runtime Users	<p>Members of this role can run the runtime display client and make local CtAPI connections.</p> <p><b>Note:</b> Any Windows® user account that has to start runtime needs to be assigned to this role. See <a href="#">Add the Required Users to the Runtime Users Role</a>.</p>
Server Users	<p>Members of this role can run Plant SCADA as a server process.</p> <p>If you are not running Plant SCADA as a service, add a member to this role who needs to run a Plant SCADA server (including a display client with [CtAPI]Remote enabled).</p>

**Note:** Plant SCADA computers use a server password to authenticate each other. This creates a trusted network between servers and, optionally, clients. This password is specified for a computer via [Configurator](#) or the Computer Setup Wizard. To set the server password for a computer, you need to be a member of the **Configuration Users** security role. To read the server password you need to be a member of either the **Configuration Users** or the **Server Users** security role. You can be a member of these roles either directly or via an associated domain group.

---

If you have installed deployment server components on a computer, additional three Security Roles will exist.

Security Role	Description
Deployment Administrators	Members of this role can add or remove client computers to/from deployment server. They can also perform upload and deploy operations.
Deployment Users	Members of this role can deploy a new project to a connected deployment client computer.
Deployment Uploaders	Members of this role can upload a new project version to the deployment server.

If you have installed Industrial Graphics Server on a computer, two additional Security Roles will exist.

Security Role	Description
Industrial Graphics Users	<p>Members of this role can connect and authenticate with the Industrial Graphics Server.</p> <p>For more information, see the topic <i>Configure User Access for an Industrial Graphics Web Client</i> in the Plant SCADA documentation.</p> <p><b>Note:</b> You should avoid adding individual users to this security role. To allow authorization in a distributed system, only add domain groups to an Industrial Graphics security role.</p>
Industrial Graphics R/W Users	<p>Members of this role can connect and authenticate with the Industrial Graphics Server. They will also be able to write to variable tags in a Plant SCADA system, provided the tags have been configured to support writes via the <b>Write Roles</b> property.</p> <p>For more information, see the topic <i>Enable Tag Writes for Industrial Graphics Applications</i> in the Plant SCADA documentation.</p> <p><b>Note:</b> You should avoid adding individual users to this security role. To allow authorization in a distributed system, only add domain groups to an Industrial Graphics security role.</p>

During installation, by default the local Windows user groups are associated with these security roles as members (see the information on *Windows User Groups and Security Roles* in the topic [Installation Information](#)).

You can view the current associated members with the security roles via the **Security Roles** page under Plant SCADA in **Configurator**. When you select a role, the existing members associated with the role will be listed in the **Members of...** section.

The following security roles define which Windows users can access specific features, software applications and project resources.

Security Role	Members
Configuration Users	SCADAPC01\SCADA.ConfigUsers
Runtime Users	SCADAPC01\SCADA.RuntimeUsers
Server Users	SCADAPC01\SCADA.ServerUsers, NT SERVICE\...
Deployment Administrators	SCADAPC01\SCADA.DeploymentAdmins
Deployment Uploaders	SCADAPC01\SCADA.DeploymentUploaders
Deployment Users	SCADAPC01\SCADA.DeploymentUsers

**Members of 'Configuration Users'**

Users who can start the configuration tools and set the server password

SCADAPC01\SCADA.ConfigUsers

Add Remove

Configuration Messages

Refresh All Messages Configure Close

It is recommended that you replace the local Windows groups associated with these security roles with your own domain groups. If required, you can also assign additional user accounts or groups to a role (see [Modifying the Members of a Security Role](#)).

## See Also

[Modifying the Members of a Security Role](#)

## Modifying the Members of a Security Role

The **Security Roles** page under Plant SCADA in **Configurator** lists the available Plant SCADA Roles, depending on the components you have selected during Plant SCADA installation.

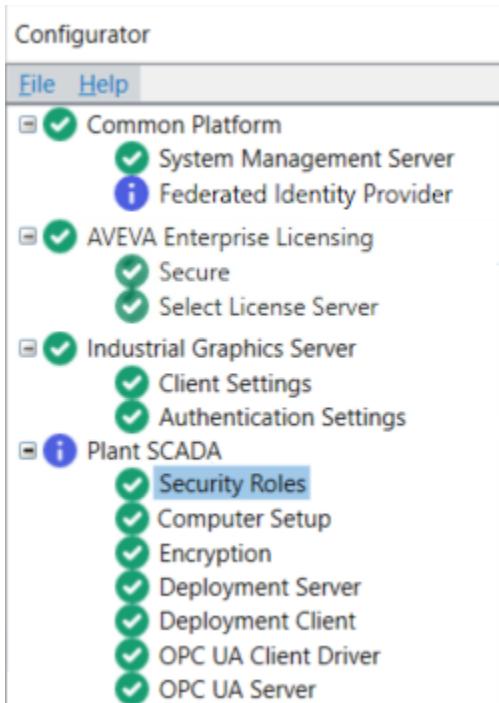

By default, the Windows® User Groups created by the Plant SCADA installer are associated with these roles (see

the information on *Windows User Groups and Security Roles* in the topic [Installation Information](#)).

If required, you can change the members that are associated with each security role. You can also delete the default groups and replace them with your own.

#### Add local or domain groups to a security role:

1. Open the **Configurator**.
2. From left side panel, select Plant SCADA | **Security Roles**.

3. Select a security role displayed in the table. The existing members associated with the role will be listed in the **Members of...** section.

The following security roles define which Windows users can access specific features, software applications and project resources.

Security Role	Members
Configuration Users	SCADAPC01\SCADA.ConfigUsers
Runtime Users	SCADAPC01\SCADA.RuntimeUsers
Server Users	SCADAPC01\SCADA.ServerUsers, NT SERVICE\...
Deployment Administrators	SCADAPC01\SCADA.DeploymentAdmins
Deployment Uploaders	SCADAPC01\SCADA.DeploymentUploaders
Deployment Users	SCADAPC01\SCADA.DeploymentUsers

[Reset All](#)

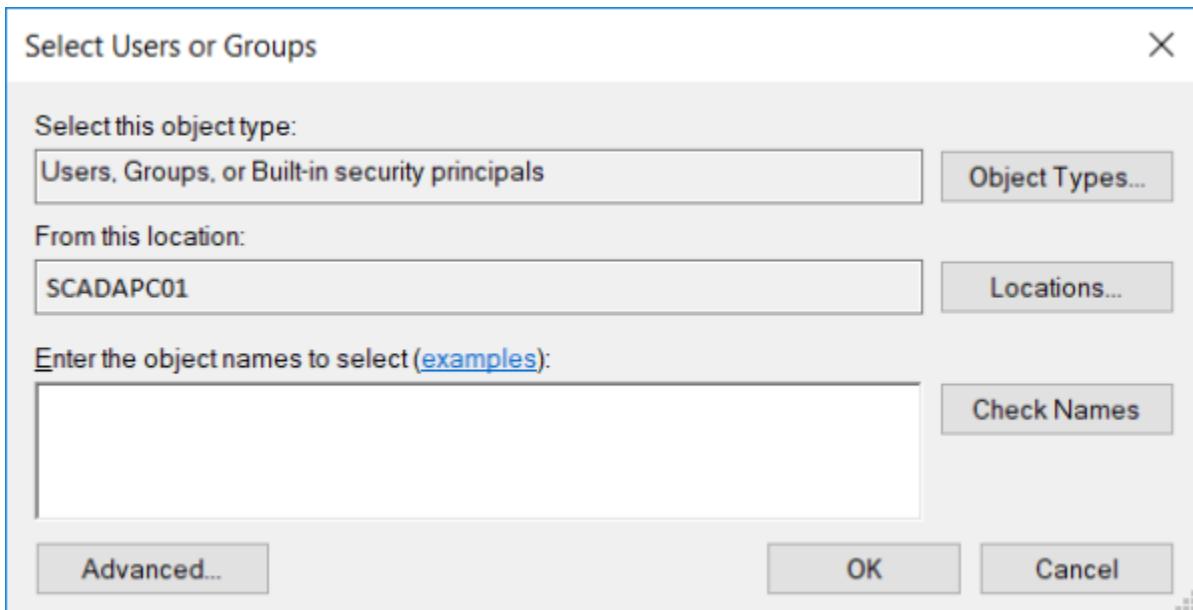

#### Members of 'Configuration Users'

Users who can start the configuration tools and set the server password

SCADAPC01\SCADA.ConfigUsers
-----------------------------

[Add](#)   [Remove](#)

- To add more members to the security role, click **Add**. The **Select Users or Groups** dialog box opens.
- Under **Enter the object names to select** type the name of local or domain group, that you want to assign to the role, and then click **OK**.

You can use the **Check Names** button to verify if the entered names are valid.

**Note:** You can add a maximum of 10 members to a security role. To manage the memberships through normal

---

Windows group management practices, it is recommended that you add a minimal number of members per security role. It is ideal to have one domain group per role.

---

### Remove local or domain groups from a security role:

1. From left side panel of the **Configurator**, select Plant SCADA | **Security Roles**.
2. Select a security role from the table. The existing members associated with that role will be listed in the **Members of...** section.
3. Select the member that you want to remove from the role.
4. Click **Remove**.

The **Plant SCADA Runtime Manager** service account is not removable from the **Server Users** role.

---

**Note:** When removing members from the security roles, make sure that each role has at least one member before you apply the changes.

---

### Applying the Changes in Security Roles:

After modifying the members of a security role, stop all the other Plant SCADA processes and services, then click **Configure** to apply the changes. This will update the security on Plant SCADA's folders and registry keys to match the new members of each role.

---

**Note:** If the Configurator displays the error message "security roles could not be updated as one or more processes are running", you can double-click on it to see all the applications that need to be manually closed and started, as well as any services that need to be restarted.

---

### Resetting the Members of Security Roles:

To reset all security roles to their default members, click **Reset All** from the **Security Roles** page. Stop all the other Plant SCADA processes and services, then click **Configure** to apply the changes. Any default user groups that no longer exist will be recreated.

### Discarding the Changes in Security Roles:

If you have not applied the changes after any modification and want to undo them, click **Close** and **Exit** Configurator.

## See Also

[Security Roles](#)

[Add the Required Users to the Runtime Users Role](#)

## Add the Required Users to the Runtime Users Role

The Runtime Users role is used to control access to Plant SCADA's runtime. Any Windows® user account that has to start runtime needs to be directly added to this role, or one of the User Groups associated with the role (see [Security Roles](#)).

If you have configured Plant SCADA to use any of the following features, you will need to ensure that the relevant user is added to the Runtime Users role so that runtime can be launched.

- If Runtime Manager is running as a service and you are not using the default service account "NT SERVICE\ Citect Runtime Manager".

- If you are using a local CTAPI application that is not being run by the currently logged in user (for example, the CTAPI application is running as a Windows service under a different user account).

To determine which users you need add into this role, check the following:

- If Runtime Manager is running as a service, check the properties of the "Plant SCADA Runtime Manager" service. If this is not running under the "NT SERVICE\Citect Runtime Manager" account, then the user this service is running under will need to be added to the Runtime Users role.
- If you are running a CTAPI application as a different user to the currently logged in user, then the user account this applications runs under needs to be added to the Runtime Users role.

## See Also

[Modifying the Members of a Security Role](#)

## Directory Security

The user and data directories that are installed by Plant SCADA (by default, under "%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>") are protected by Windows® access control lists (ACLs) to avoid unauthorized access.

During installation, access permissions for these directories will be granted (with certain operational restrictions) to the members of the following Plant SCADA Security Roles.

Directory	Security Role	Permission
Config	Configuration Users, Runtime Users and Server Users	Read/Write Access
Data	Configuration Users, Runtime Users and Server Users	Read/Write Access
Logs	Configuration Users, Runtime Users and Server Users	Read/Write Access
User	Configuration Users, Runtime Users and Server Users	Read/Write Access
Starter	Configuration Users	Read Access
Deployment\Client	Configuration Users, Runtime Users and Server Users	Read/Write Access

In addition to the above table, the required permissions will be granted to the service accounts for Plant SCADA's services. Full Control permission will also be granted to the local Administrators group and the System account.

**Note:** You can specify a different location for these directories following installation using Citect.ini parameters. If you do this, you need to manually configure the access control lists for the new folder locations so that they match the permissions that were applied to the original directories during installation. See [Configure Directory Security for Modified Folder Locations](#) in the installed Plant SCADA documentation.

[Security Roles](#)

### Configure Directory Security for Modified Folder Locations

During a default installation, Plant SCADA's user and data directories are installed here:

"%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>"

The folders have Windows® access control lists (ACLs) applied to them to avoid unauthorized access and to enable the operation of required services.

However, path substitutions and the following INI parameters can be used to specify a different location for these directories following installation.

- [CtEdit]Config - specifies where configuration files are located.
- [CtEdit]Data - specifies where data files are located.
- [CtEdit]Logs - specifies where the log files are located.
- [CtEdit]Starter - specifies where the starter projects are located.
- [CtEdit]User - specifies where databases are located.

If you have used a path substitution or adjusted the default value for one of these parameters in a Citect.ini file or a profile, you need to manually configure the access control list for the new folder location. This is required to match the permissions that are applied to these folders during installation.

#### To configure the access control list for a new system folder location:

1. In Windows Explorer, browse to the location where the system folder was originally installed.  
For example, the default location for the Config folder is:  
%PROGRAMDATA%\AVEVAPlant SCADA2023\Config
2. Open the properties for the folder and go to the **Security** tab.
3. Keep the properties dialog open and browse to the new location for the system folder (as specified in your INI settings).
4. Open the folder properties for the new location, and go to the **Security** tab.
5. Edit the **Group or user names** list for the new location so that it matches the settings for original folder.  
The groups and users (and the permissions they require) will be different for each folder type. You need to confirm that you copy the appropriate settings to a new folder location.  
Ensure you include any service accounts that have access to the default location. When entering a service account in the **Select Users or Groups** dialog, you must prefix with "NT SERVICE\" (for example, "NT SERVICE\Citect Runtime Manager"). Select the local computer instead of any domain in the **From this location** field.
6. You then need to disable any inherited permissions for the folder via the **Advanced** button on the Security tab.

[Directory Security](#)

[Security Roles](#)

## Runtime System Security

You can protect a Plant SCADA runtime system with user-based security. This can be integrated with existing Windows™ user groups, or you can create your own user accounts in Plant SCADA.

In both cases, users are assigned to "roles" that determine the permissions they are granted. Roles use "privileges" to restrict access to specific commands (such as those that operate specialized machinery or acknowledge critical alarms), and "areas" to control access to geographical or logical sections within a plant.

To set up security in Plant SCADA, you firstly need to consider how you will implement **areas** and **privileges** within your system.

- [Areas](#) define sections within a production facility, creating geographical or logical boundaries that can be used to restrict access.
- [Privileges](#) define the level of access that is applied to system elements within your project.

Once you have planned how areas and privileges will be managed (and how they can work in tandem), you can start adding **roles** and **users** to the system.

- [Roles](#) define a set of permissions (based on privileges and areas) that can be assigned to users of the same type.
- [Users](#) represent the individuals (or groups) that need to access to the runtime system.

You can define users in Plant SCADA, or you can integrate Windows™ user groups. Every user needs to be assigned to a role to be granted privileges.

This section of the help also describes how to limit access to a computer while Plant SCADA is running (see [Securing Runtime Computers](#)).

## Areas

Areas allow you to visualize a production facility as a set of discrete sections. You can define areas geographically (especially if parts of the plant are separated by distance or physical barriers), or logically (as discrete processes or individual tasks).

You can define up to 255 separate areas. You can then refer to these areas by number (1 to 255) or use a label to assign a meaningful name to the area (see [Use a Label to Name an Area](#)).

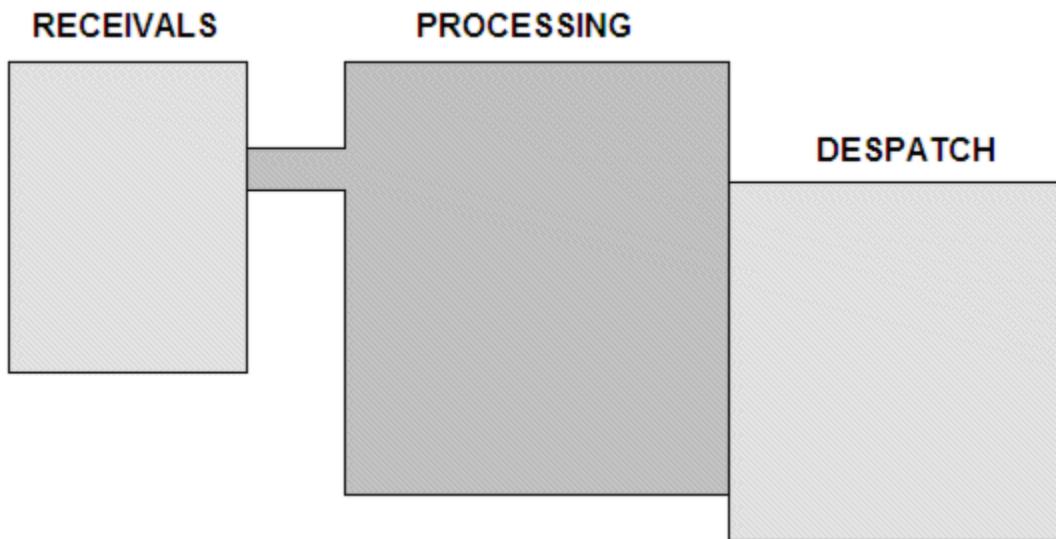

After you have defined your areas, you can then configure the system elements your operators will use in those areas, such as commands, objects, alarms and reports. Refer to [Roles](#) for more information on how areas and roles work together.

---

**Note:** Any system element that is not assigned to an area between 1 and 255 is automatically placed in a default area known as Area 0. Every user can view the system elements in Area 0, but without the matching privilege will be unable to control them.

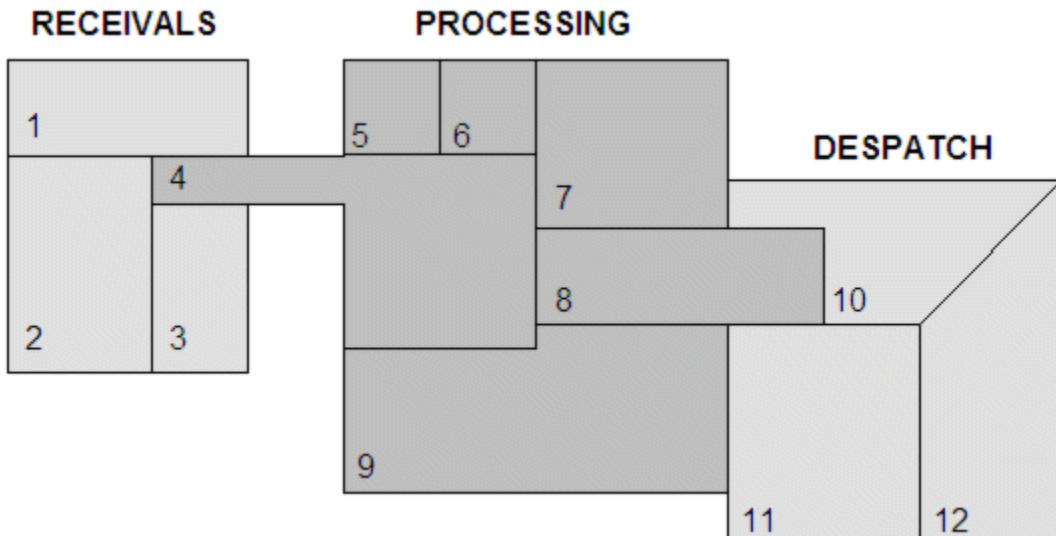

## Example

A simple manufacturing plant could be divided into just three areas - receipts, processing, and dispatch.

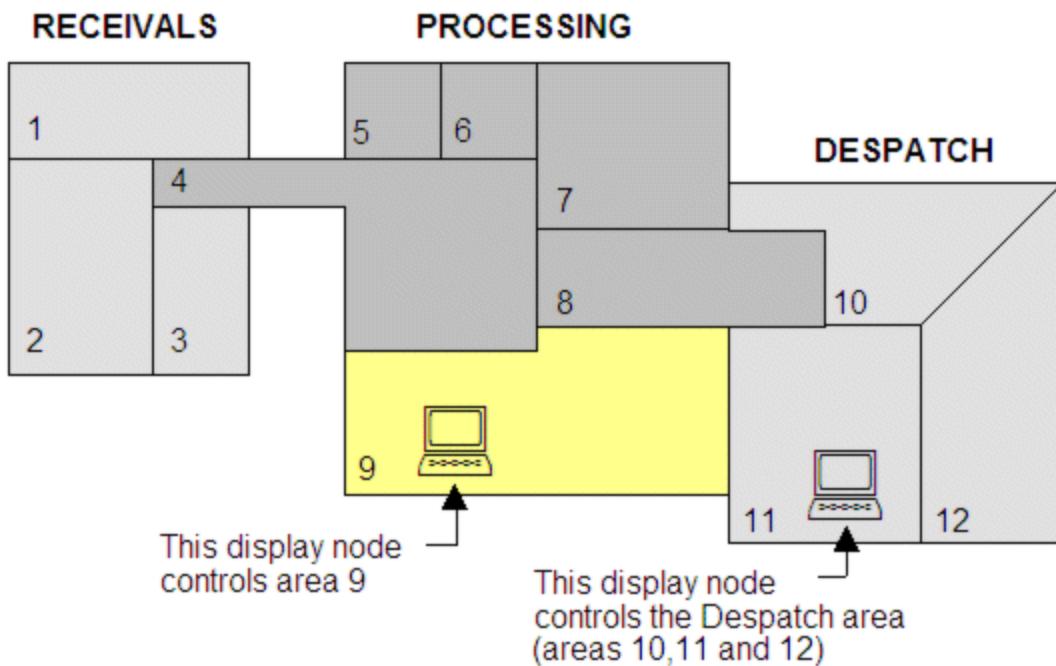

This is an effective scenario if there is a single Plant SCADA control client used to monitor each area.

With a larger or more complex facility, you might need to define several areas, like this:

This demonstrates how you can define smaller areas that are collectively controlled by an operator or control client. This method can increase flexibility, but can introduce a higher level of complexity to your system.

You can simplify the configuration of a complex system by creating a group from multiple areas. For example, areas 10, 11 and 12 in the example above could be grouped and labeled as "Despatch" (see [Create an Area Group](#)).

You can also provide view-only access to an area (see [Configure View-only Access to an Area](#)).

## See Also

[Privilege and Area Combinations](#)

[Runtime System Security](#)

## Use a Label to Name an Area

It can be easier to remember an area by a meaningful label (name) rather than a number. For example:

Label Name	DespatchAccum
Expression	10
Comment	Label Area 10 as "DespatchAccum"

This would allow you to use "DespatchAccum" whenever you need to refer to area 10. For example:

Command	CONVEYOR = 1;
Area	DespatchAccum
Comment	This command belongs to Area 10 (DespatchAccum)

**Note:** If you leave the **Area** field blank on a form, the command does not belong to any particular area - it is assigned to every area of the plant.

**To label an area:**

1. In the **Standards** activity, select **Labels**.
2. In a blank row, click in the **Project** cell and select the required project.
3. Enter a **Label Name** for the label.
4. Enter an expression to be substituted for the label, for example, the number of the area you would like the label to represent.
5. Enter a relevant **Comment**, if required.
6. Click **Save**.

**Note:** To modify an existing label, click in the individual cells and select or enter the required value.

**See Also**

[Create an Area Group](#)

**Create an Area Group**

You can group several areas together and define a name for the group.

In the example below, areas 10, 11, and 12 are associated with the name "Despatch".

Group Name	Despatch
Association 1	DespatchAccum
Association 2	11
Association 3	12
Comment	Areas 10, 11, 12 = "Despatch"

This means any command assigned to "Despatch" will belong to areas 10, 11, and 12.

You can also define a group that includes other groups. In the example below, the name "Plantwide" refers to the areas defined in the "Receivals", "Process", and "Despatch" groups.

Group Name	Plantwide
Association 1	Receivals
Association 2	Process
Association 3	Despatch
Comment	Associate every area with "Plantwide"

**To define a group of areas:**

1. In the **Standards** activity, select **Groups**.
2. Add a row to the Grid Editor.

3. Enter a **Group Name**.
4. Complete the required **Association** fields.
5. Click **Save**.

## See Also

[Add a Group](#)

### Configure View-only Access to an Area

You might need to provide a user access to information from areas within a plant, even though you do not want that user to control any of the processes within those areas. For example, the user may need to monitor the processes in one area as they might directly affect another area.

In the following example, John Smith has been assigned the role of Despatch Handler and as such has been granted control of:

1. System elements located in **Despatch**, with a privilege level of **1**
2. System elements located in **DespatchAccum**, with a privilege level of **4**
3. View-only access Plantwide to track when product is due to arrive in Despatch for packing and distribution.

User Name	J Smith
Global Privilege	
Viewable Areas	Plantwide
Areas for Priv 1	Despatch
Areas for Priv 2	
Areas for Priv 3	
Areas for Priv 4	DespatchAccum
Areas for Priv 5	
Areas for Priv 6	
Areas for Priv 7	
Areas for Priv 8	
Comment	Login for John

Alternatively, you could restrict users access to a group of areas (for example, "Receivals") or to a single area (for example, 12).

## See Also

[Privilege and Area Combinations](#)

## Privileges

Plant SCADA provides eight privileges, numbered 1 to 8, that you can use to restrict access to some of the elements in a runtime system. These elements include:

- Graphics pages
- Graphics page objects
- Alarms
- Trends
- SPC tags
- Accumulators
- Keyboard commands
- Reports.

To implement privileges in a Plant SCADA system, you need to perform the following:

- Assign privileges to the required elements (using the **Privilege** property for each element)
- Assign matching privileges to the [Roles](#) that require access to those elements.

When configuring privileges for a role, you can assign global privileges that apply to all [Areas](#), or you can assign privileges for specific areas.

The properties that define privileges for a role include the following:

Role Property	Description
Privileges	Sets global privileges for the role (that apply to all areas).  If you assign a role a global privilege, that role is also granted view access to every area automatically. Any user assigned that role will be able to view every area of the plant.
Priv 1 Areas ... Priv 8 Areas	Sets privileges for specific areas. For example, if "Priv 1 Areas" is set to "1,2,3", users assigned to this role will have privilege 1 access to Areas 1,2 and 3.
View Areas	Allows users assigned to the role to view the specified areas.

For more information about the configuration of areas and privileges, including some examples, see [Privilege and Area Combinations](#).

Not every system element needs a privilege classification. For example, every user will require access to a login

command. A blank privilege setting (or privilege 0) means that an element has no classification and will be accessible to all users.

**Note:** You can use the Citect.ini parameter [Privilege]Exclusive to implement hierarchical privilege. This means users with privilege 3 have access to commands with a privilege classification of 3, 2, and 1. To allocate every privilege, you only need to specify privilege 8.

## See Also

[Users](#)

[Runtime System Security](#)

## Privilege and Area Combinations

Outlined below are four general rules regarding the use of privileges and areas within Plant SCADA.

1. Global privileges apply to every area.
2. Assigning a privilege to an area within a role means any user assigned that role will gain viewable access to that area automatically. However the user can only operate system elements in that area that have a matching privilege. As a result of the first rule, if users are assigned a global privilege they will also be able to view every area.
3. Area 0 includes every privilege a role may have been assigned in other areas. In other words, if granted a privilege 3 for use in another area that role can also control those system elements in Area 0 that have a privilege set as 3.
4. All users can view Area 0.

The table below outlines numerous scenarios, and the resulting security that is applied to an alarm when accessed by a user assigned to an "operator" role.

Alarm Properties	Operator Role Properties	Result
Area = 0 <All areas> Privilege = 0 <None>	View Areas = 0 (blank) Global privileges = 0 (blank) Privilege 1 Areas = 0 (blank) Privilege 2 Areas = 0 (blank) ...	No privileges are assigned to the alarm, or the operator role. An operator will be able to view and acknowledge the alarm.
Area = 0 <All areas> <b>Privilege = 1</b>	View Areas = 0 (blank) Global privileges = 0 (blank) Privilege 1 Areas = 0 (blank) Privilege 2 Areas = 0 (blank) ...	The alarm is assigned level 1 privileges. An operator will be able to view the alarm, but cannot acknowledge it as the operator role does not have the necessary level 1 privileges.
Area = 0 <All areas> <b>Privilege = 1</b>	View Areas = 0 (blank) <b>Global privileges = 1</b> Privilege 1 Areas = 0 (blank)	An operator can view the alarm and acknowledge it, as the operator role has been granted

Alarm Properties	Operator Role Properties	Result
	Privilege 2 Areas = 0 (blank) ... ...	matching global privileges (level 1 access). The operator will also be able to view and control other system elements that have level 1 privileges across all areas of the plant.
<b>Area = 1</b> Privilege = 0 <None>	View Areas = 0 (blank) Global privileges = 0 (blank) Privilege 1 Areas = 0 (blank) Privilege 2 Areas = 0 (blank) ...	An operator cannot view the alarm, as it is now assigned to Area 1 and the operator role has no permissions for Area 1.
<b>Area = 1</b> Privilege = 0 <None>	<b>View Areas = 1</b> Global privileges = 0 (blank) Privilege 1 Areas = 0 (blank) Privilege 2 Areas = 0 (blank) ...	The View Areas property has been adjusted so that users assigned to the operator role can view Area 1. They can acknowledge the alarm as it has no privilege restrictions.
<b>Area = 1</b> <b>Privilege = 1</b>	View Areas = 1 Global privileges = 0 (blank) Privilege 1 Areas = 0 (blank) Privilege 2 Areas = 0 (blank) ...	An operator can view the alarm in Area 1, but cannot acknowledge it as the operator role does not have the required level 1 privileges.
<b>Area = 1</b> Privilege = 1	View Areas = 1 <b>Global privileges = 1</b> Privilege 1 Areas = 0 (blank) Privilege 2 Areas = 0 (blank) ...	An operator can view the alarm and acknowledge it as the operator role now has global privileges for level 1.
<b>Area = 1</b> Privilege = 1	View Areas = 0 (blank) Global privileges = 0 (blank) <b>Privilege 1 Areas = 1</b> Privilege 2 Areas = 0 (blank) ...	An operator can view the alarm and acknowledge it as the operator role now has level 1 privileges for the matching area (Area 1).
<b>Area = 2</b> Privilege = 1	View Areas = 0 (blank) <b>Global privileges = 1</b> Privilege 1 Areas = 0 (blank) Privilege 2 Areas = 0 (blank)	The alarm is now in Area 2, however, an operator can still view the alarm and acknowledge it as the operator role has global privileges for level 1.

Alarm Properties	Operator Role Properties	Result

[Areas](#)

## Roles

Roles define a set of permissions that can be assigned to users of the same type. Before you create a role, determine the permissions required by the users that will be assigned to the role (based on the available [Privileges](#) and [Areas](#)).

To integrate Windows user groups into your Plant SCADA security, use the **Windows Group** property when defining a role. See [Integrate Windows™ User Groups](#).

---

**Note:** Area 0 is assigned by default to every role. This means users can view any system element in Area 0 (no privileges defined).

### To add a Role record:

1. In the **Security** activity, select **Roles**.
2. Add a row to the Grid Editor.
3. Type the required information in each column, or in the fields in the Property Grid.  
For a description of the properties, see below.
4. Click **Save**.

## Role Properties

### General Properties

Property	Description
<b>Role Name</b>	The name of the role. Each name must be unique.
<b>Windows Group</b>	<p>The name of the Windows™ user group associated with this role. You can enter a group name on its own (for example, "PlantOperators"), or you can restrict the group's accessibility by including a local computer name or domain name (for example, "ComputerName\PlantOperators" or "DomainName\PlantOperators").</p> <p>You can only associate Windows user groups with up to 1024 Plant SCADA roles. Duplicated Windows user groups are not supported.</p>

Property	Description
	For more information, see <a href="#">Integrate Windows™ User Groups</a> .
<b>Privileges</b>	<p>The privilege assigned globally to the role. Enter a value of 16 characters or less.</p> <p>In the privilege field you can separate numbers with commas or you can enter a range separated by two periods, for example, 1..8.</p> <p>As you configure your system, you can assign privileges to the various elements, such as graphics objects, alarms, accumulators, commands, and so on. For example, a role with a Global Privilege of 3 will be able to send any command that is assigned a privilege of 3, or action any alarm with a privilege of 3, or click any button that is assigned a privilege of 3, etc. Unless you are using areas, if you do not specify a global privilege, the role cannot access any command with a privilege assigned.</p> <p><b>Note:</b> (For users using windows authentication) When you have completed the fields in this dialog and if you have not already done so, add the users to the group in Windows security that you want to have the privileges of this role.</p>
<b>View Areas</b>	<p>The areas the user assigned the associated role is permitted to view. Enter a value of 16 characters or less.</p> <p><b>Note:</b> Do not set Viewable Areas in conjunction with Global privileges, as global privileges give roles view access to areas automatically.</p> <p>Remember, you need to still assign privileges to the elements in these viewable areas, such as graphics objects, alarms, accumulators, commands, etc. If you do not, the user will have full access to them. For example, if you do not assign a privilege to a command in one of these areas, the user will be able to send it regardless of whether you want them to or not.</p> <p>To make an element (such as a button on a expression) view only for a particular user, assign it an expression and a privilege. Add the area to the user's list of Viewable Areas, but don't give the user the necessary privileges in that area (or the necessary global privilege).</p> <p>Multiple areas can be defined using groups.</p>

Property	Description
	<p>If you do not specify "Viewable Areas", the user will have viewable access to area 0. See <a href="#">Privilege and Area Combinations</a> for more information.</p>
<b>Allow RPC</b>	<p>Determines if a user or group will be restricted from performing remote MsgRPC and ServerRPC calls.</p> <p>From the drop-down, select <b>True</b> or <b>False</b>:</p> <ul style="list-style-type: none"> <li>• True - the user or group will be allowed to run MsgRPC and ServerRPC</li> <li>• False - the user or group will not be allowed to run MsgRPC and ServerRPC.</li> </ul> <p>If the field is left blank, it will default to FALSE. The following compiler warning message will be generated:</p> <p>"'Allow RPC' permission is not defined (defaulting to FALSE)."</p> <p><b>Note:</b> If you want to use MsgRPC to call a procedure on a remote client computer, you will need to set the parameter [Client]AllowRPC to 1 on the client computer.</p>
<b>Allow Exec</b>	<p>Determines whether a user or group will be allowed to run the Exec Cicode function.</p> <p>From the drop-down select True or False.</p> <ul style="list-style-type: none"> <li>• True - user or group allowed to run Exec.</li> <li>• False - user or group not allowed to run Exec.</li> </ul> <p>In the Example project, Allow Exec is set to TRUE for the Engineer role. Note that this is used in conjunction with the Citect INI parameter <b>[Security]BlockExec</b>. Therefore, the parameter also needs to be set as <b>[Security]BlockExec=0</b> so that users with this role can run the Exec Cicode function. For more information about the parameter, refer to the Parameters help.</p> <p>If the field is left blank, Allow Exec will default to FALSE.</p>
<b>Manage Users</b>	<p>Determines if the user is authorized to manage user accounts. From the drop-down select TRUE or FALSE.</p> <p>If TRUE the user is able to:</p> <ul style="list-style-type: none"> <li>• Add, modify, and delete users at runtime.</li> </ul>

Property	Description
	<ul style="list-style-type: none"> <li>• Modify other users passwords without having to know the user's old password.</li> </ul> <p>If FALSE the user will only be able to change their own password. To do this they will need to know their old password.</p> <p>In the Example project, Manage Users is set to TRUE for the Engineer role.</p>
<b>Kernel Access</b>	<p>Determines if a user can launch the Kernel window at runtime. Choose from the following:</p> <ul style="list-style-type: none"> <li>• <b>No Access</b> - the user cannot launch the Kernel.</li> <li>• <b>Read Only</b> - the user can display the Kernel, but cannot perform some privileged commands like running Cicode.</li> <li>• <b>Full Access</b> - the user can display the Kernel and has full access to its functionality and commands.</li> </ul> <p><b>Note:</b> You need to restrict access to the Kernel. Anyone using the Kernel has total control of Plant SCADA (and subsequently your plant and equipment). For more information, see the section <i>Access to Cicode and Cache Commands</i> in the topic <a href="#">The Kernel</a>.</p> <p><b>Note:</b> If you change the Kernel Access setting for a Role and run the recompiled project, you will need to restart any server processes that you want to run the Kernel on.</p>
<b>Comment</b>	Any useful comment.
<b>Entry Command</b>	A Cicode command that is executed when the user assigned this role logs in. You can use any Cicode command or function. Enter a value of 254 characters or less.
<b>Exit Command</b>	A Cicode command that is executed when the user assigned this role logs out. You can use any Cicode command or function. Enter a value of 254 characters or less.
<b>Priv1 Areas... Priv8 Areas</b>	The privileges (by area) assigned to the user. Enter a value of 16 characters or less. Using this combination of areas and privileges, you can assign a user different privileges for different areas. For example, users assigned a role with privilege class 6 in areas 29 and

Property	Description
	<p>30 will only have access to commands in those areas that require privilege class 6.</p> <p>In the privilege field you can separate numbers with commas or you can enter a range separated by two periods, for example, 1..8.</p> <p><b>Note:</b> In assigning a privilege to an area, you are making that area viewable to users assigned that role.</p> <p>If you do not specify areas with associated privileges, access is defined by Viewable Areas or Global Privileges only.</p>

### Project Properties

Property	Description
Project	The project in which the role is included.

### See Also

[Runtime System Security](#)

[Users](#)

### Users

Plant SCADA runtime security supports two types of users:

- Native Plant SCADA users
- Windows™ users.

Every user needs to be assigned to a [Roles](#) to be granted privileges and access to areas.

If you want to use native Plant SCADA users, you define them in the Security activity. See [Add a Plant SCADA User](#).

If you want to use Windows users, they need to be part of a Windows User Group that is associated with a role. See [Integrate Windows™ User Groups](#) for more information.

---

**Note:** Each operator needs to enter a User Name and Password to use the Plant SCADA runtime system. To allow a user to login, you can use the [Login\(\)](#) or [LoginForm\(\)](#) Cicode functions. You can also use the [\[General\]PasswordExpiry](#) parameter to specify when a password will expire.

### See Also

[Runtime System Security](#)

[Roles](#)

## Add a Plant SCADA User

Before you add a Plant SCADA user to your project, check the [Reserved User Names](#) list. This list details built-in users already included in Plant SCADA.

**Note:** You can also use Windows™ user groups to manage runtime security. See [Integrate Windows™ User Groups](#) for more information.

### To add a user:

1. In the **Security** activity, select **Users**.
2. Add a row to the Grid Editor.
3. Type the required information in each column, or in the fields in the Property Grid.  
For a description of the properties, see below.
4. Click **Save**.

You can also group several Plant SCADA users together and define a name for the group. See [Add a Group](#).

**Note:** If you restore a project from a backup, or install a new project from a compiled offline master, the runtime user details might be thrown out of synchronization. For more information, see [User Records and Project Restoration](#)).

## User Properties

### General Properties

Property	Description
<b>User Name</b>	The user's name. Enter a value of 16 characters or less. User Names are restricted to using the same syntax as Tag names. See Tag name syntax.
<b>Full Name</b>	The full name of the user or class of user. Enter a value of 32 characters or less. This name is used as a comment and for display in alarm logs and command logs.
<b>Password</b>	The user's password. When you double click in this cell or when you select <b>Change</b> next to the Password field in the Property Grid, the Set Password dialog is displayed. In the <b>New Password</b> field, enter a value of 16 characters or less. Enter the same password in the <b>Confirm Password</b> field and click <b>OK</b> . When you enter the passwords six dots (.) will be displayed for the password. When you save the user record, the password will be encrypted before it is saved to the Users.dbf. If the contents of the <b>Password</b> and <b>Confirm Password</b> fields are different when the record is saved, a message will be displayed that indicates a mismatch and invites you to try again.

Property	Description
<b>Roles</b>	<p>Each user is assigned roles. The Roles field will accept zero or more comma-separated role names. If zero roles are specified for the user, this is the same as configuring the user with no privileges.</p> <p><b>Note:</b> When a Windows or Plant SCADA user who is linked to multiple roles logs onto runtime the privileges and areas that the user will be assigned are the combined privileges of the linked roles.</p>
<b>Type</b>	<p>The generic type of user. Enter a value of 16 characters or less. For example: Operator, Supervisor or Manager.</p> <p>The Type field is used in configuration only to specify a class of user that can then be used as the basis for creating new users in runtime via the <a href="#">UserCreate()</a> Cicode function. When this function is run it displays a form where you can select the user Type. When you do this, your new user will inherit the properties of the chosen user class record that you have already created. In doing this it uses the first user record with a matching Type value.</p> <p>In configuration, decide what user classes you need. Each class (or Type) would contain any specific Global Privilege, Viewable Areas and Areas for Privilege and Entry and Exit Commands values . Maintain just one user record for each class and then base other individual users on this. If you create new users in configuration in the usual way by using Add, Replace technique, then you will get multiple user records with the same Type field value. Whilst this will not directly cause a problem for individual records it could confuse development or provide scope for inconsistencies and unexpected behavior if other field values are changed. When adding records in configuration, it is therefore recommended that you remove duplicate Type values from additional user records.</p>
<b>Comment</b>	Any useful comment. Enter a value of 48 characters or less.
<b>Password version</b>	Indicates if a password is a legacy password. A new password (created in Version 2015 or later) will display "2". A legacy password will display "1". It is recommended that update any legacy passwords.
<b>Seed</b>	Indicates if each password is uniquely encrypted. If

Property	Description
	<p>you duplicate a user account (by copying and pasting a row), the password for each will have the same seed. This will cause generate a compile error message. To solve this problem, you need to change the password for each account.</p> <p>If you need to keep the same password for the duplicated accounts, you can select all of the duplicated users in the Grid Editor, and <b>Change</b> the password in the Property Grid. This will generate new seeds for each of the duplicated accounts.</p>

### Project Properties

Property	Description
Project	The project in which the user is included.

### Reserved User Names

The following user names have been reserved and should not be used when you add users to your Plant SCADA system.

- driver
- logic
- method call
- schedule
- system
- guest.

If you attempt to log in with one of these reserved user names, a hardware alarm will be raised and the login will be unsuccessful.

**Note:** You should also avoid using these reserved user names for [Integrate Windows™ User Groups](#) that will log in to Plant SCADA.

### See Also

[Add a Plant SCADA User](#)

### User Records and Project Restoration

If you restore a project from a backup, or install a new project from a compiled offline master, any user records created in Plant SCADA are reset to match those originally configured in the project. If the runtime user creation, password change ability, or password expiry functions are used, the runtime details might be thrown out of synchronization with master offline projects.

Here, you need to have procedures in place to use the current Users.dbf file (which is running live in the plant) when offline project compilations are performed. This minimizes the likelihood of either deleting users created at runtime, or of having expired user records locked when a new system is deployed and run.

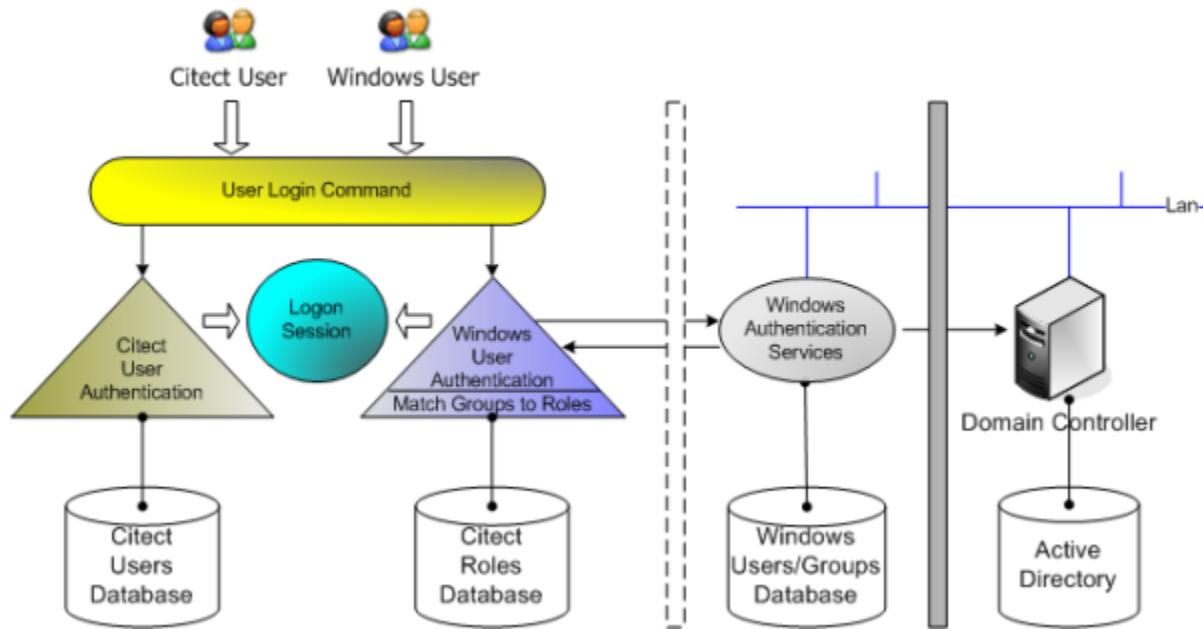

**Note:** Online changes arising from user creations and modifications are reflected only in the local \_Users.rdb and Users.dbf files. Perform user administration activities on a central node so that user records remain synchronized across a distributed network. Other nodes will use the Copy= functionality in Plant SCADA or custom engineered database replication.

## See Also

[Add a Plant SCADA User](#)

## Integrate Windows™ User Groups

Plant SCADA provides the ability to integrate Windows™ user accounts into the security model for a runtime system. You can achieve this by linking a Windows user group to a [Roles](#) defined within Plant SCADA. This allows each user within the Windows user group to log in to Plant SCADA with the permissions defined for the associated role.

To associate a Windows user group with a role, you use the **Windows Group Name** property. You can enter a group name on its own (for example, "PlantOperators"), or you can restrict the group's accessibility by including a local computer name or domain name (for example, "ComputerName\PlantOperators" or "DomainName\PlantOperators").

If you include a domain path with a Windows group name, the Plant SCADA computer where login occurs will need to belong to that domain for the login to be successful. Similarly, if you specify a Windows user group that is local to a particular computer, a Plant SCADA login will only be successful on that computer.

If the **Windows Group Name** property does not specify a local computer name or domain name, any domain computer can be used to authenticate users.

If the same user name exists in both the Plant SCADA users database and an associated Windows user group, authentication will firstly be attempted against the account in the Plant SCADA user database.

For more information on Windows user accounts across a number of different login scenarios, see [Windows™ Security Usage Scenarios](#).

For information on how to add groups and users to Windows, refer to the Windows documentation appropriate to your operating system.

---

**Note:**

- The AutoLogin capability has also been extended to include Windows users that are associated with a role. In order to invoke this functionality for a Windows user you need to set the [\[Client\]AutoLoginMode](#) parameter in the Citect.ini file.
  - Integrated Windows security can be used with the [MultiSignatureForm](#) Cicode function if multiple-user authorization is required.
- 

## See Also

[Roles](#)

### Windows™ Security Usage Scenarios

The following describes how a user will be allowed to negotiate access to a Plant SCADA runtime system when using Windows groups and roles.

---

**Note:** Some scenarios will not be supported if you use a local Windows user to access a Plant SCADA computer. It is recommended that you always use domain Windows user accounts.

---

When a Windows user logs on to a display client, authentication is performed locally on the Plant SCADA process that is running.

If you are running a standalone system with all processes running locally, you can use a local Windows user to log on.

If the display client connects remotely to one or more Plant SCADA servers that are distributed across multiple domains, a domain user will be required. You also need to make sure that all the Plant SCADA computers are on trusted domains. If the domain controllers are unavailable, you will not be able to log on to the display client.

Auto login (for example, a login that occurs following a restart) will work if the current user meets the criteria described above.

## Securing Runtime Computers

The Plant SCADA runtime system is a Windows™-based application. Typically, Windows allows you to run several applications at the same time, however, this may impact performance or obscure runtime messages and information if you require a computer to be dedicated to Runtime.

For example, an operator display panel may be used to present alarm notifications. You will not want the runtime screen minimized or hidden behind another window.

There are several different ways can limit access to software other than Plant SCADA.

## See Also

- [Client Startup Restrictions](#)
- [Running a Display Client as a Shell](#)
- [Disabling Windows Keyboard Commands](#)
- [Disabling Control Menu Commands](#)
- [Removing the Cancel Button](#)

### Client Startup Restrictions

On start up Plant SCADA will establish initial communication with the server using a view-only login. By default this communication between the client and the server is in view-only mode. In this mode the user cannot write to any tag, acknowledge any alarm or use Cicode functions.

**Note:** View-only mode is applied to the whole control client process, including any Cicode task that is running.

Write only access is available after a user has successfully logged in. Once the user logs out it returns to view-only mode.

Users can configure login by modifying the [\[Client\]AutoLoginPage](#) parameter.

## See Also

- [Securing Runtime Computers](#)

### Running a Display Client as a Shell

To limit certain operators from switching a client over to a different application during runtime, you can configure Windows™ to launch with Plant SCADA running as the shell. This will deploy Plant SCADA Runtime as the only available interface for a computer, limiting access to within the context of the current project.

For information on how to set up a client as a shell, contact your local support office.

## See Also

- [Disabling Windows Keyboard Commands](#)

### Disabling Windows Keyboard Commands

The Windows™ environment provides commands to switch between applications running on the computer at the same time. When using Plant SCADA, these commands might not be desirable - they allow an operator access to other Windows facilities without your direct control. You might be able to disable some of these commands with the Setup Wizard (see [Keyboard Security Configuration](#)).

## See Also

- [Disabling Control Menu Commands](#)

## Disabling Control Menu Commands

The runtime system's Control Menu can be tailored to give access to several commands specific to Plant SCADA, such as Shutdown (to shut down the runtime system), or Kernel (to display the Kernel).

You can enable and disable these commands with the Setup Wizard (see [Control Menu Security Configuration](#))..

## See Also

[Removing the Cancel Button](#)

### Removing the Cancel Button

When the Plant SCADA runtime system starts, a message box displays the status of the system startup. This message box normally contains a **Cancel** button that allows you to cancel the startup. This button is useful when you are debugging or testing the system. When you have completed testing, you can remove the **Cancel** button from the message box with the Setup Wizard (see [Miscellaneous Security Configuration](#)), so that there will not be an unintentional cancellation of system startup.

## Standards

The Standards activity allows you to create and configure assets that are intended for use across multiple Plant SCADA projects. For example, you may need to configure alarm fonts that adhere to a corporate safety strategy.

The following features are configured in the Standards activity:

- [Labels](#)

Labels allow you to use a series of commands (or expressions) in your system without having to repeat them each time they are used. When you compile the project, the commands (or expressions) defined in the label are substituted in every occurrence of the label.

Labels are similar to macros used in programming languages such as Basic or 'C'.

- [Styles](#)

Styles can be used to manage the appearance of symbols, status animations and numeric values in AVEVA™ Industrial Graphics applications.

- [Groups](#)

Groups can be used for many purposes, for example, to define a set of users, multiple areas or multiple devices.

- [Fonts](#)

Alarm categories and Cicode functions allow you to use predefined fonts, known as **system fonts**, to display text.

## Labels

Labels allow you to use a series of commands (or expressions) in your system without having to repeat them each time they are used. When you compile the project, the commands (or expressions) defined in the label are

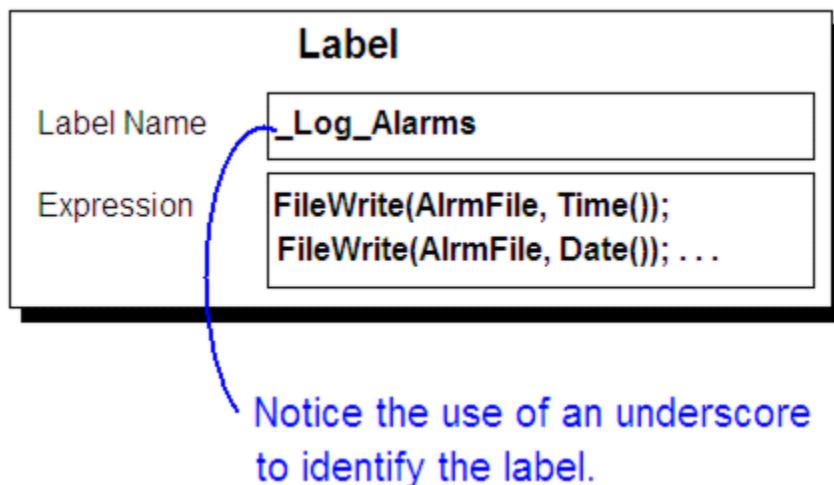

substituted in every occurrence of the label.

Labels are similar to macros used in programming languages such as Basic or 'C'.

You often use the same combination of statements in different commands. For example, when an operator acknowledges an alarm, you might want to log the details to a file. Such a command would require several statements:

Command	FileWrite(AlrmFile, Time()); FileWrite(AlrmFile, Date()); ...
---------	--

Instead of entering the same statements when necessary in a command, you can define a label, and then use the label instead of the statements. When you compile your project, each occurrence of the label is resolved; that is, the expression in the label is substituted for the label name. For example:

Once defined, a label can be used as a statement in a command, for example:

System Keyboard	
Key Sequence	F5 Enter
Command	_Log_Alarms;
Privilege	1

When an operator issues this command, the expression defined in the label is substituted in the command.

**Label**

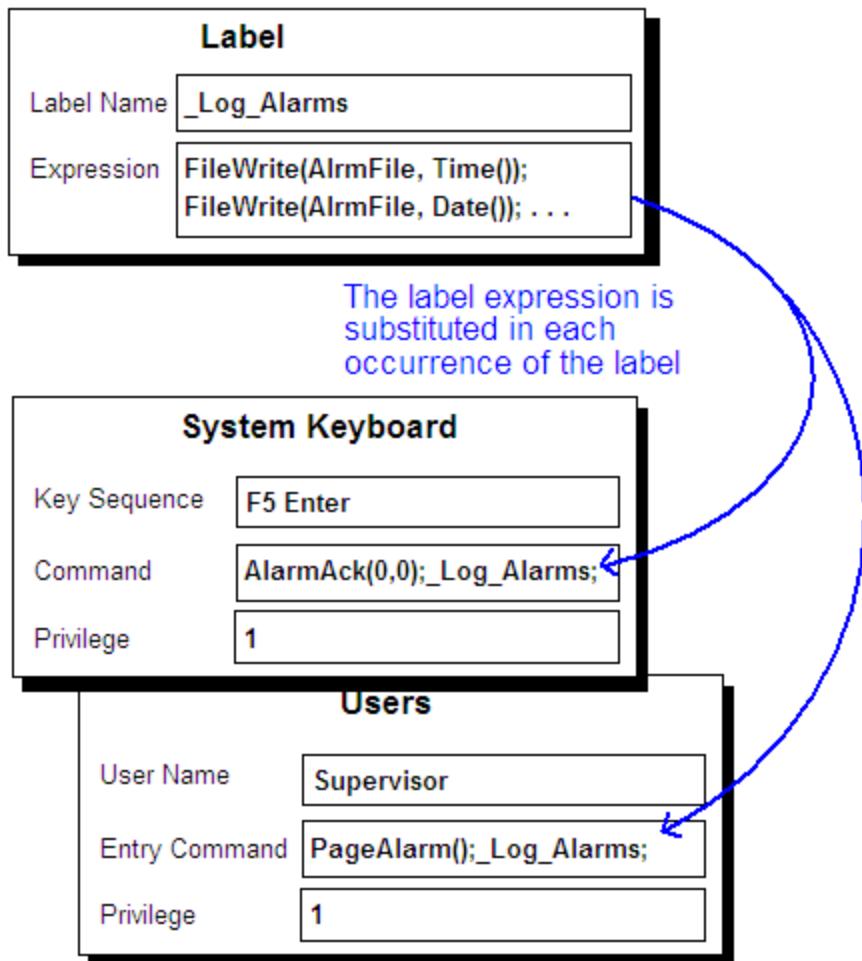

**Label Name** \_Log\_Alarms

**Expression** FileWrite(AlrmFile, Time());  
FileWrite(AlrmFile, Date()); ...

When an operator issues the command, the statements in the expression execute

System Keyboard	
Key Sequence	<u>F5 Enter</u>
Command	<u>_Log_Alarms;</u> ←
Privilege	1

You can also use the label in combination with other statements, for example:

The main advantage of a label is that it is a global definition, recognized throughout the Plant SCADA system. If you want to change something (in the above example you might change the file name or the way the data is logged), you only need to change it in one place - in the label definition. Other occurrences of the label name will reflect the changes.

## See Also

- [Define a Label](#)
- [Use Arguments in Labels](#)
- [Convert Values into Strings](#)

## Define a Label

**Labels** allow you to reference a set of commands (or expressions) that are used repeatedly across a Plant SCADA project.

### To define a label:

1. In the **Standards** activity, select **Labels**.
2. Add a row to the Grid Editor.

3. Type the required information in each column, or in the fields in the Property Grid.
- For a description of the properties, see below.
4. Click **Save**.

## Label Properties

### General Properties

Property	Description
<b>Label Name</b>	A name of 128 characters or less. Whenever this name is used (for example, in Cicode or a field), Plant SCADA will automatically substitutes the expression below.
<b>Expression</b>	The expression to be substituted for the label (maximum length is 254 characters). You can use a label to substitute a name for an entity or a Cicode expression; for instance, when you need to use the entity or Cicode expression in several database records.
<b>Comment</b>	Any useful comment.

### Project Properties

Property	Description
<b>Project</b>	The project in which the label is included.

## See Also

[Use Arguments in Labels](#)  
[Convert Values into Strings](#)

## Use Arguments in Labels

You can [Define a Label](#) that accept arguments enclosed in parentheses (). The following example shows a label that increments a variable by a specific value:

Label Name	Inc(X, STEP)
Expression	X = X + STEP

Here, "X" is the variable to be incremented and "STEP" determines the amount of the increment. You can then use this label in a command, as in the following example:

Key Sequence	FastInc
Command	Inc(SP12, 10);

An operator can use this command to increment the value of SP12 by 10.

You can also use arguments in a label in the following ways:

### Specify a Default Value for an Argument

You can specify a default value for an argument when you define a label, for example:

Label Name	Inc(X, STEP = 10)
Expression	X = X + STEP

When you subsequently use this label without any arguments in a command, the default value is used, for example:

Key Sequence	FastInc
Command	Inc(SP12);

### Use a Substitution String in an Argument

You can pass a string substitution as an argument in a label, for when several variables have part of the variable name in common; for example:

Label Name	SPDev(TAG)
Expression	Prompt("Deviation=" + "IntToStr(CP##TAG## - SP##TAG##));

In the above example, TAG is the common portion of the variable name, and is substituted at each occurrence in the expression. To display the difference between two variables CP123 and SP123, you would specify SPDev(123) in a command, for example:

Command	SPDev(123);
---------	-------------

You cannot use a substitution within a string. In the following example, the DESC Parameter (a text description) will not be substituted as it is between quotation marks:

```
Prompt("Deviation for ##DESC##=" + "IntToStr(CP##TAG## - SP##TAG##))
```

## See Also

[Convert Values into Strings](#)

## Convert Values into Strings

Sometimes, you need to convert a value into a string before it can be used. In the following example, the value of a tag is converted before it is used in the DspStr() function.

Label Name	ShowVariable(TAG)
Expression	DspStr(25, "BigFont", #TAG + "=" + TAG:#.#);

In the above example, only one argument (TAG) is passed to a function that actually requires three arguments

(AN, font and message). When you use this label in a command, the function uses AN 25 and the message displays in "BigFont". Only the third argument (the actual message) varies.

The third argument passed to the function is:

```
...#TAG+"="+TAG:##.#
```

#TAG indicates that the name of the tag (and not its value) is displayed.

TAG:##.# indicates that the value of TAG is converted to a string and displayed. It is formatted with two numbers before the decimal point and one number following the decimal point.

You can use the above label in a command such as:

Command	ShowVariable(SP12);
---------	---------------------

When you use this command in your runtime system, the command displays "SP12=<value>", where **value** is the actual value of SP12 at the time (for example **SP12=42.0**).

[Use Arguments in Labels](#)

## Styles

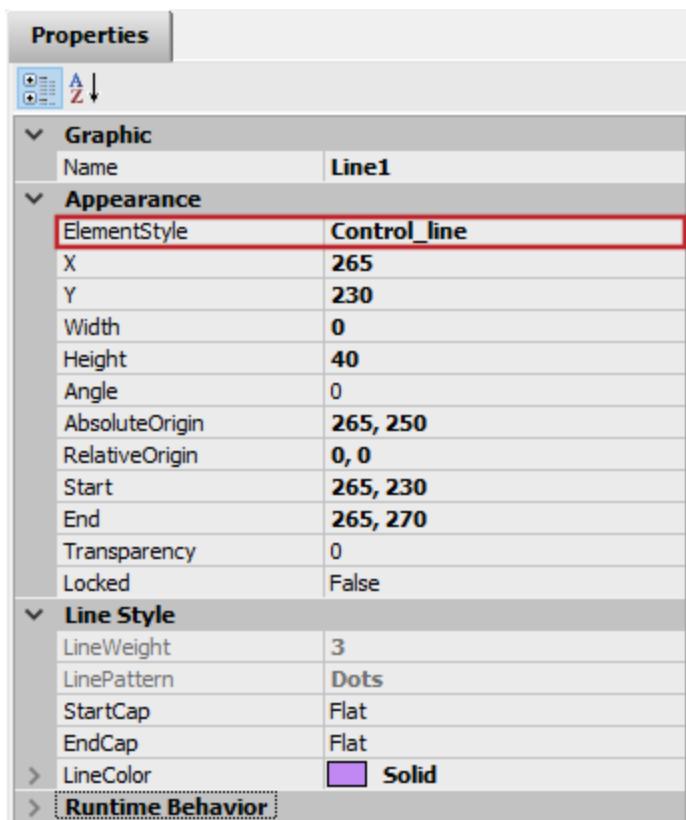

Styles can be used to manage the appearance of elements, status animations and numeric values in AVEVA™ Industrial Graphics applications.

A style defines a set of visual properties that determine the appearance of elements such text, lines, graphic outlines, and interior fill.

When a style is applied to an Industrial Graphics symbol, the specified visual properties take precedence over a symbol's native visual properties. This allows you to establish consistent visual standards.

Style can be applied to selected objects in the Industrial Graphics Editor (see the topic [Applying Element Styles to Elements](#)). For example, you can specify a style in the **Element Style** field in the Properties Editor. This field includes a drop-down list of styles that are currently configured in the active project.

When a style is selected for an object, you are no longer able to modify the value for any properties that have an override configured. In the example above, the **LineWeight** and **LinePattern** fields appear gray to indicate that an override has been configured for these properties in the **Control\_line** style.

Styles are defined in Plant SCADA Studio's **Standards** activity. The **Styles** view hosts the **Configure Styles** dialog, which allows you to configure an overriding style for a selected visual element.

The available elements are distributed across the following three tabs:

- **Quality and Status** — defines the appearance of primitive elements and the status element so they will reflect the quality and/or status of an attached I/O (see [Configure Style Overrides for Quality and Status Elements](#)).
- **Element Styles** — defines visual properties for symbols, including text, lines, outlines, and fill (see [Configure Style Overrides for Element Styles](#)).
- **Format Styles** — defines the format used for numeric values in display animations (see [Configure Format Styles for Value Display Animations](#)).

In each case, pre-configured styles are included for a default set of elements. The predefined values of these element styles can be changed, however, they styles cannot be renamed or deleted.

User-defined styles are also available for Element Styles and Format Styles. You can rename a user-defined style to help identify its intended purpose.

The order of precedence for property styles (from high to low) is:

1. Quality and Status
2. Element style animation
3. Style animations

4. Group-level element style
5. Element-level element style
6. Local element-level style.

---

**Note:** The Industrial Graphics Editor and runtime will only use the styles configured in the active project. If you are editing content in an included project, be aware that the pages and symbols will be displayed using the styles specified in the active project.

You can copy the styles configured for Industrial Graphics from one Plant SCADA project to another. See [Copy Styles to Another Project](#).

## See Also

[AVEVA™ Industrial Graphics](#)

## Configure Style Overrides for Quality and Status Elements

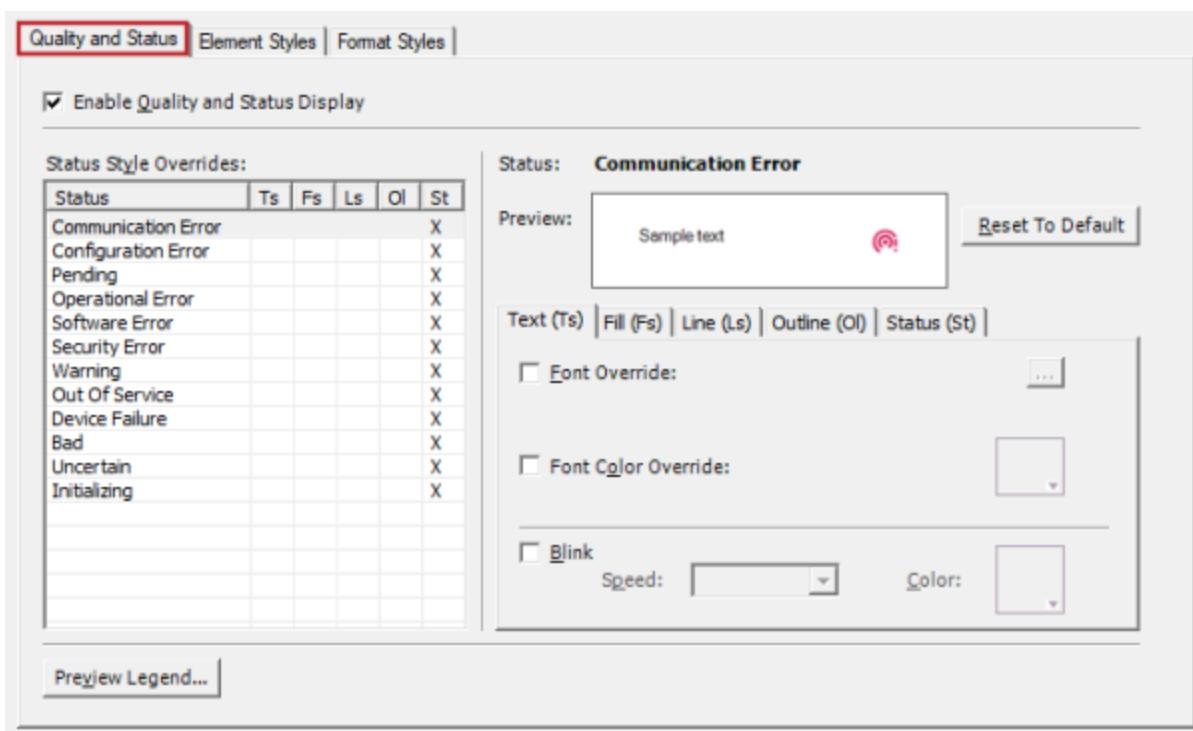

When defining [Styles](#) for AVEVA™ Industrial Graphics objects, you can configure the appearance of elements so that they will reflect the quality and/or status of an attached I/O. This allows you to standardize the appearance of quality and status animations.

There are two ways to indicate status and quality:

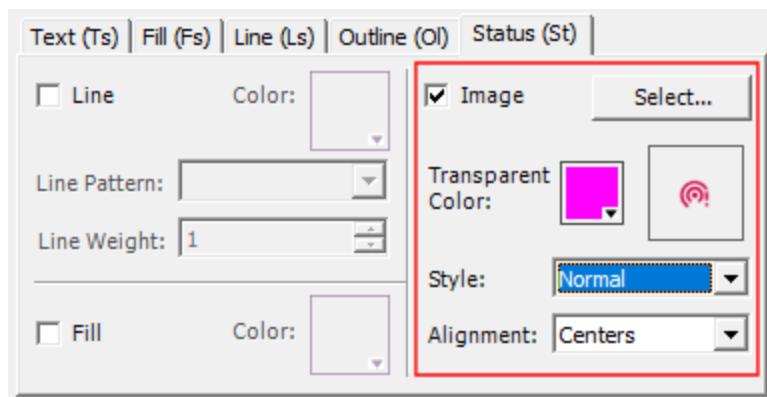

- Use the Status Element, available from the Industrial Graphics Editor Toolbox
- Apply styles to primitive objects so they reflect a particular quality or status.

### To configure style overrides for quality and status elements:

1. In the **Standards** activity, select **Styles**.
2. On the Styles Configuration dialog, select **Edit**. The Configure Styles dialog will appear.
3. Select the **Quality and Status** tab.

4. Select **Enable Quality and Status Display**. This will apply styles to normal primitives that have I/O attached to them.
5. In the **Status Style Overrides** panel, select the status element you would like to modify. The check marks in the Status Style Override panel indicate if an element already has an override configured for it. The columns represent the following:
  - Ts — text
  - Fs — fill
  - Ls — line
  - OI — outline
  - St — status.
6. To view or edit the style override settings for the selected element, click on the corresponding tabs in the section to the right of the dialog.
  - **Text (Ts)** tab — allows you to define a **Font Override**, a **Font Color Override** or **Blink** settings for the text that is used.
  - **Fill (Fs)** tab — allows you to define a **Fill Override** or **Blink** settings for the fill that is used.
  - **Line (Ls)** tab — allows you to define a **Line Pattern Override**, **Line Weight Override**, **Line Color Override** or **Blink** settings for the line that is used.
  - **Outline (OI)** tab — allows you to select to **Show Outline**, and then define a **Line Pattern**, **Line Weight**, or **Blink** settings for the outline.
  - **Status (St)** — allows you to set the **Image** properties for a Status Element (which uses an image to indicate quality and status). You can **Select** the image used, and specify **Transparent Color**, **Style** and **Alignment** properties.

**Note:** The **Line** and **Fill** properties on the Status (St) tab are not supported in Plant SCADA. They will not affect the style applied to a Status Element.

The **Preview** panel will display the outcome of the current configuration when the selected element represents an active state.

7. If required, select the **Reset to Default** button to return the selected element to its default state.
8. Click **OK** to close the Configure Styles dialog.

[Configure Format Styles for Value Display Animations](#)

## Configure Style Overrides for Element Styles

When defining **Styles** for AVEVA™ Industrial Graphics objects, you can configure style overrides for the visual elements of symbols. This allows you to standardize the appearance of the symbols included in a project.

**To configure style overrides for elements styles:**

1. In the **Standards** activity, select **Styles**.
2. On the Styles Configuration dialog, select **Edit**. The Configure Styles dialog will appear.
3. Select the **Element Styles** tab.

- In the **Element Style Overrides** panel, select the element style you would like to modify. If you select a user-defined style, you can double click on it to rename it, or right-click and select **Rename**. The check marks in the Element Style Override panel indicate if an element already has an override configured for it. The columns represent the following:
  - Ts — text
  - Fs — fill
  - Ls — line
  - Ol — outline.
- To view or edit the style override settings for the selected element, click on the corresponding tabs in the section to the right of the dialog.
  - Text (Ts)** tab — allows you to define a **Font Override**, a **Font Color Override** or **Blink** settings for the text that is used.
  - Fill (Fs)** tab — allows you to define a **Fill Override** or **Blink** settings for the fill that is used.
  - Line (Ls)** tab — allows you to define a **Line Pattern Override**, **Line Weight Override**, **Line Color Override** or **Blink** settings for the line that is used.
  - Outline (Ol)** tab — allows you to select to **Show Outline**, and then define a **Line Pattern**, **Line Weight**, or **Blink** settings for the outline.
 The **Preview** panel will display the outcome of the current configuration for the selected element.
- If required, select the **Reset to Default** button to return the selected element to its default state.
- Click **OK** to close the Configure Styles dialog.

**Note:** If the Industrial Graphics Editor is currently open, style configuration changes will not appear until after the editor has been restarted.

## See Also

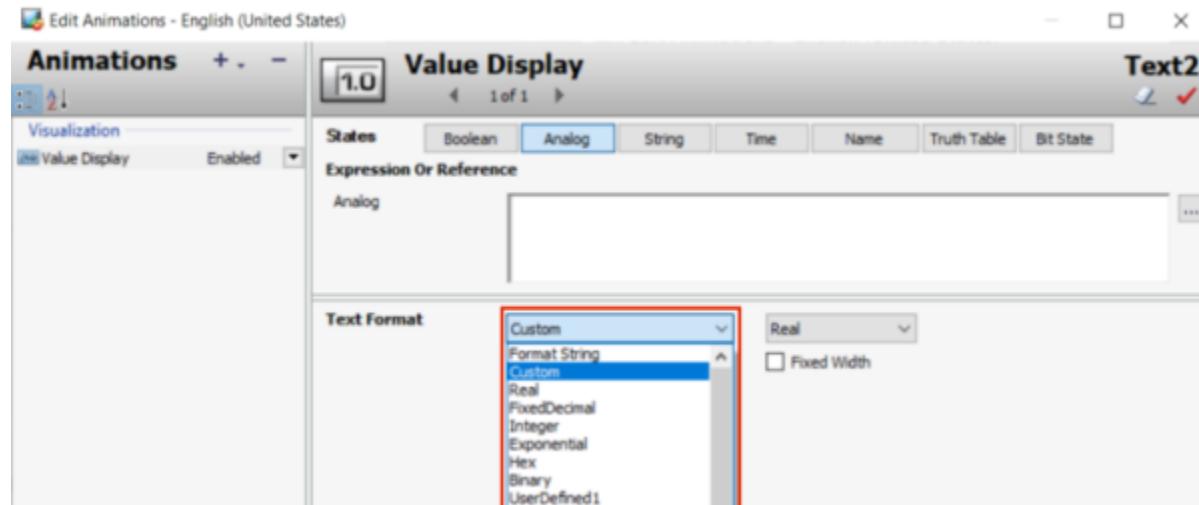

[Configure Style Overrides for Quality and Status Elements](#)

[Configure Format Styles for Value Display Animations](#)

## Configure Format Styles for Value Display Animations

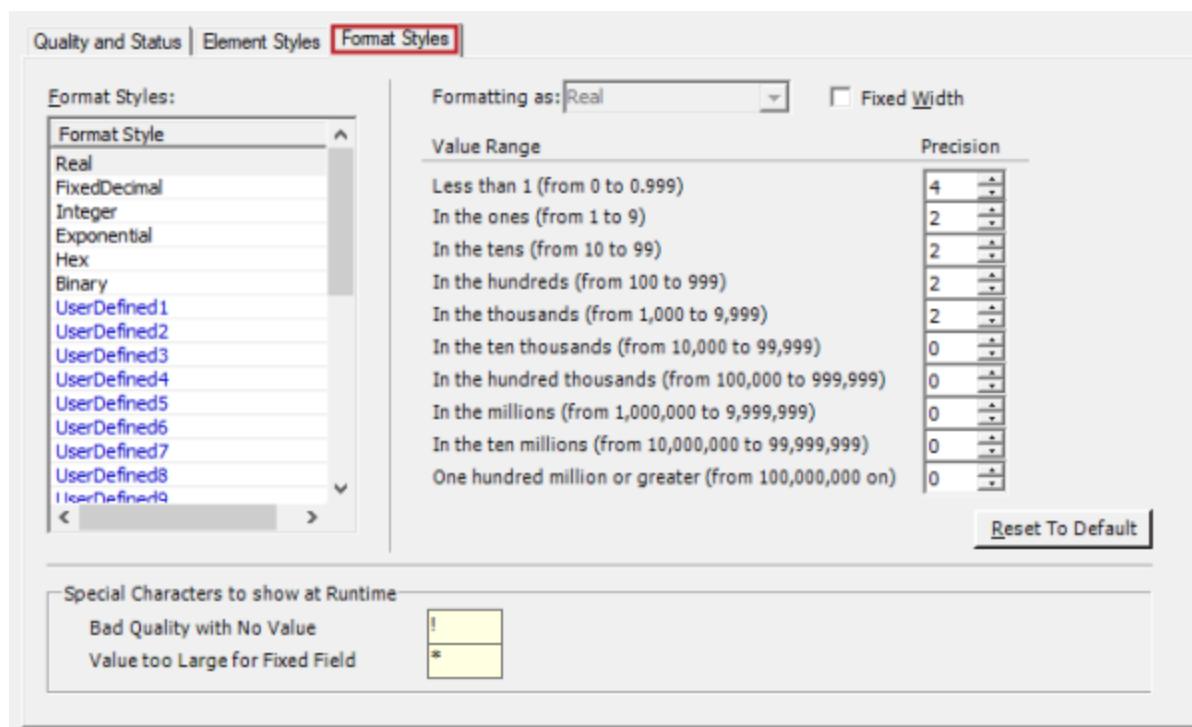

When defining [Styles](#) for AVEVA™ Industrial Graphics objects, you can configure the format used for numeric values in display animations. You can define the value range, precision, and whether or not a number has a fixed width.

Default format styles are available for six numeric value types. You can also configure and rename up to 25 user-defined format styles. You can use the Edit Animations dialog in the Industrial Graphics Editor to apply a format style to an analog Value Display animation.

### To configure format styles for value display animations:

1. In the **Standards** activity, select **Styles**.
2. On the Styles Configuration dialog, select **Edit**. The Configure Styles dialog will appear.
3. Select the **Format Styles** tab.

4. In the **Format Style** panel, select the style you would like to modify.  
If you select a user-defined style, you can double click on it to rename it, or right-click and select **Rename**.
5. Specify the type of value in the **Formatting as** field.
6. Define the level of **Precision** or the number of bits used for the selected value type using the fields that are displayed. For example, if you have selected Real in the **Formatting As** field, you need to specify the Precision used for each Value Range.
7. If required, select **Fixed Width**.
8. Under **Special Characters to show at Runtime**, specify the characters that you would like to use to indicate **Bad Quality with No Value** and **Value Too Large for Fixed Field**. You can only specify one character for each.
9. If required, select the **Reset to Default** button to return the selected format style to its default state.
10. Click **OK** to close the Configure Styles dialog.

**Note:** If the Industrial Graphics Editor is currently open, style configuration changes will not appear until after the editor has been restarted.

## See Also

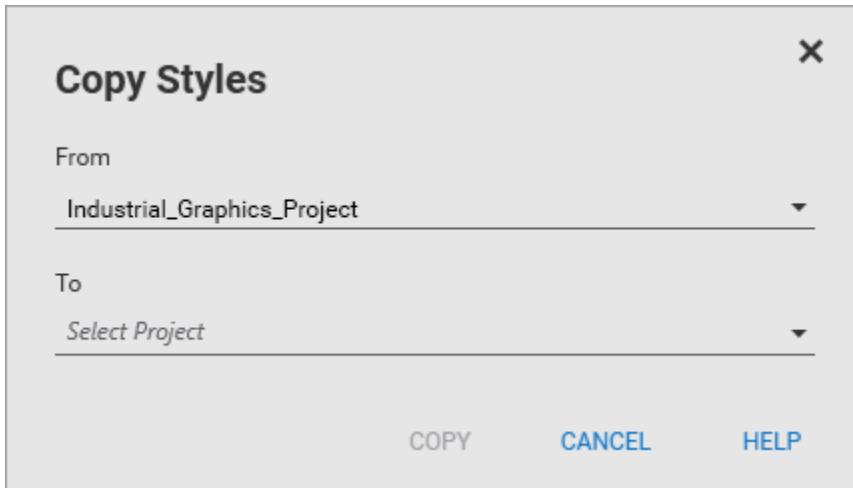

- [Configure Style Overrides for Element Styles](#)  
[Configure Style Overrides for Quality and Status Elements](#)

## Copy Styles to Another Project

You can copy the styles configured for Industrial Graphics from one Plant SCADA project to another.

### To copy Industrial Graphics styles to another project:

1. In the **Standards** activity, select **Styles**.
2. On the command bar, select **Copy Styles**. The Copy Styles dialog will appear.

3. In the **From** field, select the project that includes the styles you want to copy.
4. In the **To** field, select the project to which you want to add the copied styles.
5. Click **COPY**.
6. Click **Yes** on the dialog that appears to confirm that you want to overwrite the styles configured in the destination project.

**Note:** You are not able to copy styles to a system project.

## See Also

- [Configure Style Overrides for Quality and Status Elements](#)
- [Configure Style Overrides for Element Styles](#)
- [Configure Format Styles for Value Display Animations](#)

## Groups

Groups can be used for many purposes, for example, to define a set of users, multiple areas or multiple devices. You can also specify complex groups by defining a group of groups. A group can be used anywhere that an individual entity can be used.

## See Also

- [Add a Group](#)

## Add a Group

To define a **Groups**, you associate a list of entities with a group name.

**To add a group:**

1. In the **Security** activity, select **Groups**.
2. Add a row to the Grid Editor.
3. Type the required information in each column, or in the fields in the Property Grid.  
For a description of the properties, see below.
4. Click **Save**.

## Group Properties

### General Properties

Property	Description
<b>Group Name</b>	The name of the group. Enter a value of 15 characters or less.
<b>Association 1 . . . Association 10</b>	A list of the entities associated with the Group Name. Enter a value of 16 characters or less. An association can be a number, a name, or another group. You can also specify a range of numbers in the format <n1..n2> for example: 4..10 specifies numbers 4,5,6,7,8,9,10.
<b>Comment</b>	Any useful comment. Enter a value of 48 characters or less.

### Project Properties

Property	Description
<b>Project</b>	The project in which the user is included.

## Fonts

Alarm categories and Cicode functions allow you to use predefined fonts, known as **system fonts**, to display text. You also need to define a system font for animated text.

**Note:** If an animation is associated with an I/O device that does not initialize properly at startup or goes offline while the system is running, the associated animation is grayed on the relevant graphics pages (because the values are invalid). You can disable this feature with the [Page]ComBreak parameter. See [Handling Communication Errors in Reports](#).

You can also configure colors for your fonts, see [Configuring Custom Color Fonts](#).

## See Also

[Add a System Font](#)

## Add a System Font

System [fonts](#) can be defined for use with alarm categories and Cicode functions.

### To add a system font:

1. In the **Standards** activity, select **Fonts**.
2. Add a row to the Grid Editor.
3. Type the required information in each column, or in the fields in the Property Grid.  
For a description of the properties, see below.
4. Click **Save**.

## Fonts Properties

### General Properties

Property	Description
<b>Font Name</b>	The name of the font. Unlike background text, strings, and numbers (which can use any standard Windows font), you need to define a font for animated text.
<b>Font Type</b>	<p>Any text font supported by Windows (31 characters maximum). Choose a font type from the menu. You can also specify bold, italic, and underlined text. To specify any of these options, append the appropriate specifier to the font type, for example:</p> <ul style="list-style-type: none"><li>• "Courier,B" specifies bold characters.</li><li>• "Helv,I" specifies italic characters.</li><li>• "TmsRmn,U" specifies underlined text.</li></ul> <p>You can also specify multiple options, for example, "Courier,B,I,U" specifies bold, italic, and underlined characters.</p> <p><b>Note:</b> To use a font that is not displayed in the menu, you need to install the font on your computer before you can use it in your system. To view, install, or remove Windows fonts, use the Windows Control Panel. Refer to your Windows documentation for details. (If your system uses a network, every computer needs to have the font installed.)</p>
<b>Pixel Size</b>	The size of the displayed text. You can specify text

Property	Description
	<p>fonts in pixels or points.</p> <p>To specify a point size, enter a negative number in the <b>Pixel Size</b> field; for example, "—10" specifies a ten-point font size. Be aware that you can only specify a point size as a whole number (integer).</p> <p>If you have not installed the Font Type (or Pixel Size) on your system, a default font and/or size is used that most closely resembles the font and/or size you have specified.</p> <p>If you use a point size, the size remains constant across screen resolutions. On low-resolution screens, the font appears larger than on high-resolution screens, which might cause misalignment of animation. Only use a point size to display text on computer screens of the same resolution.</p>
<b>Foreground Color</b>	<p>The foreground color of the displayed text (i.e., the color of the text characters). You can use a predefined color label, a user-defined custom label, or the RGB encoded number generated by the function <a href="#">MakeColour</a>.</p> <p><b>Note:</b> Avoid confusing predefined labels with the color Name feature associated with the Color Picker. You cannot use color names with this dialog; doing so generates a compile error message.</p>
<b>Background Color</b>	<p>The background color of the displayed text. You can use a predefined color label (accessible via the menu), a user-defined custom label, or the RGB encoded number generated by the function <a href="#">MakeColour</a>.</p> <p>This property is optional. If a background color is not specified, it defaults to transparent.</p>
<b>Comment</b>	Any useful comment (48 characters maximum).
<b>Foreground Flash</b>	<p>The secondary color applied to the font if using flashing color for your text characters. You can use a predefined color label (accessible via the menu), a user-defined custom label, or the RGB encoded number generated by the function <a href="#">MakeColour</a>.</p>
<b>Background Flash</b>	<p>The secondary color applied to the background if using flashing color. You can use a predefined color label (accessible via the menu), a user-defined custom label, or the RGB encoded number generated by the function <a href="#">MakeColour</a>.</p>

Property	Description
	If a color is not specified, the text remains solid.

**Project Properties**

Property	Description
<b>Project</b>	The project in which the font is included.

**See Also**

[Configuring Custom Color Fonts](#)

## Configuring Custom Color Fonts

Colors are referenced by using hex codes for red, green and blue (RGB) values. You can view RGB values (in decimal) of a selected color by choosing **Tools | Edit Favorite Colors** in **Graphics Builder**.

If, for example, the color you want to use has the values R = 128, G = 170, B = 213, you can convert these to their hex equivalents (R = 0x80, G = 0xAA, B = 0xD5).

If you define a label for your color, you can use decimal or hex values. For example:

- **Label Name:** Plate\_Blue
- **Expression:** 0x80AAD5 (or 8432341)

Once you have defined your label, you can create fonts to use in your project for alarm categories, Cicode functions, and button objects. For example, use the Fonts dialog box to define a font with the following properties:

- **Font Name:** Plate\_Font
- **Font Type:** Arial
- **Pixel Size:** 12
- **Foreground Color:** Plate\_Blue

**See Also**

[Fonts](#)

## Setup

The Setup activity is intended to manage assets that are unlikely to require ongoing configuration once they have been set up.

The following features are configured in the Setup activity:

- [Alarming](#)

- Project Database Parameters
- Devices
- Triggering Events
- Languages
- Keyboard Keys
- Custom Files.

## Alarming

The **Alarming** view in the **Setup** activity is where you configure project-wide settings that relate to the management of alarms. These settings include:

- Alarm categories (see [Add an Alarm Category](#))
- Priority display properties (see [Configure Display Properties for an Alarm Priority](#))
- Alarm mode display properties (see [Configure Display Properties for an Alarm Mode](#))
- Cause and response information (see [Add Cause and Response Information to Alarms](#)).

## See Also

[Manage Alarms](#)

## Add an Alarm Category

You can use alarm categories to group the alarms in your Plant SCADA system (see [Categorize Alarms](#)). Up to 16376 alarm categories can be created.

**To add an alarm category to a project:**

1. In the **Setup** activity, select **Alarming**.
2. On the menu below the Command Bar, select **Alarm Categories**.
3. Type the required information in each column, or in the fields in the Property Grid (see below for a description of the fields).
4. Click **Save**.

You will now be able to assign alarms to the category you have created in the System Model activity (see [Assign an Alarm to an Alarm Category](#)).

### **WARNING**

#### **UNINTENDED EQUIPMENT OPERATION**

When configuring an alarm category, do not use a blocking Cicode function in the following fields:

- ON Action

- OFF Action
- ACK Action.

A blocking function or a lengthy operation will affect the polling of alarms, and may result in slow or delayed alarm processing. Therefore, do not configure long running functions in these fields but keep the functions simple or they may not be executed correctly. To execute complicated functions, it is recommended to use TaskNew() function to initiate a new task which performs the required function in a separate task.

If the configuration of these fields is updated and reloaded by the alarm server, the new actions will be executed. However, the updated configuration can not call any new or updated user functions which did not exist before reloading, even if a new task is used to run it. If used, nothing will happen until the alarm server is restarted. Hence, confirm that the updated actions do not refer to brand new or updated functions or tasks prior to reloading the alarm server.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

## Alarm Category Properties

### General Properties

Field	Description
Category	<p>The alarm category as a numeric value (0-16375). The following category numbers are reserved:</p> <ul style="list-style-type: none"><li>• Category 0 is reserved for selecting all the alarms with all categories.</li><li>• Category 254 is reserved for user-created alarm summary entries.</li><li>• Category 255 is reserved for hardware alarms.</li></ul> <p>This field supports up to 16 characters.</p>
Priority	<p>The priority applied to alarms assigned to this alarm category (0- 255). Alarm priority determines the order in which alarms are displayed, acknowledged, enabled and so on.</p> <p>Priority 1 is the highest priority, and priority 255 is the lowest. For example, if alarms with priorities 1 to 8 were displayed, priority 1 alarms would be displayed first in their time/date order, then priority 2 alarms, then priority 3, and so on up to priority 8.</p> <p>Priority 0 is the default priority. It is reserved for selecting alarms of all priorities when referencing priorities. For example, if you use the Cicode function <b>AlarmSetInfo</b> to change an alarms list so that alarms of all priorities are displayed, you would use the following settings:</p>

Field	Description
	<p><i>Type = 7, Value = 0.</i></p> <p><b>Note:</b> When priority 0 is used to display alarms of priorities, priority 0 only alarms will display first, followed by priority 1 alarms, then priority 2, and so on. You can also customize the order in which alarms are displayed on an alarm summary page using the SummarySort and SummarySortMode parameters. (This order will override the alarm category priority order.)</p>
<b>Show on Active</b>	<p>Determines if alarms assigned to this category display on active alarms pages.</p> <p>You can set this field to TRUE or FALSE. The default value is TRUE.</p> <p><b>Note:</b> For Situational Awareness projects, <b>Show On Active</b> must be blank (TRUE) for associated alarm counts to appear on the Page Navigation Zone and Tree Views.</p>
<b>Show on Summary</b>	<p>Determines if alarms assigned to this category display on alarm summary pages.</p> <p>You can set this field to TRUE or FALSE. The default value is TRUE.</p>
<b>Comment</b>	Any useful comment.

#### Font Properties

Field	Description
<b>UnAck On Font</b>	<p>Defines the font used to display alarms that are unacknowledged and active.</p> <p>This property is optional. If no font is specified, the font defaults to 10pt YELLOW.</p> <p>This field supports up to 16 characters.</p>
<b>UnAck Off Font</b>	<p>Defines the font used to display alarms that are unacknowledged and no longer active.</p> <p>This property is optional. If no font is specified, the font defaults to 10pt BROWN.</p> <p>This field supports up to 16 characters.</p>
<b>Ack On Font</b>	<p>Defines the font used to display alarms that have been acknowledged and are still active.</p> <p>This property is optional. If no font is specified, the font defaults to 10pt CYAN.</p>

Field	Description
	This field supports up to 16 characters.
<b>Ack Off Font</b>	Defines the font used to display alarms that have been acknowledged and are no longer active. This property is optional. If no font is specified, the font defaults to 10pt WHITE. This field supports up to 16 characters.
<b>Disabled Font</b>	Defines the font used to display disabled alarms. This property is optional. If no font is specified, the font defaults to 10pt WHITE. This field supports up to 16 characters.

*Format Properties*

Field	Description
<b>Alarm Format</b>	Defines the screen display format used on active alarm pages for alarms in this category. <b>Note:</b> Alarm pages based on the tab-style templates will not consider individual formats for each category. The screen display format used for an alarm page is set by the first available of the following definitions: <ul style="list-style-type: none"> <li>• [Format]Alarm parameter</li> <li>• The Alarm Format specified for category 0</li> <li>• The default alarm display format.</li> </ul> When applied to pages based on a standard template, Alarm Format specifies how the data for alarms in this category are displayed on alarms pages (on the screen only). Each alarm displays on the alarms page in a single line, for example: 12:32:21RFP3 Raw Feed pump 3 Overload When alarms are displayed using variable width fonts (such as Arial or Helvetica), the alarm fields may not align properly across different rows. This can be avoided by using a field separator in the alarm format configuration instead of just a space. Tab characters, denoted by either " <code>^t</code> " (horizontal tab) or " <code>^v</code> " (vertical tab), between the alarm fields will act as alignment points in your alarm display. If you leave the Alarm Format field blank, the format defaults to: <code>{Time,12} {Tag,10} {Name,20} {Desc,32}</code> You can change this default setting with the parameter

Field	Description
	<p>[Alarm]DefDspFmt.</p> <p>See <a href="#">Alarm Format Fields</a> for details about each field type.</p> <p><b>Note:</b> If an alarm value is longer than the field it is to be displayed in, it will be truncated or replaced with the #OVR ("overflow of format width") alert message. When the alarm is logged to a device (i.e. printed or written to a file or database), the format specified for the logging device overrides the display format.</p>
<b>Summary Format</b>	<p>Defines the screen display format used on alarm summary pages for alarms in this category.</p> <p><b>Note:</b> Alarm summary pages based on the tab-style templates will not consider individual formats for each category. The screen display format used for an alarm summary page is set by the first available of the following definitions:</p> <ul style="list-style-type: none"> <li>• [Format]Alarm parameter</li> <li>• The Alarm format specified for category 0</li> <li>• Default Alarm display format.</li> </ul> <p>When applied to pages based on a standard template, Summary Format is defined the same way as <b>Alarm Format</b> (see above). However, you can also use additional data fields.</p> <p>See <a href="#">Alarm Format Fields</a> for details about each field type.</p> <p>If you leave the Summary Format field blank, the format defaults to:</p> <pre>{Name,20} {OnTime,8} {OffTime,8} {DeltaTime,8} {Comment,22}</pre> <p>You can change this default setting with the parameter <b>[Alarm]DefSumFmt</b>.</p> <p><b>Note:</b> When an alarm is logged to a summary device (i.e. printed or written to a file or database), the format specified for the logging device overrides the display format.</p>
<b>SOE Format</b>	<p>Defines the screen display format used on sequence of event (SOE) pages for alarms in this category.</p> <p><b>Note:</b> SOE pages based on the tab-style templates will not consider individual formats for each category. The screen display format used for an SOE page is set by the first available of the following definitions:</p> <ul style="list-style-type: none"> <li>• [Format]Alarm parameter</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>The Alarm format specified for category 0</li> <li>Default Alarm display format.</li> </ul> <p>When applied to pages based on a standard template, SOE Format is defined the same way as <b>Alarm Format</b> (see above). However, you can also use additional data fields.</p> <p>See <a href="#">Alarm Format Fields</a> for details about each field type.</p> <p>If you leave the SOE Format field blank, the format defaults to:</p> <pre>{DATE,16} {TIME,16} {TAG,10} {NAME,15} {MESSAGE,64} {STATE,16} {CLASSIFICATION,13} {USERNAME,16} {USERLOCATION,16}</pre> <p>You can change this default setting with the parameter <b>[Alarm]DefSOEFmt</b>.</p>

**Actions Properties**

Field	Description
<b>ON Action</b>	<p>Specifies a Cicode command that is executed when an alarm of this Category becomes active (ON).</p> <p><b>Example:</b> Where <b>ON Action</b> is <b>STOP_PROCESS = 1;</b> In this example the digital variable <b>STOP_PROCESS</b> is set to ON when an alarm in this category is triggered.</p> <p><b>Note:</b> Do not put a blocking Cicode function in this field. The alarm system executes ON, OFF, or ACK actions within the polling loop. A blocking function will affect the polling of alarms, and may result in slow or delayed alarm processing.</p> <p>A special case of this command occurs when the ON Action is self-referring, with a form such as TAG1 = TAG1 + 1. This command will not work properly since tags are not reread before processing the ON action (for performance reasons). This particular command will therefore initially set the value of TAG1 to 1 rather than incrementing it.</p> <p>To correctly run a command of this type in the ON Action, use TaskNew() to run your own Cicode function to perform the tag command. For example: ON Action is TaskNew("MyFunc","Data",5);</p>
<b>OFF Action</b>	Specifies a Cicode command that is executed when an

Field	Description
	<p>alarm of this Category is reset (OFF).</p> <p><b>Example:</b></p> <p>Where <b>OFF Action</b> is <b>ENABLE_PROCESS = 1;</b></p> <p>In this example the digital variable ENABLE_PROCESS is set to ON when an alarm in this category is reset.</p> <p><b>Note:</b>Do not put a blocking Cicode function in this field. The alarm system executes ON, OFF, or ACK actions within the polling loop. A blocking function will affect the polling of alarms, and may result in slow or delayed alarm processing.</p>
<b>ACK Action</b>	<p>A Cicode command that is executed when an alarm of this Category is acknowledged.</p> <p><b>Note:</b> Do not put a blocking Cicode function in this field. The alarm system executes ON, OFF, or ACK actions within the polling loop. A blocking function will affect the polling of alarms, and may result in slow or delayed alarm processing.</p>

### Storage Properties

Field	Description
<b>Alarm Acquisition Error</b>	<p>Acquisition error is an error related to acquiring data from I/O sub-system for the underlying tag and/or expression, for example, Device Offline, Tag Unknown, etc. (Integer length 6).</p> <p>All acquisition errors are stored for each alarm record separately within the alarm server as a new AcqError field. They are not logged and no hardware alarm is raised from them.</p> <p>The AcqError field stores the error as the Plant SCADA error code (for example, NO ERROR). This field is made accessible through the alarm browse functionality. If there are multiple acquisition errors for a single alarm record, then the first of these is stored within the system.</p>
<b>Summary Device</b>	<p>Specified the device to which the alarm summary is sent.</p> <p>The format specified in the device is used instead the display format. If not specified, alarm summaries are not logged.</p>
<b>Log Device</b>	<p>Specifies the device to which alarm state changes are logged. An alarm entry is made in the log device each</p>

Field	Description
	<p>time an alarm assigned to the category changes state (on, off, acknowledged, enabled, or disabled).</p> <p>When the alarm is printed, or written to a file or device, the format specified in the device overrides the display format.</p> <p>If not specified, alarm state changes are not logged.</p>
<b>Log Transitions: ON</b>	<p>Determines if the alarm details are logged when an alarm assigned to this category becomes active.</p> <p>You can set this field to TRUE or FALSE. The default value is TRUE.</p>
<b>Log Transitions: OFF</b>	<p>Determines if the alarm details are logged when an alarm assigned to this category becomes inactive.</p> <p>You can set this field to TRUE or FALSE. The default value is TRUE.</p>
<b>Log Transitions: ACK</b>	<p>Determines if the alarm details are logged when an alarm assigned to this category is acknowledged.</p> <p>You can set this field to TRUE or FALSE. The default value is TRUE.</p>

### Project Properties

Property	Description
<b>Project</b>	The project in which the specified alarm category is included.

## Configure Display Properties for an Alarm Priority

You can configure optional display properties for each alarm priority value (1-255). This allows you to:

- Specify a name for a priority value to provide a meaningful representation of its purpose.
  - Define background and foreground colors that provide a visual representation of priority on a graphics page.
- 
- Note:** Transparent colors are not supported.
- Associate Genies with a priority that you can use as an alarm flag or icon.

**To configure display properties for an alarm priority:**

1. In the **Setup** activity, select **Alarming**.
2. On the menu below the Command Bar, select **Alarm Priorities**.
3. Add a row to the Grid Editor.
4. Type the required information in each column, or in the fields in the Property Grid (see below for a description of the fields).
5. Click **Save**.

---

**Note:** Though the functionality is supported, it is advised that you do not configure the top three alarm priorities with **Show On Indicator** set to **FALSE**.

---

## Alarm Priority Properties

### General Properties

Field	Description
<b>Priority</b>	The priority value (1- 255).
<b>Display Name</b>	Can be used to provide a meaningful representation of a priority value.
<b>Short Name</b>	Can be used to provide a short-form name that represents the priority value. For example, you can use this short name as a label on an alarm flag.
<b>Comment</b>	Any useful comment.
<b>Show on Indicator</b>	<p>Specifies if the priority will be ignored or not on Alarm Indicator. Default is TRUE (priority is not ignored). If this value is FALSE, Alarm Indicator will ignore this priority and take the next prioritized alarms. For example, if there are two alarms raised with priority 3 and 4 in the same graphic object, and priority 3 has Show on Indicator set to FALSE, the alarm border will ignore alarms set to priority 3 and display alarm border using priority 4 color codes.</p> <p>When this value is set to FALSE, it will not be included in the alarm counts on any alarm equipment tree views or navigation areas.</p> <p><b>Note:</b> You still need to configure correct color codes on color properties even if "Show on Indicator" value is set to FALSE as these colors are used when there is server – client property mismatch caused by alarm server reloading. For example, when that field on server side configuration has been changed from TRUE to FALSE on server side only by reloading, these colors</p>

Field	Description
	may appear on display client's alarm borders even if client configuration has that field set to FALSE. As this situation indicates configuration mismatch, operators should get updated projects from engineers and restart the client.
<b>UnAck On Foreground Color</b>	Specifies the foreground color to display when an alarm of this priority is in an ON state and unacknowledged.
<b>UnAck On Background Color</b>	Specifies the background color to display when an alarm of this priority is in an ON state and unacknowledged.
<b>Ack On Foreground Color</b>	Specifies the foreground color to display when an alarm of this priority is in an ON state and acknowledged.
<b>Ack On Background Color</b>	Specifies the background color to display when an alarm of this priority is in an ON state and acknowledged.
<b>UnAck Off Foreground Color</b>	Specifies the foreground color to display when an alarm of this priority is in an OFF state and still unacknowledged.
<b>UnAck Off Background Color</b>	Specifies the background color to display when an alarm of this priority is in an OFF state and still unacknowledged.
<b>Library Name</b>	The name of library to which the associated Genies belong (see below).
<b>Genie Name</b>	The name of a Genie that you want to use as a visual representation of this priority. This allows the Genie to be used as an alarm flag (see <a href="#">Use Alarm Indicators</a> ).
<b>Small Genie Name</b>	<p>The name of a small Genie that you want to use as a visual representation of this priority. This allows the Genie to be used as a small icon that indicates alarm priority. For example, it can be used for:</p> <ul style="list-style-type: none"> <li>• Priority And State symbols in an alarms list (see <a href="#">Create Priority and State Symbols for an Alarms List</a>).</li> <li>• The alarm counts on a tree-view (see <a href="#">Add a Tree View to a Page</a>).</li> </ul>

Field	Description
	<ul style="list-style-type: none"><li>The alarm counts in the Navigation Zone (see <a href="#">Navigation Zone</a>).</li></ul>

### Project Properties

Property	Description
Project	The project in which the alarm priority is included.

## Configure Display Properties for an Alarm Mode

An alarm mode provides a way to group together any alarms that are currently in the same mode of operation. For example, you can use a mode to represent any alarms that are currently shelved or disabled. This allows you to configure global display properties that can be applied to an alarm as it moves into the specified mode of operation. For example, you can:

- Define background and foreground colors that provide a visual representation of a mode on a graphics page.
- Associate Genies with a mode that you can use as an alarm flag or icon.

**Note:** You can only use the predefined modes that are included with Plant SCADA, that is, Shelved/Disabled.

### To configure display properties for an alarm mode:

- In the **Setup** activity, select **Alarming**.
- On the menu below the Command Bar, select **Alarm Modes**.
- Add a row to the Grid Editor.
- Type the required information in each column, or in the fields in the Property Grid (see below for a description of the fields).
- Click **Save**.

## Alarm Mode Properties

### General Properties

Field	Description
<b>Display Name</b>	Can be used to provide a meaningful representation of a mode. You need to select a name from those available in the drop-down list, otherwise a compile error will be generated.
<b>Short Name</b>	Can be used to provide a short-form name that represents the mode. For example, you can use this short name as a label on an alarm flag.
<b>Comment</b>	Any useful comment.
<b>Foreground Color</b>	Defines the foreground color to display when an alarm is in the specified mode of operation. Transparent colors are not supported.
<b>Background Color</b>	Defines the background color to display when an alarm is in the specified mode of operation. Transparent colors are not supported.
<b>Library Name</b>	The name of library to which the associated Genies belong (see below).
<b>Genie Name</b>	The name of a Genie that you want to use as a visual representation of this mode. This allows the Genie to be used as an alarm flag (see <a href="#">Use Alarm Indicators</a> ).
<b>Thumbnail Name</b>	The name of a small Genie that you want to use as a visual representation of this mode. This allows the Genie to be used as a small icon that indicates alarm priority.

**Project Properties**

Property	Description
<b>Project</b>	The project in which the alarm mode is included.

**See Also**[Use Alarm Indicators](#)[Shelve Alarms](#)[Disable Alarms](#)**Add Cause and Response Information to Alarms**

You can add cause and response information to an alarm that describes the circumstances that would cause the alarm and the most appropriate course of action to take. This information can be presented to an operator at

runtime. See [Provide Cause and Response Information to Operators](#).

You can configure up to eight alarm responses for each alarm tag.

### To add cause and response information for alarms:

1. In the **Setup** activity, select **Alarming**.
2. On the menu below the Command Bar, select **Cause and Response**.
3. Add a row to the Grid Editor.
4. Type the required information in each column, or in the fields in the Property Grid (see below for a description of the fields).
5. Click **Save**.

## Cause and Response Properties

### General Properties

Field	Description
<b>Cluster</b>	The name of the cluster that runs the alarm. This field needs to be defined if your project has more than one cluster.
<b>Alarm Tag</b>	The alarm tag associated with the cause and response information.

### Cause and Response Properties

Field	Description
<b>Cause</b>	A description of the cause of the alarm (maximum of 254 characters).
<b>Response</b>	A description of the appropriate response to the alarm (maximum of 254 characters).
<b>Response Time</b>	A description of the period of time in which the specified response should be acted upon (maximum of 254 characters).
<b>Consequence</b>	A description of the likely outcome if the suggested response is not acted upon within the specified response time (maximum of 254 characters).

### Project Properties

Property	Description
<b>Project</b>	The project in which the cause and response information is included.

[Manage Alarms](#)

## Project Database Parameters

Project database parameters can be used to set nominal defaults for parameters that are local to a specific Plant SCADA project, rather than a particular computer. For example, you could use the project database parameters to specify login requirements for all computers in a Plant SCADA system.

**Note:** Parameter settings in the Citect.ini file take precedence over project database parameters. For more information, see [About Parameters](#).

### To set parameters in the project database:

1. In the **Setup** activity, select **Parameters**.
2. Add a row to the Grid Editor.
3. Type the required information in each column, or in the Property Grid (see below for a description of the properties).
4. Click **Save**.

If you set (or change) parameters in the project database, you need to recompile the project before the new parameter settings are applied.

## Parameters Properties

### General Properties

Field	Description
<b>Section Name</b>	The parameter section. Enter a value of 48 characters or less.
<b>Name</b>	The name of the parameter for which you want to define a value. Enter a value of 64 characters or less. Numeric and digital variables have a default value of 0 and string variables default to "" (empty string). If you do not specify a data type, the local variable will be treated as 16-bit integer.
<b>Value</b>	The value of the parameter. Enter a value of 254 characters or less.
<b>Comment</b>	Any useful comment (254 characters).

### Project Properties

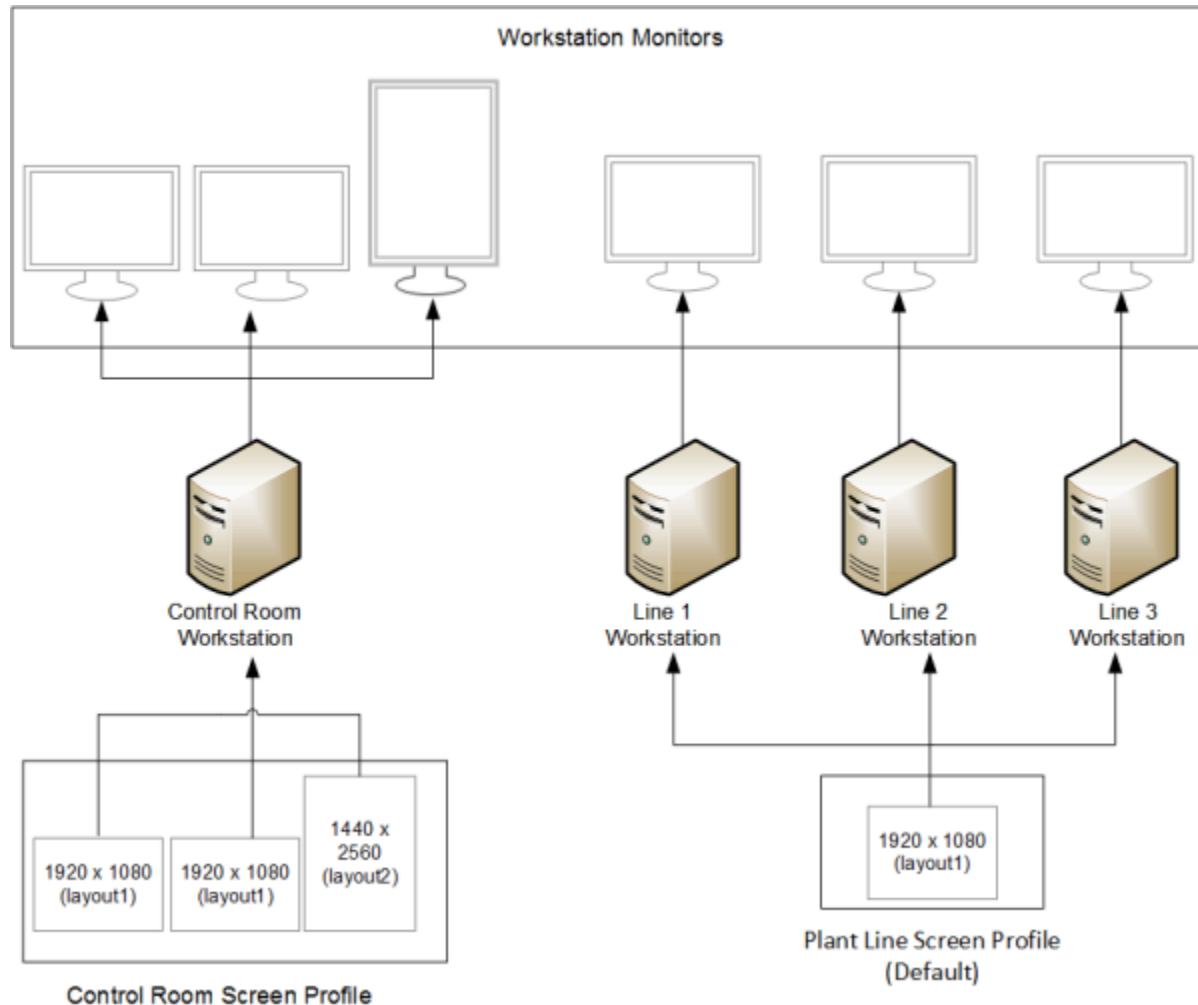

Property	Description
<b>Project</b>	The project in which the project database parameter is configured.

## Screen Profiles

A screen profile specifies the physical characteristics of one or more workstation screens and how these screens are arranged with respect to each other. Each screen icon that appears in a screen profile represents a physical screen.

You can create, manage and configure screen profiles with the Screen Profile Editor, which is displayed below the Screen Profile table in the **Setup** activity. You can create as many screen profiles as you want.

A screen profile is applied at runtime using the Setup Wizard (see [Screen Setup](#)).

### Add a screen profile to a project:

1. In the **Setup** activity, select **Screen Profiles**.
2. Type the required information in each column, or in the fields in the Property Grid (see below for a

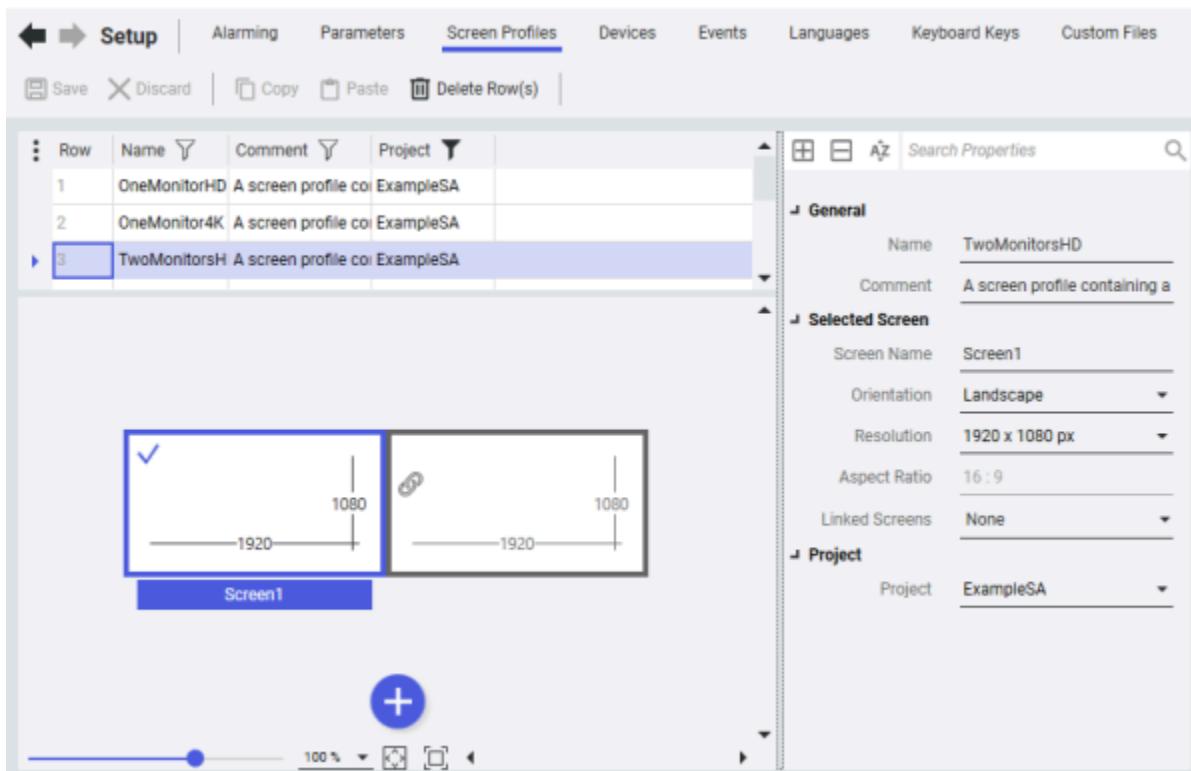

description of the fields).

3. Click **Save**.

Selecting a screen profile in the grid displays the arrangement of monitors for that profile.

#### Add a screen profile using the editor:

The editor that allows you to manage screens is located below the Screen Profiles table in the **Setup** activity. A maximum of 20 screens can be added to a profile.

Click to add a new screen (monitor). A new screen is always added to the right of the selected screen and its resolution is the same as the selected screen. For each screen defined in a profile, you need to specify a name, the screen's orientation and resolution. Also, you need to arrange the screen icons in a screen profile to represent the configuration of actual client workstation screens. You can do this by dragging and dropping the screen icon to match its physical location. The dragged rectangle is red when in an invalid position and green when valid.

By default, the first screen that you add is named "Primary" and the following screens are named "Screen1", "Screen2" and so on. However, these names may be changed in the Screen Profile Property Grid or table. The primary screen displays a solid green tick.

To set a screen as the primary screen, click the clear green tick mark displayed in the top left hand corner of the screen icon. The tick mark changes to a solid green mark, and the screen becomes the primary screen.

---

**Note:** The primary screen should match the primary monitor configuration on Windows on the client workstation.

To delete a screen, click on the top right corner of the screen icon. Alternatively, select the screen by clicking on it and press the **Delete** keyboard button.

To zoom in/out to view the arrangement of screens, use the slider to increase or decrease the zoom. You can also

select the zoom from the list of values next to the slider, or type the required value.

Clicking  adjusts the arrangement of screens to fit the screen. Clicking  sets the zoom to 100%.

## Screen Profile Properties

### General Properties

Field	Description
<b>Name</b>	Name to identify the screen profile. Names should be unique within a project, and cannot contain symbols or characters such as /, \, ?, *, ", <, > and  . Names can contain a maximum of 64 characters.
<b>Comment</b>	Any useful comment about or description of the screen profile.

### Project Properties

Property	Description
<b>Project</b>	The project for which the specified screen profile is created.

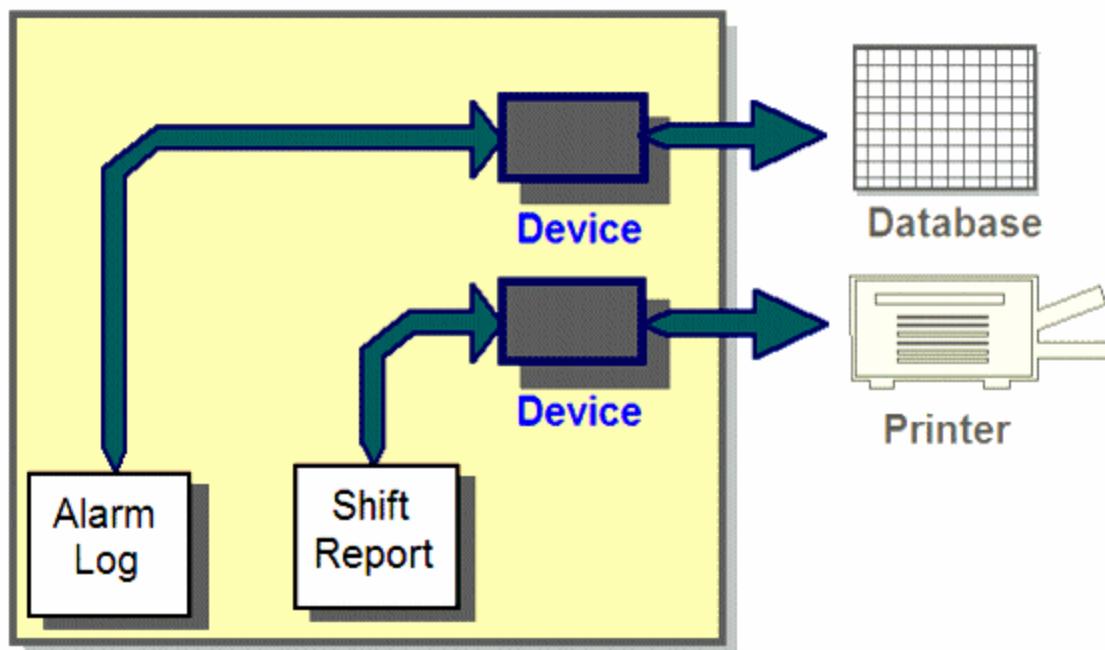

### Selected Screen Properties

Property	Description
<b>Screen Name</b>	<p>The name given to the screen. By default, the primary screen that you add is named "Screen1" and the following screens are named "Screen2", "Screen3" and so on. However, these names may be changed.</p> <p><b>Note:</b> Screen1 cannot be deleted. However, it can be renamed and re-positioned.</p> <p><b>Note:</b> The first screen (Screen1) should match the Windows primary monitor configuration on the client workstation.</p> <p>The screen name should follow these naming rules:</p> <ul style="list-style-type: none"> <li>• Should be less than 32 characters</li> <li>• Can contain only letters, numbers and _ (underscore)</li> <li>• Cannot start with a number</li> <li>• Should contain at least one letter</li> <li>• Should be unique within a screen profile</li> </ul>
<b>Orientation</b>	Whether the display is in Portrait or Landscape mode.

Property	Description
<b>Resolution</b>	<p>Display resolution of the selected screen. You can set the resolution to values between 768 x 768 and 16384 x 16384, or select from the following:</p> <ul style="list-style-type: none"> <li>• XGA (1024 x 768)</li> <li>• SXGA (1280 x 1024)</li> <li>• HD768 (1366 x 768)</li> <li>• WSXGA (1440 x 900)</li> <li>• HD900 (1600 x 900)</li> <li>• UXGA (1600 x 1200)</li> <li>• HD1080 (1920 x 1080) - This is the default.</li> <li>• WUXGA (1920 x 1200)</li> <li>• QHD (2560 x 1440)</li> <li>• WQXGA (2560 x 1600)</li> <li>• 4K UHD (3840 x 2160)</li> </ul>
<b>Aspect Ratio</b>	<p>This is automatically set depending upon the resolution of the screen. This cannot be modified.</p>
<b>Linked Screens</b>	<p>Select screen(s) from the list to link to the current screen. The current screen and linked screens share the same context. Linked screens function as a group and can be linked (as a group) to an individual screen.</p> <p><b>Note:</b> An unlinked screen can be linked only to another unlinked screen individually.</p> <p>Linked screens display a link icon when selected.</p>

## Devices

In a Plant SCADA system, a device is used to transfer high-level data such as reports, command logs or alarm logs. For example, you could use a device to send the output from a report to a printer, or you could use a device to save your alarm logs to a database.

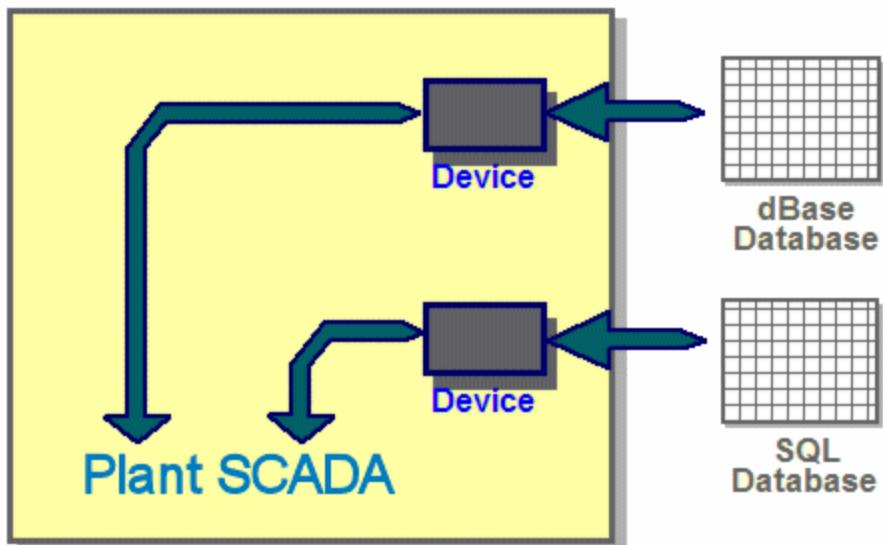

**Note:** A device is very different to an I/O device. An I/O device allows Plant SCADA to exchange plant floor data with a physical piece of equipment via a communications cable. If you are looking for information on I/O devices, see [I/O Devices](#).

A device can write data to the following:

- RTF files
- ASCII files
- dBASE databases
- SQL databases (through ODBC-compliant drivers)
- Printers (connected to your Plant SCADA computer or network).

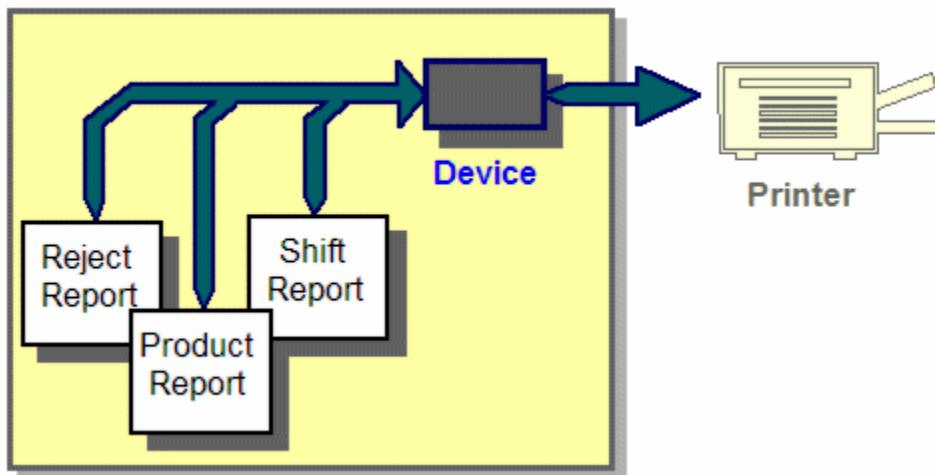

You can also read data from the following sources using a device and Cicode functions:

- ASCII files
- dBASE databases
- SQL databases

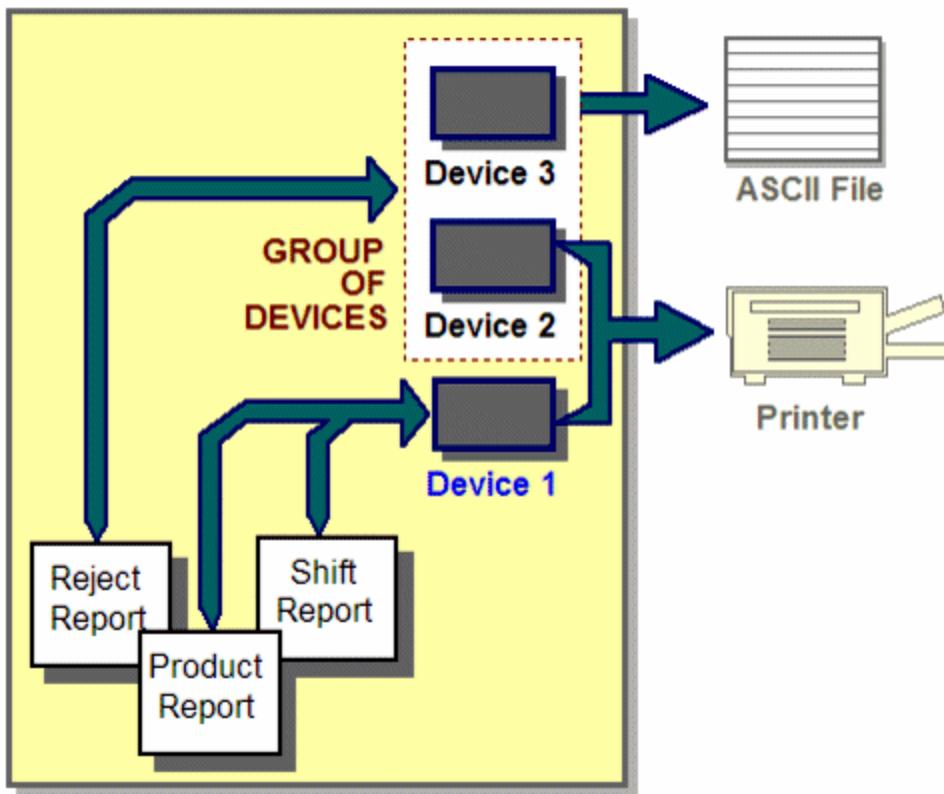

**Note:** You can also use ActiveX data objects (ADO.NET) to create an interface between Plant SCADA and an SQL database. For more information, see [Using Structured Query Language](#).

You can configure any number of devices in a Plant SCADA system. However, a device can be used as a common resource. This means you could configure a single device that sends the output of all your reports to a printer (when they are requested).

You can also configure device groups. A group of devices allows you to export the same data to two (or more) locations.

You can read from a devices group, however, data is only read from the first device in the group.

**Note:** The Plant SCADA Include project contains a set of predefined devices. For a description of the devices that are available, see [Predefined Devices](#).

## Add a Device

[Devices](#) are used to transfer high-level data such as reports, command logs or alarm logs.

### To add a device:

1. In the **Setup** activity, select **Devices**.
2. Add a row to the Grid Editor.
3. Type the required information in each column, or in the fields in the Property Grid.  
For a description of the properties, see below.
4. Click **Save**.

**Note:** SQL devices are configured differently to other types of devices. For information, see [Configure SQL](#)

---

[Devices.](#)

## Device Properties

### General Properties

Property	Description
Name	The name of the device. The field is not case-sensitive.
Format	<p>Specifies how the data is formatted in the device. The format is determined by the type of device, and the data that is sent to the device (see <a href="#">Format Data in the Device</a>). Enter a value of 120 characters or less.</p> <p>If you are logging alarms or command messages, you need to specify a format, or no data is written to the device.</p> <p>See <a href="#">Command Fields</a> for a list of the fields (or field combinations) you can use to format a command logging device.</p> <p>For a list of the fields you can use to format an alarm logging device, see the following:</p> <ul style="list-style-type: none"><li>• <a href="#">Alarm Display Fields</a></li><li>• <a href="#">Alarm SOE Fields</a></li><li>• <a href="#">Alarm Summary Fields</a>.</li></ul> <p><b>Note:</b> The log device for a command is specified wherever the command is defined. The log device for an alarm is specified at the Alarm Categories form.</p> <p>When producing reports, the format is ignored. (The format defined for the report is used to write the report to the device.)</p>
Header	Additional information for the device. Enter a value of 254 characters or less.
File Name	The file name of the device. Enter a value of 253 characters or less.
Type	<p>The type of device. Enter a value of 16 characters or less.</p> <ul style="list-style-type: none"><li>• ASCII_DEV - ASCII file *</li><li>• PRINTER_DEV - Printer</li><li>• DBASE_DEV - dBASE file</li><li>• SQL_DEV - SQL database</li></ul>

Property	Description
	<p>* When defining RTF report properties, an ASCII device would be selected if the report was to be saved as a file.</p> <p>This property is optional. If you do not specify a type, the device <b>Type</b> is ASCII_DEV unless:</p> <ul style="list-style-type: none"> <li>• The file name is a printer device (LPT1: to LPT4: or COM1: to COM4: or a UNC name), where <b>Type</b> is PRINTER_DEV, or</li> <li>• The file name extension is .DBF, where <b>Type</b> is dBASE_DEV.</li> </ul> <p>See <a href="#">Print Management</a>.</p>
<b>No. Files</b>	<p>The number of history files (see <a href="#">Use Device History Files</a>). Enter a value of 4 characters or less.</p> <p>By default, Plant SCADA creates a single data file for each device. (This data file is called &lt;filename.TXT&gt; or &lt;filename.DBF&gt;, depending whether the device is an ASCII device or database device.) The number of history files you specify here are in addition to the data file.</p> <p><b>Note:</b> If you do not want history files created, you need to enter 0 (zero) here, and set the <a href="#">[Device]CreateHistoryFiles</a> parameter to 0; otherwise, 10 history files will be created as a default. You need to also verify that the data file is of a fixed size. (If the data accumulates, the file eventually fills the hard disk.)</p> <p>If you specify -1 the data is appended to the end of one file.</p> <p>If you are logging alarm, keyboard commands, or reports to the device, specify the number of files to be created, and the time of each file.</p>
<b>Time</b>	<p>The time of day to synchronize the beginning of the history file, in hh:mm:ss (hours:minutes:seconds). Enter a value of 32 characters or less. If you accepted the default number of history files above, and you specify a time and period, 10 history files will be created. If you do not specify a time, the file is synchronized at 0:00:00 (i.e. midnight).</p> <p>If you omit both the time and the period, additional history files will still be created (with the default time and period). If you don't want history files to be</p>

Property	Description
	created, you need to set the <a href="#">[Device]CreateHistoryFiles</a> parameter to 0 (zero).
<b>Period</b>	<p>The period of the history file, in hh:mm:ss (hours:minutes:seconds). Enter a value of 32 characters or less. Alternatively you can:</p> <ul style="list-style-type: none"> <li>Specify a weekly period by entering the day of the week on which to start the history file, for example Monday, Tuesday, Wednesday, etc.</li> <li>Specify a monthly period by entering the day of the month on which to start the history file, for example 1st, 2nd, 3rd, 4th, 5th, etc.</li> <li>Specify a yearly period by entering the day and month on which to start the history file, for example 1st January, 25th February, etc. The day and month needs to be separated by a space.</li> </ul> <p>If you accepted the default number of history files above, and you specify a time and period, 10 history files will be created.</p> <p>If you do not specify a period, the time field will be ignored and the device will assume users will invoke device logging manually.</p> <p>If you omit the time but have specified a period, additional history files will still be created (with the default time mid-night at 00:00:00). If you don't want history files to be created, you need to set the <a href="#">[Device]CreateHistoryFiles</a> parameter to 0 (zero).</p>
<b>Comment</b>	Any useful comment.
<b>Cluster Name</b>	Select a cluster from the list of clusters defined previously with the in the <b>Topology</b> activity of Plant SCADA Studio. If this is a single cluster system this field can be left blank.
<b>Process</b>	Select the type of server (or client) on which the process runs that sends data to the device. This field is used to prevent a history file being created while the device is active. If there is no history processing then this field can be left blank.

## Project Properties

Property	Description
Project	The project that includes the device.

[Configure a Device Group](#)

## Configure SQL Devices

SQL devices are configured and used in a slightly different way than other types of devices.

### To configure an SQLdevice:

1. In the **Setup** activity, select **Devices**.
2. Add a row to the Grid Editor.
3. Complete the following fields:
  - **Name** - Specify a name for the device, for example mySqlDevice.
  - **Format** - Specify the format of the device. The format is the definition of the column names in the target database table. For example:  
`{date,10}{day,15}{month,20}{year,4}`
  - **Header** - Specify the connection string for the database. For example, Driver={SQL Server};Server=MyServer.
  - **File name** - Specify the complete database table name. For example, TestDatabase.dbo.MySqlCalendar.
  - **Type** - The type should be set to SQL\_DEV.
4. Configure the rest of the fields as per other devices, see [Add a Device](#).
5. Click **Save**.

## Example

When configured, the device can be associated with SCADA elements, or used in Cicode. SQL devices are used in Cicode in a slightly different way to other types of devices. For example, the order of DevSetField and DevAppend is different with SQL devices.

The following example makes a connection to a SQL device, cleans the records, adds new records to the device, finds records matching the condition, then closes the connection:

```
FUNCTION
DataSQLDeviceLogging()
  STRING strValue = "";
INT hConnection = DevOpen("mySQLDevice") // open the device
  IF hConnection <> -1 THEN
    DevZap(hConnection); //clean the records
    DevSetField(hConnection, "date_","30-03-2011");
    DevSetField(hConnection, "day_","Wednesday");
    DevSetField(hConnection, "month_","March");
    DevSetField(hConnection, "year_","2011");
    DevAppend(hConnection);
```

```
DevSetField(hConnection, "date_","31-03-2011");
DevSetField(hConnection, "day_","Thursday");
    DevSetField(hConnection, "month_","March");
DevSetField(hConnection, "year_","2011");
    DevAppend(hConnection);
    DevSetField(hConnection, "date_","01-04-2011");
DevSetField(hConnection, "day_","Friday");
    DevSetField(hConnection, "month_","April");
DevSetField(hConnection, "year_","2011");
    DevAppend(hConnection);
    DevSetField(hConnection, "date_","02-04-2011");
DevSetField(hConnection, "day_","Saturday");
DevSetField(hConnection, "month_","April");
    DevSetField(hConnection, "year_","2011");
    DevAppend(hConnection);
    IF DevFind(hConnection, "April", "month_") = 0 THEN
        strValue = StrTrim(DevGetField(hConnection, "day_"));
    END;
    DevClose(hConnection); //close the connection
END;
END
```

## Configure a Device Group

A device group allows you to send data to a number of devices using a single group name. The following example shows the property settings for a group called "AlarmInfo".

Group Property	Value
Group Name	AlarmInfo
Association 1	AlarmPrint
Association 2	AlarmLog
Association 3	AlarmDBF

In this case, when the group name "AlarmInfo" is used, the information will be sent to three devices - "AlarmPrint", "AlarmLog", and "AlarmDBF".

### To configure a device group:

1. In the **Security** activity, select **Groups**.
2. Add a row to the Grid Editor.
3. Configure the fields as required. For a description of the fields, see Add a Group.
4. Click **Save**.

**Note:** You can read from a devices group, however, data is only read from the first device in the group.

## See Also

[Add a Device](#)

## Format Data in the Device

The device format specifies how to format the data in the device. The format is determined by the type of device, and the data that is sent to the device.

### Printer and ASCII Devices Format

The format specifies how each line of data is printed on the printer or written to the ASCII file, for example:

```
RFP3 Raw Feed pump 3 Overload 12:32:21  
RFP9 Secondary Feed Overtemp 13:02:45
```

To include Plant SCADA data you need to specify the field name and (optionally) a width for each field to be printed or written to the file. The format has the following syntax:

```
{<field name>, [width[, justification]]}
```

You need to enclose each field in braces {}, for example:

Format	{Tag,8}{Name,32}
--------	------------------

In this case, two fields are printed or written to the file - Tag, with 8 characters, and Name, with 32 characters. The width specifier is optional - if you do not specify a width, the width of the field is determined by the number of characters between the braces, for example:

Format	{Name }
--------	---------

In this case, Name is followed by four spaces - the field is printed or written to the file with 8 characters.

#### List and Tables

To set the justification of the text in each field, use a justification specifier. You can use three justification characters, L (Left), R (Right), and N (None) - for example:

Format	{Tag,8,L} {Name,32,R}
--------	-----------------------

The justification specifier is optional - if it is omitted, the field is left justified. If you use a justification specifier, you need to also use the width specifier.

To display field text in columns, use the tab character (^t) - for example:

Format	{Tag,8}^t{Name,32}^t{Desc,32} {Time,8,R}
--------	--

#### Fixed text

You can include fixed text by specifying the text exactly as it is to be printed or written to the file - for example:

Format	Name of Alarm:
--------	----------------

Any spaces that you use in a text string are also included in the string.

**Note:** When producing reports, the device format is ignored. The format for the report is defined in the report format file.

## **dBASE and SQL Database Devices Format**

The format specifies the structure (field names and field widths) of the database. The format has the following syntax:

{<field name>, <width>}

You need to use braces (`{ }`) to enclose each field, for example:

Format	{Tag,8}{Name,32}
--------	------------------

In this case, the database is created with two database fields - Tag (with 8 characters) and Name (with 32 characters). The size of each database field is determined by the width you specify in the format. (Justification character are ignored.) Every database field is character (string) field types.

You can define your own fields (as well as the standard Plant SCADA fields) for the database device, for example:

Format	{Name,16}{Water,8}{Sugar,8}{Flour,8}{Salt,8}{Yeast,8}{Milk,8}
--------	---

This database device has the following structure:

Do not leave any spaces between each field definition or at the end of the format string, or Plant SCADA creates extra fields for each space (in the device). Do not specify a field name longer than 10 characters, or Plant SCADA truncates the name to 10 characters. (The dBASE file format limits field names to a maximum of 10 characters.)

In this example, the database is created with seven database fields. To access the above dBASE device, use a Cicode function similar to the following:

```
hDev = DevOpen("Recipe");
DevFind(hDev, "Name", "Bread");
PLC_Water = DevGetField(hDev, "Water");
PLC_Sugar = DevGetField(hDev, "Sugar");
. . .
. . .
DevClose(hDev);
```

## DBase Devices

If the database does not exist, it is created with the specified format. If you do not specify a format, and if the file name specifies an existing dBASE file, Plant SCADA uses the existing fields in the database.

## SQL Devices

You need to create the SQL database by an external application before it can be used.

If you edit a dBASE or SQL device record (in an existing project), the associated physical device is not edited. For example, if the device is a dBASE type device and you add an extra field in the device, the extra field is not added to existing database files (when you run Plant SCADA).

If you want to make changes to the file structure of an existing database and retain existing data, you need to manually edit the data using dBASE, Excel or some other database tool.

If you want to make changes to the file structure of an existing database and don't want to keep the existing data:

1. Close the device.
2. Manually delete the device file.
3. Make your modifications.
4. Open the device.

When the device is opened, no device file is available, and a new data file is created with the necessary changes.

## See Also

[Command Fields](#)

### Command Fields

You use the following fields (or combination) to format a command logging device:

Field Name	Description
{UserName,n}	The name of the user (User Name) who was logged on when the command was issued.
{FullName,n}	The full name of the user (Full Name) who was logged on when the command was issued.
{Time,n}	The time (in short format) when the command was issued (hh:mm).
{TimeLong,n}	The time (in long format) when the command was issued (hh:mm:ss).
{Date,n}	The date (in short format) when the command was issued (dd:mm:yy).
{DateLong,n}	The date (in long format) when the command was issued (day month year).
{DateExt,n}	The date (in extended format) when the command was issued (dd:mm:yyyy).
{Page,n}	The page that was displayed when the command was issued.
{MsgLog,n}	The message sent as the <i>Message Log</i> property (of the command record).

You can use the following fields (in the command field) for **Keyboard commands only**:

{Arg1,n}	The first keyboard command argument (if any).
{Arg2,n}	The second keyboard command argument (if any).
...	
{Arg8,n}	The eighth keyboard command argument (if any).
{Native_MsgLog,n}	The native language version of the message sent as the <i>Message Log</i> property (of the command record).

Where n specifies the display field size.

For example, you could have a device configured as follows:

Name	KeyLog
Format	{Date,9} {MsgLog,27} {Arg1,3} by {FullName,11}

Then a keyboard command (object, page, or system) could be created with the following configuration:

Log Device	KeyLog
Key Sequence	### ENTER
Log Message	Density setpoint changed to

Resulting in an output of the following kind: "01/01/99 Density setpoint changed to 123 by John Smith".

## Use a Database Device

You can use a database device to do the following:

### Write dBase Records

To write data to a database device, first append a record to the end of the device, then add data to the fields of the record. For a dBASE database, the DevAppend() function appends the record, and the DevSetField() function writes data to a field. The following function writes a recipe record to a device:

```

FUNCTION
WriteRecipeData(INT hDevice, STRING sName, INT Water, INT Sugar,
    T Flour, INT Salt, INT Yeast, INT Milk)
    DevAppend(hDevice);
    DevSetField(hDevice, "NAME", sName);
    DevSetField(hDevice, "WATER", IntToStr(Water));
    DevSetField(hDevice, "SUGAR", IntToStr(Sugar));
    DevSetField(hDevice, "FLOUR", IntToStr(Flour));
    DevSetField(hDevice, "SALT", IntToStr(Salt));
    DevSetField(hDevice, "YEAST", IntToStr(Yeast));
    DevSetField(hDevice, "MILK", IntToStr(Milk));
END

```

## Write SQL Records

To use an SQL device in Plant SCADA, you cannot use every the Cicode Device function; you can only use the following functions:

DevOpen()	DevClose()	DevGetField()	DevFind()	DevWrite()
DevNext()	DevSeek()	DevAppend()	DevWrite()	DevZap()
DevControl()	DevSetField()			

To write Plant SCADA data to an SQL database, use the DevWrite() function, but you need to add a new record and write to fields in the new record. No data is written to the database if you do not write to all fields.

For example:

```
FUNCTION
WriteRecipeData(INT hDevice, STRING sName, INT Water, INT Sugar,
                INT Flour, INT Salt, INT Yeast, INT Milk)
    DevWrite(hDevice, sName);
    DevWrite(hDevice, Water);
    DevWrite(hDevice, Sugar);
    DevWrite(hDevice, Flour);
    DevWrite(hDevice, Salt);
    DevWrite(hDevice, Yeast);
    DevWrite(hDevice, Milk);
END
```

The following functions return error 267 (File mode is invalid) when the device type is SQL:

DevFlush()
DevPrev()
DevDelete()

The follow function returns error 263 (Cannot read file) when the device type is SQL:

DevRead()
-----------

The following functions return error -1 when the device type is SQL:

DevSize()
DevRecNo()

## Locate and Read Database Records

To read data from a dBASE or SQL database device, use the DevFind() function to locate the record, and then the DevGetField() function to read each field:

```
FUNCTION
GetRecipe(STRING sName)
    INT hDev;
    hDev = DevOpen("Recipe");
    IF hDev >= 0 THEN
```

```
IF DevFind(hDev, sName, "NAME") = 0 THEN
    PLC_Water = DevGetField(hDev, "WATER");
    PLC_Sugar = DevGetField(hDev, "SUGAR");
    PLC_Flour = DevGetField(hDev, "FLOUR");
    PLC_Salt = DevGetField(hDev, "SALT");
    PLC_Yeast = DevGetField(hDev, "YEAST");
    PLC_Milk = DevGetField(hDev, "MILK");
ELSE
    DspError("Cannot Find Recipe " + sName);
END
DevClose(hDev);
ELSE
    DspError("Cannot open recipe database");
END
END
```

## Delete Records

You can delete dBASE records with the DevDelete() function. The following Cicode function deletes records from a dBASE device:

```
FUNCTION DeleteRecords(INT hDev)
    WHILE NOT DevEOF(hDev) DO
        DevDelete(hDev);
        DevNext(hDev);
    END
END
```

To delete every record from a dBASE database, use the DevZap() function:

```
FUNCTION DeleteRecords(INT hDev)
    DevZap(hDev);
END
```

To delete records from an SQL database, use the Cicode SQL functions.

To open a database device or devices:

Use the DevOpen() function. this function returns an integer handle to identify each device, as in the following example:

```
INT hRecipe;
hRecipe = DevOpen("Recipe");
```

When you are finished with a device, close it to free Cicode system resources by using the DevClose() function. For example:

```
DevClose(hRecipe);
```

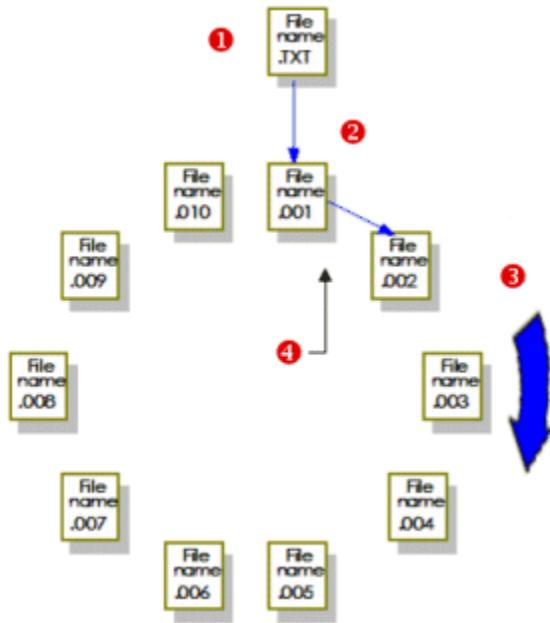

## See Also

[Use Device History Files](#)

## Use Device History Files

To make the long-term storage of logged data easier to organize and more accessible, Plant SCADA uses a system of rotational history files to store historical data. To use this system, you need to specify how many device history

files you want to keep. For example, if you want to keep 10 history files, they would be saved rotationally as illustrated below:

1. When Plant SCADA begins logging, data is written to a file called <filename>.txt or <filename>.dbf, depending on the type of device.
2. At midnight the following Sunday, the file <filename>.txt is renamed to <filename>.001 and a new <filename>.txt is created.
3. At midnight the following Sunday, the file <filename>.001 is renamed to <filename>.002, <filename>.txt is renamed to <filename>.001, and then a new <filename>.txt is created.
4. After week 10, the first file is overwritten (week 11 in the first cycle).

The history files will not be created if the device is not being used.

---

**Note:** To archive your data for long-term storage, manually back up your history files before they are overwritten. The 10 history files are in addition to the default data file that is saved for each device.

---

By default, Plant SCADA uses 10 files (if history files are specified). You can change the default by specifying the number of files to use, for example:

No. Files	20
Comment	Plant SCADA uses twenty files for the data

The maximum number of files you can specify is 999.

You can also specify the period between files, that is, when a new history file is used, for example:

Period	Comment
1:00:00	Use a new file each hour
6:00:00	Use a new file every six hours

Period	Comment
72:00:00	Use a new file every three days
Monday	Use a new file each week beginning on Monday
15th	Use a new file every month beginning on the 15th of each month
25th June	Use a new file every year beginning on the 25th of June

**Note:** Marked improvement in system performance is observed when a period of one week or more is specified.

You can also specify the time of day to synchronize the beginning of the history file, for example:

Time	Comment
6:00:00	Synchronize the file at 6:00 am
12:00:00	Synchronize the file at 12:00 midday
18:30:00	Synchronize the file at 6:30 pm

The first file does not actually begin at this time: the first file begins when you start your runtime system. The time and period together determine when new history files are created, for example:

Time	Period
6:00:00	Monday

In the above example, Plant SCADA creates a new file each Monday at 6:00am. If you start your runtime system at 7:30am on Sunday, your first file only contains 22.5 hours of data. If you leave your system running, subsequent files start each Monday at 6:00am, and contain one full week of data.

## Predefined Devices

This section describes devices that are predefined in the [Include Project](#).

### Devices database

The table below shows the devices supported by Plant SCADA.

Device Name	Type	Description
ASCII_DEV	0	Ascii Device number
PRINTER_DEV	1	Printer Device number
dBASE_DEV	2	dBASE device number
SQL_DEV	4	SQL device number
AlarmDisk	0 (ASCII File)	Default alarm log file

Device Name	Type	Description
AlarmPrint	0 (ASCII File)	Default alarm print device
KeyDisk	0 (ASCII File)	Default keyboard log file
KeyPrint	1 (Printer)	Default keyboard printer log
Printer1	1 (Printer) LPT1:	Printer 1 device
Printer2	1 (Printer) LPT2:	Printer 2 device
SummaryPrint	0 (ASCII File)	Default alarm summary printer device
SummaryDisk	0 (ASCII File)	Default alarm summary log file
_Trend	3 (dBASE)	Trend RDB device
Scratch	0 (ASCII File)	Device for DevModify function

**Note:** Do not modify the Include Project. Changes to the Include project are lost when you reinstall or upgrade Plant SCADA.

## Print Management

The Windows printer management has been designed for page-based printers: laser printers and shared network printers. The printer driver does not print anything on the printer until the page is full; it then prints the page.

This is the preferred printing method (when printers are shared on a network), because it minimizes the likelihood of conflict of data when more than one operator uses the print facility at the same time.

However, this method is inappropriate when logging alarms or keyboard commands. If you send alarm logging to this type of printer, Plant SCADA flushes the data to the printer when the current activity completes, or when the [DEVICE]FlushTime parameter has been exceeded (it defaults to 10 seconds). If, for example, you have one alarm occurring each minute, each alarm is printed on a new page (because the default flush time is less than the alarm frequency).

You can bypass the Windows print management by writing the output to a file. Set the device type to ASCII\_DEV and specify the file name as lpt1.dos, lpt2.dos or lpt3.dos (depending on the port to which your printer is connected). The printer needs to be either on a local port, or a captured network printer. When you log to this device, the data is printed immediately on the printer with no extra form feeds.

For correct logging operation, reserve one printer to be your logging printer. This printer has to be a local printer, not on the network server. You can then send any other non-logging printouts, (for example, reports) to a shared network or local printer.

[Devices](#)

## Triggering Events

You can use a triggering event to initiate an action, such as a command or set of commands. For example, an operator can be notified when a process is complete, or a series of instructions can be executed when a process reaches a certain stage.

A triggering event can be run automatically:

- At a specified time and period.
- When a trigger condition becomes TRUE.
- When a trigger condition is TRUE at a specified time and period.

Triggering events needs to be enabled to operate. To do this, use the Setup Wizard (custom setup) to enable **Events** (see [Events Configuration](#)). If using a network, you can process triggering events on any computer (or every computer).

**Note:** The events system is not redundant. That is, it is not possible to assign primary and standby events servers. If you require a redundant event reporting system, use reports instead. See [Reports](#).

## See Also

[Add a Triggering Event](#)

[Add a Triggering Event](#)

[Use Event Triggers](#)

## Add a Triggering Event

You can use a triggering event to initiate an action, such as a command or set of commands.

**To configure a triggering event:**

1. In the **Setup** activity, select the **Events**.
2. Add a row to the Grid Editor.
3. Type the required information in each column, or in the fields in the Property Grid.  
For a description of the properties, see below.
4. Click **Save**.

**Note:** The events server needs to be enabled for triggering events to work. See [Triggering Events](#).

## Event Properties

### General Properties

Property	Description
Name	For a single computer system, specify <b>GLOBAL</b> for the event name.

Property	Description
	<p>If you are using a network and want to run an event on every computer, specify <b>GLOBAL</b> for the event name. If you want to run an event only on specific computers, specify an event name and use the Setup Wizard (Custom setup) to specify which computer(s) will run the event. The event name does not have to be unique: you can specify many events with the same name.</p> <p>Enter a value of 16 characters max.</p> <p><b>Note:</b> Make event names conform to correct <a href="#">Tag Name Syntax</a>. The use of any other characters such as spaces will result in a compiler error. Instead of a space, use an underscore character (_).</p>
<b>Time</b>	<p>The time of day to synchronize the <b>Period</b> in hh:mm:ss (hours:minutes:seconds). If you do not specify a time, <b>Period</b> is synchronized at 00:00:00 (that is, midnight). Enter a value of 32 characters maximum.</p>
<b>Period</b>	<p>The period to check for the event, in hh:mm:ss (hours:minutes:seconds). Enter a value of 32 characters maximum. Alternatively you can specify:</p> <ul style="list-style-type: none"> <li>• A weekly period by entering the day of the week to check for the event, for example, Monday, Tuesday, Wednesday.</li> <li>• A monthly period by entering the day of the month to check for the event, for example, 1st, 2nd, 3rd, 4th, 5th.</li> <li>• A yearly period by entering the day and the month to check for the event, for example, 1st January, 25th February, and so on. The day and month needs to be separated by a space.</li> </ul> <p>If you do not specify a period or time, the period defaults to one second. If you do not specify a period, but do specify the time, the period defaults to one day.</p>
<b>Trigger</b>	<p>The Cicode expression (or Variable tag) which is used to determine whether the event Action is executed. This expression is checked every one second. Enter a value of 254 characters maximum.</p>
<b>Action</b>	<p>The commands to execute. Enter a value of 64 characters maximum. These commands will execute in</p>

Property	Description
	<p>the following circumstances:</p> <ul style="list-style-type: none"> <li>When the specified <b>Time</b> and <b>Period</b> occurs, and the <b>Trigger</b> condition is TRUE or blank.</li> <li>When the <b>Trigger</b> becomes TRUE, and the <b>Time</b> and <b>Period</b> field are blank. The Trigger needs to become FALSE and TRUE again for the action to re-execute.</li> </ul>
<b>Comment</b>	Any useful comment. Enter a value of 48 characters maximum.
<b>Cluster Name</b>	The default cluster to be used when the event action and event trigger Cicode is run. Any tags in these Cicode expressions will resolve to this default cluster if they don't have their cluster specified inside the expression. This field can be left blank in single cluster systems or if every tag inside the expressions are declared in the <ClusterName>.<TagName> format.

### Project Properties

Property	Description
<b>Project</b>	The project in which the triggering event is included.

### See Also

[Specify Event Times and Periods](#)

[Use Event Triggers](#)

## Specify Event Times and Periods

The **Period** determines when a [Triggering Events](#) is run. You can specify the period in hh:mm:ss (hours:minutes:seconds), for example:

Period	Comment
1:00:00	Run the event every hour
6:00:00	Run the event every six hours
72:00:00	Run the event every three days
Monday	Run the event each Monday

Period	Comment
15th	Run the event on the 15th of each month
25th June	Run the event on the 25th of June

You can also specify the time of day to synchronize the event, for example:

Period	Comment
6:00:00	Synchronize the event at 6:00 am
12:00:00	Synchronize the event at 12:00 midday

The Time synchronizes the time of day to run the event and, with the Period, determines when the event is run; for example:

Time	6:00:00
Period	1:00:00

In this example, the event is run every hour, on the hour. If you start your runtime system at 7:25am, your event is run at 8:00am, and then every hour after that.

## See Also

[Use Event Triggers](#)

## Use Event Triggers

You can use any Cicode expression (or variable tag) as a trigger for an event. If the result of the expression (in the **Trigger** field) becomes TRUE, and if the **Time** and **Period** fields are blank, the event is run. For example:

Time	
Period	
Trigger	RCC1_SPEED<10 AND RCC1_MC

This event is only run when the expression (Trigger) becomes TRUE, that is, when the digital tag RCC1\_MC is ON and the analog tag RCC1\_SPEED is less than 10. The expression needs to become FALSE and then TRUE again before the event is run again.

If you use the Time and/or Period fields, the Trigger is checked at the Time and/or Period specified, for example:

Time	6:00:00
Period	1:00:00
Trigger	RCC1_SPEED<10 AND RCC1_MC

This event is run each hour, but only if the expression (Trigger) is TRUE (that is, if the digital tag RCC1\_MC is ON and the analog tag RCC1\_SPEED is less than 10).

## See Also

[Add a Triggering Event](#)

## Languages

Plant SCADA supports a language switching capability that allows text within the runtime environment to be translated and displayed into a variety of languages.

Language switching is configured in two very different ways, depending on the type of content you are creating.

- **Standard Projects**

With a standard Plant SCADA project you can flag items for translation and then display them in a specified language at runtime. A project can support multiple languages, and you can dynamically switch between them.

To achieve this, you need to provide the required translations by building a localized database for each supported language.

For more information, see [Configure Languages for a Standard Project](#).

- **Industrial Graphics Applications**

If you are producing content for an AVEVA™ Industrial Graphics application, you can apply different set of strings to a graphic object for each supported language. The content that gets displayed is then determined by the language that is selected in the Industrial Graphics Web Client.

For more information, see [Configure Languages for Industrial Graphics Applications](#).

## Configure Languages for a Standard Project

In a standard Plant SCADA project, items such as alarm descriptions, button text, keyboard/alarm logs, graphics text and Cicode strings can be marked for translation and then displayed in a specified language at runtime. A project can support multiple languages, and you can dynamically switch between them.

---

**Note:** If you want to configure language switching for an Industrial Graphics application, see [Configure Languages for Industrial Graphics Applications](#).

Text translation does not happen automatically. A language will only be supported if the required translations are manually inserted into a localized language database.

To enable your runtime system to switch between different languages, your firstly need to mark the text you would like translated and locate the required translations. See [Prepare a Project for Multi-language Support](#).

You will then be able to:

- [Set the Local Language Used at Runtime](#)
- [Change the Local Language at Runtime](#).

---

**Note:**

- Plant SCADA can support both neutral languages (for example, "French") and region-specific variations (for example, "French (Belgium)"). However, each of these will generate and use its own language database ("French.dbf" and "French(Belgium).dbf"). You cannot refer to a regional variation of a language using just the neutral language name.

- 
- It is recommended that you use languages that specify a regional variation, particularly if you plan to migrate your system to the AVEVA Industrial Graphics platform.
- 

## See Also

[Officially Supported Languages](#)

### Prepare a Project for Multi-language Support

To prepare a project for multi-language support, you need to consider the following procedures:

- **Defining the languages supported by a project**

The **Languages** view in Plant SCADA Studio's **Setup** activity allows you to specify which local languages you would like a project to support. During compilation, a local language database is created for each language you define in this view.

See [Define the Languages Supported by a Project](#).

- **Translating the language databases**

Local language databases are used to define the translations from native language to local language. When a project is compiled, any text that is marked for translation is drawn into the supported language databases. You can then manually edit a databases to define the translations required for the specified language.

Recompiling the project will then capture the translations you have input.

See [Translate a Local Language Database](#).

- **Marking text and alarm text for translation**

Language change indicators are used to identify any text you would like translated at runtime.

Plant SCADA distinguishes between a project's *native* language (that is, the language used by the developer during configuration), and the *local* language (the language displayed to the end user). Based on this principle, any text marked with a language change indicator can be converted from native language to a local language at runtime.

See [Mark Text for Translation](#) and for alarm specific strings [Mark Alarm Text for TransltionP](#).

## See Also

[Set the Local Language Used at Runtime](#)

### Define the Languages Supported by a Project

To set up multi-language support in your project, complete the following:

1. In the **Setup** activity, define the required **Languages** for the main project. For example, "French (France)" and/or "Japanese (Japan)".
- 

**Note:** You cannot refer to a regional variation of a language (for example, "French (France)") using just the neutral language name (for example, "French"). These two variations will generate and use separate databases ("French(France).dbf" and "French.dbf"). It is recommended that you use languages that specify a regional variation.

---

2. In the **Setup** activity, select **Parameters** and define the default language for your project. For example, French (France).
3. In the include project (if any and not a standard Include project) define languages in the **Setup** activity. For example, French (France) and Japanese (Japan).
4. Compile and generate the language DBFs.
5. Open each language DBF and insert translation (for main and include projects).
6. Recompile to include the new translations.

**Note:** The language defined in the Citect.ini file will take precedence over the default language defined in your project.

During compilation, a local language database (for example, French.dbf) is generated for each of the defined languages. If the project does not have an existing database for one of the specified languages, one will be created with its native column populated with native strings and local column empty.

Once this process is complete, an .rdb file is added to the master project for each defined language to facilitate the operation of multi-language switching during runtime.

The following table provides an example of how the defined languages would impact the project "MasterProject1" when compiled.

Project name	Defined languages	Existing and newly defined language databases	.dbf files created during compilation	.rdb files created during compilation
		Local Language Databases		Runtime Database
MasterProject1	French(France) English Japanese(Japan)	English.dbf	French(France).dbf Japanese(Japan).dbf	lanen.rdb lanfr-fr.rdb lanja-JP.rdb Plus RDBs for languages defined in default include projects.

If your master project includes an Include project (not one of the include projects included with Plant SCADA) you will need to define the supported languages within your include project as well as in the master project.

The following table provides an example of how the defined languages would impact the project "MasterProject1" when linked to "IncludeProject1" which has its own existing language databases.

Project name	Defined languages	Existing and newly defined language databases	.dbf files created during compilation	.rdb files created during compilation
		Local Language Databases		Runtime Database
MasterProject1	French(France) English Japanese(Japan)	English.dbf	French(France).dbf (1) Japanese(Japan).dbf	lanen.rdb lanfr-fr.rdb (1 & 2 are merged) lanja-JP.rdb

				Ianko-KR.rdb Plus RDBs for languages defined in default include projects
IncludeProject1	French (France) English Korean(Korea)		English.dbf French.dbf (2) Korean(Korea).dbf	

If a project and one of its included projects have variations of the same language database, the translations will be merged into the '.rdb file', in the table above the French files (1 & 2) were merged.

You can also see that during compilation the Korean.dbf was created and added to the "MasterProject". Once you have defined the required languages, and defined the default language for your project you can open the language DBFs and insert translation (for main and include projects).

---

**Note:** If you do not define any languages in Plant SCADA Studio, Plant SCADA will create a default file "\_lanEN.rdb". The native text will be used for the associated translations.

---

### To define the languages supported by a project:

1. In the **Setup** activity, select **Languages**.
2. Add a row to the Grid Editor.
3. Configure the fields as required. For a description of the fields, see [Languages Properties](#).
4. Click **Save**.

---

**Note:** When setting the properties for you will be required to associate a setting for the parameter **[CtEdit]ANSIToOEM** for each language. This parameter defines whether or not the language requires translation to OEM. See the topic [OEM Character Sets](#) for more information.

---

### See Also

[Translate a Local Language Database](#)

[Officially Supported Languages](#)

[Define an Unsupported Language](#)

## Languages Properties

Languages have the following properties (see [Define the Languages Supported by a Project](#)).

### Language

Select the language from the drop down list provided.

### Source File (Optional)

A file which contains translation for the chosen language. Enter the complete file name (with extension) For example, Spanish.DBF.

The compiler raises an alert for any specified file names with the wrong extension or without an extension.

If a file is specified but cannot be found, the compiler creates a DBF file in that name with empty translations.

If this field is empty and "English(Australia)" has been chosen, the compiler will look for "English(Australia).DBF" first, if not found, then "English.DBF", if still not found, it will create a file named "English(Australia).DBF" with empty translations.

#### ANSIToOEM

This field corresponds to the Citect.ini parameter [\[CtEdit\]ANSIToOEM](#), which determines if ANSI to OEM translation is required to support a language. Once you associate a setting for this parameter with a language, the parameter will be adjusted accordingly whenever the language is implemented. See [OEM Character Sets](#) for more information.

#### Comment

Any useful comment (optional).

[Officially Supported Languages](#)

# Officially Supported Languages

Technically any languages that are supported by the OS can be used in the project (by defining it in the **Languages** view in Plant SCADA Studio's **Setup** activity). However, the subset of languages that Plant SCADA "officially" supports is listed below.

**Note:** Plant SCADA can support both neutral languages (for example, "French") and region-specific variations (for example, "French (Belgium)"). However, each of these will generate and use its own language database ("French.dbf" and "French(Belgium).dbf"). You cannot refer to a regional variation of a language using just the neutral language name. It is recommended that you use languages that specify a regional variation.

Language	Language Code	Charset

[Logging Data in Different Languages](#)  
[Define an Unsupported Language](#)

# Define an Unsupported Language

If necessary, you can define languages that are not [officially supported](#) by Plant SCADA in the **Setup | Languages** view in Plant SCADA Studio.

The format for specifying a non-supported language needs to follow Windows language and region definitions.

The format for specifying an unsupported language is:

<LanguageName>(<RegionName>)

For example,

"Hebrew(Israel)", where the language name is "Hebrew", and the region name is "Israel".

"Chinese (Traditional)(Taiwan)", where the language name is "Chinese (Traditional)", and the region name is "Taiwan".

When an unsupported language is specified and is used at login (that is, with the [LoginForm\(\)](#), [Login\(\)](#) or [UserLogin\(\)](#) Cicode functions), the runtime will display the prompt line "Unsupported language" and display the content in the specified language.

If the specified language is unsupported, some system texts are displayed in English rather than the specified language, such as the SOE message field. It is possible that the system may not be able to determine the character set of a non-Plant SCADA-supported language. In this case, you need to provide their desired character sets by:

- Setting [\[Language\]CharSet = <value>](#),
- Calling [ParameterPut\("Language", "CharSet", <value>\)](#)

Allowable values for <value> are:

- 0 - ANSI ASCII
- 1 - System Default Character Set
- 128 - Japanese - Shift JIS
- 129 - Korean - Hangul
- 130 - Korean - Johab
- 134 - Chinese - simplified GB2312
- 136 - Chinese - traditional Big5
- 161 - Greek
- 162 - Turkish
- 163 - Vietnamese
- 177 - Hebrew
- 178 - Arabic
- 186 - Baltic
- 204 - Russian
- 222 - Thai
- 238 - East European

[Set the Local Language Used at Runtime](#)

### Translate a Local Language Database

The local language databases created during compilation are located in the project directory. Each consists of two fields: NATIVE and LOCAL.

Any text that is marked with a language change indicator is automatically entered in the NATIVE field when a project is compiled. Text that has been marked since the last compile is appended to the database; the rest of the database remains unchanged.

To include the required translations for a specific language, open the associated database in a database editor (such as Microsoft Excel™ with DBF Add-in) and enter the localized translations in the LOCAL field.

For example, French.dbf may have the following translations added to it:

NATIVE	LOCAL
Line Disconnected Alarm at Line Speed	alarme "Ligne deconnectee" sur la vitesse de la ligne
Main Menu page	Page du menu principal
Conveyor Belt Trip	Tapis roulant declenche

When the project is run, the French translations will display in place of the associated native text.

If you do not enter a local equivalent for a native text string, the native text is displayed by default. You can specify to display "#MESS" instead of the native text by setting the [\[Language\]DisplayError](#) parameter to 1 (one); the default is 0 (zero).

**Note:** The [\[Language\]DisplayError](#) parameter does not apply to alarm strings.

A language database can contain entries which are not actually included in a project. This means that a single language database can be developed that is applicable to many projects.

Once you have completed adding translations to a database, you will need to recompile the project to implement the changes.

**Note:** After translation, review the foreign language interface and verify that translated strings fit in their graphics elements correctly.

## See Also

[Set the Local Language Used at Runtime](#)

### Mark Text for Translation

During project development, you need to mark any text you want to change to another language at runtime with a language change indicator, like this:

`@( Native Text [,Width [,Justify]])`

where *Native Text* is the text to be translated. This text will be replaced by the local equivalent at runtime.

Be aware that the brackets are necessary as they specify the extent of the native language text; *Width* and *Justify*

are optional (indicated by the square brackets).

For example, if English is the native language, you could enter the following alarm description:

Equipment Desc:	@(Pump, 20, R)
-----------------	----------------

This indicator serves two purposes; it flags the text as native, and tells Plant SCADA to change the text from native to local at runtime.

By default, the text that you enter here can be in any combination of upper- and lowercase. In other words, *Motor Inoperative* will be considered the same string as *motor inoperative* or *MOTOR Inoperative*, and they will have the same local language translation. Case-sensitivity can be introduced by setting the [\[Language\]CaseSensitive](#) parameter to 1.

---

**Note:**

1. The [\[Language\]CaseSensitive](#) parameter does not apply to alarm strings. Alarm strings are always case sensitive. For example Motor Inoperative is different to MOTOR INOPERATIVE.
2. Alarm fields no longer support Width and Justify options.

Refer to the topic [Mark Alarm Text for TranslationP](#) for more information

---

*Width* can be assigned any value from 0 to 254. If the local text is longer than specified, it is truncated and left-justified. If a width is not specified, the field is the length of the local text and the text left-justified.

*Justify* specifies the text justification and can only be used with *Width*.

*Justify* can be one of the following values:

- **I** or **L** - Left
- **r** or **R** - Right
- **c** or **C** - Center
- **n** or **N** - None

For example, to limit the local text in the previous case to 20 characters with right justification:

Equipment Desc:	@(Pump, 20, R)
-----------------	----------------

Characters that are normally part of the formatting - **@** , **(** - can also be used within the native text. To do this, place a caret (^) character before them. For example, to include a comma without introducing a formatting error:

Equipment Desc:	@(Pump^, overload, 20, R)
-----------------	---------------------------

---

**Note:** The caret (^) character does appear at runtime or in the language database.

## See Also

[Define the Languages Supported by a Project](#)

## Mark Alarm Text for TranslationP

During project development, you need to mark any alarm text you want change to another language at runtime with a language change indicator.

Partial translation of alarm related strings such as "ABC@(DEF)" or "@(ABC)DEF" and multiple markers per sentence such as "@(ABC)DEF@(IJK)" is no longer supported. During compilation, the @ at the beginning of the

sentence is accepted and the brackets removed so that the whole sentence will be translated. Any "@(" encountered in the middle or end of the sentence (anywhere not at the beginning) will trigger a compiler alert message and will be removed.

**Note:** For alarm related strings the Escape character ^ is removed during compilation. When used immediately preceding a valid translation marker such as ^@{(text)}, it will skip translation and will be removed.

The following table outlines translation marker scenarios and what will happen if:

Scenario	Translated	Display as	Language	Compiler Error message
@(Text)	Yes	Text	In selected language	None
@(Text) some text	No	Text some text	In default language e.g. English	Unsupported syntax for marking translation text, it will not be translated.
Some text @(at the end)	No	Some text at the end	In default language e.g. English	Unsupported syntax for marking translation text, it will not be translated.
Some text @{(in the middle) and more	No	Some text in the middle and more	In default language e.g. English	Unsupported syntax for marking translation text, it will not be translated.
@(Text) and @{(more text)	No	Text and more text	In default language e.g. English	Unsupported syntax for marking translation text, it will not be translated.
@@(Text)	No	Text	In default language e.g. English	Unsupported syntax for marking translation text, it will not be translated.
@(Text @ Text)	Yes	Text @ Text	In selected language	<p>None</p> <p><b>Note:</b> @ by itself is regarded as a normal character, translation marker requires @ to be immediately</p>

Scenario	Translated	Display as	Language	Compiler Error message
				followed by ( and a ) to follow later. The string will appear in the local language DBFs as "Text @Text". Double layers of translation markers are invalid.

## See Also

[Define the Languages Supported by a Project](#)

# Set the Local Language Used at Runtime

The default local language that gets displayed at runtime is determined by the Citect.ini parameter [\[Language\]LocalLanguage](#). The language entered in this parameter should be pre-defined in the [Languages](#) view in Plant SCADA Studio's [Setup](#) activity.

Once this parameter is set (and the steps outlined in [Prepare a Project for Multi-language Support](#) are complete), you can then configure either the [Login\(\)](#), [UserLogin\(\)](#) or [LoginForm\(\)](#) functions to set the preferred language for the project at runtime. When the user logs in to the project, any marked native text will be replaced by the preferred language defined in the corresponding .dbf file. Be aware that changing languages at runtime will cause any open pages to reload.

**Note:** To use characters for Baltic, Central European, Cyrillic, Greek, Turkish, and Asian languages, or right-to-left languages (Arabic, Hebrew, Farsi, and Urdu) the operating system needs to have the corresponding language version of Windows, or have installed system support for that language.

## See Also

[Logging Data in Different Languages](#)

[Change the Local Language at Runtime](#)

# Logging Data in Different Languages

Alarm and keyboard logs can be processed in both the native and the local language. This means that both native and local users can read the historical logs. The logs can employ the same device, or separate devices.

Logs in the local language are produced using the standard field names. For example, if {NAME} {DESC} {COMMENT} is entered in the format field of an alarm category, the alarm name, description and comment of alarms in that category will be logged in the local language.

All fields which support the automatic language change facility can also be logged in the native language. To do

so, just precede the field name with **NATIVE**. For example, to log the name, description and comment of a category of alarms, enter {NATIVE\_NAME} {NATIVE\_DESCRIPTION} {NATIVE\_COMMENT} in the format field for that category.

To log both native and local to the same device, just enter the standard fields, and the native fields together in the format field. To log them to different devices, use a Group of two devices, and enter the local fields as the format for one, and the native fields as the format for the other.

## See Also

[ASCII and ANSI Character Sets](#)

### Change the Local Language at Runtime

The language of runtime display items such as alarm descriptions, button text, keyboard/alarm logs, graphic text, Cicode strings and so on can be changed using one of the following functions:

- Login
- UserLogin
- LoginForm.

Normal operations of the project continue unaffected.

Local translations that are missing from the specified language database are replaced by the native equivalent. You can specify to display "#MESS", instead of the native text, by setting the [\[Language\]DisplayError](#) parameter to 1 (one); the default is 0 (zero).

---

**Note:**

1. The [\[Language\]DisplayError](#) parameter does not apply to alarm strings.
  2. For alarm data where there are multiple clients and one user name, a scenario may occur where the runtime display shows a variety of languages. For more information refer to [Alarm Data Localization](#).
- 

## See Also

[Logging Data in Different Languages](#)

### Alarm Data Localization

Alarm data localization is saved in user accounts on alarm servers. For each user account, the last login action across the network determines the current language setting of the user. If the same user account is used simultaneously with different languages on each of the display clients the runtime display may show a mixture of languages.

For example: Client A , Client B, Client C all log in (different clients) with the user name "Operator":

1. Client A logs into "Operator" with French. Once login has been successful, the display contents in Client A are in French, including both UI and alarm data.
2. Client B then logs into "Operator" with English. Once login has been successful, the display contents in Client B are in English, including both UI and alarm data. However, the alarm data in Client A is in English instead of French. Thus Client A would display both French and English even though Client A has logged in with French.

3. Client C then logs into "Operator" with German. Once login has been successful, the display contents in Client C are in German, including both UI and alarm data. However, the alarm data in Client A and Client B are in German instead of French or English. Thus Client A would display both French and German even though Client A has logged in with French, and Client B would display both English and German.

In this scenario allow Client A, Client B and Client C to use separate accounts, such as "OperatorA", "OperatorB", "OperatorC". This will then allow each user to view the runtime display in their preferred language.

## See Also

[Set the Local Language Used at Runtime](#)

## ASCII and ANSI Character Sets

Each screen character is defined by a code (number). Operating systems and applications need to know these codes to attach meaning to individual characters. A character set provides a code for every character. For your operating system/application to interpret a character correctly, you need to use the correct character set.

---

**Note:** Character sets are distinct from fonts. A font defines the visual/appearance properties of a character, not its meaning.

ASCII (American Standard Code for Information Interchange) is a widely adopted 7-bit code specifying the basic alphanumeric character set of the English language. For example, the character capital "A" has the ASCII value of 65, the character lowercase "a" a value of 97.

The ASCII character set contains 96 characters and is commonly used as a standard for protocols and files.

Much of Plant SCADA uses ANSI (American National Standards Institute) character sets. ANSI character sets are language-based, with each different language version of Windows (French, Korean and so on) requiring a specific ANSI character set. Codes 32 to 127 contain standard ASCII characters.

Windows uses Unicode, but still supports ANSI character sets. Several of Plant SCADA's utilities have been created for Unicode, for instance Process Analyst. Unicode accommodates known character sets by having one 16-bit (worldwide) character encoding standard.

## See Also

[OEM Character Sets](#)

## OEM Character Sets

OEM character sets are those which are used by MS-DOS or Console applications (they are operating system dependent). Most OEM character sets do not match the ANSI character sets. For example, line drawing characters commonly used in MS-DOS character sets were replaced with language characters in ANSI character sets.

As explained below, when building multiple language projects give adequate consideration to the role that ANSI and OEM character sets play, in the way the language strings are stored and interpreted.

Language configuration information is stored in dBASE files (a database standard defined primarily for MS-DOS applications) where string information is customarily stored as OEM characters. When using a Windows application (such as Excel) to edit dBASE files, the characters on screen are in the ANSI character set. When you

save this information to the dBASE file, Excel converts it to an OEM equivalent. For this conversion to work correctly the OEM character set needs to be compatible with the ANSI character set used in Excel. For example, if you have prepared strings for a project in Russian (using Excel), the OEM character set needs to support the Russian (Cyrillic) character set. The OEM character set used by Windows is primarily determined by your system setup and cannot easily be changed. This presents a challenge for multi-language projects.

For example, consider a project intended to support Russian, French, and English. Excel is used to prepare the language dBASE files. When saving information from Excel, it is translated from the respective ANSI character sets to the OEM equivalent. To display this information, Plant SCADA will need to convert it from OEM back to ANSI. However, Russian requires a Cyrillic OEM character set and French and English requires a Latin OEM character set. Because Windows can only use one OEM character set at a time (which cannot be changed dynamically), only one of the three project languages can be correctly supported during any given session.

The only way to support multiple languages with differing character sets within one Plant SCADA project, is to verify that the language information you store in dBASE files is stored in the ANSI (not the OEM) format. Further, the [\[CtEdit\]ANSIToOEM](#) parameter needs to be set to 0 (zero) to prevent a conversion from occurring automatically. The challenge for the developer in preparing the project is in saving this information in the first place, because most applications store the language information in OEM format.

---

**Note:** A multi-language project is included in the samples directory on your installation CD. This project allows you to enter information into the language dBASE files in ANSI format.

---

## Configure Languages for Industrial Graphics Applications

AVEVA™ Industrial Graphics applications can be configured to support multiple languages. You can apply a different set of strings to a graphics object for each language that is configured in Plant SCADA Studio. The content that gets displayed is then determined by the language that is selected in the Industrial Graphics Web Client.

---

**Note:** If you are looking for information on language switching for a standard Plant SCADA project, see [Configure Languages for a Standard Project](#).

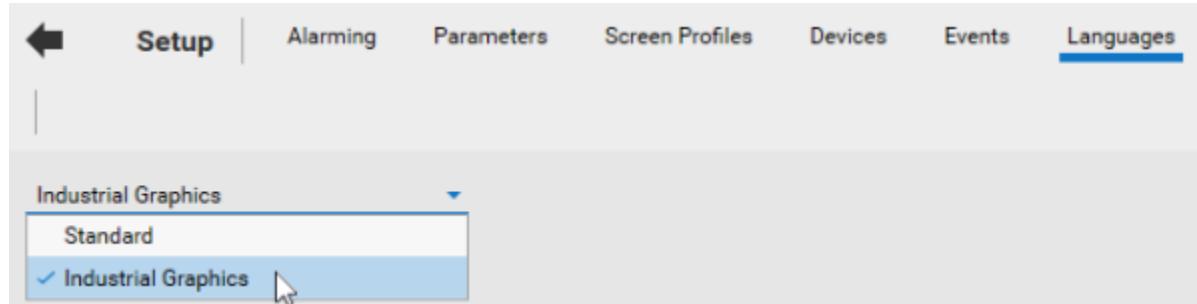

---

Perform the following steps to enable language switching for an Industrial Graphics application.

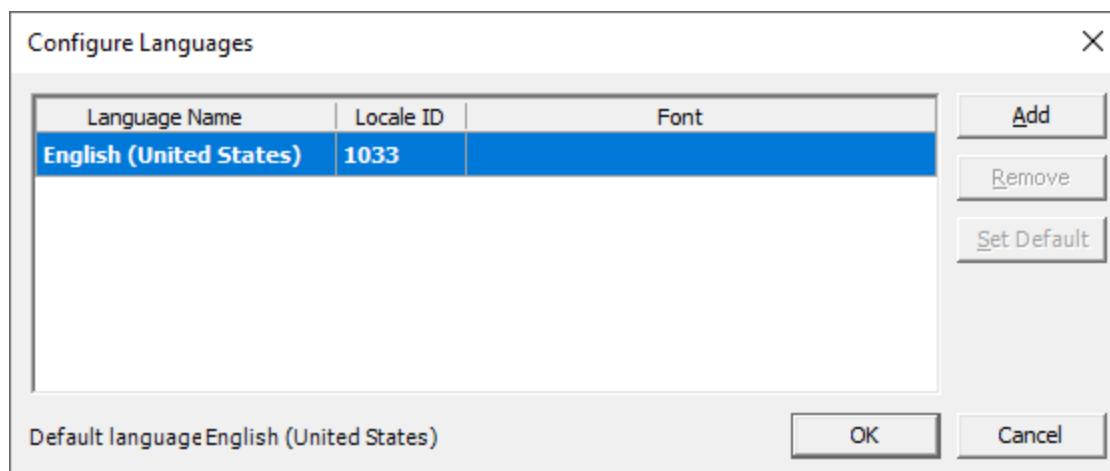

### [Set up the languages you want to support](#)

To configure the list of languages supported by an Industrial Graphics application, you need to use Plant SCADA Studio's **Setup** activity.

1. In the **Languages** view, select **Industrial Graphics** from the menu below the command bar.

2. On the Languages Configuration dialog, select **Edit**. The Configure Languages dialog will appear.

By default, the current Windows® locale setting is used to set the default language and font.

3. To add an additional language, click the **Add** button.
4. Use the Add Language dialog to select a language **By Name** or **By Locale ID**.
5. Specify a **Font** for the language.
6. Click **OK**.

The language you selected will be now appear in the Configure Languages dialog.

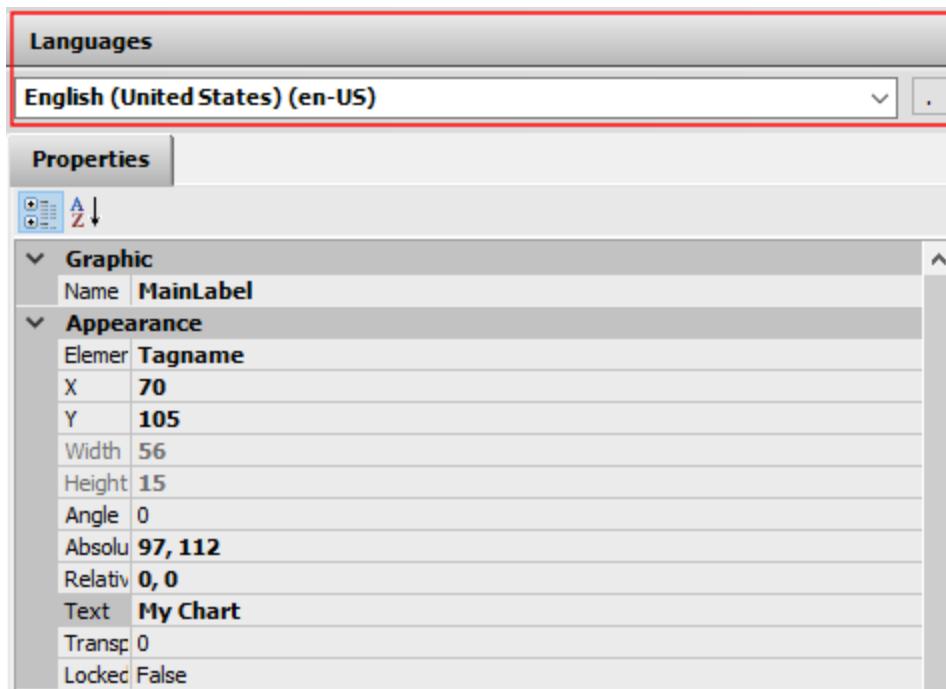

7. If required, use the **Set Default** button to change the language that will be used by default in the Industrial Graphics Editor.
8. Click OK to update the list of supported languages.

If an instance of the Industrial Graphics Editor is currently open, any changes you make to the language settings will not be applied until after the editor has been restarted.

**Note:** If you delete a language, the translations for a graphic will still be available until you specifically remove them in the Industrial Graphics Editor. See the topic *Removing a Language from a Graphic* in the *Creating Industrial Graphics* section of the help.

#### Select the required language in the Industrial Graphics Editor

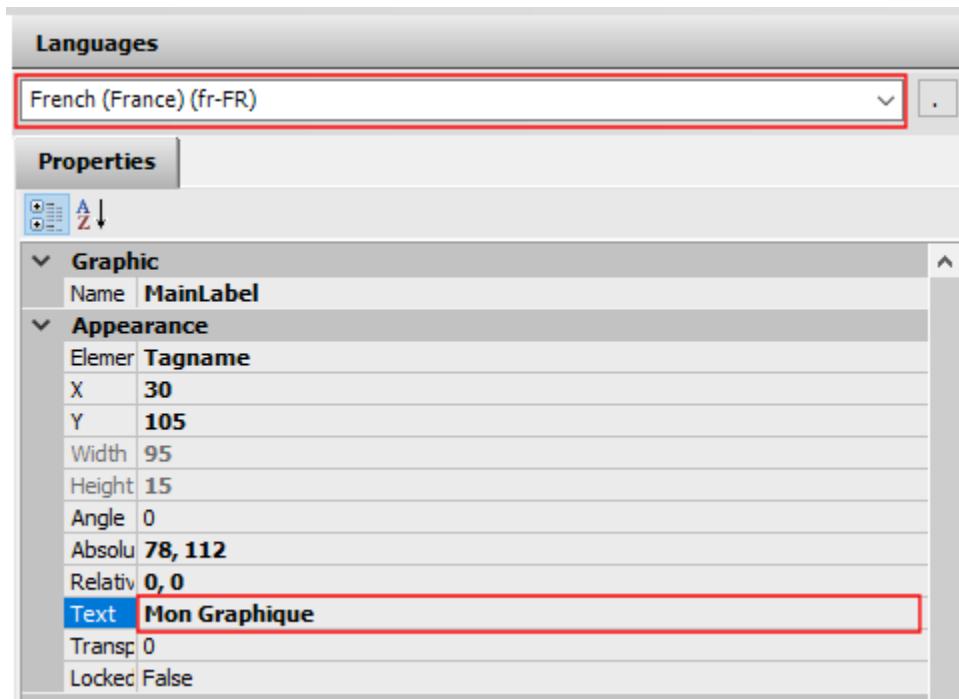

You can specify the language that is currently applied to the Industrial Graphics Editor using the **Languages** panel.

Select the required language from the drop-down menu to the right of the field. Any changes you make to the properties for a selected object will now be associated with this language.

#### Substitute the required strings

You can then select an object and make any required changes to the strings you would like to update for the selected language.

You will need to repeat these steps for each language you would like to support.

## Select a language in the Industrial Graphics Web Client

By default, your project will load using the language set as default in the browser. If the default language of the browser is not supported by your project and/or the Web Client, the default language configured in your project will be used.

**To change the current language:**

1. Go to the title bar and click .
2. Click the **Language** icon to select a language.

When you change the language, the application in the browser will be restarted.

**Note:** If you use an included project that has its own translations for graphic objects, those translation will be retained. However, their use will be limited by the languages that are configured in the active project. For more information, see [Working with Industrial Graphics Languages in Included Projects](#).

## See Also

[Use the Industrial Graphics Web Client](#)

## Working with Industrial Graphics Languages in Included Projects

If you use an included project that has its own translations for graphics objects, those translations will be retained. However, only languages that are configured in the active project will be available for use.

If you open an include project graphic that does not contain the default language of the active project, then the active project's default language is added to the list of languages for that graphic and is set as the new default language. The text strings from the last saved default language for a graphic are transferred over to the new default language for the graphic.

For example, if a graphic is part of an included project that only has the French language configured and it is used by an active project where English is the default language, the French strings are transferred over to the English language when the graphic is opened, and English is made the default language for the graphic. The French language still exists for the graphic, but it will no longer be the default language.

If a graphic is part of an included project that has both English and French configured (with French as the default language), and the graphic is opened via an active project with English as the default language, the default language for the graphic will be set to English.

## Keyboard Keys

Keyboard keys allow you to define a meaningful name for any key on a keyboard. This creates a label for the key that you can then use in keyboard commands.

For example, you could define the **F2** key as the "Login" key. When the Login key is subsequently referenced in the system, it will automatically refer to the F2 key.

Keyboard Commands are configured in the **Visualization** Plant SCADA Studio (see [Keyboard Commands](#)).

## See Also

[Define Keyboard Keys](#)

## Define Keyboard Keys

[Keyboard Keys](#) allow you to define a meaningful name for any key on a keyboard, making it easier to issue commands.

**To define a keyboard key:**

1. In the **Setup** activity, select **Keyboard Keys**.
2. Add a row to the Grid Editor.
3. Type the required information in each column, or in the fields in the Property Grid.  
For a description of the properties, see below.
4. Click **Save**.

## Keyboard Keys Properties

### General Properties

Property	Description
<b>Key Name</b>	The name assigned to the key (16 characters or less). You can define a meaningful name for any key on your keyboard, and use these keys in any keyboard command. For example, you can define the F2 key as the Login key. When the Login key is subsequently referenced in the system, it refers to the F2 key.  You can assign a key name to any key on the keyboard (including the alphanumeric keys A-Z, a-z, and 0-9). However, after a key is defined as a command key it can only be used as a command key. If you do assign a definition to an alphanumeric key (for example the character A), then that key can not be used as a data key. Each time it is pressed, the definition for the key is recognized and not the keyboard character itself. Keyboard key definitions are usually only used with non-alphanumeric characters (for example the function keys).
<b>Key Code</b>	The code assigned to the key name (16 characters or less). The Key Code is what links your Key Name to the

Property	Description
	actual key. You can specify the key code either as a hexadecimal value or use the standard label already associated with the key.
<b>Echo</b>	<p>Determines if the key is echoed on the screen (when the key is used).</p> <p>If set to TRUE, the <b>Key Name</b> is displayed (echoed) when the key is pressed. The key name is displayed on the graphics page in the keyboard entry line (AN1).</p> <p>If set to FALSE, the <b>Key Name</b> does not display when the key is pressed.</p> <p>This property is optional. If not specified, Echo defaults to TRUE.</p>
<b>Keyboard Type</b>	<p>The type of keyboard. This field is only necessary if you have more than one type of keyboard on the same system.</p> <p>If you do have more than one type of keyboard, use Keyboard Type 1 for your first type of keyboard, use a separate number for each additional type (1, 2, 3, and so on), and define keys for each keyboard. You can use the default (Type 0) for common keys.</p>
<b>Comment</b>	Any useful comment (48 characters or less).

#### Project Properties

Property	Description
<b>Project</b>	The project in which the keyboard key is included.

## Custom Files

If a Plant SCADA project relies on externally-created files that you need to incorporate into a runtime deployment (such as DBF files, HTML files, or ActiveX objects), you will need to identify these files as **Custom Files** in the **Setup** activity.

When a project is compiled, any files you have identified in this way will be compressed into one of the following zip files:

- **custActiveX.zip** - includes the associated ActiveX files
- **custFiles.zip** - includes other associated files.

These zip files are then incorporated into a project. Each time an operator starts Plant SCADA Runtime, the client process checks the project and its included projects directories. If custFiles.zip or custActiveX.zip is found locally, the compressed archive is unzipped. (If [CtEdit]Copy is specified, then the zip files may be copied from the copy path first.)

Files in CustFiles.zip are unpacked to the project directory and its sub directories, depending on the value specified in the **Destination Location** field.

ActiveX control files in CustActiveX.zip are unpacked to the project directory and its sub directories first, then moved to "%PROGRAMFILES(X86)%\Common Files\AVEVA Plant SCADA" and, if the file is a valid ActiveX control, it is registered.

---

**Note:** Custom files can be transferred to remote computers via a deployment server using Plant SCADA's Deployment feature.

---

## See Also

[Include Custom Files](#)

## Include Custom Files

[Custom Files](#) are external or user-created files that can be included in a project when it compiles. These files could include CSV or DBF files associated with tables presented on project pages, or HTML content. It should also include any required ActiveX objects.

### To include custom files in a runtime deployment:

1. Determine the name and location of any custom files that you want to include in the project.

---

**Note:** The following files cannot be included as custom files as they are used by the compiler when preparing the zip files:

- Changes.dbf
- Custfiles.dbf
- Errlog.dbf
- Custfiles.zip
- Custactivex.zip
- \_library.rdb
- \_project.rdb

- 
2. In the **Setup** activity, select **Custom Files**.

3. Add a row to the Grid Editor.

4. Type the required information in each column, or in the fields in the Property Grid.

For a description of the properties, see below.

5. Click **Save**.

If you are adding an ActiveX object, make sure the **Is ActiveX** field is set to TRUE.

---

**Note:** If an ActiveX object has an associated data source, verify that the data source can be located by the computer hosting the client. See the topic [Managing Associated Data Sources](#) under the section on ActiveX objects in the Plant SCADA Help.

---

## Custom Files Properties

### General Properties

Field	Description
<b>File Name</b>	<p>The name of a file you would like to incorporate into to a runtime deployment. For example, a CSV or DBF file associated with a table presented on a project page, an HTML file, or a required ActiveX object. You can use wild cards ('*' or '?') when specifying a file name.</p> <p>To identify a custom file, you need to precede the file name with:</p> <ul style="list-style-type: none"> <li>• an absolute path</li> <li>• the Windows relative path</li> <li>• a Plant SCADA directory</li> </ul> <p>A Windows relative path should navigate from the current project directory. A Plant SCADA directory path can be one of the following:</p> <ul style="list-style-type: none"> <li>• [BIN] – where the Plant SCADA binary files are located</li> <li>• [Config] – where the Plant SCADA configuration files are located</li> <li>• [DATA] – where the Plant SCADA data files are located</li> <li>• [USER] – where databases are located</li> <li>• [COMMONFILES] – where Plant SCADA common files are located.</li> </ul> <p><b>Note:</b> You will need to manually configure the access control list for a folder location so that it matches the permissions that were applied to the default location during installation. See Configure Directory Security for Modified Folder Locations.</p>
<b>Is ActiveX</b>	<p>This field specifies if a file is an ActiveX object or not, which determines if it should be included in custActivex.zip or custFiles.zip. If the value you select is <b>False</b>, the file will be added to custFiles.zip; if you select <b>True</b> it will be added to custActiveX.zip.</p> <p>If you leave this field blank, any file with the extension ".ocx", will be automatically added to custActiveX.zip by the compiler. This is because ActiveX objects</p>

Field	Description
	typically use this file extension. Similarly, any files that don't have this extension will be automatically added to custFiles.zip  If you select <b>False</b> in this field where an .ocx file has been identified, it will force the .ocx file to be included in custFiles.zip.
<b>Destination Location</b>	This field specifies the folder structure that should be used to host the file when it is extracted from the one of the delivered zip files. It should represent a directory path in relation to the location where extraction occurs. For example: \Files\  The base folder for extraction is %PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\User\Example
<b>Comment</b>	Any useful comment (254 characters).

### Project Properties

Property	Description
<b>Project</b>	The project in which the custom file is configured.

## Compile

The Plant SCADA compiler brings together elements of your project - the configuration databases, graphics and Cicode files - to create a runtime system.

Compilation checks the project for errors and optimizes your system for fast and efficient operation. The time necessary to compile a project depends on its size and on the speed of your computer. Typically, compiling only takes several minutes.

When the Plant SCADA compiler runs, it normally opens files in exclusive mode. In this mode only Plant SCADA has access to the files (while the compiler is running). This improves the performance of the compiler, but can also result in an incomplete compilation if two people try to compile different projects at the same time, and these projects have one or more Include projects in common.

The [\[General\]ShareFiles](#) parameter tells the compiler to open files in shared mode. This option allows shared network users to run the compiler at the same time, but it can increase the time necessary for the compilation.

### UNINTENDED EQUIPMENT OPERATION

Restart the client process if the hardware alarm "Cicode library timestamp differs" is raised after a page is opened.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

---

**Note:** A hardware alarm of "Cicode library timestamp differs" will be raised if the Cicode library used by a page has a different timestamp from the one in memory. The timestamps will be different if the project has been fully recompiled, the project has been incrementally recompiled after the page has been modified, or if the project has been incrementally recompiled after any Cicode has been modified.

---

- [Incremental Compilation](#)
- [Debug a Compilation](#)

## Compile a Project

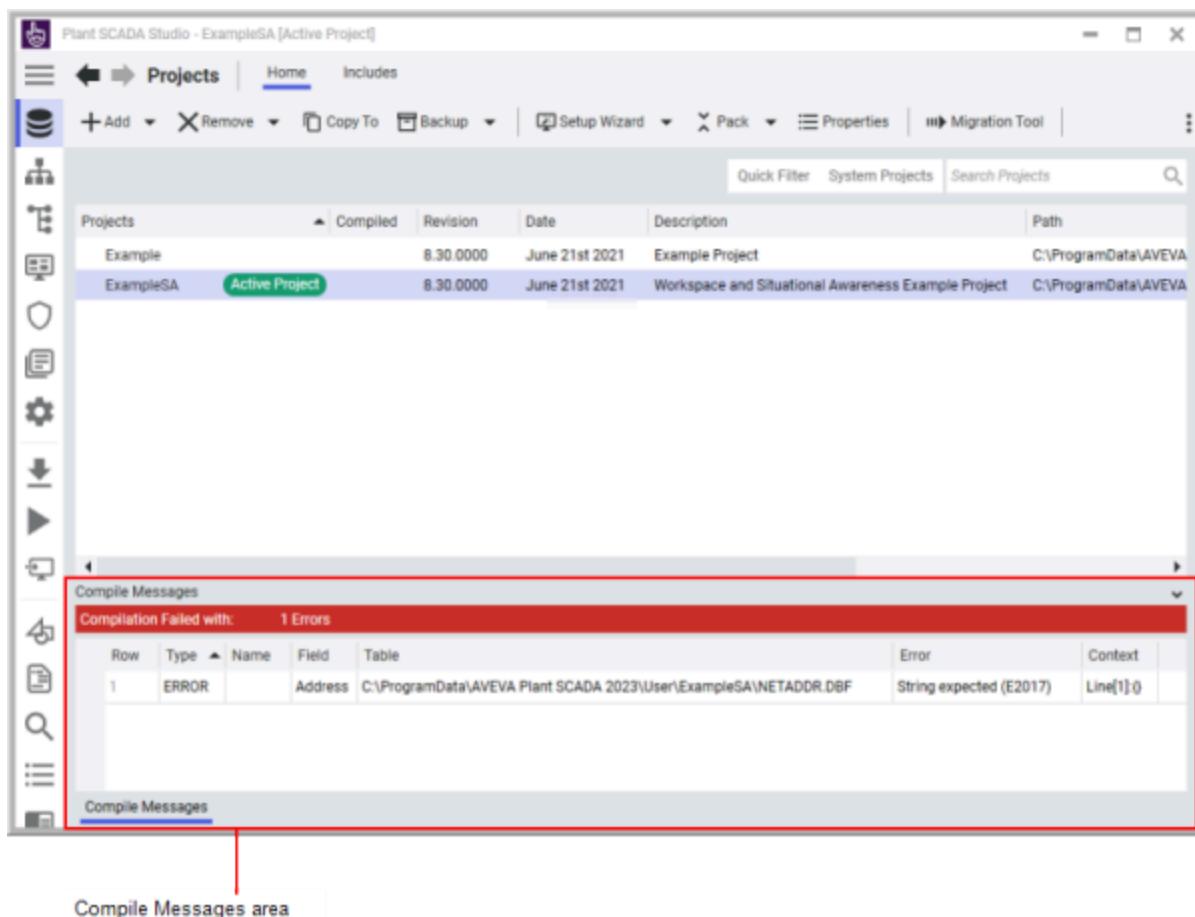

### To compile a project:

1. Open Plant SCADA Plant SCADA Studio.
2. On the Activity Bar, select **Compile**.

The **Plant SCADA Compiler** dialog box will appear and track the progress of the compile as it runs. If required, click the **Cancel** button to stop the compile.

When the compile is complete, the [Compile Messages Area](#) will open.

If any alert conditions are detected during compilation they will be listed in the **Compile Messages** area sorted by **Type**.

A Plant SCADA project can compile successfully if warning messages are generated. However, error messages and fatal messages will prevent a project from compiling successfully. You will need to fix these in order to recompile (see [Debug a Compilation](#)).

If you require further information about a particular compile message, see [Compile Messages](#).

3. To go to a database record that relates to a compile message, double click within the message row. The Grid Editor will display with the associated field selected.

---

**Note:** Plant SCADA automatically compiles the project (if uncompiled) when you try to run it.

---

## See Also

[Debug a Compilation](#)

[Incremental Compilation](#)

[Plant SCADA Studio Options](#)

## Debug a Compilation

The Plant SCADA Compiler dialog will notify you of any error messages as it compiles, and you can opt to cancel

the compilation at any stage. If there are multiple or severe errors, the compiler might automatically cancel. Once the compiler is finished, the compile messages will be listed in the [Compile Messages Area](#) sorted by **Type**. This can include the following types:

- Error messages
- Fatal messages
- Warning messages.

A Plant SCADA project can compile successfully if warning messages are generated. However, error messages and fatal messages will prevent a project from compiling successfully.

To go to a database record that relates to a compile message, double click within the message row. The Grid Editor will display with the associated field selected.

If you require further information about a particular compile message, see [Compile Messages](#).

The compiler does not verify the operation of your project. Just because your project compiles does not mean it will work correctly at runtime. For example, the compiler checks that the tags you use are defined correctly, and that your Cicode has acceptable syntax. But, it does not check your tags for incorrect scaling, or that your Cicode has no potential divide by zero errors.

## **WARNING**

### **UNINTENDED EQUIPMENT OPERATION**

- Do not attempt to run your system until you have resolved errors reported during project compilation.
- Always perform a complete compilation before promoting your project to the test or live environments.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

The compiler supports a number of options that modify the output of the compile error log, making it more practical to assess specific error types and entries. For more information, see [Compilation Options](#).

## **See Also**

[Incremental Compilation](#)

## **Compile Messages**

You might encounter error messages when you compile a Plant SCADA project.

Compile errors can be viewed in the [Compile Messages Area](#) in Plant SCADA Studio.

Each compile message includes the following fields:

Property	Description
Type	The type of error. Three types can occur during compilation. These are:

Property	Description
	<ul style="list-style-type: none"> <li>• <b>ERROR</b> - The compilation process continues, however the project will not compile successfully until you have corrected the error. For a complete list of error messages, see <a href="#">Compile Error Messages</a></li> <li>• <b>FATAL</b> - The severity of this error is such that it halts the compilation process. The project cannot be compiled until you correct the error. For a complete list of fatal messages, see <a href="#">Compile Fatal Messages</a>.</li> <li>• <b>WARNING</b> - The error was not serious enough to stop the project being compiled successfully, however investigate and correct the compile error. For a complete list of warning messages, see <a href="#">Compile Warning Messages</a>.</li> </ul>
<b>Name</b>	The name of the graphics page library, or report format file where the error has been detected.
<b>Field</b>	The database field where the error has been detected.
<b>Table</b>	The database table where the error has been detected.
<b>Error</b>	A brief description of the error.
<b>Context</b>	The location in the database field, report format file, or Cicode library where the error has been detected. The context of the error is enclosed in braces { . . . }.

## Compile Error Messages

The following table describes the [Compile Messages](#) you may encounter when compile a project. For information on how to address an ERROR message, use the code included in the error description (for example, "E2001") to locate the error message in the following table.

If the **Type** specified for a compile error message is WARNING, see the topic [Compile Warning Messages](#).

If the **Type** specified for a compile error message is FATAL, see the topic [Compile Fatal Messages](#).

Error Code	Error Message	Description
E2001	Tag not found	The specified tag does not exist. Check that the tag name and 'equipment.item' reference is correct, or add the tag to your project.  If the tag does exist in the variables database, the index to the database might be incorrect. This can occur if you have edited the variables database using Excel or some other database editor. To re-index the database, go to the Projects activity and select <b>Pack</b> on the Command Bar.
E2002	Database is empty	The database does not contain any records.
E2003	Cannot write to read only variable	This error indicates that the address of the variable tag, which refers to a protocol-specific area on the device, is read only. This means it is not possible to write to the variable tag.
E2004	Too many records in database	Too many records have been specified in the database. This error should only occur if the Citect.frm file has been changed or become corrupt. Contact Technical Support.
E2005	Too many fields in database	Too many fields have been specified in the database. This error will only occur if the Citect.frm file has been changed or become corrupt. Contact Technical Support.
E2006	Bad integer value	An integer value cannot be found where one is expected, or the integer value is out of range.
E2007	Bad floating point value	A floating-point number cannot be found where one is expected, or the floating-point value is out of range.
E2008	Tag expected	A tag name was not found where

Error Code	Error Message	Description
		one was expected, or an expression has been passed to a function that expects a tag. Check that the tag name is correct, or add the tag to your project.
E2009	Cannot read from write only variable	This error indicates that the address of the variable tag, which refers to a protocol-specific area on the device, is write only, so the variable tag does not have a value that can be read.
E2010	Primary IO device not found	The specified I/O device does not exist or cannot be located. Check that the device reference is correct, or add the I/O device to your project.
E2011	Close bracket expected	The Cicode statement has a different number of open and close brackets. Another close bracket ')' or ']' is expected in the statement.  For example: This error can be generated when a Genie is configured to be used by DspSym Cicode function but still has genie substitution syntax such as '%substitution%' on expressions that are unsupported by that configuration.
E2012	Symbol search failed	A database record does not exist. Check that the record name is correct.
E2013	Read remap is not supported for this variable	A mapped variable cannot be read when Remap Read is disabled. Check the remapping configuration.
E2014	Bad IO Device variable	The address of the variable is invalid for the protocol specified for the I/O device.
E2015	Bad raw data type	An invalid raw data type or a mismatch of data types is specified, for example, an attempt was made

Error Code	Error Message	Description
		<p>to convert an integer into a string. This may be due to a variable address implying a data type that is not compatible with the data type specified.</p> <p><b>Example 1</b>  Protocol: S7NT or PSDIRECT  Tag Data Type: REAL  Address: DB101,54.3[32]  In this case, the address implies that the variable is an array of 32 DIGITALs (via bit access) but the tag data type is REAL.</p> <p><b>Example 2</b>  Protocol: ABMLXEIP  Tag Data Type: INT  Address: T4:0/0  In this case, the address implies that the variable is a DIGITAL (via bit access) but the tag data type is INT.</p>
E2016	Array size exceeded	A tag is indexed but that tag is not declared as an array, or no index has been specified when a tag is declared as an array, or the wrong number of dimensions are specified for an array, or more than four dimensions are specified for an array.
E2017	String expected	Only strings can be used in database fields.
E2018	Protocol expected	The protocol field in the I/O Devices database is blank. You need to select a protocol for the I/O Device.
E2019	Open bracket expected	<p>You need to use parentheses () in Cicode functions, even when they have no parameters, for example MyFunction().</p> <p>This error can be generated when a</p>

Error Code	Error Message	Description
		variable tag is placed on a graphics page and the name of the tag is identical to the name of a Cicode function in the project or an included project.
E2020	Syntax error	A malformed Cicode expression has been specified. Check the structure of the expression.
E2021	Record already defined	Tag names, alarms, trends, users and Cicode functions all need to be unique within a project and any included projects. Check for duplicated names.
E2022	Incorrect number of arguments for function	Too many or not enough arguments have been specified for a Cicode function. Check the number of arguments being passed to the function and make the required adjustments.
E2023	Trailing characters in Cicode	There are extra trailing characters in a Cicode statement, following the semi-colon.
E2024	Incompatible types	<p>There is a mismatch of data types in a statement. For example, a string is specified where a number is expected.</p> <p>This error can be generated when a variable tag is placed on a graphics page and the name of the tag is identical to the name of a Cicode function in the project or an included project.</p> <p>This error can also be generated when a Genie is configured to be used by the DspSym Cicode function and has genie substitution syntax such as '%substitution%' on expressions that are unsupported by that configuration.</p>
E2025	Too many arguments	Too many arguments are specified in a Cicode function. The maximum

Error Code	Error Message	Description
		number of arguments allowed is 32.
E2026	Invalid font name	The font does not exist in the project. Check that the font name is correct, or specify the font in the <b>Standards</b> activity.
E2027	Invalid BOOLEAN value	A non-integer value was found where a TRUE or FALSE value is expected. For example, the controlling expression in an IF, WHILE, or FOR statement needs to be an integer.
E2028	Analog address not supported	An INT or other analog tag is specified where a DIGITAL tag is expected. Check that the tag name is correct, or that a DIGITAL data type is specified for the tag.
E2029	Group not found	The device listed in the report configuration does not exist. Check that the device or group name exists.
E2030	Group expected	
E2031	FUNCTION expected	A function needs to be declared with the FUNCTION keyword.
E2032	THEN expected	A THEN statement needs to be used in an IF statement.
E2033	DO expected	A DO statement needs to be used in a WHILE statement.
E2034	END expected	An END statement needs to be used at the end of a conditional statement or function definition.
E2035	Bad string conversion parameter	An invalid format parameter is specified in a string conversion. Check the format specification of the variable.
E2036	Cannot return value from void function	A RETURN statement cannot be used in a function that does not return a value. Remove the

Error Code	Error Message	Description
		RETURN statement or declare a return data type for the function.
E2037	Must return value from function	If a Cicode function is declared to return a value, it needs to have a RETURN statement.
E2038	Label is defined twice	Label names needs to be unique. Check the labels defined in the <b>Standards</b> activity for duplicated names.
E2039	Cannot use RETURN outside of functions	A RETURN statement can only be used within a function.
E2040	Statement expected	Plant SCADA is expecting a statement. Check the Cicode for syntax errors.
E2041	Operand expected	A Cicode operator needs to be followed by an operand.  This error can be generated when a Genie is configured to be used by the DspSym Cicode function and has genie substitution syntax such as '%substitution%' on expressions that are unsupported by that configuration.
E2042	Invalid time format	The time is incorrectly specified in the Time, Period or Sample Period field of a Reports, Events, Trend Tags, SPC Trend Tags, or Device.  Time formats needs to be in the format HH:MM:SS and needs to be in the range of 0:00:00 - 23:59:59. Only the hour is necessary, for example a value 16 means 16:00 (4:00 PM). Also 24:00:00 is accepted for historical purposes, and maps directly to 0:00:00.  Period formats needs to be either a valid date or a time in the format HH:MM:SS with the minutes and seconds in the range of 0 - 59. Only the seconds are necessary, for example a value of 22 means 22

Error Code	Error Message	Description
		seconds.  Sample Period formats need to either be a milliseconds value (for example 0.200 for 200 milliseconds) or a time in the format HH:MM:SS with the minutes and seconds in the range of 0 - 59. Only the seconds are necessary, for example a value of 22 means 22 seconds.
E2043	Bad analog format	The format is incorrectly specified for an analog variable. Check the Format field in the Variable Tags form.
E2044	Maximum report size exceeded	The report file size needs to be less than 63 kb. Reduce the size of the report or configure two reports.
E2045	Bad factor specification	A Cicode expression that contains an invalid expression has been used. Check the syntax of the expression.
E2046	Semicolon expected	Cicode statements need to be separated with semi-colons (;).
E2047	Page name cannot start with underscore	A Page Name needs to start with an alphanumeric character (A - Z, a - z, or 0 - 9).
E2048	Invalid group definition	A group does not exist in the project. Check that the group name is correct, or specify the group with the Groups form.
E2049	Cicode data limit reached	An array in a Cicode module cannot exceed 60 KB. Reduce the size of the array.
E2050	Expression too big	An expression is too large for the compiler. Reduce the length of the expression by splitting the expression into two or more smaller expressions.
E2051	Error reading file	An include file specified in a

Error Code	Error Message	Description
		database field cannot be found or cannot be opened. Check that the file name is correct, and that the file has been specified correctly (for example, <@FILENAME>).
E2052	Cannot use an array inside function	You cannot declare an array within a function. Arrays can only be declared as library variables, at the beginning of the library file.
E2053	Trailing characters in Name	The database record name contains invalid characters. Remove any invalid characters from the record name.
E2054	Close quotation mark expected	The Cicode statement has a different number of open and close quotation marks. Another close quotation mark ("") is expected in the statement.
E2055	String too big	The string size has been exceeded. The maximum size of the string not to exceed 255 characters.
E2056	Close comment delimiter expected	A comment opened with /* needs to be closed with the */ delimiter. Add the */ delimiter or use a single line comment that starts with an exclamation mark (!) and has no end delimiter.
E2057	Label argument error	The syntax of the argument is incorrect, or the incorrect number of arguments has been specified, or the number of characters in an argument is incorrect.
E2058	Invalid number	
E2059	Label too big	The label is too big. The size of a label cannot exceed 8kb.
E2060	Address on bad boundary	When reading a long or real from the memory of an I/O device, addresses need to be on odd or even boundaries. Addresses cannot

Error Code	Error Message	Description
		be mixed and all I/O devices need to be configured on the same boundary. You can disable checking with the [General]CheckAddressBoundary parameter.
E2061	Super Genie must be on a Page	Super Genie syntax (?) can only be used on pages. You cannot use a Super Genie in a report or Cicode function library. Use the TagRead() and TagWrite() functions instead.
E2062	Write remap is not supported for this variable	A mapped variable cannot be written to when Remap Write is disabled. Check the remapping configuration.
E2063	Digital Array must start on 16 bit boundary	
E2064	Remap is defined more than once	Duplicate mappings are configured for a variable. Check the remapping configuration.
E2065	CASE expected	A SELECT statement in your Cicode function needs to be followed by a CASE statement.
E2066	Unexpected trend sample period	
E2067	Too many function variables defined	Too many variables have been defined for a Cicode function. Check the configuration of the function and make the required adjustments.
E2068	Too many Cicode files defined	The project includes more than the allowable number of Cicode files.
E2069	MODULE function is not allowed, use PRIVATE	You have declared a Module function within your Cicode. Module is not a valid function type. Instead, the type Private needs to be used.
E2070	GLOBAL function is not allowed, use PUBLIC	You have declared a Global function within your Cicode. Global is not a

Error Code	Error Message	Description
		valid function type. Instead, the type Public needs to be used.
E2071	PUBLIC variable is not allowed, use GLOBAL	You have declared a Public variable within your Cicode. Public is not a valid variable type. Instead, the type Global needs to be used.
E2072	PRIVATE variable is not allowed, use MODULE	You have declared a Private variable within your Cicode. Private is not a valid variable type. Instead, the type Module needs to be used.
E2073	VB compiler error	
E2074	CiVBA code not allowed here	The compiler has detected CiVBA code where it is not supported.
E2076	Unexpected FUNCTION declaration found, are you missing an END?	The number of END statements in your functions is incorrect.
E2077	Tag already defined, tags must be unique	Tag names need to be unique across a project, even if they are different types. Change the tag name property for one of the duplicated tags.
E2078	Cluster not found	A cluster cannot be found. Check that the cluster reference is correct, or create the specified cluster. Clusters can be defined by selecting <b>Computers</b> in the <b>Topology</b> activity.
E2079	No Clusters defined	Every project needs to be configured to use at least one cluster. Clusters can be defined by selecting <b>Computers</b> in the <b>Topology</b> activity.
E2080	Invalid mode specified	The mode specified for the alarm, report or trend server is invalid.
E2081	More than one server of this type exists in this cluster	Each cluster can only include one pair of redundant alarm servers, one pair of redundant report servers, and one pair of redundant trend servers. Check the servers that are configured for the cluster.

Error Code	Error Message	Description
E2082	A server with this name already exists	Server names need to be unique. Rename one of the servers with the duplicated name.
E2083	Cannot use format on Expression with no result	
E2084	Network Address not defined in Topology/Network Addresses	The compiler has detected a network address that has not been defined in your project. Edit the address if it incorrect, or add it to your project.
E2085	Network Address not defined in Topology/Network Addresses	The compiler has detected a network address that has not been defined in your project. Edit the address if it incorrect, or add it to your project.
E2086	Duplicate network address for same type of server in a cluster	Two servers of the same type within a shared cluster have been configured with the same network address. Change the address for one of the servers.
E2087	Duplicate network address for IO server	Two I/O servers have been configured with the same network address. Change the network address for one of the servers.
E2088	Invalid port number	The port is not a valid number.
E2089	Invalid port number (2080-2088,2073,3073,5482,20222 are reserved)	The specified numbers are reserved. Please change these port numbers to another value.
E2090	Cluster name expected	Every project needs to be configured to use at least one cluster. Clusters can be defined by selecting <b>Computers</b> on the <b>Topology</b> activity.
E2091	Trailing characters in Expression	There are extra trailing characters following an expression.
E2092	A server with this network address and port already exists	A report, trend, alarm or I/O server is configured in your project with the same network address and port

Error Code	Error Message	Description
		number. If you intend for these servers to be configured on the same machine, change the port number, otherwise update the network address.
E2093	Cluster not found for the IO Device	Every project needs to be configured to use at least one cluster. Clusters can be defined by selecting <b>Computers</b> on the <b>Topology</b> activity.
E2094	Deadband value must be expressed as a percentage (0.0 - 100.0)	The compiler cannot decipher the value specified for a deadband. Adjust the value so that it represents a percentage (0.0 - 100.0).
E2095	Tag already defined as a local variable tag	Tag and local variables cannot have the same name. Please rename one or the other.
E2096	Cluster must be specified when two servers of the same type exist at the same net addr.	More than one server of the same type has been defined on the same machine. Please define a cluster for each server.
E2097	Invalid combination of specified & unspecified network addresses for the defined servers	The network addresses for the servers in a project need to all be blank, or all configured.
E2098	No Server of proper type is defined for the specified cluster	No server has been defined for this type in this cluster. Please define the appropriate server by selecting <b>Computers</b> on the <b>Topology</b> activity.
E2099	Primary IO devices having same network number cannot belong to the same cluster	Two primary I/O devices within the same cluster have been configured to use the same network number. If the devices have the same number to support redundancy, change the priority and startup mode. Otherwise, change the network number or move the devices to a different cluster.
E2100	Primary IO device not found for the	This error occurs when the I/O

Error Code	Error Message	Description
	cluster	device listed in the tag configuration does not exist.
E2101	Function is obsolete and cannot be used anymore	The Cicode function that you are trying to use can no longer be used. Refer to the upgrade topic for details.
E2102	Standby IO device should have a primary on the same cluster	A cluster has a standby I/O device configured, but no primary I/O device. Check the configuration of your redundant devices to confirm that a primary I/O device is assigned to the cluster.
E2103	Primary IO device must have a priority of 1	Set the Priority field for the primary I/O device to 1.
E2104	IO device has duplicate priority	The Priority field allows you to set precedence for the primary and standby devices within a cluster. Check the priority setting for the I/O devices with the same number in the specified cluster and remove any duplications.
E2105	Compound statement too large; refactor code. Please see KB article Q5070	
E2106	A duplicate menu entry already exists	Check the configuration of your menus in the <b>Visualization</b> activity and remove any duplications.
E2107	Role not found	A user or variable refers to a role that does not exist. Check the <b>Roles</b> setting for the specified user account, or the <b>Write Roles</b> setting for the specified variable.
E2108	Comma expected	
E2109	Function name is longer than 250 characters	A Cicode function name must be shorter than 250 characters. Rename the Cicode function.
E2110	Malformed device format	The format of the device is in an incorrect format. This could mean

Error Code	Error Message	Description
		<p>one of two issues is occurring:</p> <ol style="list-style-type: none"> <li>1. There is incorrect number of open and close braces ('{' and '}') in the device format. For example:  {Date,10}^v{TimeLong,12}  ^v{MsgLog,50}^v{Arg1,7}^v{FullName,20}</li> <li>2. A comma is missing between either the field name, field width or justification. For example:  {Date,10}^v{TimeLong,12}^v{MsgLog,50}^v{Arg1,7}^v{FullName,20}"</li> </ol>
E2111	Minimum update rate value must be blank or same value as defined by the primary device	The <b>Min Update Rate</b> field is not configured correctly for a standby device. Adjust the current setting so that is blank, or has the same value as the primary I/O device.
E2112	Staleness period value must be blank or same value as defined by the primary device	The <b>Staleness Period</b> field is not configured correctly for a standby device. Adjust the current setting so that is blank, or has the same value as the primary I/O device.
E2113	The setting for Background Poll must be the same for all I/O devices on the same server	The <b>Background Poll</b> field is not configured correctly on an I/O device. Check that the setting is the same on all devices that share a common I/O server.
E2114	The setting for Background Rate must be the same for all I/O devices on the same server	The <b>Background Rate</b> field is not configured correctly on an I/O device. Check that the setting is the same on all devices that share a common I/O server.
E2115	Tag element and item names cannot be used in this context	
E2116	Tag element and item names cannot be used in the context of a push data event trend	

Error Code	Error Message	Description
E2117	No User has been defined for this project. At least one user must be defined	Use the <b>Security</b> activity to add at least one user to your project.
E2118	Standby server has been defined without primary server in the cluster	A cluster has a standby server configured, but no primary server. Check the configuration of your redundant servers to confirm that a primary server is assigned to the cluster.
E2120	Two IO devices with Persist set to true have the same File Name	This occurs when two I/O devices have the <b>Persist</b> property set to "True", and the <b>File Name</b> property set to the same value. Change the file name for one of the I/O devices.
E2121	Invalid path	
E2122	Same primary IO device name used with two different network numbers	Two primary I/O devices have the same name, but different network numbers. If the devices have the same name to support redundancy, confirm that they have the same network number and have the priority and startup mode set correctly, otherwise assign them to a different cluster.
E2123	Undefined equipment name	The compiler has detected a reference to undefined equipment. Check that the reference is correct. If required, add the equipment definition to your project in the <b>System Model</b> activity.
E2124	Undefined equipment state name	The compiler has detected a reference to an undefined equipment state. Check that the reference is correct. If required, add the equipment state to your project in the <b>System Model</b> activity.
E2125	Invalid default state	
E2126	Invalid DR Mode value	

Error Code	Error Message	Description
E2127	Equipment State contains cyclic reference	
E2128	State defined without default DR Mode value	
E2129	Invalid destination location	This occurs when the destination location specified for a custom file is invalid. Check that the destination setting is correct.
E2130	Duplicate network address name for OPC Server	The compiler has detected two OPC servers with the same name. Each OPC server must have a unique name and run on a separate computer. Check the configuration of your OPC servers to make sure they use different names and network addresses.
E2131	Duplicate network IP address for OPC server	The compiler has detected two OPC servers with the same network address. Each OPC server must run on a separate computer. Check the configuration of your OPC servers to make sure they use different network addresses.
E2132	Cluster name present in Equipment name	A name used for root level equipment may not be the same as any cluster names. Check your equipment definitions.
E2133	An equipment record with this name is already present	Equipment names need to be unique within the same cluster. Check your equipment definitions.
E2134	Wrong hierarchy for OPC Server	The browsing hierarchy setting for the OPC server is invalid.
E2135	Equipment hierarchy too deep	
E2136	Equipment object name too long	The length of the complete name for the equipment needs to be less than 254 characters. Check your equipment definitions.
E2137	Equipment Name and Item too	Indicates the combination of

Error Code	Error Message	Description
	long. Specify or change the Item field	"Equipment.Item" is too long. Change the name of the Equipment and/or Item.
E2138	Equipment Name and Item not unique. Specify or change the Item field	Indicates the combination of "Equipment.Item" is not unique within the cluster. Change the name of the Equipment and/or Item.  This message will also occur if on the same level within the equipment hierarchy, the equipment object and the item object name are identical.
E2139	Equipment root has same name as an Alarm Tag	A name used for root level equipment may not be the same as any alarm tag names. Check your equipment definitions.
E2140	The Storage Method is not defined	The <b>Storage Method</b> property has not been defined for the trend.
E2141	Equipment not specified for tag item. Please specify equipment or remove tag item	Indicates that the Item field on the Tag Form (Variable Tags, Trend Tags, and all Alarm Tags) was specified without an associated Equipment Name.
E2142	Item name is also a node within the equipment hierarchy	An Item name cannot have the same name as a node on the equipment hierarchy.
E2143	No report server defined for this cluster	Equipment requires a report server to be configured. Add a report server to the cluster.
E2144	Invalid user defined	The user name conflicts with a set of <a href="#">Reserved User Names</a> . Use a different name.
E2145	Invalid role defined	
E2146	Tag name exceed length limit	
E2147	Conflict of parameters in included projects	A parameter setting in an included project is conflicting with the same parameter in the main project.

Error Code	Error Message	Description
E2150	Invalid Genie format	
E2151	Password is invalid due to duplication of user record	
E2152	Invalid Setpoint	
E2153	Set the parameter [General]TagStartDigit=1 if your tags start with a digit	If your project includes tags, tag items, or equipment names that have a number as the first character, you need to set the parameter [General]TagStartDigit to "1" to enable a compile.
E2154	Duplicate ScheduleID for IODevice	
E2155	Profile name is invalid	Profile name is invalid as it may contain a space, or any of these characters: < > : \ " / \\   ? *. Rename the profile.
E2156	Cicode IODevices do not support memory mode, memory must be set to FALSE	A Cicode I/O device will not compile if memory mode is set to TRUE. Set memory mode to FALSE for the Cicode I/O device.
E2157	Equipment Expected	An Equipment Reference refers to Equipment or Referenced Equipment that does not exist. Update the Equipment Reference, or add the missing equipment to your project.
E2158	Duplicate Equipment Reference	An Equipment Reference is configured twice. Check the configuration of the duplicated entries.
E2159	Too many alarm responses are defined for an alarm	Confirm that only eight sets of Cause and Response properties are defined for each alarm tag.
E2160	Content Type not found	
E2161	Invalid Alarm Priority	The Value property for an Alarm Priority must be between 1 and 255. If a label is used, confirm that it validates to a value between 1 and 255.

Error Code	Error Message	Description
E2162	Duplicate Alarm Priority	An Alarm Priority is configured twice. Check the configuration of the duplicated entries (including any that may occur in an included project).
E2163	Alarm Priority or Alarm Mode color must be specified	Display colors need to be configured for an Alarm Priority or an Alarm Mode. Check that the 'Foreground Color' and/or 'Background Color' properties have not been left blank.
E2164	Port Name can be no longer than 31 characters	A Port Name is too long. Use a name that is no longer than 31 characters.
E2165	Duplicate Alarm Mode display name	The Display Name specified for an Alarm Mode is configured twice. Remove one of the duplicated entries.
E2166	Invalid Alarm Mode display name	The Display Name specified for an Alarm Mode is invalid. You can select a valid name for this field from the drop-down list in the Grid Editor.
E2167	Screen Profile Name is Invalid	The specified screen profile name is invalid. Names should be less than 65 characters long and must not contain any invalid characters (< > : " / \   ? *).
E2168	Duplicate Equipment Runtime Parameter	A runtime equipment parameter is configured twice for the same equipment on the same cluster. Locate and change the duplicate entries.
E2169	Invalid equipment item name	The specified equipment item name is invalid. Use a valid item name that is not one of tag extensions keyword. If the item name is automatically generated by an equipment template, use Equipment Editor to rename the item name on the template and run

Error Code	Error Message	Description
		the <b>Update Equipment</b> command.
E2170	Network address can be no longer than 15 characters	The length of the network address is too long. Enter a network address that is less than or 15 characters in length.
E2171	Network addresses cannot be a fully qualified domain name	Network addresses cannot be a fully qualified domain name. Enter a valid computer name or an IP address instead.
E2172	Duplicate trend or SPC file name	When configuring the <b>File Name</b> property for a trend tag or SPC data file, ensure that each file uses a unique file name.
E2176	Duplicate Industrial Graphics page or symbol name	The name used for an Industrial Graphics page or symbol is not unique within the current project and its included projects. Enter a valid name for one of the duplicate items.
E2177	Embedded symbol was found but outside its project's include hierarchy	This error message will appear if an embedded symbol has been deleted or its host include project has been removed. It indicates that a new symbol with the same name as the deleted symbol has been created in a higher-level project.
E2178	Embedded symbol not found but a page with the same name was found	This error message will appear if an embedded symbol has been deleted, or its host include project has been removed. It indicates that a new page with the same name as the deleted symbol has been created.
E2179	<This error message is replaced with arbitrary text>	The compiler has detected a problem with the syntax for an object property (such as an incomplete expression). The error message will identify the object, and provide a brief explanation of what was detected.

Error Code	Error Message	Description
E2180	Page not found but a symbol with the same name was found	This error message will appear if a page has been deleted, or its host include project has been removed. It indicates that a new symbol with the same name as the deleted page has been created.
E2181	Reserved keyword is being used	Change the keyword to something that is not a reserved word. See <a href="#">Reserved Words</a> .
E2182	Invalid Unique ID format	Unique IDs for variables need to use the following format: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX  This error indicates that a unique ID is not valid.  This may occur if you modify the variables database outside of Plant SCADA Studio.  For more information, see <a href="#">Unique IDs for Variable Tags and Equipment</a> .
E2183	Duplicate Unique ID for variable	The compiler has detected duplications among the unique IDs used for the variables in your project.  This error may occur if you modify the variables database outside of Plant SCADA Studio.  For more information, see <a href="#">Unique IDs for Variable Tags and Equipment</a> .

## Compile Fatal Messages

If the **Type** specified for a [Compile Messages](#) is FATAL, it means something was detected that stopped the project from compiling successfully. For information on how to address a message of this type, use the code included in the error description (for example, "F4001") to locate the fatal message in the following table.

If the **Type** specified for a compile error message is ERROR, see the topic [Compile Error Messages](#).

If the **Type** specified for a compile error message is WARNING, see the topic [Compile Warning Messages](#).

Code	Fatal Message	Description
F4001	Out of file handles. Increase value of the parameter [CtEdit]DbFiles	<p>Plant SCADA uses a file handle to open each file. When you try to open too many files or databases simultaneously, Plant SCADA can need more file handles than are available.</p> <p>You are likely to run out of file handles if you have many included projects. When Plant SCADA compiles your project, it will open several files in each include project at the same time, so each extra project you include will increase the usage of file handles. If you get this alert message when you have added another include project, you have run out of file handles. To verify this, remove one of the included projects to see if Plant SCADA can then compile your project.</p> <p>With Windows running on a network, the setup of the number of file handles is located in various places. To increase the number of file handles in DOS, the setup is in the CONFIG.SYS file. If you are using Novell Netware you need to also increase the file handles in the NET.CFG or SHELL.CFG file. You need to also increase the number used by Plant SCADA with the [CtEdit]DbFiles parameter. Adjust the following settings the associated files:</p> <p>CONFIG.SYS FILES=120 NET.CFG or SHELL.CFG file handles=120</p>
F4002	Cannot open file	The compiler cannot open a file that is referenced by the project you are trying to compile. The file does not exist, or it has become corrupt, or your system is out of file handles.

<b>Code</b>	<b>Fatal Message</b>	<b>Description</b>
F4003	Cannot read from file	The compiler cannot read a file that is referenced by the project you are trying to compile. The end of file was found, or it has become corrupt. You should confirm that the file is functioning as expected.
F4004	Cannot write to file	The compiler cannot write to a file that is referenced by the project you are trying to compile. The file has become corrupt or the disk is full. You should confirm that the file is functioning as expected and that the required disk space is available.
F4005	Unknown field	A field is being referenced that does not exist. The database has been modified or has become corrupt. Pack the databases. If the error persists, contact Technical Support of this product.
F4006	Unexpected end of file	The end of the database has been reached or the database has become corrupt. Pack the database. If the error persists, contact Technical Support for this product.
F4007	Unexpected beginning of file	The beginning of the database has been reached or the database has become corrupt. Pack the database. If the error persists, contact Technical Support for this product.
F4008	Out of memory	Plant SCADA has run out of memory. Increase the amount of memory in the computer or use smaller databases.
F4009	Software error	An internal Plant SCADA software error has been detected. Contact Technical Support for this product.
F4010	Not database format	The database has become corrupt or the file format is unknown. Pack the database.

<b>Code</b>	<b>Fatal Message</b>	<b>Description</b>
F4011	File is read only	A file the compiler is attempting to access is set to read only. Check that the file name is correct or change the attributes of the file.
F4012	Unknown dba error	An internal Plant SCADA software error was detected. Contact Technical Support of this product.
F4013	Unknown bin error	An output file could not be opened during compilation. Pack the database. If the error persists, contact Technical Support for this product.
F4014	Disk full	The compiler is unable to function correctly due a lack of available disk space. Remove unwanted files from the disk, or replace the existing disk with a larger disk.
F4015	File locked	A file that is referenced by the project you are trying to compile appears to be locked. Check if the file is in use by another network user.
F4016	The include project was not found	The include project specified in the Context field cannot be located in Plant SCADA Studio. You should add the project, or update the reference.
F4017	Project includes itself	The project specified in the Context field contains a circular reference. Check the structure of your include projects.
F4018	Index key has changed	The database has a corrupted index. Pack the database.
F4019	File not indexed	The database needs to be indexed, but the index file associated with the database cannot be found. Pack the database.
F4021	Database table full	The database is full. If the error persists, contact Technical Support

<b>Code</b>	<b>Fatal Message</b>	<b>Description</b>
		for this product.
F4022	Reached the end of table	The end of the database has been reached or the database has become corrupt. Pack the database. If the error persists, contact Technical Support for this product.
F4023	File does not exist	The compiler cannot locate a file that is referenced by the project you are trying to compile. You should confirm that the file is in the specified location, or remove the reference to the file.
F4024	Too many files open	The maximum number of DBF files that can be open simultaneously has been exceeded. Increase the limit by changing the [CtEdit]DbFiles parameter.
F4025	File already opened in SINGLE mode	The file has been opened by another user. Set the [General]ShareFiles parameter to 1 in the Citect.ini file to open files in shared mode.
F4026	Too many include projects	The project you are trying to compile has more than 240 included projects defined. Reduce the number of included projects.
F4027	Unknown protocol	The project you are trying to compile refers to a protocol that does not exist.
F4028	Cannot compile all functions	The function library did not compile correctly.
F4029	Too many Cicode functions	More than 4500 user functions have been defined. To increase the number of functions allowed (up to 10000), use the parameter [CtEdit]MaxCicodeFunctions This error is often due to Cicode functions being defined in a number of included projects.

Code	Fatal Message	Description
		Extending this parameter might affect system performance. Only set it when advised by Citect Customer Service.
F4030	Point limit reached	The maximum number of points that can be referenced has been reached. The maximum point limit is determined by your Plant SCADA license. Contact Technical Support for this product.
F4031	Bad point limit	The incorrect point limit is specified in the Citect.ini file. The point limit needs to correspond to your Plant SCADA license.
F4032	Specification file invalid	A system file has become corrupt, or been deleted. Re-install Plant SCADA on your system. If the error persists, contact Technical Support for this product.
F4033	File size error	A Cicode functions file, report format file, or an include file is too big. The maximum file size is 1 MB.
F4034	Cicode Function greater than 64K	The code generated by a Cicode file is too large. Place the functions within the file into separate Cicode files.
F4035	OID Overflow. Set [OID]Reset=1 to regenerate OIDs	An internal error has occurred within a DBF file. Set the parameter [OID]Reset=1 to regenerate the OIDs in the database.
F4036	OID out of sequence. Set [OID]Reset=1	An internal error has occurred within a DBF file. Set the parameter [OID]Reset=1 to regenerate the OIDs in the database.
F4037	Project ID not found - each project must have an ID	The project you are trying to compile (or one of its included projects) does not appear to have a project ID. Specify an ID for the project in the Project General Properties (see <a href="#">Edit a Project's</a>

Code	Fatal Message	Description
		<a href="#">Properties</a> ).
F4038	Invalid Project ID - must be between 1 and 500	The project you are trying to compile (or one of its included projects) does not appear to have a valid project ID. Specify an ID for the project (between 1 and 500) in the Project General Properties (see <a href="#">Edit a Project's Properties</a> ).
F4039	Duplicate Project ID	The project you are trying to compile has the same project ID as one of its included projects. Specify a new ID for one of the projects in the Project General Properties (see <a href="#">Edit a Project's Properties</a> ).
F4040	The specified protocol is no longer supported	The project you are trying to compile references a protocol that is no longer supported. You should determine where the point of reference occurs and implement a supported protocol.
F4041	Citect.ini parameter specified is no longer supported	The Citect.ini file includes a parameter that is no longer supported. You should determine how the parameter is used and implement an alternative solution.
F4042	Alarm and Memory PLC devices are obsolete. Run the Migration Tool from the Tools menu	Alarm devices no longer need to be defined to use Alarm Properties as tags. Please refer to the help for the <a href="#">Project Migration Tool</a> to make the required changes to your project.
F4043	Total code size too large; refactor code. Please see KB article Q5600	The total size of your code is too large. Refer to Tech Note TN7730 via the AVEVA Knowledge and Support Center.

## Compile Warning Messages

If the **Type** specified for a compile message is WARNING, it means something was detected that did not stop the project from compiling successfully, however, further investigation is recommended. For information on how to address a WARNING message, use the code included in the error description (for example, "W1001") to locate

the warning message in the following table.

If the **Type** specified for a compile error message is ERROR, see the topic [Compile Error Messages](#).

If the **Type** specified for a compile error message is FATAL, see the topic [Compile Fatal Messages](#).

**Note:** You can disable a warning using the parameter [\[CtEdit\]SuppressCompilerWarning](#).

Code	Warning Message	Description
W1001	No IO Devices defined	No I/O devices have been defined in this project or any of its included projects (see <a href="#">Add an I/O Device</a> ).
W1002	Include project not found	An included project (specified in the Included Projects database) does not exist. Check the name of the included project. For more information, see the <i>Included Projects</i> section in <a href="#">Project Types</a> .
W1003	Argument with default found before argument with no default	<p>This error will occur when a Cicode function is defined with a default argument before an argument without a default. For example:</p> <pre>INT FUNCTION LogFieldValue(string sFile, string sField = "      ", string sValue) ... END</pre> <p>In this case, you will need to review how this function is used and either add a default value to argument sValue or remove the default from the argument sField. For example:</p> <pre>INT FUNCTION LogFieldValue(string sFile, string sField = "      ", string sValue = "      ") ... END or  INT FUNCTION LogFieldValue(string sFile, string sField, string sValue) ...</pre>

Code	Warning Message	Description
		END
W1004	Incorrect number of arguments for function	Too many or too few arguments have been passed to a Cicode function.
W1005	Tag may be unused	A tag that is included in your project is not referenced and appears to serve no purpose. Consider removing the tag, or add the required reference to the tag.
W1006	Function has the same name as built-in function	A Cicode function name within the project has the same name as an in-built Cicode function. It is recommended that you rename your function. You can then use the find and replace dialog to update any references to the original function name.
W1007	Tag not defined	The compiler has detected a reference to a tag that does not exist. You should create the required tag, or update the reference.
W1008	Function deprecated, legacy function will be removed in a future release	A Cicode function that is used in your project has been deprecated, which means it will be made obsolete in a future release. You should consider replacing the Cicode function.
W1009	Function deprecated, can only be called on the Server	A Cicode function that is used in your project has been deprecated, which means it will be made obsolete in a future release. Currently, you can only call the function on a server. You should consider replacing the Cicode function.
W1010	Function deprecated, does not support online changes made to the system	A Cicode function that is used in your project has been deprecated, which means it will be made obsolete in a future release. Currently, the function does not

Code	Warning Message	Description
		support online changes. You should consider replacing the Cicode function.
W1011	Alarm Tag not found, but valid property detected. Tag may not be available at runtime	The project refers to an alarm property that is associated with an alarm tag that does not exist. Create the specified alarm tag, or confirm that it is available on the alarm server.
W1012	Standby IODevice did not have a priority specified	The specified standby I/O device requires a priority setting.
W1013	Could not launch post compile command	Plant SCADA was unable to execute a command, script or batch file that was specified to run when compilation is complete. Check the replacement strings used for the parameters [CtEdit]CompileSuccessfulCommand and [CtEdit]CompileUnsuccessfulCommand to determine what occurred.
W1014	The tag and a cluster have the same name. It may lead to unintended behavior	Plant SCADA may behave unexpectedly if you use a tag name that is the same as a cluster name. You should rename the specified tag.
W1015	IODEvices for this unit number mix different protocols	I/O devices with the same unit number must all use the same protocol.
W1016	IODEvices for this unit number mix disk and non-disk types	I/O devices with the same unit number must either be all disk devices, or all non-disk devices.
W1017	IODEvices for this unit number mix memory and non-memory modes	I/O devices with the same unit number must either be all memory or all non-memory.
W1018	File does not exist	The compiler has detected a reference to a file cannot be found. Check that the file is available, and that name used is correct.

Code	Warning Message	Description
W1019	Multiple translations for the same native string	Multiple translations for a native string have been detected in the language database(s). You should review the language databases associated with your project (including those in any included projects), and remove any duplications.
W1020	Duplicate language	A language has been defined multiple times. You should check the languages specified in your project (including those in any included projects) and remove the duplication.
W1021	Possible missing operand between tags	The compiler has detected some incorrect Cicode syntax. For example, an operand may be missing between a tag and a constant.
W1022	Possible address on bad boundary	When the compiler finds a double-register variable, it remembers which boundary it is on and checks that all other double register variables are on the same boundary. This message will appear if the address of a long or real variable is not aligned correctly. For more information, see [General]CheckAddressBoundary.
W1023	Void functions are not supposed to return values	<p>The Cicode function uses the keyword RETURN but the function header does not contain a return type.</p> <p>For example:</p> <pre>FUNCTION LogFieldValue(string sFile, string, sField, string sValue) ... Return = FileOpen(sFile, "a+") IF iReturn = -1 THEN RETURN -1; END ... END</pre>

Code	Warning Message	Description
		<p>Change this function to the following:</p> <pre>INT FUNCTION LogFieldValue(string sFile, string sField, string sValue) ... iReturn = FileOpen(sFile, "a+") IF iReturn = -1 THEN RETURN -1; END ... END</pre>
W1024	Duplicate settings for LocalLanguage	<p>The compiler has detected that the local language setting is duplicated across the main project and its included projects. This means the language databases associated with each project would have been merged during compilation. For more information see <a href="#">Define the Languages Supported by a Project</a>.</p>
W1025	The specified language is not defined in the language form	<p>Your project refers to a language that is not specified in the <b>Languages</b> view in the <b>Setup</b> activity. You need to define the language in your project (see <a href="#">Define the Languages Supported by a Project</a>).</p>
W1026	Unsupported file extension type	<p>A file that is referred to in your project includes an extension type that is not recognized by Plant SCADA. Firstly check that the file extension is correct in the point of reference. If it is, it means the file type is not supported; you should remove the reference.</p>
W1027	The specified language is not supported	<p>Your project refers to a language that is not supported by Plant SCADA by default. You should use a supported language instead, or add support for the language to your project (see <a href="#">Define an Unsupported Language</a>).</p>

Code	Warning Message	Description
W1028	Unsupported syntax for marking translation text, it will not be translated	The compiler has detected that incorrect syntax has been used to mark some text for translation. Review the syntax used and make any required changes. For more information on correct syntax for marking translation text, see <a href="#">Mark Text for Translation</a> and/or <a href="#">Mark Alarm Text for TranslationP</a> .
W1029	Not a valid language	A language that has been defined in your project is not recognized by the compiler. Check the Languages Properties settings (see <a href="#">Define the Languages Supported by a Project</a> ).
W1030	This parameter overrides another with different value in one of the subprojects	A system parameter setting in the project database has also been detected in an included project. It is recommended you remove any duplicated system parameter settings from the included project(s).
W1032	'Allow RPC' permission is not defined (defaulting to FALSE)	<p>The <b>Allow RPC</b> property for a Role determines if a user or group of users can perform remote MsgRPC or ServerRPC calls. When upgrading projects, this field is left blank which will raise the compiler warning message.</p> <p>To allow existing users to continue using MsgRPC and ServerRPC, you need to manually change the value of <b>Allow RPC</b> to TRUE in Plant SCADA Studio's <b>Security   Roles</b> view.</p> <p>If these functions are used in your project, the roles that execute the functions will also need to have the permissions enabled.</p>
W1033	Length of the vertex path is zero	The From Offset and To Offset values specified for the polyline vertex are the same; therefore, the length of the vertex path is zero.

Code	Warning Message	Description
W1034	Transparent colors are not supported	A transparency setting is applied to a color that has been specified for an Alarm Priority display property. Transparency is not supported for Alarm Priority color settings.
W1035	'Allow Exec' permission is not defined (defaulting to FALSE)	"Allow Exec" on the Role form determines if a user or group of users can perform Exec calls in runtime. When upgrading projects if this field is left blank, the compiler warning message will be displayed.
W1036	'Manage User' permission is not defined (defaulting to FALSE)	"Manager User" on the Role form determines if a user or group of users can update user security settings at runtime. When upgrading projects if this field is left blank, the compiler warning message is displayed.
W1037	IO Server is not defined	The Server Name referenced by the I/O device is not defined in the IO servers table.
W1039	Tag usage is ambiguous; Tag exists for two or more clusters. Add cluster name to resolve.	An ambiguous tag is detected because multiple tags with the same name exist in different clusters, and the cluster name has not been specified as part of the tag name.
W1040	Numeric user names are not supported	When the user name contains only digits, for example, "12345", this message is displayed at runtime because a numeric user name is not valid.
W1041	TLS exchange, if enabled, cannot succeed using an IP address	The TLS exchange does not succeed if encryption is enabled for your system and the <b>Address</b> field in the <b>Network Addresses</b> table is set to an IP address.  To resolve this, configure the computer name of the server in the <b>DNS Name</b> field in the <b>Computers</b>

Code	Warning Message	Description
		<p>table.</p> <p><b>Note:</b> This step is not required if the <b>Address</b> field in the network address table is configured with a computer name.</p>
W1048	Reserved Keyword is being used	<p>Tag, equipment or cluster name contains <a href="#">Reserved Words</a>.</p>
W1049	Equipment parameters should be migrated to Configuration Parameters	<p>The compiler has detected legacy custom parameters in your project. It is recommended that you migrate these to configuration parameters (introduced in Plant SCADA 2023). For more information, see <a href="#">Migrate Custom Parameters to the Configuration Parameters Database</a>.</p> <p><b>Note:</b> This warning message will only be reported the first ten times an occurrence is detected.</p>
W1050	Unique ID expected. Please run Migration Tool.	<p>The compiler has detected equipment and/or variables that do not have a unique ID assigned to them. Run the <a href="#">Project Migration Tool</a> with the <b>Create unique IDs for Variables and Equipment</b> option selected.</p> <p>For more information, see <a href="#">Unique IDs for Variable Tags and Equipment</a>.</p> <p><b>Note:</b> This warning message will only be reported the first ten times an occurrence is detected.</p>
W1051	User 'Kernel' does not have Full Access to the Kernel window.	<p>The legacy 'Kernel' user that enabled Kernel access in previous versions of Plant SCADA no longer has default access to the Kernel window in version 2023 R2 (or later).</p> <p>It is recommended that you delete this user and access the Kernel through a Plant SCADA or Windows user account. See <a href="#">Display the</a></p>

Code	Warning Message	Description
		<a href="#">Kernel Window.</a>
W1052	Parameter name is empty	The <b>Name</b> field for an Equipment Configuration Parameter is empty. The equipment runtime database will not include this parameter.

## Incremental Compilation

You can compile the project incrementally. With incremental compilation, Plant SCADA only compiles the database records that were added (or changed) since the last compilation. The remainder of the project is not re-compiled.

**Note:** Some database records are dependent on other database records. If you change a dependent record, Plant SCADA compiles the entire database.

Before you run a system on a live plant, perform a complete compilation (switch off incremental compile) as the compilation will be more rigorous. Similarly, when you restore a project, you need to perform a complete compilation the first time (switch off incremental compile).

### To switch to incremental compile:

1. Open Plant SCADA Plant SCADA Studio.
2. On the Activity Bar, select **Options**.

The **Options** dialog box will appear.

3. Select the **Incremental compile** check box.
4. Click **OK**.

The compiler also supports a number of other options that modify the output of the compile error log. For more information, see [Compilation Options](#).

## See Also

[Debug a Compilation](#)

## Compilation Options

The compiler has a number of options available to help simplify the process of resolving compilation issues. Typically, these options modify the output of the compile error log, making it more practical to assess specific error types and entries.

The options listed here can be adjusted via the [Plant SCADA Studio Options](#), accessible via the [Activity Bar](#).

- **Log "tag not defined" warnings during compile**

If you select this option, the compiler will generate a "tag not defined" warning in the error log for any tags detected that are not defined in the variable database.

As Plant SCADA allows you to include undefined tags on your graphic pages, this warning may be redundant and impractical. By clearing this option, the warnings are still included in the displayed warning count, but they are not added to the error log.

- **Log deprecated warnings during compile**

If you select this option, the compiler will generate a warning to identify any deprecated elements it detects in a project, i.e. any functions, parameters, or Kernel commands that are no longer supported.

By clearing this option, the warnings are still included in the displayed warning count, but they are not added to the error log.

- **Warn about unused tags during full compile**

This option enables the generation of warning entries for unused tags that are not used directly in a Plant SCADA project. The warning entries are included in the compile errors form when a full compile is run. By default this option is not selected.

## See Also

[Incremental Compilation](#)

## Post Compile Commands

After a project has compiled successfully you can execute an optional command, script or batch file. This offers useful functionality if you have tasks that could be automated after a successful compile. This provides an expansion point for you to add your own script or command to perform additional tasks. An example of this could be an application or script to merge the language files that your project is using into a single file in the root project to aid in localization.

You can also launch an optional command, script or batch file to execute after an unsuccessful compile. Generally this would be used to create a log file to show warnings or errors generated during a compile.

To use either of these functions, add the command line containing the command or script to either the [\[CtEdit\]CompileSuccessfulCommand](#) or [\[CtEdit\]CompileUnsuccessfulCommand](#) parameter in the Citect.ini file.

[Debug a Compilation](#)

## Distribute the Project

After compiling a project, you can distribute the runtime files to your live system in the following ways:

- Using the Deployment functionality (recommended) - see [Deployment](#).
- Using the archive feature - see [Back Up a Project](#) and [Restore a Project](#) projects.
- Using a manual file transfer - pushing the runtime files directly onto your live system at the operating system

level.

- Using automatic file transfer - pulling runtime files from the configuration machine to the live server using [CtEdit]Run and [CtEdit]Copy.
- Using a shared folder on a network drive.

---

**Note:** Shared folders are not recommended for servers or control computers.

---

### Automatic file transfer

This is where runtime files are pulled down to the runtime system using the [CtEdit]Run and [CtEdit]Copy parameters.

- [CtEdit]Run points to the location of the runtime files. To avoid running a system over the network and potentially slowing down the system, it is recommended that this is a local folder under the [user] directory.
- [CtEdit]Copy points to a copy of the runtime files. This can be a remote shared location (for example the [user] folder shared on another computer) or another local folder. When Plant SCADA detects that the files in the RUN directory have a different timestamp to those in the COPY directory, the files are copied across to the RUN directory.

By updating the runtime files in the COPY directory, they will be automatically copied to the RUN directory whenever they are changed.

---

**Note:** Do not use the [CtEdit]Run and [CtEdit]Copy parameters if you intend to use Plant SCADA's Deployment functionality.

---

### Shared Folders

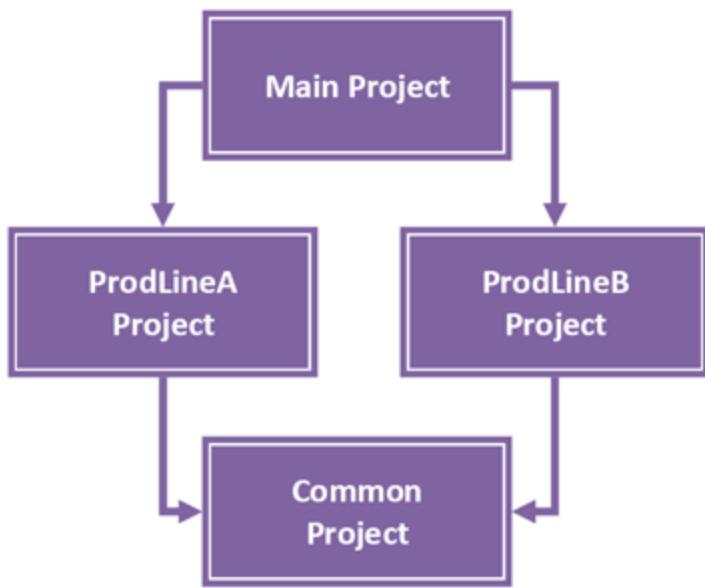

This is where the runtime files are stored in a network shared location, with a backup server specified in case the main files are not available.

- [CtEdit]Run points to the main remote shared location of the runtime files.
- [CtEdit]Backup points to the alternate remote shared location.

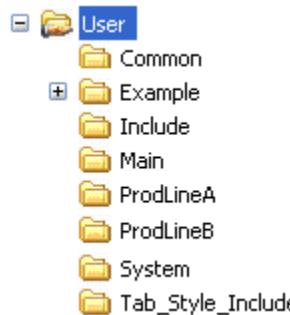

## Example — Using Run/Copy to distribute project runtime files

### File Server (PC1)

Consider the example project structure below. The overall system comprises four parts: a main project which features two separate production line projects, each of which draws on some common elements from a common project.

Run/Copy can be used to update project files from the File Server (PC1) to the File Client (PC2). Run/Copy does not support nested project folders, therefore project folders need to be on the same level as shown below.

The [User] folder (or a parent of the [User] folder) needs to be shared on the network. The shared folder needs to be accessible for machines to download the project runtime files. In this example, [User] is shared.

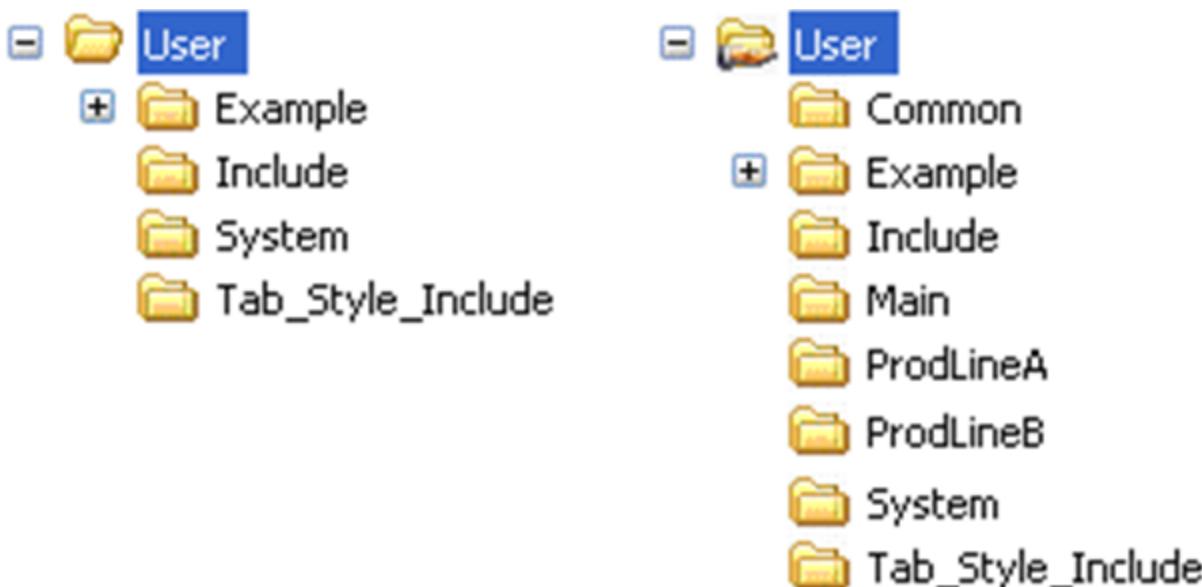

### File Client (PC2)

File Client (PC2) will use Run/Copy to get the latest updated projects from the File Server.

The settings for Run/Copy on the client are:

```
[ctEdit]Copy = \\PC1\User\Main
[ctEdit]Run = %PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\User\Main
```

The [Run] folder needs to be a child of the [User] folder on the target machine. The following pictures shows the project folders before and after the first project start-up with Run/Copy.

The project folders are automatically created by the Run/Copy process if they don't exist. In this example, the basic runtime files are copied to the [Run] folder. Any other files will be copied over on demand, such as page \*.ctg and \*.rdb files. After a successful project start-up, it is also possible for the project to start up when the [Copy] path is not available (if, for example, the File Server is uncontactable). In this case, only pages that have been previously viewed (that have been copied over previously on demand) are available.

If the target machine has the project development environment installed, do not launch Plant SCADA Studio after Run/Copy are set up. Doing so will override the [Run] path setting and you may end up running the wrong project.

[File Server Redundancy](#)

## Deployment

Deployment allows you to distribute projects (and any subsequent updates) to computers in your Plant SCADA system.

This is enabled by a deployment server, a computer that stores multiple "versions" of a project's runtime files. From here, you can deploy a specific version to any computer that has been configured as a deployment client.

Deployment offers the following benefits:

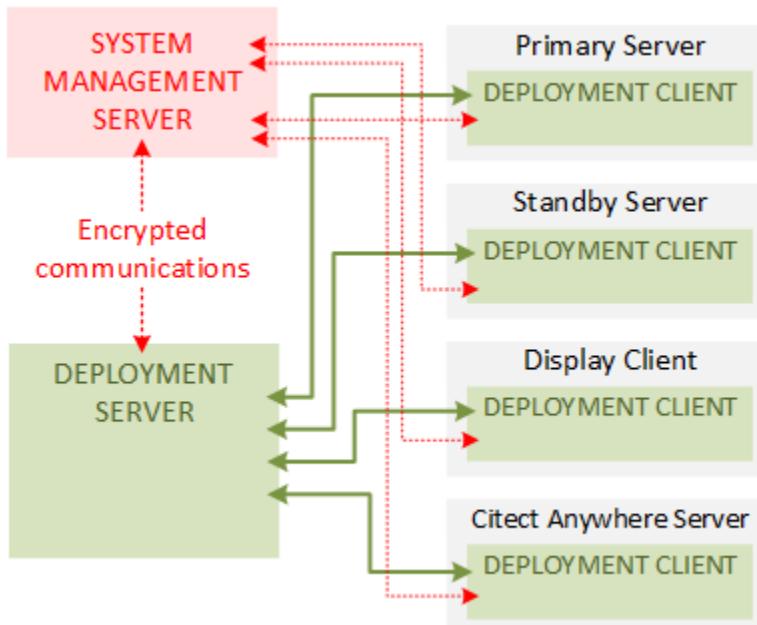

- Store multiple versions of a project's runtime files in a central network location.
- Deploy a specific version of a project to a runtime computer, or a predefined group of computers.
- Roll back a computer to a previous version of a project.
- Manage the restart options on the destination computer when a new version of a project is received.
- Tune the level of network utilization by deployment activities.
- Send only delta changes for version updates.

There are two key processes required to use deployment for your Plant SCADA system:

## 1. Set up the deployment server and deployment clients

To enable deployment, you firstly need to set up a deployment server. Deployment uses encrypted communications, which means you will require access to a System Management Server to do this (see [Set Up a System Management Server](#)).

You then need to establish a connection with each deployment client to which project versions will be delivered. You will also need to connect each deployment client to the System Management Server.

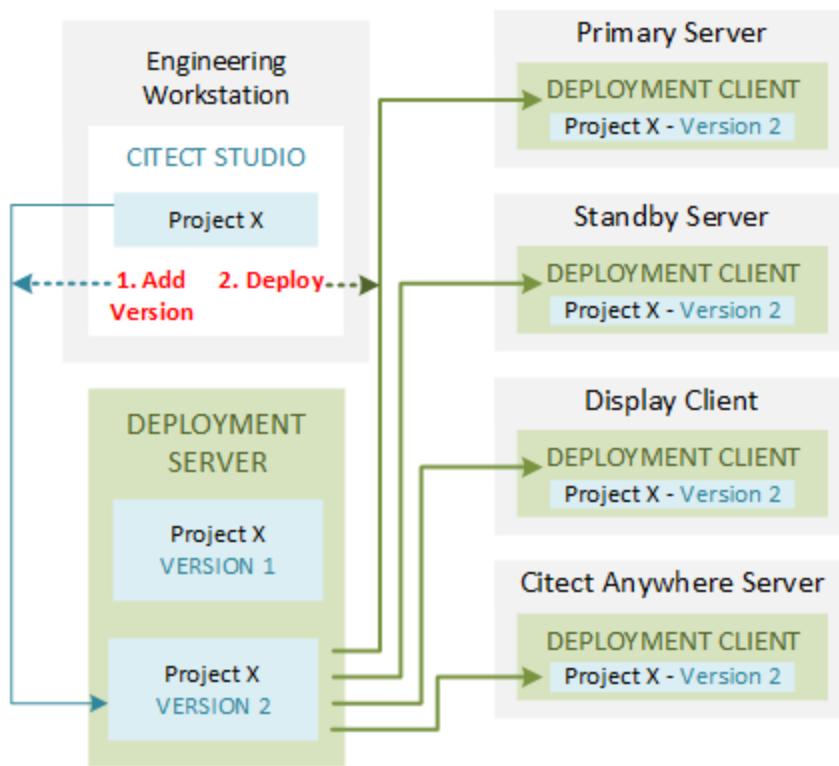

Each computer requires the installation of the relevant deployment components available from the **Customize the default components** page of the Plant SCADA installer. You can then configure these components with a tool called the Configurator. See [Prepare Your System for Deployment](#).

## 2. Manage Computers and Versions in Plant SCADA Studio

You can use the **Deployment** activity in Plant SCADA Studio to add project versions to the deployment server and manage their distribution.

The Deployment activity has two primary views:

- Use the **Versions** view to add versions of projects to the deployment server. Version numbers are incremented automatically.
- Use the **Computers** view to deploy a particular version of a project to selected computers (or a group of computers).

You can specify the **Update Method** that will be used to restart the Runtime Manager on the destination computer. Restart can occur automatically, or the operator will be prompted to accept the update and restart Runtime Manager when appropriate.

A **Settings** view is also available in the Deployment activity. You can use this view to configure a deployment server, or to manage multiple deployment servers if required.

---

**Note:** A deployment server uses Windows user groups to control access. These groups define a number of roles that support specific functionality: admin, deploy, upload and read-only. If a particular user needs to perform deployment tasks in Plant SCADA Studio, you will need to confirm that they are added to the appropriate Windows user group on the deployment sever. For more information, see [Provide Deployment Access to Additional Users](#).

## See Also

[Prepare Your System for Deployment](#)

[Deployment in Plant SCADA Studio](#)

## Prepare Your System for Deployment

Deployment uses encrypted communications, which means you will require access to a System Management Server (see [Set Up a System Management Server](#)).

To prepare your system for deployment, you need to:

- Configure or connect to an existing System Management Server.
- Setup a deployment server.

- Setup each deployment client.

The deployment clients include any computers in your Plant SCADA system to which you will deploy project versions.

**Note:**

- Ideally the Deployment Server should be installed on the same computer as the System Management Server. See [Install a Deployment Server](#).

- If you install the Deployment Server on a different computer to the System Management Server, you cannot use the default local user groups assigned to the Deployment Security Roles as they will not work in a distributed environment. You need to create domain user groups that align with the existing local groups, and add these to the Deployment Security Roles. The domain groups can then be used instead of the following default local user groups.

Deployment Administrators role: 'SCADA.DeploymentAdmins' or 'Asb.Deployment.AdminRole'.

Deployment Uploaders role: 'SCADA.DeploymentUploaders' or 'Asb.Deployment.UploadRole'.

Deployment Users role: 'SCADA.DeploymentUsers' or 'Asb.Deployment.DeployRole'.

See [Modifying the Members of a Security Role](#).

- When installing a Deployment Server as part of a workgroup, it must be installed on the same computer as the System Management Server. If you need the Deployment Server on a separate computer to the System Management Server, you will need to move your IT infrastructure to a domain.

You need to install the required components on each computer. These are available via the Plant SCADA installer. You can then use the **Configurator** to perform the following steps:

- [Configure a Deployment Server](#)
- [Configure a Deployment Client](#)
- [Configure a Runtime Computer for Deployment](#).

**Note:** The deployment server uses Windows user groups to control access to some of its functionality. If a particular user needs to perform deployment tasks in Plant SCADA Studio, you will need to make sure they are added to the appropriate Windows group on the deployment sever. For more information, see [Provide Deployment Access to Additional Users](#).

When this setup is complete, each deployment client will be ready to receive projects (and ongoing updates) from the deployment server.

## See Also

[Connect Plant SCADA Studio to a Deployment Server](#)

## Configure a Deployment Server

Deployment uses encrypted communications, which means you will require access to a System Management Server (see [Set Up a System Management Server](#)).

To configure a deployment server, you also need to have the deployment server components installed. This is an option on the **Customize the default components** page of the Plant SCADA installer (see [Install a Deployment Server](#)).

You can then use Configurator to configure a deployment server and set the deployment database password. Launch Configurator at the completion of the installation procedure, or from the Windows™ Start menu (**Programs | AVEVA | Configurator**).

On the **Security Roles** page under Plant SCADA, make sure that your user account is assigned to the Deployment Administrator role, either directly or via an associated domain group (see [Security Roles](#)).

---

**Note:** The deployment architecture installed with Plant SCADA 2023 is not compatible with deployment servers running an earlier version. See the note at the end of the topic [Install a Deployment Server](#) for more information.

### To configure the deployment server (on a local computer):

1. In the panel on the left side of the **Configurator**, select Plant SCADA | **Deployment Server**. The [**START**] page appears.
2. Select one of the following options:
  - **Configure the Deployment Server** - this option is available when no deployment server has been configured.
  - **Update the configuration of the current Deployment Server** - this option is available once a deployment server has been configured. Select it to update the database password and transfer speed for a deployment server; however you cannot update the port number.
  - **Import configuration file from previous version of the Deployment Server** - If you have an earlier version of the deployment server configured, you can import the settings. Browse for the following Configurator file in the provided field:  
"SE.Asb.Deployment.Server.WindowsService.exe.config".

---

**Note:** The default location is "%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\Config"

After importing the Configurator file, you can continue using the deployment database and file repository created previously in the current or earlier versions of Plant SCADA.

3. Click **Next**. The **AUTHORIZE** page appears.

Enter the **User Name** and **Password** for the Windows account that will be used to connect the deployment server to the System Management Server.

The user account needs to be assigned to the 'Administrators' or 'aaAdministrators' group on the System Management Server.

4. Click **Next**. The **SETTINGS** page appears.

This page allows you to set the password used by the deployment database. It also allows you to set the transfer rate to limit the network bandwidth used when deploying a project.

5. Enter the **Password** for the database. Confirm the password.

---

**Note:** To change an existing database password you need to reconfigure the deployment server.

6. In the **Transfer Speed (KB/s)** field, enter a value between 0 and 2147483647 (0 being unrestricted). The default is 10000 (KB/s). By limiting the transfer speed, you allow other processes to use the remaining network bandwidth. This value may affect the overall duration of a deployment operation. For example, if your project is 20MB with a limit set to 1000 KB/s, the project will take approximately 20 seconds to transfer.

---

**Note:** Settings may vary according to your network infrastructure.

7. Click the **Next**. The **FINISH** page appears.

If required, you can use the **Previous** button to make any changes to your settings before you complete the configuration process.

8. Click **Configure**. The Configuration Messages panel will indicate if the deployment server configuration is

successful.

---

**Note:** If you change the computer name for the deployment server, it will cause a loss of communications between the deployment server and all of the deployment clients.

If any deployment server activities are not functioning correctly, check that the **NT Service\** **CitectDeploymentServer** virtual service account has read and write permissions for the deployment server folder (%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\Deployment\Server).

Right click the **Server** folder, go to **Properties | Security**, and check that the permissions are assigned correctly.

[Configure a Deployment Client](#)

[Configure a Runtime Computer for Deployment](#)

[Connect a Computer to a System Management Server](#)

## Configure a Deployment Client

Deployment uses encrypted communications, which means you will firstly need to connect each deployment client to the System Management Server used by the deployment server (see [Connect a Computer to a System Management Server](#)).

To configure a deployment client you use Configurator. This allows you to enter the login credentials required to register the client.

---

**Note:** To configure a deployment client you need to have the deployment client components installed. This is an option on the **Customize the default components** page of the Plant SCADA installer.

Launch the Configurator at the completion of the installation procedure, or from the Windows™ **Start** menu (**Programs | AVEVA | Configurator**).

On the **Security Roles** page under Plant SCADA, make sure that your user account is assigned to the Deployment Administrator role, either directly or via an associated domain group (see [Security Roles](#)).

---

**Note:** The current user on a deployment client needs to be assigned to the Runtime Users role to run a deployment client. If this is not always possible, you can configure Runtime Manager to run as a service (see [Configure a Runtime Computer for Deployment](#)).

### To configure a deployment client (on a local computer):

1. In the panel on the left side of the **Configurator**, select Plant SCADA | **Deployment Server**. The **[START]** page appears.
2. Select one of the following options:
  - **Configure the Deployment Client** - This option is available when no deployment client has been configured.
  - **Update the configuration of the current Deployment Client** - This option is available if a deployment client has been configured. The Deployment Client configuration needs to be updated whenever there is a change in the System Management Server configuration.
  - **Import configuration file from previous version of the Deployment Client** - If you have an earlier version of the deployment client configured (from Plant SCADA 2016 or 2018), you can import the client settings. Browse for the following Configurator file in the provided field:

"SE.Asb.Deployment.Node.WindowsService.exe.config".

---

**Note:** The default location is "%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\Config"

---

3. Click **Next**. The **CONNECT** page appears.

In the **Deployment Server** field, select the deployment server to which you would like to connect. If the name does not appear in the list, type the Windows computer name of the machine on which the System Management Server is installed.

To change the deployment server to which a deployment client is connected, repeat the steps needed to configure a deployment client.

If the deployment client is also configured as a deployment server, the deployment client should only connect to the local deployment server.

4. Click **Next**. The **AUTHORIZE** page appears.

Enter the **User Name** and **Password** for the Windows user account that will be used to register the client computer with the deployment server.

The user account you enter needs to be assigned to the Deployment Administrator role on the deployment server (either directly or via an associated domain group). For more information, see [Security Roles](#).

If the System Management Server is on a different computer to the Deployment Server, the user account also needs to be assigned to the 'Administrators' or 'aaAdministrators' group on the System Management Server.

5. Click **Next**. The **SETTINGS** page appears.

On the **SETTINGS** page, you can set the Unpack Rate, and specify the location for the projects to be deployed.

- In the **Unpack rate (KB/s)** field, enter a value between 0 and 2147483647 (0 being unrestricted). If you limit the unpack rate, your system will still be able to run other processes. This value may affect the overall duration of a deployment operation.
- In the **Deployed project location** field, specify the folder path where the deployed projects from the Deployment Server will be stored. The default location is: %PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\Deployment\Client\Projects. You can use the browse button to change the folder path.

6. Click **Next**. The **FINISH** page appears.

This page informs you that the **Configurator** is ready to send a request to the deployment server for registration.

If required, you can use the **Previous** button to make any changes to your settings before you initiate the registration process.

7. Click **Configure**.

If registration is successful, the configured client information will be stored on the computer and a connection will be established. If registration is not successful, you will be notified via the Configuration Messages panel.

If there is any issues with deployment client activities, check that the **NT Service\CitectDeploymentClient** and **NT Service\Citect Runtime Manager** virtual service accounts have read and write permissions for the deployment client folder (%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\Deployment\Client).

Right click the **Client** folder, go to **Properties | Security**, and check that the permissions are assigned correctly.

## See Also

[Configure a Runtime Computer for Deployment](#)

[Connect a Computer to a System Management Server](#)

## Configure a Runtime Computer for Deployment

To prepare a computer for deployment, you need to confirm the following runtime environment settings.

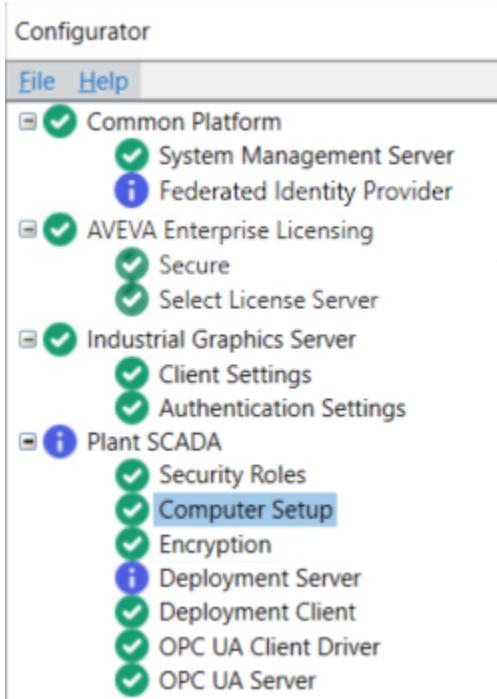

These settings can be adjusted using the **Configurator's Computer Setup** page under Plant SCADA. You can launch Configurator at the completion of the installation procedure, or go to the Windows® Start menu and locate **AVEVA | Configurator**.

## Server Authentication

If the computer will be used to host a Plant SCADA server process, you will need to specify a password for server authentication. Server processes with mismatching server passwords will not communicate with each other.

[To configure server authentication:](#)

1. In the panel on the left side of the **Configurator**, select **Plant SCADA | Computer Setup**.

2. The **Computer Setup** page appears. Navigate to the Server Authentication section. **Server Authentication** section.

### Server Authentication

*Running a server process requires the configuration of a server password. Setting this password allows servers to authenticate and create trust with each other.*

<input checked="" type="checkbox"/> Configure Server Password
Password
Confirm Password

3. Select the **Configure Server Password** check box.
4. Enter the required password and confirm it in the fields provided.

If the **Password** and **Confirm Password** fields already contain an entry, it means a server password has already been configured on the local computer. If required, you can enter a new password.

The password you use needs to match the password configured for the other server processes included in your Plant SCADA system. This password can be set on each computer using Configurator or the Setup Wizard.

5. To apply your settings, click the **Configure** button.

---

**Note:** If you change the server password while the runtime system is active, it will not disrupt any established connections as the password is only retrieved when authentication needs to occur. However, it is recommended that you apply the new password as soon as possible. To do this, you need to restart the runtime system.

---

## Project Run Path

This setting instructs Runtime Manager to run a deployed project from a specified directory.

### To set the Project Run Path:

1. In the panel on the left side of the **Configurator**, select **Plant SCADA | Computer Setup**.  
The **Computer Setup** page appears.
2. Navigate to the **Project Run Path** section.

#### Project Run Path

*Runtime can run the project selected in Plant SCADA Studio, or the project that has been deployed by the Deployment Server*

- Run the project selected in Plant SCADA Studio.
- Run the project deployed from the Deployment Server.

3. Select one of the following options to determine which project will be launched by Runtime Manager:
  - **Run the project currently selected in Plant SCADA Studio** — This is selected by default and will run the project from Plant SCADA Studio.
  - **Run the project deployed from the Deployment Server** — Select this option to set up a computer for deployment. This option allows you to run the deployed projects from the deployment server.
4. To apply your settings, click the **Configure** button.

---

**Note:** If Plant SCADA Runtime is running as a service and the **Project Run Path** option in the Configurator is changed to **Run the project deployed from the Deployment Server**, you need to restart the Runtime Manager service for deployment to function correctly.

---

## Runtime Manager Configuration

This setting instructs Runtime Manager to run as a service. This allows a project to be deployed and run on a computer without having to change other settings.

You need to select **Run Runtime Manager as a service** under the following circumstances:

- When a deployment client is configured on a computer and you want to push project updates using "Force" mode.
- If you are using encrypted communications, and the current user on a deployment client may not have required privileges.

---

**Note:** The current user on a deployment client needs to be a member of the **Configuration Users** security role to run the deployment client (see [Security Roles](#)).

---

### To run Runtime Manager as a service:

1. In the panel on the left side of the **Configurator**, select Plant SCADA | **Computer Setup**. The **Computer Setup** page appears. Navigate to the **Runtime Manager Configuration** section of the dialog.

#### Runtime Manager Configuration

*The Runtime Manager can be configured to run as a service or as a standard process. When run as a service, Runtime Manager allows projects to be deployed to the machine without having to change any other settings.*

**Run Runtime Manager as a service**

2. Select **Run Runtime Manager as a Service**.

---

**Note:** If you are using Deployment to run a project and do not select the **Run Runtime Manager as a Service** option, you will need to manually start the Plant SCADA Runtime Manager before deploying the project.

---

3. To apply your settings, click the **Configure** button.

---

**Note:** If you have configured a Plant SCADA OPC DA server on a computer that is running Plant SCADA as a Windows service, you will need to make the additional configuration changes. See the topic *Running an OPCDA Server as a Service* in the *Runtime* section of the Plant SCADA documentation.

---

[Configure a Deployment Server](#)

[Configure a Deployment Client](#)

## Provide Deployment Access to Additional Users

When you install deployment server, additional security roles will be created. By default the local Windows user groups are associated with the security roles as members. These members control access to the deployment server's functionality. You can add additional users to the roles using Configurator (see [Modifying the Members of a Security Role](#)).

**Note:** If your Deployment Server is on a separate computer to the System Management Server, you need to run your IT infrastructure as a domain. To allow authorization in this type of distributed system, only add domain groups to a deployment security role. Avoid adding individual users to these roles.

The security roles and local Windows user groups will be created and mapped as following:

Security Roles	Windows User Group	Description
Deployment Administrators	SCADA.DeploymentAdmins	Members of this role can add or remove client computers to/from deployment server. They can also perform upload and deploy operations.
Deployment Uploaders	SCADA.DeploymentUploaders	Members of this role can upload a new project version to the deployment server.
Deployment Users	SCADA.DeploymentUsers	Members of this role can deploy a new project to a connected deployment client computer.

When the deployment server is installed, the user that is logged in to the computer is automatically added to each of these groups.

For example, you may have a number of engineers that need to add project versions to the deployment server. To enable this, each engineer's Windows user account needs to be added directly or via a domain group to the "Deployment Uploaders" security role locally on the deployment server.

Refer to the documentation provided by Microsoft® to determine how to add user accounts and domain groups to a Windows™ user group.

## See Also

[Configure a Deployment Server](#)

[Connect Plant SCADA Studio to a Deployment Server](#)

## Connect Plant SCADA Studio to a Deployment Server

To deploy project versions to selected deployment clients, you need to connect the computer running Plant SCADA Studio to a deployment server.

There are two different scenarios to consider.

- **Connect Plant SCADA Studio to a local deployment server**

If you have successfully configured a local deployment server on the computer where Plant SCADA Studio is running, the local computer should be added to the **Deployment Servers** on Deployment activity's **Settings** view. You just need to confirm that your local computer is set as the active deployment server (see [Make a Deployment Server Active](#)).

If the local computer was removed from the list of deployment server at some point, you will have to add it again. See [Add a Deployment Server](#).

If you do not have a deployment server configured at all, the Deployment activity you will prompt you to set one up. You can select **Configure Local Server** on the Command Bar to launch the Configurator. See [Configure a Deployment Server](#) for further instructions.

---

**Note:** If a different Windows™ user was logged on to the local computer at the time the deployment server was configured, you may not have access to the deployment server. If this is the case, your Windows user profile needs to be added to the user groups that restrict access to the deployment server. See [Provide Deployment Access to Additional Users](#) for more information.

- **Connect Plant SCADA Studio to a remote deployment server**

The connection between the computer hosting Plant SCADA Studio and a remote deployment server needs to be encrypted. You firstly need to connect the development workstation running Plant SCADA to the System Management Server used by the deployment server (see [Connect a Computer to a System Management Server](#)).

You can then connect Plant SCADA Studio to a remote deployment server by following the procedure described in [Add a Deployment Server](#).

You will also need to confirm that your Windows user has appropriate access to the deployment server (see [Provide Deployment Access to Additional Users](#)).

When you have connected Plant SCADA Studio to a deployment server (and established appropriate access permissions), you will able to perform the tasks described in [Using the Deployment Activity](#).

---

**Note:** If you would like to synchronize your source Plant SCADA projects across a number of engineering workstations, you need to use the [Back Up a Project](#) and [Restore a Project](#) functionality. Deployment only delivers the runtime components of a project.

## See Also

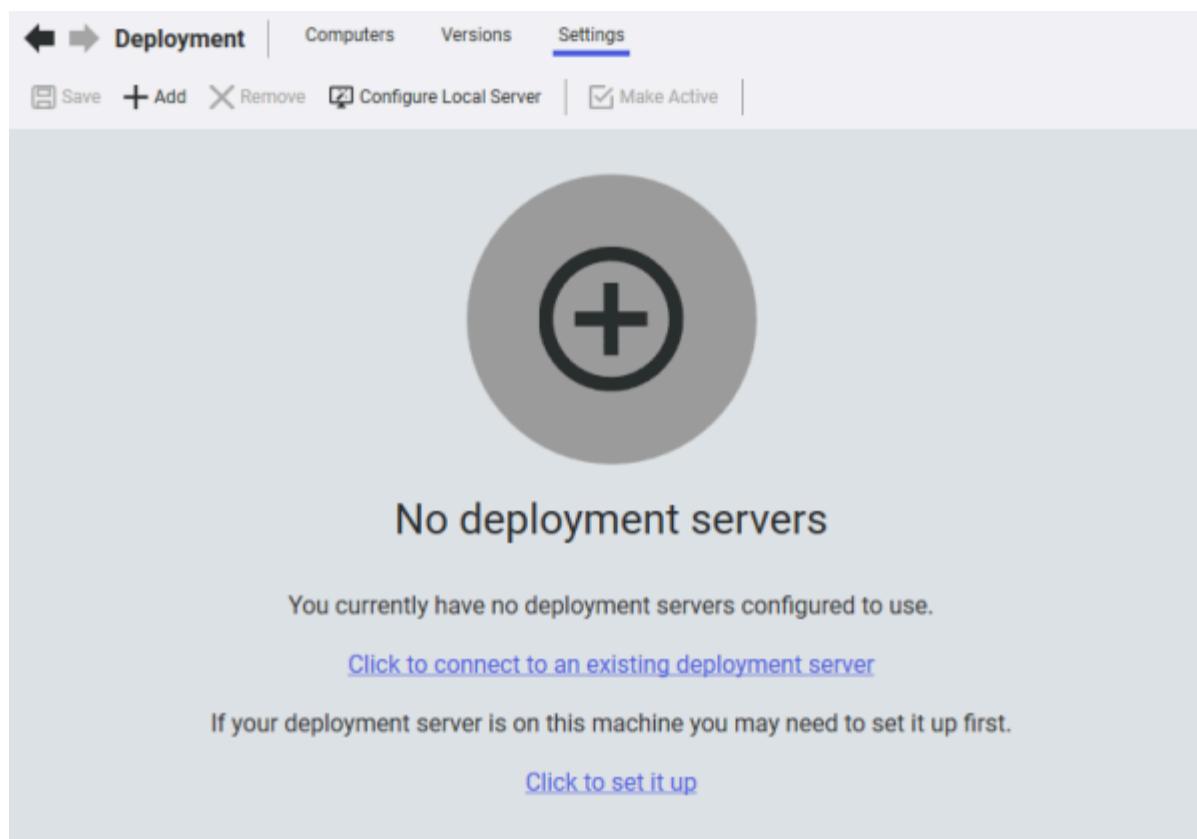

[Deployment in Plant SCADA Studio](#)

## Deployment in Plant SCADA Studio

The Deployment activity in Plant SCADA Studio includes the following views:

- [Computers](#) — use this view to deploy a version of a project to selected computers. You can also assign computers to groups in this view.
- [Versions](#) — use this view to add versions of projects to the deployment server.
- [Settings](#) — use this view to configure a deployment server, or to manage multiple deployment servers if required.

When you first open the Deployment activity, the following may appear

This indicates that Plant SCADA Studio has not been connected to a deployment server. For further instructions on how to proceed, see [Connect Plant SCADA Studio to a Deployment Server](#).

## See Also

[Using the Deployment Activity](#)

## Computers

The **Computers** view lists the deployment clients connected to the active deployment server.

The screenshot shows the 'Deployment' view in AVEVA Plant SCADA Studio. On the left is a sidebar with icons for Deployment, Computers, Versions, and Settings. The main area has tabs for Deploy, Add Group, and Remove. The 'Computers' tab is selected. At the top right, it says 'Deployment Server: deployserver.domain.com' and 'User: userid'. The main table lists four computers under the 'Computer' column: S1\_A1\_PRIMARY, S1\_A1\_STANDBY, S1\_A2\_PRIMARY, and S1\_A2\_STANDBY. The 'Description' column shows 'Area 1 Primary', 'Area 1 Standby', 'Area 2 Primary', and 'Area 2 Standby' respectively. The 'Projects' column shows SITE1\_A1 and SITE1\_A2. The 'Target' column shows the number 2. The 'Active' column shows the project name followed by '(2)'. The 'Status' column shows 'Running' for all. The 'Profile' column shows SITE1\_A1, SITE1\_A1, SITE1\_A2, and SITE1\_A2. The 'Update Method' column shows 'Prompt' for all.

Computer	Description	Projects	Target	Active	Status	Profile	Update Method
S1_A1_PRIMARY	Area 1 Primary	SITE1_A1	2	SITE1_A1(2)	Running	SITE1_A1	Prompt
S1_A1_STANDBY	Area 1 Standby	SITE1_A1	2	SITE1_A1(2)	Running	SITE1_A1	Prompt
S1_A2_PRIMARY	Area 2 Primary	SITE1_A2	2	SITE1_A2(2)	Running	SITE1_A2	Prompt
S1_A2_STANDBY	Area 2 Standby	SITE1_A2	2	SITE1_A2(2)	Running	SITE1_A2	Prompt

**Note:** If Plant SCADA Studio is not connected to a deployment server, you will not be able to access the Computers view. See [Connect Plant SCADA Studio to a Deployment Server](#). You will also need to log in to the deployment server to access and operate this view. If you have not been assigned appropriate access, see [Provide Deployment Access to Additional Users](#) or contact your system administrator.

For each computer you can select one of the projects that have versions available for deployment, and the target version you would like to deploy (see [Deploy a Version](#)). The project that is currently active on the computer is also displayed, as well as its operational status.

You can also:

- Assign computers to groups (see [Create a Computer Group](#))
- Set the method used to restart the Runtime Manager on a deployment client (see [Specify the Update Method](#))
- Deploy a profile to a computer (see [Profiles](#))
- Log out of the deployment server.

Computers have the following properties:

Column	Description
<b>Computer</b>	The name that is defined for the computer in Windows™. You are not able to change this name.
<b>Description</b>	A description of the computer. By default, this will be the description defined for the computer in Windows. To change the description, double-click in the column.
<b>Projects</b>	The name of the project that was most recently deployed to the computer, or the project you have recently selected to be deployed. The drop-down list includes all the projects that are available for deployment to the computer.
<b>Target</b>	The version that was most recently deployed to the

Column	Description
	computer, or the target version you have recently selected to be deployed. The drop-down list includes all the versions that are available for deployment to the computer. See <a href="#">Versions</a> .
<b>Active</b>	<p>The name of project (and version number) that is currently deployed to the computer. The number in brackets indicates the version number.</p> <p><b>Note:</b> The Industrial Graphics and OPC UA servers use only the "Force" method for deployment. If you have installed any of these two servers on the same computer with a Plant SCADA Runtime server or client, and using the "Prompt" or "Notify" update method for deployment, then the <b>Active</b> column will display "?". See <a href="#">Deploy a Version</a>.</p>
<b>Status</b>	<p>Indicates the current deployment status on the computer. One of the following will be displayed:</p> <ul style="list-style-type: none"> <li>• <b>Deploying</b>— a deployment is currently in progress. A progress bar is displayed.</li> <li>• <b>Not Running</b> — the active project is not running. It indicates that, Runtime Manager and Connectivity Server are not running on the computer.</li> <li>• <b>Offline</b> — Runtime Manager and/or Connectivity Server are offline (or cannot be contacted).</li> <li>• <b>Activating</b> — the project is in the process of being activated. This is dependent on the type of update method that is selected (see below). It may indicate that an operator has not restarted Runtime Manager and/or Connectivity Server (as instructed to by a prompt or notification).</li> <li>• <b>Disabled</b> — deployment is disabled on the client computer due to the INI parameter [Deployment]Enable=0.</li> </ul> <p><b>Note:</b> If deployment is unsuccessful, an error icon will display. Click on the down arrow next to the icon to reveal the deployment error message. Refer to <i>Status Column Messages</i> in <a href="#">Deployment Troubleshooting</a> for more information.</p>
<b>Profile</b>	The name of the profile that was most recently deployed to the computer, or the profile you have recently selected to be deployed (see <a href="#">Profiles</a> ). The

Column	Description
	drop-down list includes all the profiles that are available for deployment to the computer. If "(No Profile)" is displayed, the parameter settings within the local Citect.ini will be applied to the deployment client.
<b>Update Method</b>	When a version is delivered to a deployment client, Runtime needs to be restarted to apply the included changes. The Update Method allows you to specify how a restart will be initiated. Choose from the following options: <ul style="list-style-type: none"><li>• <b>Prompt</b></li><li>• <b>Notify</b></li><li>• <b>Force</b></li></ul> See <a href="#">Specify the Update Method</a> .

[Versions](#)

## Versions

To deploy a Plant SCADA project, you need to add a "version" of the project to a deployment server.

A version comprises the files that are required to run a project on a deployment client. You can add multiple versions of the same project to a deployment server, and deploy a different version to each client. You can also roll back to a previously deployed version.

The **Versions** view in the Deployment activity displays a list of the projects that have versions available for deployment.

The screenshot shows the 'Deployment' view in AVEVA Plant SCADA Studio. On the left, there's a sidebar with icons for Deployment, Computers, Versions, and Settings. Under 'Deployments', there are two entries: 'SITE1\_A1' with 2 versions and 'SITE1\_A2' with 3 versions. The 'Versions' tab is selected at the top. For 'SITE1\_A1', the table shows two rows: Version 2 (Tuesday, 25 January 2022) and Version 1 (Tuesday, 25 January 2022). For 'SITE1\_A2', it shows three rows: Version 3 (Tuesday, 25 January 2022), Version 2 (Tuesday, 25 January 2022), and Version 1 (Tuesday, 25 January 2022). The table includes columns for Version, Date, Description, Projects, Revision, Created in, and Date.

Deployments		Versions	Details					
		Version	Date	Description	Projects	Revision	Created in	Date
	SITE1_A1	2	Tuesday, 25 January 2022	S1_A1 V2	SITE1_A1	1.0	Plant SCADA 8.40	25/01/2022
		1	Tuesday, 25 January 2022	S1_A1 V1	SITE1_A1	1.0	Plant SCADA 8.40	25/01/2022
	SITE1_A2	3	Tuesday, 25 January 2022	S1_A2 V3	SITE1_A2	1.0	Plant SCADA 8.40	25/01/2022
		2	Tuesday, 25 January 2022	S1_A2 V2	SITE1_A2	1.0	Plant SCADA 8.40	25/01/2022
		1	Tuesday, 25 January 2022	S1_A2 V1	SITE1_A2	1.0	Plant SCADA 8.40	25/01/2022

**Note:** If Plant SCADA Studio is not connected to a deployment server, you will not be able to access the Versions view. See [Connect Plant SCADA Studio to a Deployment Server](#). You will also need to log in to the deployment server to access and operate this view. If you have not been assigned appropriate access, see [Provide Deployment Access to Additional Users](#) or contact your system administrator.

You can use the Versions view to add versions of the active Plant SCADA project to the deployment server (see [Add a Version](#)).

You can also:

- Remove a version (see [Remove a Version](#))
- View the included projects for a version (see the **Projects** column description below)
- Log out of the deployment server.

The **Deployments** column to the left includes each project that has versions added to the deployment server. Each is represented by a green card that also displays the most recent version number and the date it was created. The versions associated with a project are listed to the right.

Versions have the following properties:

Column	Description
<b>Version</b>	The unique number that is automatically incremented with each new version of the project added to the deployment server.
<b>Date</b>	The date the version was added to the deployment server.
<b>Description</b>	A description of the version.
<b>Projects</b>	A list of the included projects in the version. Click on the arrow within the field to reveal the list of included projects.
<b>Revision</b>	The value specified for the project in the Revision

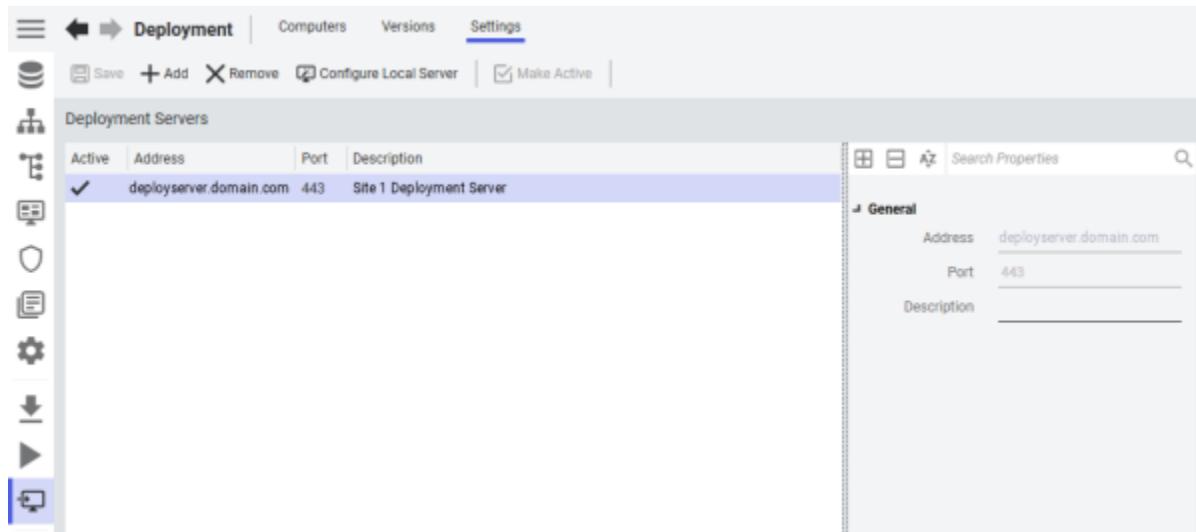

Column	Description
	column of the Projects activity.
<b>Created In</b>	The version of Plant SCADA that was used to create the project.
<b>Date</b>	The date specified for the project in the Date column of the Projects activity.

## Settings

The **Settings** view in the Deployment activity lists the deployment servers that you have connected to Plant SCADA Studio. A selected check box indicates which of the servers is currently "active".

**Note:** If the Settings view displays a message prompting you to connect to a deployment server, see [Connect Plant SCADA Studio to a Deployment Server](#).

If you have configured a local deployment server on the computer where Plant SCADA Studio is running, the local computer needs to be added. To include additional servers, you need to add them (see [Add a Deployment Server](#)) to the Settings view.

You can also use the Settings view to:

- Change the deployment server that is currently active (see [Make a Deployment Server Active](#))
- Remove a deployment server (see [Remove a Deployment Server](#))
- Change the **Description** for a deployment server.

Each deployment server has the following properties:

Property	Description
<b>Address</b>	The name of machine hosting the deployment server. This is name defined for the computer in Windows™. You are not able to change this name.
<b>Port</b>	The port used by the deployment server for https communication with the deployment clients. This value is set in the Configurator, you are not able to edit this value.
<b>Description</b>	A description of the deployment server. To change the description, double-click in the column or edit the field in the property grid to the right.

**Note:** You need to log on to an active deployment server to access its **Computers** and **Versions**. If you have not been assigned appropriate access on the deployment server, see [Provide Deployment Access to Additional Users](#) or contact your system administrator.

## Using the Deployment Activity

You can perform the following tasks Plant SCADA Studio's **Deployment** activity:

- [Add a Deployment Server](#)
- [Make a Deployment Server Active](#)
- [Remove a Deployment Server](#)
- [Create a Computer Group](#)
- [Rename a Computer Group](#)
- [Remove a Computer Group](#)
- [Remove a Deployment Client](#)
- [Add a Version](#)
- [Deploy a Version](#)
- [Remove a Version](#)
- [Specify the Update Method.](#)

**Note:** You need to log in to the deployment server to access and operate the **Computers** and **Versions** views. If you have not been assigned appropriate access, see [Provide Deployment Access to Additional Users](#) or contact your system administrator.

## See Also

[Deployment in Plant SCADA Studio](#)

## Add a Deployment Server

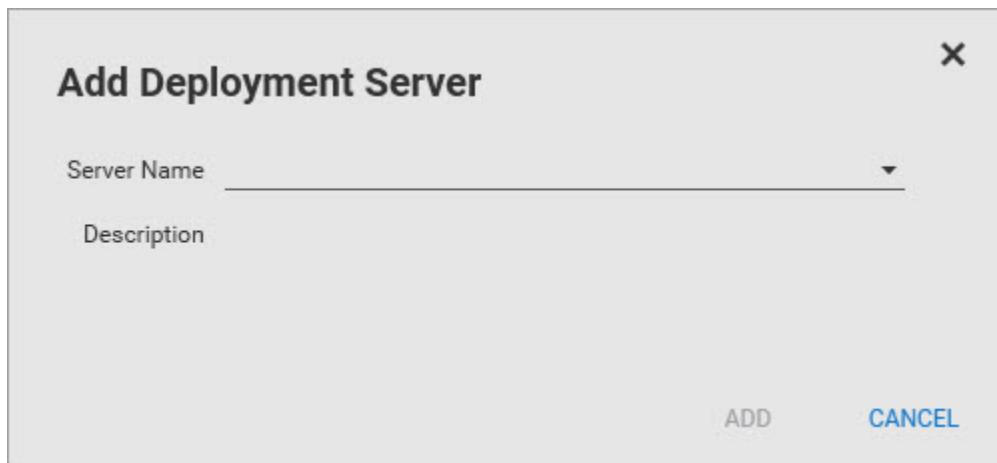

To use a deployment server, you firstly need to add it to the Deployment activity. To do this, use the [Settings](#) view.

**Note:** Plant SCADA Studio requires an encrypted connection to the deployment server to perform deployment operations. Before you add a deployment server, you need to connect the development workstation running Plant SCADA to the System Management Server used by the deployment server (see [Connect a Computer to a System Management Server](#)).

### To add a deployment server:

1. From the **Deployment** activity, select **Settings**.
2. If no deployment servers have been added, select **Click to connect to an existing deployment server**. Otherwise, click **Add** on the Command Bar.

The **Add Deployment Server** dialog will appear.

3. From the **Server Name** list, select the deployment server to which you want to connect. For more information, see [Configure a Deployment Server](#). If the configured deployment server is not listed, enter the Windows computer name. If the deployment server is not configured, click **Configure Local Server** on the Command Bar to configure deployment through the Configurator.
4. Enter an optional **Description** for the server.
5. Click **Add**.  
The deployment server will appear in the **Deployment Servers** list.

6. To use the deployment server, you need to make it the active server (see [Make a Deployment Server Active](#)). Once active, you will be able to log on to the deployment server through the [Versions](#) or [Computers](#) view.

**Note:** You may need to confirm that the current Windows user has appropriate access to the deployment server (see [Provide Deployment Access to Additional Users](#)).

## See Also

[Configure a Deployment Server](#)

[Remove a Deployment Server](#)

## Make a Deployment Server Active

To use a deployment server, it needs to be the selected as the "active" server. To do this, use the [Settings](#) view in the **Deployment** activity.

### To make a deployment server active:

1. From the **Deployment** activity, select **Settings**.
2. In the **Deployment Servers** list, select the required server.
3. On the Command Bar, click **Make Active**.  
The check box next to the server will be selected.
4. Click **Save**.

Once active, you will be able to log on to the deployment server through the [Versions](#) or [Computers](#) view.

## See Also

[Add a Deployment Server](#)

## Remove a Deployment Server

You can remove a deployment server from the [Settings](#) view in the Deployment activity.

### To remove a deployment server:

1. From the Deployment activity, select **Settings**.
2. From the list of **Deployment Servers**, select the server you would like to remove.
3. On the Command Bar, click **Remove**.  
The server will be removed from the Deployment Servers list.
4. The server will be removed from the grid.
5. Click **Save**.

## See Also

[Add a Deployment Server](#)

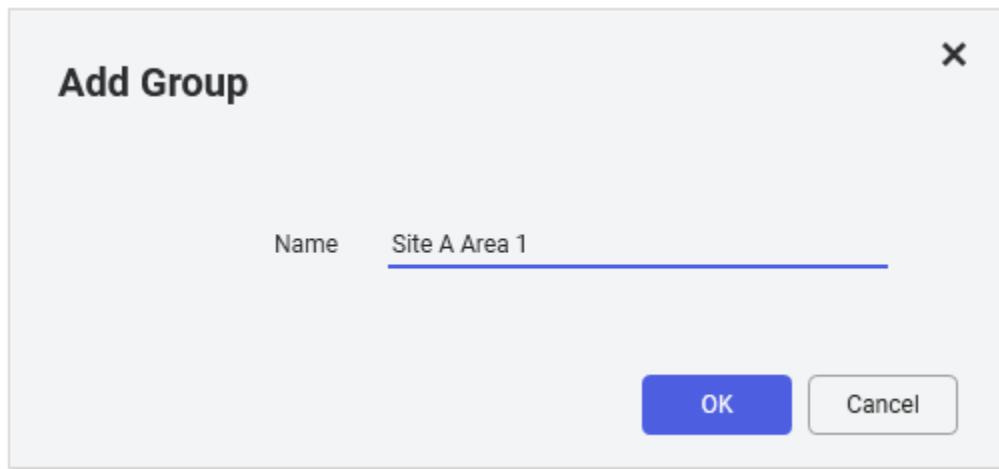

## Create a Computer Group

You can organize the deployment clients in the [Computers](#) view into groups.

### To create a computer group:

1. From the **Deployment** activity, select **Computers**.
2. On the Command Bar, select **Add Group**.

3. In the **Add Group** dialog, enter a name for the group and click **OK**.

The group will display in the **Computer** column.

4. To add computers to the group, select the required computers and drag them in to the group you have created.  
To select multiple computers, select the first computer and hold the **Shift** key while you use the up and down arrow key to select adjacent rows.

You can use the arrow next to a group name or hide or display the computers in a group.

## See Also

[Remove a Computer Group](#)  
[Rename a Computer Group](#)

## Rename a Computer Group

### To rename a computer group:

1. From the **Deployment** activity, select **Computers**.
2. In the **Computer** column, double-click the name of a group to make it editable.
3. Enter a new name for the group.  
A prompt confirming the name change will display.
4. Click **OK**.

## See Also

[Remove a Computer Group](#)  
[Create a Computer Group](#)

## Remove a Computer Group

### To remove a computer group:

1. From the **Deployment** activity, select **Computers**.
2. In the **Computer** column, select the group you want to remove.
3. On the Command Bar, select **Remove**.  
The Remove Group dialog is displayed.
4. Click **OK** to remove the group.

**Note:** When you remove a group, the computers included in the group will remain in the **Computer** column.

## See Also

[Create a Computer Group](#)

[Rename a Computer Group](#)

## Remove a Deployment Client

If a deployment client is no longer used by a deployment server, you can remove it from the [Computers](#) view.

### To remove a deployment client:

1. In the **Deployment** activity, select **Computers**.
2. In the **Computer** list, select the deployment client you would like to remove.
3. On the Command Bar, select **Remove**.
4. On the Remove Computer dialog, click **OK** to confirm the removal.

**Note:** This process only removes the client from the Computers view. Any project versions that have been deployed to the client will still be available.

If you want to replace a removed deployment client, run the Configurator (on the deployment client) to configure the client again.

## See Also

[Configure a Deployment Client](#)

## Add a Version

To deploy a Plant SCADA project, you need to add a version of the project to the deployment server (see [Versions](#)).

### To add a version:

1. From the **Deployment** activity, select **Versions**.

2. In the **Deployments** list, select the project for which you want to add a version.

If no versions exist, you will be prompted to create one for the active project.

- Click the hyperlink **Let's create the first deployment of <Name of Project>**.
- If the active project has not been compiled, you will be prompted to compile it. Click **OK**.
- When compilation is complete, proceed to step **4**.

3. From the Command Bar, select **Add Version**.

If the selected project has not been compiled, you will be prompted to compile it. Click **OK**.

When compilation is complete, the Add Version dialog will appear.

4. Add a **Description** for the new version and click **OK**. (Be aware that you cannot change a version description after it has been added.)

The Version Deployment Preparation dialog will appear. If required, you click **Abort** to stop the preparation progress.

When version preparation is complete, a dialog will inform you if the process was successful.

5. **Close** the notification dialog.

If successful, the new version will appear in the **Versions** view.

Deployment	Versions	Details				
Version	Date	Description	Projects	Revision	Created in	Date
SITE1_A1	3	Tuesday, 25 January 2022	> SITE1_A1	1.0	Plant SCADA 8.40	25/01/2022
		Tuesday, 25 January 2022 S1_A1 V2	> SITE1_A1	1.0	Plant SCADA 8.40	25/01/2022
		Tuesday, 25 January 2022 S1_A1 V1	> SITE1_A1	1.0	Plant SCADA 8.40	25/01/2022

Versions are stored on the deployment server with the file extension ".aaspkg".

## See Also

[Deploy a Version](#)

[Remove a Version](#)

## Deploy a Version

**Note:** To successfully deploy a version of a project, the Connectivity Service or the Runtime Manager needs to be running on the deployment client computer either as a service or as a standard application. To determine which project Runtime Manager is running, refer to the [Deployment Troubleshooting](#) question "**Runtime Manager is not running the deployed project**".

### To deploy a version:

1. From the **Deployment** activity, select **Computers**.
2. Select the check box next to the computers or groups to which you want to deploy a version. To make multiple selections, you can:

- Select adjacent rows by holding the **Shift** key while you use the up or down arrow keys.
- Select distributed rows by holding the **Ctrl** while selecting the required rows. (You can also cancel selection by clicking on a row again.)
- Select all computers by using the check box next to the **Computers** column header.

---

**Note:** If you have selected multiple computers, any setting changes you make to a particular computer will apply to every selected computer.

3. In the **Projects** column, select the name of the project you would like to deploy.

The **Target** column will display the latest available version of that project.

4. In the **Target** column, select the version of the project you would like to deploy from the drop-down menu. You can select a version that was previously deployed if required.

If the target version has been previously deployed, you can rollback to an earlier version of the project directly from the client computer using the Computer Setup Wizard. See [Project Configuration](#) for more information.

5. In the **Profile** column, select the profile you would like to deploy from the drop-down menu (see [Profiles](#)). The settings in the associated <ProfileName>.ini file will be implemented on the deployment client after the Runtime Manager has been restarted. If no profile is selected, the local Citect.ini file will be used.

If you have configured two profiles for the one project, both profiles are deployed with the version of the project; however, only the selected profile will be used.

To determine which profile is active on the deployment client, check the setting for the Citect.ini parameter [RuntimeManager]Profile=<ProfileName>.

---

**Note:** The Industrial Graphics and OPC UA servers do not support profiles. If you have installed the Industrial Graphics server and/or OPC UA server on the same computer with a Plant SCADA Runtime server or client, then only the Runtime server and client will use the selected profile. The Industrial Graphics and OPC UA servers will ignore the selected profile.

6. In the **Update Method** column select either Prompt, Notify or Force (see [Specify the Update Method](#)).

If no project versions have previously been deployed to the client computer, Plant SCADA will force an update to the Runtime Manager and/or the Industrial Graphics server.

---

**Note:** The Industrial Graphics and OPC UA servers only support the "Force" update method. If you have installed the Industrial Graphics server and/or OPC UA server on the same computer with a Plant SCADA Runtime server or client, then only the Runtime server and client will use the selected update method. The Industrial Graphics and OPC UA servers will apply the "Force" method.

If the operator is prompted to update and clicks **Cancel** instead of accepting the new version, a message will be displayed in Runtime Manager. This message alerts the operator that a new deployment of a project is available. When Runtime Manager is restarted, the project will be activated.

7. Ensure that the Connectivity Service and/or the Runtime Manager are running on the deployment client computer.

8. Click **Deploy**.

9. The status column will update with the progress of the deployment.

10. When the version has been deployed, the **Active** column will display the project name with the active version number in brackets.

If you have installed the Industrial Graphics server and/or OPC UA server on the same computer as a Plant SCADA Runtime server or client, and using the "Prompt" or "Notify" update method for deployment, then the **Active** column in the deployment computer will display:

- "?(?)" for a new deployed project.
- "<Project name>(?)" for a new deployed version.

Restarting the Runtime Manager will run the new deployed project or version, and the **Active** column will display the deployed project name with the active version number.

**Note:** When the Industrial Graphics server and/or OPC UA server are installed on the same computer as a Plant SCADA Runtime server or client, they will update to a new deployed version at different speeds. So, the **Active** column in the deployment computer will be updated, only when the deployment is complete.

- 
11. After successful deployment, Plant SCADA will start the relevant processes. The Runtime Manager and/or the Industrial Graphics server on the deployment client will be updated with the deployed project version.

**Note:** If deployment is unsuccessful, an exception icon will display. Click on the down arrow to reveal the error message and click **OK** to close. For information on each error message, refer to the [Deployment Troubleshooting](#) section.

---

## Remove a Version

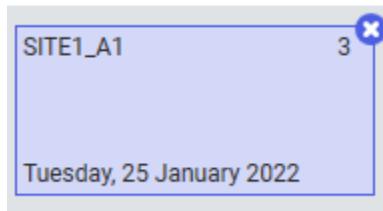

If a version is no longer required on a deployment server, you can remove it.

### To remove a version:

1. From the **Deployment** activity, select **Versions**.
2. Select the version of the project you would like to remove.
3. On the Command Bar, click **Remove Version**.

Or:

If you want to remove all versions of a project, click the "x" icon in the top right corner of the project card.

4. A Remove Version notification will appear. Click **Yes** to confirm.

**Note:** You cannot remove a version that is currently active on a deployment client. To remove an active version, you firstly need to replace it by deploying a different version.

---

## See Also

[Versions](#)

[Add a Version](#)

## Specify the Update Method

When a version is delivered to a deployment client, the Runtime Manager needs to be restarted to apply the included changes. The **Update Method** allows you to specify how a restart will be initiated.

### WARNING

#### LOSS OF CONTROL

- If you set the Update Method to **Force**, the runtime system will automatically shutdown on the deployment client when a deployment occurs.
- If you set the Update Method to **Prompt**, the runtime system may be shutdown at an inappropriate time if an operator does not fully understand the implications of the dialog that appears.

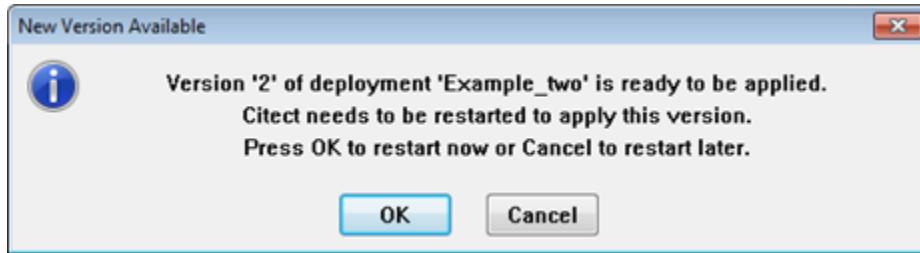

You need to carefully consider how an update method will impact the runtime system before you deploy a project version.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

There are three options you can use for the Update Method.

- **Prompt**

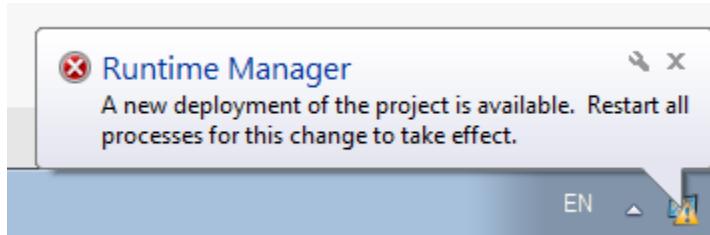

When the Update Method is set to **Prompt**, the client machine accepts the project and a message box will display prompting the operator to restart Runtime Manager.

**Note:** To use your own prompt instead of the default prompt, you can create custom Cicode and implement it with the parameters [Deployment]AskRestartFunc and [Deployment]AskRestartArgs. Refer to [Create a Custom Deployment Prompt](#) for more information.

- **Notify**

When the Update Method is set to **Notify**, the client machine accepts the project and a notification is added to the system tray indicating a new project has been deployed and that Runtime Manager needs to be restarted.

- **Force**

When the Update Method is set to **Force**, the client machine accepts the project and restarts Runtime Manager automatically.

**Note:** If you do not restart the Runtime Manager after using "Prompt" or "Notify" updated method, it will continue with the older version and project. If you have installed Industrial Graphics server and/or OPC UA Server in the same machine, then the Industrial Graphics Server and/or OPC UA Server automatically activates the newly deployed project and version. So, the Runtime manager and Industrial Graphics Server and/or OPC UA Server may not sync with each other.

---

If Runtime Manager is not running on a deployment client, a deployed project will be transferred but will not run. You will need to start Runtime Manager to launch the project.

## See Also

[Deploy a Version](#)

## Create a Custom Deployment Prompt

If the **Update Method** for deployment is set to **Prompt**, the deployment client normally displays a default "New Version Available" message box when deployment occurs (see [Specify the Update Method](#)). However, you can customize the way an operator is notified that Runtime Manager requires a restart.

For example, you could:

- Build a delay function that allows an operator to postpone a restart for a period of time.
- Add a simple animated notification to a graphics page.

To do this:

1. Create custom Cicode that produces the result you require.
2. Implement the Cicode using the parameters [\[Deployment\]AskRestartFunc](#) and [\[Deployment\]AskRestartArgs](#).

## See also

[Deploy a Version](#)

## Using Citect Anywhere to View Deployed Projects

Citect Anywhere™ is a browser-based client that you can use to view a Plant SCADA project using a mobile device. You can use Citect Anywhere clients to view deployed projects at runtime, and to acknowledge deployed project notifications.

Once you acknowledge a notification regarding a new deployment, Runtime Manager will restart and your Citect Anywhere session will end. On relaunching your Citect Anywhere client, you will be able to view the newly deployed project.

---

**Note:** To view deployed projects, Runtime Manager needs to be running on the deployment client either as a service or as a standard application.

[Deployment in Plant SCADA Studio](#)

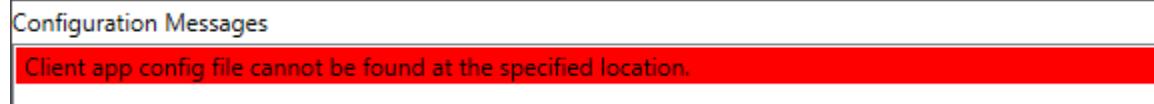

# Deployment Troubleshooting

The suggested solutions described here are organized into the following sections:

1. The Configurator
2. Deployment Activity
3. Status Column Messages
4. System Management Server

## The Configurator

When you try to configure a deployment server or deployment client with the Configurator, the **Configuration Messages** panel may display a message with a red background.

This indicates that the task you were attempting has not been successful. For a suggested solution, select the relevant message from those listed below.

---

**Note:** If you double-click on a message in the Configuration Messages panel, a dialog box will appear that provides more details about the message you have selected.

### An existing database has been detected and it is password protected.

The Configurator stores the deployment database password to the ArchestraA™ Data Store (ADS) service. This message appears when the Configurator is unable to access the deployment database using the stored password provided by the ADS service (or a stored password does not exist).

This could be the result of manually restoring another deployment database, or the removal of the password data from the ADS service. To repair the deployment server:

1. Enter the last known password that can access the password-protected database.  
Or
2. Delete the deployment database and reconfigure the deployment system.

### Configuration of the Deployment Server was unsuccessful.

The Configurator stores the deployment database password in the ArchestraA™ Data Store (ADS) service. This message appears when the Configurator cannot establish communication with the ADS service.

To repair the deployment server:

1. Ensure the ADS service is running via Windows™ Services console.  
Or
2. Check the Archestra System Management Console for any error messages.

**Failed to access the System Management Server due to invalid user name or password.**

Confirm that the user specified on the Authorize page is a member of either the "aaAdministrators" or "Administrators" Windows group on the System Management Server.

**Deployment Client registration was unsuccessful.**

There are a few solutions to consider when this message appears:

1. **Deployment server administrator credentials** — If the action suggested in the detailed configuration message tells you to check the "Deployment Server Administrator credentials", it indicates that the User Name and Password entered on the AUTHORIZE page of the Configurator were not valid. Confirm that valid user credentials have been entered. For more information, see [Provide Deployment Access to Additional Users](#).
2. **SSL/TLS exception** — If the detailed configuration message indicates that an SSL/TLS exception occurred, it means the deployment certificate is not available in the expected location on the local workstation (Trusted Root Certification Authorities). The certificate is required to establish https communication between the computer running the Configurator and the deployment server.
3. **Server refuses connection** — If the detailed configuration message indicates that the target server "actively refused" a connection or "failed to respond", try the following solutions:
  - The Plant SCADA Deployment Server Service may not be running, or is not running on the designated network port. Check the deployment server service is running and is bound to the correct network port.
  - A firewall on the deployment server service may be blocking inbound connections. Check the firewall settings and allow the network inbound connection for the deployment server service.
  - A firewall on the workstation running the Configurator may be restricting an outbound connection. Allow the outbound connection.
  - A proxy setting may present on the workstation running the Configurator. Check the proxy setting on the workstation and confirm that the deployment server can be contacted.
  - The DNS (Domain Name System) did not recognize the deployment server by machine name, or the IP does not match the machine name with the DNS record. This may be due to an IP address change, as the deployment server was not in contact with DNS server for a period of time. The deployment server/client address uses a full computer name address convention; Host name + DNS suffix (for example, "https://computer\_name.example.com"). If the deployment server is not recognized by its computer name, try to restart the deployment server and wait a period of time (this may take up to 15 minute or depending on your network infrastructure). If you are still unable to resolve the machine name, contact your network administrator.

---

**Note:** If you want your system to use secured features such as encryption or deployment, you should not install Plant SCADA on the computer that acts as the domain controller within your Windows® domain.

**The "DeploymentClient" could not be started**

You will see this error if the authentication details to access the Deployment Server have changed since the previous login.

Delete the Deployment Client configuration file located in "%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\Config". Re-configure the Deployment client. For more information, see [Configure a Deployment Client](#).

**The system cannot find the file specified.**

Any Windows™ 10 computer that has upgraded to Version 1511 (and Build 10586.420) will have this issue.

This is caused by missing registry entries ("RegisteredOwner" and "RegisteredOrganization") in:

HKEY\_LOCAL\_MACHINE\SOFTWARE\WOW6432Node\Microsoft\Windows NT\CurrentVersion

Add the registry keys, restart the Configurator, and try to configure the deployment server again.

## Deployment Activity

Review the descriptions below.

### Unable to deploy projects following upgrade to Plant SCADA 2023

The deployment architecture installed with Plant SCADA 2023 is not compatible with deployment servers running an earlier version. If you are trying to deploy a 2023 project to a computer that has not been upgraded to 2023, the following limitations will apply.

- You cannot use Plant SCADA Studio to add projects to a deployment server that is running a different version of Plant SCADA.
- You cannot deploy a project from a deployment server to a deployment client if they are running different versions of Plant SCADA.

If you have a distributed system that includes some computers on an earlier version of Plant SCADA, you should reinstate your existing deployment server to distribute projects to these computer until the roll out of 2023 is complete. You will also need to configure a new deployment server to deploy 2023 projects to your upgraded computers.

If you upgraded from version 2020 R2, you can uninstall 2023 and reinstate a 2020 R2 deployment server. You can use your existing configuration files to connect with any deployment clients that are still running 2020 R2.

If you upgraded from version 2018 R2, you can uninstall 2023 and reinstate the 2018 R2 deployment server. You will need to generate new certificates to reconfigure the deployment client connections.

### Unable to log into deployment server: "Service Unavailable"

When you attempt to log in to a deployment server, a popup with the following message appears:

"A problem occurred while performing 'LOG IN'. Service Unavailable (503)"

This means the deployment server cannot be reached by Plant SCADA Studio. This can be caused by:

- A firewall is present on the deployment server service blocking inbound connections. Check the firewall settings and allow inbound connections.
- A firewall on the computer running Plant SCADA Studio may be restricting an outbound connection. Check the firewall settings and allow outbound connections.
- The deployment server service may not be running, or is not running on the designated network port. Check that the deployment server service is running and is bound to the correct network port.
- A proxy setting may present on the computer running Plant SCADA Studio. Check the proxy setting on the computer and confirm that the deployment server can be pinged.
- The DNS (Domain Name System) did not recognize the deployment server by machine name, or the IP does not match the machine name with the DNS record on the workstation running Plant SCADA Studio. This may be due to an IP change as the deployment server was not in contact with DNS server for a period of time.

The deployment server address uses a full computer name address convention; Host name + DNS suffix (for example, "[https://computer\\_name.example.com](https://computer_name.example.com)"). If the deployment server is not recognized by the computer name, try to restart the deployment server and wait a period of time (this may take up to 15

minute or depending on your network infrastructure). If you are still unable to resolve the machine name, contact your network administrator.

---

**Note:** If you want your system to use secured features such as encryption or deployment, you should not install Plant SCADA on the computer that acts as the domain controller within your Windows® domain.

---

### **Unable to log into deployment server: "The underlying connection was closed."**

When you attempt to log in to a deployment server, a popup with the following message appears:

"An error occurred while sending the request. The underlying connection was closed. Could not establish trust relationship for the SSL/TLS secure channel."

Plant SCADA Studio connects with the deployment server via an encrypted connection to perform deployment operations. The System Management Server is used to establish a trust relationship between the computer running Plant SCADA Studio and the deployment server.

The above error may be shown when the connection between the computer hosting Plant SCADA Studio and a remote deployment server is not encrypted.

To resolve this, you need to connect the development workstation running Plant SCADA to the System Management Server used by the deployment server (see [Connect a Computer to a System Management Server](#)).

You will also need to confirm that your Windows user has appropriate access to the deployment server (see [Provide Deployment Access to Additional Users](#)).

### **The deployment client service is running, but the status of the computer shows "Offline"**

This means the deployment server cannot be reached by the deployment server. This can be caused by:

- A firewall is present on the deployment client service blocking inbound connections. Check the firewall settings and allow inbound connections.
- A firewall on the deployment server may be restricting an outbound connection. Check the firewall settings and allow outbound connections.
- A proxy setting may be present on the deployment server. Check the proxy setting on the computer and confirm that the deployment client can be contacted.
- The DNS (Domain Name System) did not recognize the deployment client by machine name, or the IP does not match the machine name with the DNS record on the deployment server. This may be due to an IP change as the deployment client was not in contact with DNS server for a period of time.

The deployment client address uses a full computer name address convention; Host name + DNS suffix (for example, "https://computer\_name.example.com"). If the deployment client is not recognized by the computer name, try to restart the deployment client and wait a period of time (this may take up to 15 minute or depending on your network infrastructure). If you are still unable to resolve the machine name, contact your network administrator.

---

**Note:** If you want your system to use secured features such as encryption or deployment, you should not install Plant SCADA on the computer that acts as the domain controller within your Windows® domain.

---

- A trusted connection cannot be established between deployment server and client. To repair the connection, you need the original authentication file that was generated when the deployment server was configured. Use the Configurator to reconfigure deployment client using the original authentication file.

### **Deployment is enabled on a client, but the status of the computer shows "Disabled"**

If you use the Configurator to change a deployment client's Project Run Path from "Run the project selected in Plant SCADA Studio" to "Run the project deployed from the Deployment Server", it should enable deployment

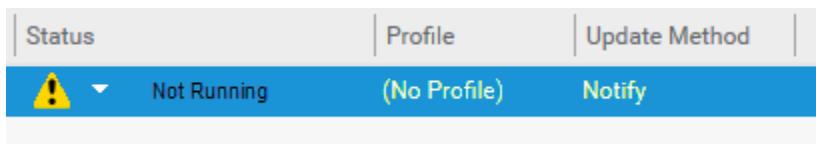

on the computer. However, the status of the computer may still show "Disabled" in Plant SCADA Studio.

Selecting the "Run the project deployed from the Deployment Server" option sets the [Deployment]Enabled INI parameter to 1. However, you need to restart the running Plant SCADA processes for the change to take effect.

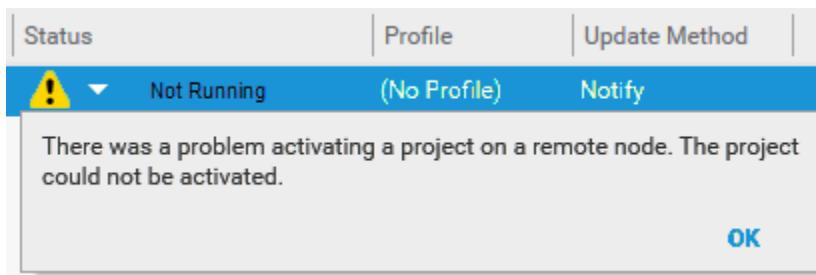

- If any Plant SCADA processes, AVEVA Plant SCADA Runtime Manager or AVEVA Plant SCADA Connectivity Server are not running, restart the Plant SCADA Deployment Client Service or start AVEVA Plant SCADA Runtime Manager and AVEVA Plant SCADA Connectivity Server on the deployment client machine.
- If any Plant SCADA processes are running, restart all the processes via AVEVA Plant SCADA Runtime Manager and AVEVA Plant SCADA Connectivity Server.
- If there are no Plant SCADA processes listed in AVEVA Plant SCADA Runtime Manager, restart AVEVA Plant SCADA Runtime Manager (or the AVEVA Plant SCADA Runtime Manager Service) and AVEVA Plant SCADA Connectivity Server.

## Status Column Messages

The **Status** column on the [Computers](#) view may display a notification icon. It will typically appear when you attempt to deploy a project version.

This indicates that runtime is not operating as expected on the deployment client. To view a message describing the circumstances, click the arrow to the right of the icon.

For a suggested solution, select from the messages listed below.

### **One or more Plant SCADA processes are stopped.**

One or more Plant SCADA processes in AVEVA Plant SCADA Runtime Manager and/or AVEVA Plant SCADA Connectivity Server are not running. Start these processes, or restart AVEVA Plant SCADA Runtime Manager and AVEVA Plant SCADA Connectivity Server on the deployment client to complete deployment.

### **An unexpected error occurred in one or more Plant SCADA processes.**

One or more Plant SCADA processes in AVEVA Plant SCADA Runtime Manager and/or AVEVA Plant SCADA Connectivity Server are not operating as expected. Restart AVEVA Plant SCADA Runtime Manager and AVEVA Plant SCADA Connectivity Server on the deployment client.

### **One or more Plant SCADA processes are not responding.**

One or more Plant SCADA processes in AVEVA Plant SCADA Runtime Manager and/or AVEVA Plant SCADA Connectivity Server are not operating as expected. Restart AVEVA Plant SCADA Runtime Manager and AVEVA Plant SCADA Connectivity Server on the deployment client.

**There was problem transferring a project version onto a remote node. The transfer did not finish successfully.**

This message can indicate:

- The connection between the deployment server and deployment client is not working.  
Or
- There is not enough disk space on the deployment client to download the project version.

To resolve this:

- Check that the connection between deployment server and deployment client is functional and stable.
- Confirm that there is enough disk space available for the project version.

The default location of the cache folder that stores downloaded versions is:

%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\Deployment\Client\Cache

This is defined as a value of "DeploymentNode.BaseStoragePath" under the "appSettings" section of SE.ASb.Deployment.Node.Windows.Service.exe.config.

If you manually change this value, you need to restart the Plant SCADA Deployment Client Service.

**There was a problem activating a project on a remote node. The project could not be activated.**

This message can indicate:

- AVEVA Plant SCADA Runtime Manager (or the AVEVA Plant SCADA Runtime Manager Service) is not running.  
Or
- AVEVA Plant SCADA Connectivity Server is not running.  
Or
- Deployment is disabled on the deployment client.

To resolve this, first confirm that AVEVA Plant SCADA Runtime Manager (or the AVEVA Plant SCADA Runtime Manager Service) and AVEVA Plant SCADA Connectivity Server are running.

To enable deployment on the deployment client:

1. Launch the Configurator.
2. Select **Plant SCADA | Computer Setup** in the left panel.
3. Select **Run the project deployed from the Deployment Server** under **Project Run Path**.
4. Click **Configure**.

When resolved, you can try to deploy the version again.

**An internal error occurred while deploying a project version onto a remote node. The deployment did not finish successfully.**

This message can indicate:

- There is not enough disk space on the deployment client to unpack the version.
- The Deployment Client Service is running as a Network Service user, and the following has occurred:
  - The Network Service user does not have full control permission to the Cache folder.

- The Network Service user does not have full control permission to the Deployment folder.

To resolve this, firstly confirm that there is enough space on the disk for the version. The deployment folder path is defined as value of [CtEdit]Deploy in Citect.ini. To change deployment folder path:

1. Launch the Configurator.
2. Select **Plant SCADA | Deployment Client** in the left panel. The **START** page appears.
3. Check that the radio button **Update the configuration of the current Deployment client** is selected. Click **Next**. The **SETTINGS** page appears.
4. Enter a valid path in the field under **Deployed project location**.
5. Click **Configure**.

When resolved, you can try to deploy the version again.

To resolve the Network Service user issue:

- Confirm that the Network Service user has full control permission to the cache folder.  
The default location of the cache folder that stores downloaded versions is:  
`%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\Deployment\Client\Cache`  
This is defined as a value of "DeploymentNode.BaseStoragePath" under the "appSettings" section of `SE.ASb.Deployment.Node.Windows.Service.exe.config`.
- Confirm that the Network Service user has full control permission to the deployment folder.  
The deployment folder path is defined as value of [CtEdit]Deploy in Citect.ini.

When resolved, you can try to deploy the version again.

## System Management Server

### Changing the System Management Server port after a Deployment Server and Client have been configured

The Deployment Client, Deployment Server and the System Management Server use port sharing. This allows all these services to use the same default https port number (443).

After configuring these services, we recommend that you do not change the port. If you need to do this, perform the following steps:

1. On the **Advanced Settings** page of Configurator's System Management Server plugin, change the port number on the **Ports** tab.
2. Click on **Configure** button to configure the SMS with the new port.
3. Restart Configurator.
4. Stop the Deployment Server and Deployment Client services.
5. Delete the following files from the default location "`%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\Config`", or from the location specified during installation.
  - `SE.ASb.Deployment.Node.WindowsService.exe.config`
  - `SE.ASb.Deployment.Server.WindowsService.exe.config`
6. Launch the Configurator.

7. Reconfigure the Deployment Server and Deployment Client using the “Configure...” option. The Deployment Server and Deployment Client services will start up without any error messages.
8. If you have also changed the HTTP port, then restart the connectivity service.
9. Launch Plant SCADA Studio.
10. In the **Settings** view of the Deployment activity, add a Deployment Server with the new port number and make it active.
11. Log in to the Deployment Server and delete the computer that belongs to the old port. The status of that computer will be "Offline".

All deployment activities will now work with the new System Management Server port.

## Runtime

Runtime activates a compiled project and engages it with the production system. When launched, runtime allows your operators to visually monitor a system, initiate production processes and respond to alarm conditions. Historical and trend data can also be collated while runtime is active.

You can launch runtime for the active project in Plant SCADA Studio via the Activity Bar (see [Run a Project](#)).

You can also use the [Runtime Manager](#) to run individual processes in a multi-process system, allowing a particular server or client to be launched independently. This can be useful for hardware testing and system analysis. In some cases, this also allows you to implement project configuration changes without restarting your runtime system (see [Online Changes](#)).

If required, you can temporarily transfer the communications of a server to another computer to assist with hardware maintenance and system analysis (see [Server Redirection Using Address Forwarding](#)).

You can also configure actions to occur when runtime commences (see [Startup and Runtime Configuration](#)), and run the system using a specific configuration file ( see [Using an Alternative INI File](#)).

There are tools available to [Monitor Runtime](#) and [Debug Runtime](#).

---

**Note:** Before you attempt to run a project, check that the host computer has been appropriately configured using the Setup Wizard. See [The Setup Wizard](#) for more information.

---

## See Also

[Firewall Settings and Plant SCADA](#)

[Virtualization Host Support](#)

[Anti-virus Software Setup](#)

[Running the System as a Windows Service](#)

## Run a Project

### To launch runtime:

1. Check that the project you would like to run is currently selected as the active project (see [View Projects](#)).
2. On the Activity Bar, select **Run**.

If Plant SCADA detects that the active project is not compiled, it will compile the project.

When this is complete, the [Runtime Manager](#) will launch and display the status of each process as they start up. If required, you can use the **Cancel** button on the Runtime Manager to stop runtime from launching.

Runtime Manager (Service Mode)

 Special Build: 8.30.0.405  
ExampleSA  
Encryption: Enabled

CPU	Process ID	Process	Type	Status	Message
All	14456	System Services	System Services	Running (Demo)	
All	20928	Cluster1.IOServer1	IOServer	Running	
All	3428	Cluster1.AlarmServer1	Alarm	Running	
All	14092	Cluster1.TrendServer1	Trend	Running	
All	24360	Cluster1.ReportServer1	Report	Running	

[Restart All](#) [Shutdown All](#) [Hide](#) [Help](#)

**Note:** You can also use Runtime Manager to stop and start individual processes in a multi-process system. This can be useful for hardware testing and system analysis. See [Launch Runtime Manager from Plant SCADA Studio](#).

## See Also

[Runtime Manager Interface](#)

## Runtime Manager

Runtime Manager is used to start, stop, monitor, and shutdown Plant SCADA processes during runtime.

Runtime Manager

 Special Build: 8.30.0.405  
ExampleSA  
Encryption: Enabled

CPU	Process ID	Process	Type	Status	Message
All	10916	Cluster1.IOServer	IOServer	Running	
All	12100	Cluster1.AlarmServer1	Alarm	Running	
All	3828	Cluster1.TrendServer1	Trend	Running	
All	4680	Cluster1.ReportServer1	Report	Running	
All	9336	Client	Client	Running	

[Restart All](#) [Shutdown All](#) [Hide](#) [Help](#)

When you run a Plant SCADA project, the [Runtime Manager Interface](#) will appear. It reviews your project settings, and the Citect.ini file, then starts the required processes on the specified CPUs. The **Message** column

displays verbose startup messages for each process as they start.

The Runtime Manager also displays the status of encryption configured on the workstation. This can be one of the following depending upon the setup defined in the [Encryption](#) node of Configurator:

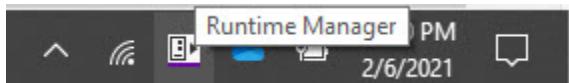

- Enabled
- Mixed
- Disabled.

If the encryption status is **Invalid Configuration**, it indicates that encryption has been enabled but the System Management Server has not been configured. [Configure a System Management Server](#) using Configurator before running your project again.

**Note:**

- If the Runtime Manager encounters a licensing issue or an invalid configuration in the Citect.ini file during startup, an alert message is displayed, an error is logged and the system does not start.
- If networking is disabled, you can only start up Plant SCADA as a single process.
- When working with deployed versions of projects, you can restart a single process or all processes if the deployed project that is running has not been changed; however if a new version has been deployed, you will not be able to restart a single process. You will need to restart all processes.

When all the Plant SCADA processes have started, the Runtime Manager window minimizes to an icon in the notification area on the Windows™ task bar. It will continue to be operational while your project is running.

Clicking on the icon in the notification area restores Runtime Manager to the foreground, allowing you check the status of the Plant SCADA processes.

Runtime Manager can also be launched during the configuration of a project (see [Launch Runtime Manager from Plant SCADA Studio](#)). Launching Runtime Manager in this way presents it in an idle state, allowing you to start each process independently.

When displayed, you can use Runtime Manager to perform the following tasks:

- [Monitor Runtime Processes](#)
- [Start a Process](#)
- [Stop a Process](#)
- [Restart a Process](#)
- [Cancel a Process](#)
- [Use the Kernel with a Selected Process](#)
- [Hide Runtime Manager](#)
- [Shut Down Runtime Manager](#).

You can also reload updated database files for a process during runtime, allowing you to implement some project configuration changes without performing a full restart. For more details see [Reload a Process](#).

For more information on using Runtime Manager, click on its **Help** button.

**Note:** If the title bar of Runtime Manager displays "Runtime Manager (Service Mode)", it means the local Plant SCADA servers are currently being run as a Windows™ service. While in Service Mode, the Runtime Manager will operate with limited functionality. For more information about Service Mode, see [Operate Runtime Manager in Service Mode](#)

---

[Service Mode.](#)

## Runtime Manager Interface

Runtime Manager represents each individual process on the local computer as a row in a table. Each row (process) includes the following columns:

Column	Description
CPU	The CPU number(s) on which the process is running, or 'All' to indicate the process is running on all CPUs.
ProcessID	The Windows ProcessID.
Process	Lists each Plant SCADA component running in the process. Where Plant SCADA is running in single process mode and all components are sharing a process, they appear comma-separated on a single line in this column.
Type	The type of process (Alarm, Report, Trend, I/O Server or Client). Where Plant SCADA is running in single process mode and all components are sharing a process, the type is known as 'MIXED'.
Status	The status of each process. See <a href="#">Monitor Runtime Processes</a> for a list of each status reported by Plant SCADA Runtime Manager.
Message	Displays message information relevant to the status of each process, such as the date and time of project compilation, as well as project name. For example, during startup of each process the verbose startup message appears in this column.

The Plant SCADA Runtime Manager interface also includes the following buttons:

- **Restart All** - Restarts all the processes on the workstation, including any that are not currently running (see [Restart a Process](#)).
- **Start All** - If no processes are currently running, this button starts all the processes on this workstation (see [Start a Process](#)).

As soon as a process is running, this button changes to **Shutdown All** which stops all processes and shuts down Runtime Manager (see [Shut Down Runtime Manager](#)).

While a process is starting, this button will display **Cancel**. This allows you to stop any processes that are currently starting (see [Cancel a Process](#)).

- **Hide** - minimizes Runtime Manager (see [Hide Runtime Manager](#)).
- **Help** - opens the Runtime Manager documentation.

## See Also

- [Stop a Process](#)
- [Reload a Process](#)
- [Use the Kernel with a Selected Process](#)

## Launch Runtime Manager from Plant SCADA Studio

You can start [Runtime Manager](#) during the configuration of a project from the following locations:

- The System Menu (click on the following icon in Plant SCADA Studio's top left corner)  

- Graphic Builder's **Tools** menu.

This will launch the Runtime Manager in an idle state, allowing you to start processes independently in a multi-process system. This can be useful for system testing and analysis, as it allows you to start a particular server or client without having to perform a full compile of a project.

**Note:** Only one instance of Plant SCADA Runtime Manager can run on a machine at any time.

Once a process is started (by right-clicking on it and selecting **Start**), the Runtime Manager displays the startup log for the selected processes and launches runtime.

## See Also

- [Runtime Manager Interface](#)

## Monitor Runtime Processes

Plant SCADA Runtime Manager monitors the status of each Plant SCADA process running on the local workstation. It presents the status of each process in the Status column. This can include the following states.

Status	Definition
Exception	The Plant SCADA process being monitored has stopped functioning and is currently generating an exception report, which can be used to diagnose the situation.
Starting	The Plant SCADA process being monitored is currently starting up.
Stopped	The Plant SCADA process being monitored has: <ul style="list-style-type: none"><li>• Been stopped due to a shutdown.</li></ul>

Status	Definition
	<ul style="list-style-type: none"> <li>• Stopped unexpectedly.</li> <li>• Disappeared due to a shutdown via Windows™ Task Manager.</li> </ul>
Running	The Plant SCADA process being monitored is currently running.
Stopping	The Plant SCADA process being monitored is currently shutting down.

When the status of a process changes to exception, a notification balloon appears from the task bar icon to inform you a process has stopped unexpectedly. A further notification balloon appears when the process has finished generating the exception report and the state has transitioned to stopped.

When the status of a process changes to **stopped** abnormally, a notification balloon appears from the task bar icon to inform you a process has stopped.

If the status of a process changes to **not responding**, a notification balloon appears from the task bar icon to inform you a process is not responding.

While a process is running, the Message column indicates the project being run and the date and time that the project was compiled. A tool tip is also available on each process which indicates how long the process has been running.

## See Also

- [Restart a Process](#)
- [Cancel a Process](#)
- [Reload a Process](#)

## Start a Process

If a Plant SCADA process is not running, has stopped or is not responding, you can use Runtime Manager to start the process.

---

**Note:** If a new version of a project has been deployed to the computer where Runtime Manager is operating, you will not be able to restart a single process. You will need to restart all processes.

### To start a process:

- Right-click the process to start and choose **Start** from the shortcut menu.

Runtime Manager will start the selected process. The verbose startup message appears for that process until the startup completes, and the status for the process is set to "Running".

---

**Note:** By default, a process that has stopped abnormally is restarted automatically. This behavior is controlled by the Citect.ini parameter [\[RuntimeManager\]AutoRestartTrigger](#).

If all the processes are in a stopped state, you can click the **Start All** button to start all processes.

## See Also

- [Stop a Process](#)
- [Restart a Process](#)
- [Cancel a Process](#)
- [Reload a Process](#)

## Stop a Process

If a Plant SCADA process is running, you can use Runtime Manager to stop the process.

### To stop a process:

- Right-click the process to stop and choose **Stop** from the menu that appears.  
Runtime Manager stops the Plant SCADA process. Its status is changed to "Stopped".

## See Also

- [Start a Process](#)
- [Restart a Process](#)
- [Cancel a Process](#)
- [Reload a Process](#)

## Restart a Process

You can restart a selected Plant SCADA process without interrupting the current state of other processes.

### To restart a process:

- Right-click the required process and choose **Restart** from the menu that appears.  
Runtime Manager will stop the process and start it again. The verbose startup messages appear, then the status for the process is set to "Running".

## See Also

- [Start a Process](#)
- [Stop a Process](#)
- [Cancel a Process](#)
- [Reload a Process](#)

## Cancel a Process

If a Plant SCADA process is currently starting, you can right-click on the process and choose **Cancel** from the menu that appears.

A **Cancel** button is also available on the Runtime Manager while a process is starting.

---

**Note:** If the Citect.ini parameter [\[Page\]StartUpCancel](#) is set to 0, the Cancel option will be unavailable in Runtime Manager.

---

[Reload a Process](#)

## Reload a Process

You can reload the configuration for a server processes during runtime. This will reload any updated database files, allowing you to implement some project configuration changes without performing a full restart. For more details see the topic *Server Side Online Changes*.

### To reload a process:

- Right-click on the process and choose **Reload** from the shortcut menu.

The **Status** column will change to indicate that a reload is in progress. Once the reload is complete (successfully or otherwise), the **Message** column describes the result of the operation.

Message	Description
Reload could not start because another reload was being commenced.	Check that no reloads are currently active before you attempt the reload again.
The last reload was completed at {time}, on {date}.	Indicates the reload was successful.
Reload could not start because the requested components in this process are disabled.	All components in the selected process are disabled due to license restrictions or a Citect.ini file setting (for example, <a href="#">[Trend]Disable</a> is set to 1).
Server reload failed. Please check Citect syslog for more information.	View for the syslog.dat file to determine why the reload was unsuccessful.
Unknown error: {0}	{0} represents the error code returned by the system when a reload of the database files was attempted.

---

**Note:** It is recommended that the [ServerGetProperty](#) Cicode function be used with the *LibRDBMemTime* and *LibRDBDiskTime* properties to check if there is a change to the Cicode library before attempting a reload.

---

Following a reload please check the corresponding server's syslog.dat file for any reload messages. The Cicode changes will not be reloaded, therefore a restart may be more appropriate.

## **WARNING**

### **UNINTENDED EQUIPMENT OPERATION**

Restart the server process if a "Cicode library timestamp differs" error is detected. The library mismatch is indicated on the server in either the hardware alarm or the server's syslog.dat file.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

**Note:** A message in the Syslog.dat file and hardware alarm of "Cicode library timestamp differs" (error code 454) will be raised if the Cicode library used by one or more server runtime databases is different from the one in memory. The timestamps will be different if the project has been fully recompiled (with or without Cicode modification), or if the project has been incrementally recompiled after any Cicode has been modified.

## **See Also**

[Start a Process](#)

[Stop a Process](#)

[Restart a Process](#)

[Cancel a Process](#)

## **Use the Kernel with a Selected Process**

If a Plant SCADA process is running, the Kernel window can be used to diagnose the runtime information for that process.

To enable the Kernel to be launched from Runtime Manager, you need to confirm following settings:

- The Citect.ini parameter [\[Debug\]Menu](#) needs to be set to 1. By default, this parameter is set to 0 which means the Kernel menu option will not be available.  
You can also use the Setup Wizard to configure this setting. Run the Setup Wizard, select **Custom** mode, and select the **Kernel on menu** option on the [Control Menu Security Configuration](#) page.
- Users who access the Kernel need to be assigned to a [Role](#) that has the **Kernel Access** property set to "Full Access" or "Read Only". A Read Only user can access the Kernel, but cannot perform some privileged commands like running Cicode.

**Note:** If you attempt to display the Kernel for a display client process from Runtime Manager, it will not succeed if no one is logged in or the current user is assigned to a role with **Kernel Access** set to "No Access". An error message will be displayed in this case.

### **To view the Kernel for a process:**

1. In Runtime Manager, right click on the process for which you would like to view the Kernel window.
2. Select **Kernel** from the context menu which appears.
3. The Kernel window for the selected process will appear and a login dialog will display. Enter a valid user name and password (see above).

## ⚠ WARNING

### UNINTENDED EQUIPMENT OPERATION

- Do not use the Kernel for normal Plant SCADA operation. The Kernel is only for diagnostics and debugging purposes.
- Configure your security so that only approved personnel can view or use the Kernel.
- Do not view or use the Kernel unless you are an expert user of Plant SCADA and Cicode, or are under the direct guidance of AVEVA Support.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

## Dump Kernel Data for a Running Process

You can dump Kernel data for a running process directly from the Runtime Manager.

1. Right-click the running process.
2. Select **Dump Kernel**.

When complete, the message "Kernel data has been dumped successfully" is displayed. Kernel data for only one process may be dumped at a time. Kernel data is dumped in non-verbose mode. This menu option can be disabled by setting the INI parameter [\[RuntimeManager\]AllowDumpKernel](#) to 0.

## See Also

[Display the Kernel Window](#)

## Hide Runtime Manager

The **Hide** button minimizes Runtime Manager to the notification area on the Windows™ task bar.

Runtime Manager does not stop running, the interface is just hidden until you require it again.

Clicking the task bar icon restores Runtime Manager to the foreground.

## See Also

[Runtime Manager Interface](#)

## Shut Down Runtime Manager

All runtime processes need to be stopped before Runtime Manager can shut down.

### To shut down Runtime Manager:

- Click the **Shutdown All** button on the Plant SCADA Runtime Manager interface.

Runtime Manager stops all processes that are currently running, not responding, or stopped. It displays verbose shutdown messages for each process.

---

**Note:** When Log Off | Reboot | PowerOff options are executed from Cicode during the shutdown of Plant SCADA, Runtime Manager will appear and display the verbose shutdown messages for each instance. Then, when complete, it automatically shuts down Runtime Manager.

---

If the Citect.ini parameter [\[RuntimeManager\]ExitAfterShutdown](#) is set to 1 (its default value), Runtime Manager automatically closes when all processes have stopped.

---

**Note:** For security reasons the **Shutdown** button in Runtime Manager can be disabled. To do this, set the Citect.ini parameter [\[Debug\]Shutdown](#) to zero (0).

---

### See Also

[Runtime Manager Interface](#)

[Launch Runtime Manager from Plant SCADA Studio](#)

### Operate Runtime Manager in Service Mode

Plant SCADA can be run as a Windows™ service, allowing for unattended operation of system servers. The associated service, named "Plant SCADA Runtime Manager", is configured using the Microsoft Management Console. For more information, see the topic [Configure a System to Run as a Windows Service](#).

When Plant SCADA is running as a service, the [Runtime Manager](#) will operate in "Service Mode". This is indicated by the application title bar, which displays "Runtime Manager (Service Mode)".

---

**Note:** If you are running as part of a trusted network (for example, [\[Client\]PartOfTrustedNetwork](#) is set to 1), you will not be able to run your project if the current user is not assigned to the Configuration Users or Server Users security role (see [Security Roles](#)). Similarly, if you are running an /X client process as part of a trusted network ([\[Client\]AdditionalClientsArePartOfTrustedNetwork](#) is set to 1), the current user will also need to be assigned to one of these security roles.

---

When operating in Service Mode, the Runtime Manager will demonstrate the following functionality changes:

- The display client process will not appear in the list of processes.
- A process named "System Services" will appear in the list of processes. This process performs system functions for the service. If you stop the System Services process, it will cause the other Plant SCADA processes to close down as the system will no longer be able to detect a license.
- When the display client is manually shut down, it will not close Runtime Manager.
- After the display client is manually shut down, clicking the **Restart All** or **Start All** button (if they are available) will not start the display client. You can start the display client again from Plant SCADA Studio, or by launching Plant SCADA Runtime from Windows **Start** menu.
- Clicking the **Shutdown All** button will shut down all the managed processes that are currently running. When all the processes have stopped, you can manually close Runtime Manager via the close button in the top right-hand corner.

Running Plant SCADA as a service in single process mode is not recommended. If you run Plant SCADA in this condition, the following limitations will apply:

- Hardware alarms originating from the server process will not appear.
- The following Cicode functions will not be executed within the server process:
  - AlarmSumAppend
  - AlarmSumCommit
  - AlarmSumDelete
  - AlarmSumFind
  - AlarmSumFindExact
  - AlarmSumFirst
  - AlarmSumGet
  - AlarmSumLast
  - AlarmSumNext
  - AlarmSumPrev
  - AlarmSumSet
  - AlarmSumSplit
  - AlarmSumType
  - DriverInfo
  - IODeviceControl
  - IODeviceInfo
  - SPCAlarms
  - ServerInfoEx
  - TrnAddHistory
  - TrnDelHistory

---

**Note:** If you attempt to switch Plant SCADA between Service Mode and normal operation, you need to close down the display client and the Runtime Manager before you restart Plant SCADA in a different mode.

---

## Online Changes

Online changes refer to the ability to implement project configuration changes in a runtime system without the need to restart the processes that are currently running.

These types of changes fall into two categories:

- [Client Side Online Changes](#)
- [Server Side Online Changes](#).

## See Also

[Restarting the System Online](#)

## Client Side Online Changes

During runtime, Plant SCADA clients only require graphics, code and communications information to operate successfully. Other configuration information is deployed to an appropriate server.

This means the following configuration changes can be made to a project without the need to restart clients:

- I/O devices
- Tags
- Alarms
- Trends
- Reports
- Accumulators.

Following any configuration changes to these areas of functionality, you can compile and distribute a project as you normally do. However, despite the fact a client restart is not required, you will have to restart the following servers to implement the changes in the runtime system.

- I/O devices - require a restart of the I/O server
- Tags - require a restart of the I/O server
- Alarms - require a restart of the alarm server
- Trends - require a restart of the trends server
- Reports - require a restart of the reports server
- Accumulators (require a restart of the reports server).

---

**Note:** You are able to reload a page at runtime even if the associated Cicode library has changed. However, the hardware alarm "Cicode library timestamp differs" will be raised if the Cicode library that was used to create the page does not match the one that is in memory. Under these circumstances, it is recommended that you restart a client. See [Handling Cicode Changes during Runtime](#).

---

## See Also

[Server Side Online Changes](#)

## Handling Cicode Changes during Runtime

You are able to reload a page at runtime even if the associated Cicode library has changed. However, the system will compare the Cicode library that was used to create the page to the one that is in memory. If they do not match, the hardware alarm "Cicode library timestamp differs" is raised. The page is displayed, but the Cicode that is executed will be from the memory version of the Cicode library and not the latest compiled version.

A restart of the client is needed to update the Cicode library version to the latest compiled version.

**UNINTENDED EQUIPMENT OPERATION**

Restart the client process if the hardware alarm "Cicode library timestamp differs" is raised after a page is opened.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

**Note:** A hardware alarm of "Cicode library timestamp differs" will be raised if the Cicode library used by a page has a different timestamp from the one in memory. The timestamps will be different if the project has been fully recompiled, the project has been incrementally recompiled after the page has been modified, or if the project has been incrementally recompiled after any Cicode has been modified.

It is recommended that the [ServerGetProperty](#) Cicode function be used with the *LibRDBMemTime* and *LibRDBDiskTime* properties to check if there is a change to the Cicode library before attempting a reload. Following a reload, it is recommended that you check the corresponding server's syslog.dat file for any reload messages.

## See Also

[Client Side Online Changes](#)

[PageDisplay](#)

[PageGoto](#)

## Server Side Online Changes

Records can be modified during runtime using Plant SCADA Studio, recompiled and the resulting database files updated. You can initiate a configuration reload for each server using the Runtime Manager or Cicode functions.

**Note:** It is recommended that the [ServerGetProperty](#) Cicode function be used with the *LibRDBMemTime* and *LibRDBDiskTime* properties to check if there is a change to the Cicode library before attempting a reload.

Following a reload please check the corresponding server's syslog.dat file for any reload messages. The Cicode changes will not be reloaded, therefore a restart may be more appropriate.

### **WARNING**

#### **UNINTENDED EQUIPMENT OPERATION**

Restart the server process if a "Cicode library timestamp differs" error is detected. The library mismatch is indicated on the server in either the hardware alarm or the server's syslog.dat file.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

**Note:** A message in the Syslog.dat file and hardware alarm of "Cicode library timestamp differs" (error code 454) will be raised if the Cicode library used by one or more server runtime databases is different from the one in memory. The timestamps will be different if the project has been fully recompiled (with or without Cicode modification), or if the project has been incrementally recompiled after any Cicode has been modified.

## Restart an Alarms Server

The following fields are reloaded on alarms servers:

- Digital alarms
- Time stamped alarms
- Analog alarms
- Advanced alarms
- Multi-digital alarms
- Time stamped digital alarms
- Time stamped analog alarms

The alarm category is not reloaded on the client side.

The following alarm category fields are used by the server and will be reloaded:

- ON Action
- OFF Action
- ACK Action
- Summary Device
- Log Device, ON, OFF and ACK log devices

### **WARNING**

#### **UNINTENDED EQUIPMENT OPERATION**

On updating the Equipment Name or Equipment Item for an alarm, the update will not be reflected on the client side until the alarm servers have been restarted. The reload procedure will indicate a reload error on Runtime Manager. Reloadlog.dat and Syslog.dat of the server process will show the details of the unsupported changes. You can use this information to revert the changes, or restart all servers after deploying your updated project.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

The numbers of **added**, **modified** and **deleted** categories are recorded in the system log. Alarm categories are identified by their category numbers.

- **Added** — Indicates how many categories with new category numbers have been added to the alarm server.
- **Modified** — Indicates how many categories (of which the category number existed in the runtime before reloading) have been modified in the alarm server. If a user has defined a new category record, but its category number was used by an existing category, the category reload will count this situation as a modification of the category with this category number, rather than an addition. A category is shown as modified if any content in the category record is modified, including the case that only client side settings are modified. In this case, the reload does not change the state of this category in the memory, but it is still counted as one modified category.
- **Deleted** — Indicates how many categories have been deleted from the alarm server. A category is defined as deleted if none of the other categories has the same category number as this category. In the case that two

category records have the same category number, deleting the latter one in the table will instead increment the modify count, while delete the former one would not increment any count.

Two category records with the same category number are treated as one category in runtime, and the later one would be loaded.

When [\[Alarm\]EnableErrorLogging](#) is set to 1, an alarm server adds a syslog entry for errors from adding, modifying or deleting an alarm record or a category record. The errors can be due to category number out of range or category priority number out of range. Two new hardware alarms (520 and 523) have been introduced for those errors. See Cicode and General Errors for more details.

Reloading an alarm server will affect alarm property tags and may make them invalid (when an alarm is deleted) or make them available (when adding alarms).

#### To reload an alarm server:

1. Compile the project on main and standby servers.
2. Reload the standby alarm server using Cicode function [ServerReload](#) or the Runtime Manager. At this point the standby server loads the new RDB and indicates that the server is in "Prepared" state for synchronization. The database is not updated at this stage.
3. Reload the main alarm server. At this point the main server loads the new RDB and then updates the configuration data in its database. The database on the main alarm server then synchronizes with the database on the standby server.

Use the [\[Alarm\]UseConfigLimits](#) INI parameter to set whether on reload or restart the alarm property values are retrieved from the RDB or the alarm server side database.

## See Also

[Server Side Online Changes](#)

### Restart a Trends Server

The following data will be reloaded on a trend server when adding, removing and modifying the records of:

- Trend tags
- SPC tags.

Modifying the following archive properties will put a record in an error state and no acquisition will be done for corresponding records:

- Sample Period
- Type (from Periodic to non Periodic or vice versa)
- Filename
- Storage Method
- No. Files
- Time
- Period.

A hardware alarm, a syslog entry and a reload error message will be raised. The history files will not be deleted. For periodic to periodic Type changes, reload will not generate an error.

If you want to have a valid archive for the modified record, you need to delete the old history files (after archiving manually) and then trigger the reload again after forcibly compiling the Trend configuration. This is necessary because the trend system doesn't reload the trend rdb file if the compile time of in-memory file is same to the on disk file. Therefore changes to an existing trend record's archive properties is a two staged reload.

Due to reload the display clients will need to request the latest configuration data for trend records. The Process Analyst will periodically refresh configuration data from the trend server. The Trend server tag browsing is optimized to handle the more frequent requests.

For legacy trends including SPC, configuration data will be refreshed from the trend server when a page update is triggered.

## See Also

[Impact of a Server Reload on Historical Records](#)

[Server Side Online Changes](#)

## Restart a Reports Server

The following fields will be reloaded on a Report Server:

- Reports
- Accumulators

## See Also

[Impact of a Server Reload on Historical Records](#)

[Server Side Online Changes](#)

## Impact of a Server Reload on Historical Records

The following sections detail the effects on the history of reloaded Alarm, Trend and Report records. This is dependent on which fields have changed.

- A 'Yes' in the **New Alarm** column indicates changes to that field will make a new alarm and delete the old one and therefore the history is not kept.
- A 'Yes' in the **Invalid History** column means changes to that field will make the history of that record invalid.

## Alarm Servers

### Common Alarm fields

Field Name	New Alarm	Invalid History
Alarm Tag	Yes	No
Cluster Name	Yes	No
Alarm Description	No	No
Alarm Category	No	No
Help	No	No
Delay	No	No
Comment	No	No
Privilege	No	No
Area	No	No
Custom 1..8	No	No
Paging	No	No
Paging Group	No	No

**Analog and Time Stamped Analog Alarm fields**

Field Name	New Alarm	Invalid History
Variable Tag	No	Yes
High High	No	Yes
High	No	Yes
Low Low	No	Yes
Low	No	Yes
SetPoint	No	Yes
Deviation	No	Yes
High High Delay	No	No
High Delay	No	No
Low Low Delay	No	No
Low Delay	No	No
Deviation Delay	No	No

Field Name	New Alarm	Invalid History
Rate	No	Yes
Deadband	No	Yes
Format	No	No

**Digital and Time Stamped Digital Alarm fields**

Field Name	New Alarm	Invalid History
Variable Tag A	No	Yes
Variable Tag B	No	Yes

**Time Stamped Alarm fields**

Field Name	New Alarm	Invalid History
Variable Tag	No	Yes
Timer	No	Yes

**Advanced Alarm fields**

Field Name	New Alarm	Invalid History
Expression	No	Yes

**Multi-Digital Alarm fields**

Field Name	New Alarm	Invalid History
Variable Tag A	No	Yes
Variable Tag B	No	Yes
Variable Tag C	No	Yes
Realarm	No	Yes
On Function	No	Yes
Off Function	No	Yes
State	No	Yes
State Description	No	Yes

**Trend Servers**

Changes to the following properties of trends make existing trend files invalid and result in the creation of a new

trend file (renaming the old one for backup):

- Sample Period
- Type
- Storage Method
- No of Files
- Time (File)
- Period (File)

Changing the scale of a tag will make the trend history invalid.

Effect of reload on a modified Trend:

Field Name	New Alarm	Invalid History
Trend Tag Name	Yes	No
Cluster Name	Yes	No
Expression	No	Yes
Trigger	No	Yes
Comment	No	No
Privilege	No	No
Area	No	No
Eng Units	No	No
Format	No	No

## Report Servers

Effect of reload on a modified Report:

Field Name	New Alarm	Invalid History
Report Name	Yes	No
Cluster Name	Yes	No
Time	No	Yes
Period	No	Yes
Trigger	No	No
Report File Format	No	No

Field Name	New Alarm	Invalid History
Output Device	No	No
Privilege	No	No
Area	No	No

## Accumulators

Effect of reload on a modified Accumulator:

Field Name	New Alarm	Invalid History
Name	Yes	No
Cluster Name	Yes	No
Trigger	No	Yes
Run Time	No	Yes
No. of Starts	No	No
Totaliser Inc	No	No
Totaliser	No	No
Comment	No	No
Privilege	No	No
Area	Yes	No

## Restarting the System Online

With the online restart facility, you can change your project configuration and examine the results in the runtime system without having to shut down Plant SCADA. You can update your system while it is running.

---

**Note:** If you've configured Plant SCADA to use multiprocessor support, it is recommended that you use the Runtime Manager instead of the restart facility. The runtime manager allows you to restart different processes individually, whereas the restart facility will restart every Plant SCADA processes on the machine.

---

The time taken for the system changeover depends on the size of the project and the extent of the changes to the project:

- If you only change graphics pages, Plant SCADA does a *partial restart* (changing only the pages in the runtime system). Changeover is instantaneous.
- If you change any databases (for example, add a new alarm tag, trend tag, or Cicode function), Plant SCADA does a *full restart* to run the updated project.

## See Also

[Restarting a Networked System Online](#)

### Restarting a Networked System Online

If you are using Plant SCADA on a network, and would like to restart Plant SCADA without undue impact on the control of the plant, use a structured restart procedure. You can use any Plant SCADA computer on the network to initiate the online restart.

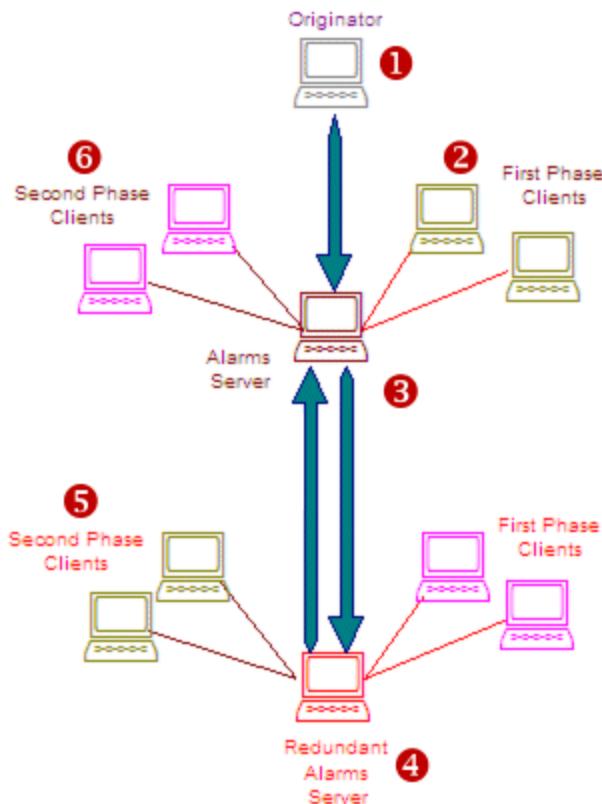

#### To phase shutdowns:

1. Set the citect.ini parameter [\[Shutdown\]Phase](#) on each client to either 1 or 2 to identify the phase of the client.
2. Issue a [Shutdown](#) command from the server.

When the Shutdown() command is issued, clients with phase set to "1" are shutdown first. When the first phase 1 client has reconnected to the server, clients with phase set to "2" are shutdown.

Plant SCADA automatically manages the online restart in the following sequence:

1. The Originator issues the Shutdown("Everybody") command.
2. The Alarm Server that the originator is connected to shuts down its first phase clients.
3. The Alarm Server that the originator is connected to advises the other Alarm Server then shuts itself down.
4. The second Alarm Server shuts down its first phase clients and waits for the other Alarm Server to restart (running the new project).
5. When the first Alarm Server is back on line, the second Alarm Server shuts down its second phase clients and then shuts itself down.
6. The first Alarm Server restarts its first phase clients and shuts down and restarts its second phase clients.

**Note:** If you've configured Plant SCADA to use multiprocessor support, it is recommended that you use the Runtime Manager instead of the restart facility. The runtime manager allows you to restart different processes individually, whereas the restart facility will restart every Plant SCADA process on the machine.

## See Also

[\[Shutdown\]Phase](#)  
[\[Shutdown\]NetworkIgnore](#)  
[Shutdown](#)

## Using Multiple Projects

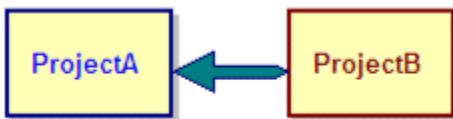

The most effective method of using the online restart facility is to use two projects. The first project becomes the current runtime system while the second project is in the development stage. You can manage both projects as follows:

Project A is currently the runtime system while Project B is under development.

When Project B is complete, you can use the online restart facility to change the runtime system to Project B.

You can then copy Project B to Project A for further development.

---

**Note:** If you've configured Plant SCADA to use multiprocessor support, it is recommended that you use the Runtime Manager instead of the restart facility. The runtime manager allows you to restart different processes individually, whereas the restart facility will restart every Plant SCADA process on the machine.

---

### Initiating the Online Restart

To initiate the online restart, the originator (any Plant SCADA computer on the network) issues a shutdown command with the Shutdown function, for example:

```
Shutdown("Everybody", "MyProject", 2);
```

Where possible, balance clients across both phases of the shutdown. The [Shutdown]Phase parameter defines the phase to which each Plant SCADA computer responds.

You can exclude selected computers (for example I/O Servers) from the online restart procedure with the [Shutdown]NetworkIgnore parameter.

For security, you can prevent selected computers from initiating the online restart procedure with the [Shutdown]NetworkStart parameter.

---

**Note:** If you've configured Plant SCADA to use multiprocessor support, it is recommended that you use the Runtime Manager instead of the restart facility. The runtime manager allows you to restart different processes individually, whereas the restart facility will restart every Plant SCADA process on the machine.

---

### Using a Callback Function

You can use a callback function (with the OnEvent function) to perform housekeeping tasks before the system shuts down. You would normally call OnEvent in the main startup function (defined with the [Code]Startup parameter). Each time a Shutdown() call is made, the callback function is run.

```
/* A user shutdown procedure. */
INT
FUNCTION
MyStartupFunction()
  ...
  OnEvent(25, MyShutdown);
  ...
END
INT
FUNCTION
MyShutdown()
```

```

STRING sPath;
// Perform housekeeping tasks
...
sPath = ProjectCurrentGet();
If sPath = "ProjectA" Then
    ProjectSet("ProjectB");
Else
    ProjectSet("ProjectA");
END
Shutdown("Everybody", sPath, 2);
END

```

## Firewall Settings and Plant SCADA

Plant SCADA networking and redundancy needs runtime to communicate through Windows Firewall. This means your Windows Firewall settings will need to be adjusted so that Plant SCADA and its components are included in the list of authorized programs.

The Plant SCADA installer can automatically adjust the required settings for you. If Windows Firewall is operational on a computer when installation occurs, the installer will display a **Firewall** page. To allow Plant SCADA to adjust these setting for you, select **Yes, please modify Windows Firewall settings**.

This will create Inbound Rules for each of the following components.

Name	Program	Local Port
Citect SCADA Runtime (x64)	C:\Program Files (x86)\AVEVA Plant SCADA\Bin\Bin (x64)\Citect.exe	All ports
Plant SCADA Runtime	C:\Program Files (x86)\AVEVA Plant SCADA\Bin\Citect32.exe	All ports
Configurator	C:\Program Files (x86)\Common Files\ArchestrA\configurator.exe	All ports
Configurator 443	All programs	443
Configurator 80	All programs	80
LicenseServerPort	All programs	55555
LicenseServerAgentPort	All programs	59200

**Note:** Microsoft Windows® distinguishes between **Public**, **Home** and **Work** networks. Each network has its own firewall profile. The Plant SCADA installer will automatically modify the Windows Firewall settings for the active network profile during installation. If you plan to change your network settings, you will need to manually modify the firewall settings for each profile within Windows.

If during installation you select **No, I will modify Windows Firewall settings later**, you will need to manually configure an Inbound Rule for each of the components listed above. You should confirm if a rule already exists, as Inbound Rules are also created under the following circumstances:

- Inbound Rules for the License Server ports are created when installation of License Server occurs.

- Inbound Rules for Configurator will be created when a System Management Server is selected within Configurator.
- Inbound Rules are created for Runtime when it is launched.

**Note:** If you postpone modifying the Windows Firewall settings during installation, when you launch Runtime for the first time a Windows Security Alert dialog will appear. When this occurs, click the **Allow access** button. The Inbound Rules for Plant SCADA Runtime will be updated and runtime will be launched.

If required, you can also manually modify the Inbound Rules created by Plant SCADA. For example, if the default "All ports" setting that is applied to Citect SCADA Runtime does not comply with your security requirements, you can manually set the **Local Port** property to a specific port.

You should also check that the required **Ports** are correctly configured.

## Inbound Rule settings

Inbound Rules are configured using Windows Firewall Advanced Settings (refer to Microsoft Windows documentation for further information about configuring Inbound Rules).

For each Inbound Rule, you need to configure the following properties:

### General Properties

- **Name** – see table above.
- **Enabled** – Yes.
- **Action** – Allow the connection.

### Programs and Services Properties

- **Programs** – see table above.

### Advanced Properties

- **Profile** – for Plant SCADA Runtime select **Domain**. For Configurator and License Server components select **Domain, Private and Public**.

### Protocols and Ports Properties

- **Protocol Type** – TCP (or UDP where required).
- **Local Port** – see table above.
- **Remote Port** – All Ports.

## Ports

You should confirm that the following ports are open (if they are required).

Port	Description
80	The default HTTP port used for web port sharing.
443	The default HTTPS port used for web port sharing.

Port	Description
808	Net.TCP Port Sharing Service. This is used by an Industrial Graphics Server or OPC UA Server.
1900	SSDP port for announcing the System Management Server.
2073	If a client acts as CTAPI server then port 2073 has to be added to the inbound rules.
2088	Time synchronization port. This service is not enabled by default.
3073	CTAPI (encrypted connections).
48031	The default for an OPC UA Server's Endpoint Connection setting.

On computers running a server process, you also need to open the server ports as inbound rules. See [Server Processes](#).

---

**Note:** If the alarm server is not functional, or the hardware alarm "No server could be found" is raised for a report server, trend server, I/O server or alarm server, you should check the firewall settings to see if communication between runtime and the network is blocked.

---

## Startup and Runtime Configuration

You can specify a Cicode function to execute automatically when Plant SCADA starts up. This Cicode gets executed as soon as the Cicode system comes online. use the Setup Wizard to specify the name of the startup function.

You can also run a report on startup. Plant SCADA searches for a default report called "Startup" when it starts up. If you have configured a report called "Startup", it is run automatically. You can change the name of the startup report (or disable it altogether) by using the Setup Wizard.

You can customize many elements of Plant SCADA's runtime and startup behavior. Only The Setup Wizard is necessary, but you can also use parameters for more control.

## Server Redirection Using Address Forwarding

Plant SCADA allows you to temporarily transfer the communications of a server to another computer to assist with hardware maintenance and system analysis.

By including an address forwarding section within a citect.ini file, you can override a server's project-configured address, redirecting network traffic to a different address and port.

For example, if you would like to test a new server before adding it to a project configuration, you could make the necessary address forwarding adjustments within the citect.ini file of a single client to direct it to the new hardware. The server could be tested within the context of a system without having to recompile the project.

You need to make the necessary adjustments within the citect.ini file for every computer that is likely to be

impacted by address forwarding.

For example, if you have a computer configured to run two I/O servers, and you would like to temporarily redirect one of them, then both server machines and every connecting client need to have the necessary address forwarding adjustments made to their citect.ini files, so that the servers are aware of each other.

If your system is configured to support network redundancy, a server may have multiple network cards. If this is the case, you need to consider the following when configuring a server redirection:

- Make sure the IP address configured for forwarding is the one that is currently being used by the destination server.
- If a hostname is used for an address forwarding target, make sure it is mapped to the IP address that is currently being used by the destination server. This mapping can be defined locally (via a hosts file) or globally (via DNS services).
- Make sure static IP addresses are used, not dynamic addresses.

Address forwarding is implemented using the following syntax within a citect.ini file:

```
[AddressForwarding]  
<ClusterName>.<ServerName>=<IPv4 ipaddress>:<port>
```

Or:

```
[AddressForwarding]  
<ClusterName>.<ServerName>=<IPv6 ipaddress>:<port>
```

Address forwarding is only interpreted and used during startup of Plant SCADA Runtime. It is recommended (but not necessary) that the Setup Wizard is run before running up a project to confirm your changes.

## WARNING

### UNINTENDED EQUIPMENT OPERATION

- Do not use address forwarding as the primary mechanism for specifying client/server communications. It bypasses the normal configuration checks enforced by the compiler.
- Carefully track any adjustments you make to the citect.ini file, as they need to be manually corrected once redirection is no longer necessary.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

## Virtualization Host Support

You can run components of your Plant SCADA system in a virtual environment.

The following virtualization environments are supported:

- Microsoft Hyper-V: based on the version of Windows
- VMware Workstation: basic virtualization without High Availability and Disaster Recovery
- VMware vSphere

For further information on virtualization, please refer to the [AVEVA™ Knowledge & Support Center](#).

## Anti-virus Software Setup

### **WARNING**

#### **SYSTEM PERFORMANCE DEGRADATION**

The "on access" scan in anti-virus products can lock files used by Plant SCADA, usually having the effect of slowing Plant SCADA down whilst it waits for the scan of that file to finish.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

### **CAUTION**

#### **INOPERABLE SYSTEM OR LOSS OF DATA**

In some extreme cases, anti-virus software may (incorrectly) detect certain patterns within data files as being viruses. Depending on the anti-virus configuration, this may result in files being relocated or deleted, resulting in data being lost or the system being inoperable.

**Failure to follow these instructions can result in injury or equipment damage.**

It is recommended that the following directories are excluded from scanning by any anti-virus products:

- Program Files installation directory (including files and sub directories)
- Data and Logs directories
- Any alarm server archive paths

The above exclusions are recommended for "on access" or "real time" scans that run continuously and scan each file that is read from or written to. Scheduled scans, which are usually daily or once a week, should also have these exclusions added with the exception of the Program Files exclusion.

## Using an Alternative INI File

When Plant SCADA starts up, it reads default values from the Citect.ini configuration file. Plant SCADA expects this file to exist in the config folder in the User and Data directory selected during installation. If the file is not found in this location, it will not search elsewhere and will instead display an error.

If you need to store your INI file elsewhere, specify the path to it on the command line when starting citect32.exe and CitectIDE.exe.

If you are running multiple projects, you can specify an alternative Citect.ini file for each project. The new INI file name needs to be passed to the Plant SCADA system applications (CitectIDE.exe and Citect32.exe) as a command line argument.

#### **To specify an alternative INI file for Plant SCADA:**

1. Click the icon that you use to start Plant SCADA Studio or Runtime.
2. Right-click to display the shortcut menu and select **Properties**.
3. Click the **Shortcut** tab.
4. Add the name of the INI file to the command line property of the appropriate icon using the -i option. For

example, to start Plant SCADA using the initialization file "my.ini", enter the following line:

```
"%PROGRAMFILES(X86)%\AVEVA Plant SCADA\bin\citect32.exe" -i"c:\citect\user\myproj\MY.INI"
```

**Note:** The Setup Wizard uses the same INI as specified for Plant SCADA Studio. You can specify different INI files for both the Runtime and Plant SCADA Studio programs. However, if you initiate Runtime from Plant SCADA Studio, it uses the INI that is specified for Plant SCADA Studio.

## Monitor Runtime

There are two types of runtime information you can use to identify and resolve operational problems:

- Hardware alarms
- Log files.

Hardware alarms are typically displayed on a dedicated alarm page to alert operators to current problems (see [Alarms](#)).

Log files are a record of time-stamped system data that can be analyzed to determine the cause of a problem (see [Log Files](#)).

This information can be analyzed directly to identify problems, or you can use the Plant SCADA Kernel to perform advanced debugging (see [Debug Runtime](#)).

## See Also

[Configure Logging](#)

[Adjust Logging During Runtime](#)

[The Crash Handler](#)

## Log Files

Log files are a record of time-stamped system data. Plant SCADA supports the log files described in the table below.

**Note:** Some common AVEVA components, such as Industrial Graphics and Enterprise Licensing, display log messages in the Log Viewer, an MMC snap-in that operates within AVEVA's Operations Control Management Console. For more information, see [Log Viewer](#).

Log file	Description
syslog.dat	<p>The syslog.dat file is the primary log file for Plant SCADA. It contains useful system information, from low-level driver traffic and Kernel messages, to user defined messages. Trace options (except some CTAPI traces) are sent to this file.</p> <p>The SysLog.dat file is a tab-delimited file with each field set to a minimum width. This enables the file to</p>

Log file	Description
	<p>be easily viewed in a text editor or imported into an application such as Excel. The file has the following format:</p> <ul style="list-style-type: none"> <li>• Level – 5 chars</li> <li>• Category – 11 chars</li> <li>• Thread Id – 4 byte hex</li> <li>• Driver Name – 16 chars</li> <li>• Unit – 16 chars</li> <li>• Function – 50 chars</li> <li>• File – 30 chars</li> <li>• Line – 4 byte decimal</li> <li>• Message – 1024 chars</li> </ul> <p>Plant SCADA locks syslog.dat while running. However, you can still view it by using the 'SysLog' command in the Kernel.</p> <p>There is a single SysLog file per IOServer process for both the Drivers and the IOServer (in earlier versions of Plant SCADA there was 1 file for the IOServer and 1 file for the Drivers).</p>
tracelog.dat	<p>The tracelog.dat file contains managed code logging, mainly in relation to data subscriptions and updates. Field traces and requests to native drivers go to the syslog.dat or a specific driver log file.</p> <p>In traces in the PSIClient and CSAToPSI categories, Sent and Received Notations (indicated with "&lt;=" and "&gt;") will be added to indicate tag data flow on the client side.</p> <ul style="list-style-type: none"> <li>• "&gt;" indicates that the log entry is tracing a message that the client has sent to clusters.</li> <li>• "&lt;=" indicates that the log entry is trace a message that the client has received from an IO Server.</li> </ul> <p>In addition, the session name will be appended in the message to identify the I/O server which handled the tag request.</p>
debug.log	<p>This file contains information about a crash or other serious internal issues. If a crash occurs, it will identify the version and path of each DLL being used at the time. It can be used to confirm you have the right</p>

Log file	Description
	version of files.
kernel.dat	Kernel.dat contains a copy of the kernel screens. It has the "dumpkernel(0x8000)" mode added to it on a crash, and is also available via Cicode calls to "dumpkernel".
ipc.log	This log is used for CTAPI communication traffic.
<driver>.dat	Driver logs relating to the operation of a particular driver and are named accordingly. For example, the OPC driver is logged in 'OPC.dat'.
Params.dat	The Params.dat file is an historical record of non default SCADA parameters. For example, 2010/12/01-14:42:07.847 [Code] Threads= 128 Default= 64.
tracelog.RuntimeManager.dat	This file contains logs relating to the operation of the Runtime Manager.

Log files may have additional suffixes included in their name, for example, an archived log file will include a timestamp (see [Log File Time Stamping](#)).

If a system uses separate processes, a log file is appended with the component name. An example of this could be:

`syslog.IOServer.Cluster1.dat`

Plant SCADA log files are stored in the Windows Program Data directory (see [Log File Locations](#)).

---

**Note:** If Plant SCADA suffers an unexpected shut down, the Crash Handler will create a compressed file containing a number of log and data files that may be useful in determining the cause. See [The Crash Handler](#).

## See Also

[Configure Logging](#)

[Perform Log File Calculations](#)

## Log File Time Stamping

Plant SCADA log file entries use the following timestamp format:

`yyyy-mm-dd<SPACE>HH:mm:ss.fff<TAB>TZD`

Where:

- `yyyy` = year (for example: 2008, 2009)
- `mm` = month (for example: 01, 05, 12)
- `dd` = date (for example: 01, 02, 31)
- `HH` = hour of the day (using 24 hour format, for example: 08, 13, 22)

- *mm* = minute (for example: 00, 02, 59)
- *ss* = seconds (for example: 00, 02, 20, 59)
- *fff* = milliseconds (for example: 000, 123, 999)
- *TZD* = local time offset from the UTC (for example: +10:00, -09:00)

---

**Note:** Time-stamps are always in local time.

---

For example:

2009-06-03 11:19:33.249 +01:00

## See Also

[Configure Logging](#)

## Log File Locations

The Plant SCADA log files are located in the Windows Program Data directory:

%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\Logs

Driver log files will also appear in the Logs directory in a folder named after the particular driver.

## See Also

[Configure Logging](#)

## Perform Log File Calculations

If you wish to perform calculations on the time and dates recorded in Plant SCADA [Log Files](#), this can be accomplished by opening the files in Microsoft Excel.

Open the file in Excel by selecting settings in the Text Import wizard such that the date and time fields are NOT split into separate cells. Once opened in Excel, select the column containing the date and time and format the cells in the column with a custom format of yyyy-mm-dd hh:mm:ss.000. This will allow Excel to correctly parse the date/time, and store the value in days, as the number of days (and fractions of a day) since 1900-01-01 00:00:00.000 (this date/time has a value of 1).

Calculations between date/time values can be simply performed. However, it needs to be remembered that, since Excel treats times as days, if the difference in milliseconds between two date/times is necessary, the result of the difference calculation needs to be multiplied by (24\*60\*60\*1000).

## Parsing the UTC offset

Using the UTC offset in Excel is a little more complicated, as Excel will not accept negative times. Therefore format the UTC offset cell/s as a text string, and write a formula to convert it into a fraction of a day. For example, if the UTC offset is held in cell B4, the formula is:

=LEFT(B4,1)&TIME(MID(B4,2,2),RIGHT(B4,2),0)

This will convert the UTC offset into a correctly signed numerical value expressed as a fraction of one day.

For example:

- "+09:00" is converted to "+0.375"
- "-04:30" is converted to "-0.1875"

This UTC offset value can be subtracted from the local time to derive the UTC time.

UTC offset could be used with merge logs from two different time zones. In this case you may wish to make both logs based on UTC time. For example:

11:00:00.000 +01:00 is 10:00:00.000 in UTC (minus 1 hour)

09:01:00.000 -01:00 is 10:01:00.000 in UTC (plus 1 hour)

## See Also

[Configure Logging](#)

## Configure Logging

You can make adjustments to the way Plant SCADA logs data using Citect.ini parameters. This includes the ability to filter logs according to priority, category or severity.

## Configure syslog.dat

The syslog.dat file is the primary log file for Plant SCADA (see [Log Files](#)). The following list represents the basic set of parameters you can use to configure logging to syslog.dat.

- [\[Alarm\]EnableErrorLogging](#) — Enables or disables the logging of operational errors to syslog.dat.
- [\[Alarm\]EnableStateLogging](#) — Enables or disables the logging of major alarm system state changes to syslog.dat.
- [\[General\]Verbose](#) — enables a startup dialog box which shows the opening runtime databases and other information.
- [\[General\]VerboseToSysLog](#) — sends additional startup information generated by [General]Verbose to syslog.dat.

The syslog.dat file is restricted in size (to 2000 kb by default). When it reaches its size limit, Plant SCADA renames it "syslog.bak", and starts a new syslog.dat.

You can make this size restriction larger or smaller by using the [\[Debug\]SysLogSize](#) parameter. For example, the following lines in the Citect.ini will set the syslog.dat size to 30 Mb:

```
[DEBUG]
SysLogSize=30000
```

If you want to archive unlimited system log files, you can set [\[Debug\]SysLogArchive](#) to 1. This adds a time stamp to the file name.

## Configure tracelog.dat

The tracelog.dat file contains managed code logging, mainly in relation to data subscriptions and updates (see [Log Files](#)).

The following list represents the basic set of parameters you can use to configure logging to tracelog.dat.

- [\[Debug\]EnableLogging](#) — enables or disables logging to the tracelog.dat file.
- [\[Debug\]Priority](#) — allows you to filter messages logged to the tracelog.dat file according to their priority.
- [\[Debug\]SeverityFilter](#) — allows you to filter messages logged to the tracelog.dat file according to their severity.
- [\[Debug\]SeverityFilterMode](#) — indicates whether messages declared by [\[Debug\]SeverityFilter](#) will be included or excluded from the log.
- [\[Debug\]CategoryFilter](#) — allows you to filter messages logged to the tracelog.dat file by component category.
- [\[Debug\]CategoryFilterMode](#) — indicates whether messages declared by [\[Debug\]CategoryFilter](#) will be included or excluded from the log.

---

**Note:** By default, the setting for [\[Debug\]CategoryFilterMode](#) will exclude the categories specified by [\[Debug\]CategoryFilter](#). Be aware that this behavior is different to [\[Debug\]SeverityFilterMode](#), which includes the declared severities by default.

---

Archiving of the tracelog.dat file is enabled or disabled by the parameter [\[Debug\]ArchiveFiles](#). Archiving occurs once the maximum size specified by [\[Debug\]MaximumFileSize](#) is reached.

A full list of available parameters are listed on the Logging Parameters page of the Computer Setup Editor. From here, you can learn how each parameter will impact system logging, and make adjustments directly into the local Citect.ini file.

Some of the available logging parameters can be updated while your Plant SCADA system is running. For more information, see [Adjust Logging During Runtime](#).

---

**Note:** Logging can cause a strain on system resources. When configuring logging, be aware of the potential impact on normal operation. For example, a large number of traces can affect CPU performance, while log file archiving may use up disk space.

---

## See Also

[Log Files](#)

[The Crash Handler](#)

## Adjust Logging During Runtime

You can modify and query logging settings during runtime using the following Cicode functions:

- [SetLogging](#) - allows you to make changes to the current logging configuration without the need to restart a system that is already running. An optional parameter can be used to persist the settings to the INI file.
- [GetLogging](#) - allows you to view current logging settings.

The parameters you can modify and query include the following:

- [\[CtAPI\]Debug](#)
- [\[Debug\]DriverTrace](#)
- [\[Debug\]SysLogSize](#)

- [Debug]EnableLogging
- [Debug]Priority
- [Debug]CategoryFilterMode
- [Debug]CategoryFilter
- [Debug]SeverityFilterMode
- [Debug]SeverityFilter
- [Debug]LogShutdown
- [Debug]DebugAllTrans
- [IOServer]RedundancyDebug
- [General]Verbose
- [General]VerboseToSysLog

There is also a subset of the logging related INI parameters that can be modified online within the Citect.ini file, as the system will read their values periodically or on demand. The parameters you can modify in this way include the following:

- [PubSub]LogLevel
- [PubSub]LogDevice
- [General]ShowDriverError
- [Debug]SysLogArchive
- [Dial]Debug
- [Trend]TrendDebug

The parameters that support this functionality are identified on the Logging Settings page of the Computer Setup Editor.

## See Also

- [Log Files](#)
- [The Crash Handler](#)

## The Crash Handler

The Crash Handler can be used to help determine the cause of an unexpected program shut down.

If Plant SCADA suffers an unexpected shut down, the Crash Handler will create a compressed file containing a number of log and data files that may be useful in determining the cause. These files include:

- syslog.dat
- Citect.ini
- tracelog.dat
- kernel.dat
- params.dat

- reloadlog.dat
- debug.log
- user.dmp (see below)

In a multi-process system, these files may use extended names, for example:

syslog.IOServer.Cluster1.dat

You can configure Plant SCADA to save the Crash Handler zip file to the local Logs directory. If an unexpected shut down occurs, the path to the saved zip file will be recorded in the syslog.dat.

These features are not enabled by default; to enable and configure the Crash Handler you need to set the [CrashHandler Parameters](#).

---

**Note:** AVEVA may use the information included in an unexpected shutdown email to help resolve problems in future releases, but it cannot reply or follow up a problem with users directly. To discuss these, contact Technical Support.

---

## Configure User.dmp

User.dmp is a configurable file that logs exception details. When an unexpected shut down occurs, it captures objects and their variables in memory in a process referred to as a "mini-dump". This dump file can be analyzed by Technical Support.

The information included in this process is adjustable via the parameter [\[Debug\]MiniDumpType](#). It supports a "light" mini-dump (with local stack information for unmanaged code) through to a "heavy" dump (the default setting) which includes accessible memory for a process and thread information. You can also switch the mini-dump off.

To reduce the amount of disk space used by a dump file, it is compressed after it is created (along with other log files) into one of the following zip files:

- Citect32Exception\_[timestamp].zip (32-bit process)
- CitectException\_[timestamp].zip (64-bit process)

To help manage the amount of disk space used by this process, you can adjust the number of zip files that are stored using [\[Debug\]MaxMiniDumps](#).

You can also raise a hardware alarm to warn when disk space on the drive where these files are stored falls below a specified minimum amount using [\[Debug\]LogsDriveMinimumFreeSpace](#).

## See Also

[Log Files](#)

## Debug Runtime

Debugging Plant SCADA's runtime system involves two processes:

- Gathering information about Runtime
- Analyzing logged data to identify problems.

The information gathered from your system will include:

- Hardware alarms
- Log files.

Hardware alarms are typically displayed on a dedicated alarm page to alert operators to current problems.

[Log Files](#) are a record of time-stamped system data that can be analyzed to determine the cause of a problem.

This information can be analyzed directly to identify problems, or you can use the Plant SCADA Kernel to perform advanced debugging.

[The Kernel](#) can perform low-level diagnostic and debugging operations, and runtime analysis of your Plant SCADA system. Use it to display low-level data structures, runtime databases, statistics, debug traces, network traffic, I/O device traffic and so on.

You can also call built-in Cicode function or user-written Cicode functions, and use the Cicode Profiler to view how your Cicode is performing.

---

**Note:** The process involved in debugging device communications is described in the *Communicating With I/O Devices* section of the help. See [Troubleshooting Device Communications](#).

---

## See Also

[System Tuning](#)

## The Kernel

You use the Plant SCADA kernel to perform low-level diagnostic and debugging operations, and for runtime analysis of your Plant SCADA system. Use it to display low-level data structures, runtime databases, statistics, debug traces, network traffic, I/O device traffic and so on. You can also call built-in Cicode functions or user-written Cicode functions.

The Kernel includes the following areas:

- **General** - presents statistics and information on the overall performance of Plant SCADA. For example, this page shows memory usage, summaries of protocol and I/O Device statistics, as well as CPU usage. Access this by using the Page General command.
- **Table** - displays information about Plant SCADA runtime data structures. This area is extensive and is initially difficult to navigate. However, Page Table Stats is insightful. Access this by using the Page Table command.
- **Drivers** - displays statistics and information about the individual protocols running on the I/O Server. Each individual port has its own page of information. Access this by using the Page Driver command.
- **I/O Devices** - similar to the driver information, this shows specific statistics and information about each I/O Device. Access this by using the Page Unit command.

---

**Note:** You need to restrict access to the Kernel: anyone using the Kernel has total control of Plant SCADA (and subsequently your plant and equipment).

---

## ⚠ WARNING

### UNINTENDED EQUIPMENT OPERATION

- Do not use the kernel for normal Plant SCADA operation. The kernel is only for diagnostics and debugging purposes.
- Configure your security so that only approved personnel can view or use the kernel.
- Do not view or use the kernel unless you are an expert user of Plant SCADA and Cicode, or are under the direct guidance of Technical Support for this product.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

### Access to Cicode and Cache commands

So that there is no unauthorized use of Cicode and Cache commands, users who access the Kernel need to be assigned to a **Role** that has the **Kernel Access** property set to "Full Access" otherwise they will not be able to execute these commands.

**Note:** If you change the **Kernel Access** setting for a Role and run the recompiled project, you will need to restart any server processes that you want to run the Kernel on.

See [Display the Kernel Window](#) for instructions on how to enable access to the Kernel.

### See Also

[Inside the Kernel](#)

[Kernel Commands](#)

### Display the Kernel Window

You can display the Kernel window in the following ways.

- Plant SCADA can provide a command option on the **Control** menu (see [Display the Kernel from the Control Menu](#)).
- You can define a runtime command to display the Kernel window when necessary (see [Define a Runtime Command](#)).
- You can launch the Kernel for a selected process from Runtime Manager (see [Use the Kernel with a Selected Process](#)).

To display the Kernel window for a display client, the user that is currently logged in now needs to be assigned to a **Role** that has the **Kernel Access** property set to "Full Access" or "Read Only". A Read Only user can access the Kernel, but cannot perform some privileged commands like running Cicode.

To display the Kernel window for a server process (including when [Running the System as a Windows Service](#)), you will need to log in using a dialog that is displayed when the Kernel window is launched.

You will need to enter a user that is assigned to a Role that has the **Kernel Access** property set to "Full Access" or "Read Only".

**Note:** After commissioning a system, it is recommended that you review the **Kernel Access** setting for each Role.

---

This will avoid accidental or unauthorized use of the Kernel.

---

## See Also

[Close the Kernel Window](#)

[The Kernel](#)

### Display the Kernel from the Control Menu

To add a **Kernel** option to the control menu of a display client, the Citect.ini parameter [\[Debug\]Menu](#) needs to be set to 1. By default, this parameter is set to zero (0).

You can also run the Setup Wizard, select **Custom** mode, and select the **Kernel on menu** option on the [Control Menu Security Configuration](#) page.

You can then display the Kernel window by selecting the Kernel option from the Control Menu (top-left corner) at runtime.

---

**Note:** The menu option will not be available if the logged in user is not assigned to a [Role](#) that has the **Kernel Access** property set to "Full Access" or "Read Only".

---

If you do not have a title bar displayed, you can access the Control Menu by pressing ALT-SPACE (verify that the **Alt-Space enabled** option is selected on the [Keyboard Security Configuration](#) page of the Setup Wizard).

## See Also

[Display the Kernel Window](#)

[Close the Kernel Window](#)

### Define a Runtime Command

To display the Kernel window, define a runtime command that calls the [DspKernel](#) function, passing 1 in the **iMode** argument. For example:

Command	DspKernel(1);
Comment	Displays (opens) the Kernel window

---

**Note:** The Kernel will not display if the logged in user is not assigned to a [Role](#) that has the **Kernel Access** property set to "Full Access" or "Read Only".

---

To close the Kernel window, call the DspKernel() function again, passing 0 in the **iMode** argument:

Command	DspKernel(0);
Comment	Closes the Kernel window

## See Also

[Display the Kernel Window](#)

## [Close the Kernel Window](#)

### **Close the Kernel Window**

You can close the Kernel window in the following ways:

- Select **File | Exit** from the main menu
- Select **Close** from the control menu
- Click the X button in the top-right corner of the main Kernel window.

### **See Also**

[Display the Kernel Window](#)

[Inside the Kernel](#)

### **Inside the Kernel**

When displayed, the Plant SCADA Kernel consists of a top-level window that contains several child windows:

- A **Main** window that displays diagnostic messages
- A **Shell** window for executing commands
- Additional windows opened in response to entered commands.

At startup, the **Main** window displays information about your Plant SCADA startup processes. The Main window also displays runtime system messages, providing a continuous operational history of your Plant SCADA system.

The **Shell** window contains a command line interface (similar to the Command prompt) where you can type in Kernel commands to perform a Kernel operation or to display other child windows.

---

**Note:** Access to the Cache and Cicode Kernel commands is restricted to specific users for security. For details, see the section *Access to Cicode and Cache Commands* in the topic [The Kernel](#).

If Plant SCADA runtime is configured to use multiple client or server processes, each process will have a separate Kernel window that displays specific system messages. For example, system messages related to a trend server process will appear in the Trend window in the Kernel.

For a default configuration, the Main window displays the following messages:

- **Initializing Sub Systems** - The primary parts of Plant SCADA are getting started.
- **Initializing Font System** - Creating fonts that have been defined within Plant SCADA. These are fonts used for displaying items such as alarms, and pre-V5.0 dynamic text.
- **Initializing Client System.**
- **Starting IO Server** - Only visible if the Plant SCADA computer is an I/O Server. If the computer is an I/O Server and this message does not display, the computer is improperly set up: run the Setup Wizard to check your configuration. **IO Server Started** - The server has started and is functioning correctly.
  - **Initializing I/O Server** - Starting to check what is necessary for the I/O Server to work, and initializing any cards that are necessary.
  - On a Client, these messages will be replaced with **Calling '<I/O Server>' Connected**.

- **Initializing Cicode System** - Cicode has been loaded into memory, and is prepared to run.
  - **Initializing com System** - Checking that ports and hardware are responding and functioning correctly.
  - **Initializing Request System** - The system that handles requests from the Client part of Plant SCADA to the Server parts of Plant SCADA.
  - **Initializing Trend Client System** - The Trend Client is slightly different than the normal client, so it needs separate initialization.
  - **Starting Trends Server** - You will only see these messages if the Plant SCADA computer is a Trends Server. If the computer is a Trends Server, and these messages do not display, most likely the computer is improperly set up. run the Setup Wizard to check your configuration.
    - **Trend Startup** - Plant SCADA is checking for the trend files, and making new ones if they can't be found.
    - **Initializing Trend Acq System** - Every trend you define has its own sample rate. Here Plant SCADA is setting up the system so it can poll the data at the correct rate for each trend pen.
- On a Client, these messages will be replaced with **Calling '<Trends Server>' Connected**.
- **Initializing Alarm System**.
  - **Loading Alarm Databases** - You will only see these messages if the Plant SCADA computer is an alarms server. This is loading alarm data into memory. If the computer is an alarms server, and these messages do not display, most likely the computer is improperly set up. run the Setup Wizard to check your configuration.
  - **Open Alarm Save File**

#### Loading Alarm Save File

**Alarm Save File Loaded** - Plant SCADA gets the alarm save file (that was created in the specified directory), and examines it in order to see the status of existing alarms. If you have a redundant alarms server, then this alarms server will interrogate the other instead of using the alarm save file - since the information on the other server will be newer than any file.

**Starting Alarm Processing** - The server is now processing (and serving) alarm data.

On a Client, these messages will be replaced with **Calling '<Alarm Server>' Connected**.

- **Initializing Report System**.
- **Starting Reports Server** - You will only see this message if the Plant SCADA computer is a reports server. If the computer is a reports server, and this message does not display, most likely the computer is improperly set up. run the Setup Wizard to check your configuration. On a Client, this message will be replaced with **Calling '<Reports Server>' Connected**.
- **Initializing Page System** - Plant SCADA will now display the Startup Page. At this time Plant SCADA will cover up the Kernel if it is displayed.
- **Initializing Functions** - Executing any Cicode functions that have been defined as running at start up.

The next line of information is the start up time and Plant SCADA version number.

- **Channel PORT# is Online**

#### Channel PORT# is Online

**Channel PORT# is Online** - You will only see these messages if the Plant SCADA computer is an I/O Server. These are messages telling you that any ports you have defined in the I/O Server have come online. If you get a messages saying that the port is not online, or could not be opened, check the configuration of your project. PORT# is the Port Name specified in the Ports form.

- **Unit 'UNIT#' Port PORT# is Online**

### Unit 'UNIT#' Port PORT# is Online

**Unit 'UNIT#' Port PORT# is Online** - Only visible if the Plant SCADA computer is an I/O Server. This indicates that the I/O Device with the Unit Number of UNIT# (as defined in the I/O Devices form), is connected to port PORT# .

- **Communication System Online** - Plant SCADA has completed startup operations and is now fully operational (running).

[Use the Kernel to Commission a System](#)

### Use the Kernel to Commission a System

All systems in Plant SCADA start smoothly. When commissioning a system, check the Kernel. If any element does not initialize properly or reports errors at startup, your Plant SCADA system is not working correctly and requires investigation.

Common causes of startup errors are:

- Incorrect computer setup (usually solved by the Setup Wizard).
- Networking errors or bad hardware.
- Communication errors (usually just a configuration issue).

Use the Main window to check that your I/O devices come online correctly when starting. First the ports need to initialize, then the I/O device itself will come online. When a device does not initialize as expected, Plant SCADA displays a message such as "PLC not responding", "I/O Device Offline" or similar.

Some I/O devices might take two attempts to come online. If so, Plant SCADA waits (usually 30 seconds) and tries again. If the I/O device does not come online after the second attempt, check your configuration (at both ends) and cabling.

---

**Note:** The Kernel continues to report changes in the status of I/O devices to the Main window. This information might also be reported as alarms to the Hardware Alarms page.

---

[Kernel Commands](#)

### The Cicode Profiler

The Cicode Profiler lets you gather information on how Cicode is performing in your project. This information includes the name of the function, the number of times the function was called (including from inside other functions), and the percentage of time the function took up during the profile period.

A high time and percentage value may indicate the Cicode function (and Cicode functions that may also call it) need to be reviewed and optimized.

---

**Note:** Contact Technical Support for assistance with optimizing your Cicode functions and those functions belonging to system include projects.

---

The information is presented in the following:

- A new kernel table, '[Page Table Profile](#)'.
- A CSV file. If in single process mode the file will be called "CicodeProfile.csv". For multi-process mode, the file name will contain the cluster and server name for server processes, for example, "CicodeProfile.Cluster1.TrendServer1.csv".

This file is created when the Profiler is disabled at the end of a profiling session (either through one of the methods for disabling or by shutting down Plant SCADA). This file can be found in the Log directory for the Plant SCADA installation.

To activate the Cicode Profiler, you can do one of the following:

1. Use the 'Profile' Kernel command).
2. Define type 4 when using Cicode function [CodeSetMode](#).
3. Set the INI parameter [\[Code\]ProfilerEnabled](#). Refer to the Parameters help for more information.

[Kernel Commands](#)

## Kernel Commands

Commands are issued at a command line interface (similar to the Windows Command Prompt), from the Shell window. Some commands display their results in the main Kernel window; others open a child window for information display (or for further commands). You can open a maximum of eight windows at once (including the Main and Shell windows).

You can use several keyboard keys to scan and reuse commands from the command history, to speed up the issuing of Kernel commands. (The command history is a list of commands that you have previously issued). These keyboard keys are listed below:

Key	Description
Up arrow	Scans backward through the command history. (Commands are displayed in the command line.)
Down arrow	Scans forward through the command history. (Commands are displayed in the command line.)
F3	Puts the last command you issued in the command line.
Left arrow	Moves the cursor back one character at a time (in the command line).
Right arrow	Moves the cursor forward one character at a time (in the command line).
Delete	Deletes the character to the right of the cursor (in the command line).

Key	Description
Backspace	Deletes the character to the left of the cursor (in the command line).
Insert	Switches from over-strike mode to insert character mode (in the command line).

The table below describes the Kernel commands.

Command	Description
<a href="#">Cache</a>	Changes the cache timeout for each I/O Device.
<a href="#">Cicode</a>	Opens a child window that you can use to call Cicode functions.
<a href="#">Cls</a>	Clears text from the current window (the Shell window or Cicode window). You can also use "Cls Main" to clear text in the main window.
<a href="#">Ctapi</a>	Enables logging of server-side CtAPI debugging information.
<a href="#">Debug</a>	Enables the debugging of raw data transfer between Plant SCADA and a driver.
<a href="#">Diag Cicodestack</a>	Sends a report on the call stacks for all running Cicode to the relevant log file.
<a href="#">DriverTrace</a>	Controls the listing of driver control blocks (DCBs) between the I/O server and drivers.
<a href="#">Exit</a>	Closes a Cicode or Shell window.
<a href="#">Help</a>	Displays a list of the commands available in the Kernel.
<a href="#">Log</a>	Enables or disables the logging of I/O Device reads and writes.
<a href="#">Page General</a>	Displays general statistics information.
<a href="#">Page Driver</a>	Displays information about each driver in the Plant SCADA system.
<a href="#">Page Memory</a>	Displays the memory debug heap.
<a href="#">Page Queue</a>	Displays the queues that are active on the system.
<a href="#">Page RDB</a>	Displays information about Plant SCADA's Runtime Databases.

Command	Description
<a href="#">Page Table</a>	Displays information about Plant SCADA's internal data structures.
<a href="#">Page Unit</a>	Displays information about each I/O Device in the Plant SCADA system.
<a href="#">Pause</a>	Pauses debug output.
<a href="#">Profile</a>	Enter "profile 1" to enable the Cicode Profiler, or "profile 0" to disable it (see <a href="#">The Cicode Profiler</a> ).
<a href="#">Shell</a>	Opens a new command (shell) window. <b>Note:</b> The last shell window cannot be closed.
<a href="#">Stats</a>	Resets system statistics.
<a href="#">Tran</a>	Enables logging for tran activity messages in the syslog.dat file.
<a href="#">Write Log</a>	Sends a customized message to the relevant syslog.dat file.
<a href="#">Write Modules</a>	Lists all the loaded native process modules into the relevant debug.log file.

[The Kernel](#)

[Display the Kernel Window](#)

## Cache

Changes the cache timeout for each I/O Device with which Plant SCADA is communicating.

---

**Note:** To use this command, you need to be running the Kernel under a user account that is assigned to a [Role](#) with the **Kernel Access** property set to "Full Access". For more information, see the section *Access to Cicode and Cache Commands* in the topic [The Kernel](#).

---

## Syntax

**Cache <I/O Device name> <Timeout>**

Where:

- **<I/O Device name>**

Any valid I/O Device defined in the project (using the I/O Devices form), or \* for I/O Devices.

- **<Timeout>**

Timeout in milliseconds, or 0 (zero) to disable timeout.

This command allows you to tune the cache timeout while the I/O Server is communicating with the I/O Devices. If you set the timeout to 0 (zero), the cache is disabled. If you specify a cache timeout for an I/O Device that has the cache disabled, the cache is enabled.

Any changes made to an I/O Device only apply while the I/O Server is running. If you restart the I/O Server, the cache timeout reverts to the value configured in the project. Once you have determined the optimum cache timeout, make the change persistent by setting the value in the I/O Devices form (for the particular I/O Device).

## See Also

[Kernel Commands](#)

[Display the Kernel Window](#)

## Cicode

Opens a child window that you can use to call Cicode functions, on either a local or remote computer. Any built-in or user-written function can be called from this window.

---

**Note:** To use this command, you need to be running the Kernel under a user account that is assigned to a [Role](#) with the **Kernel Access** property set to "Full Access". For more information, see the section *Access to Cicode and Cache Commands* in the topic [The Kernel](#).

---

You do not need to specify all the optional arguments, as the optional arguments will be given runtime defaults (not compiler defaults) as follows:

Data type INT = 0

Data type REAL = 0.0

Data type STRING = ""

## Syntax

**Cicode [<Name>]**

Where:

- **<Name>**

Optionally the name of a Plant SCADA Server (for example, Alarms, Reports, Trends) or a client computer name.

If you enter the Cicode command with no Name argument, a local Cicode window is created. Cicode commands are executed on the local computer.

In a multi-cluster systems when connecting to a server, the following syntax needs to be specified:

<clustername>.<server>

For example, to connect to the Alarm Server on Cluster1, use:

**Cicode Cluster1.Alarm**

If you enter a server or computer name as the Name argument, you can create a Cicode window to the remote server or computer. Cicode commands entered in a remote Cicode window are executed on the remote

computer. For example, to create a Cicode window where commands execute on the Alarm Server, use:

`Cicode Alarm`

If you issue the command from a server, you can create a window to the "MyComputer" computer:

`Cicode MyComputer`

If the remote computer can be found, its name is displayed in the title of the Cicode window, otherwise a local window is created.

---

**Note:**

- Specifying a server name or computer name does not work in a Kernel window operating on a server running in service mode.
- You can only specify a computer name if you are issuing the command on a server. This function only supports client-to-server or server-to-client connections.

---

Each Cicode command is executed with its own Cicode task, so you can start tasks that take a long time to complete. The Cicode prompt returns immediately after the Cicode task has started and the task continues to run in the background. If the function is completed immediately, the return result of the function is displayed. If the function continues to run, the result is not displayed and cannot be returned - the message "Task still running" and the task handle is returned instead.

---

**Note:** Remember that there is no Privilege check on any command issued from this window, so you have full access to the system.

---

The Cicode prompt 0:> shows the current window number with which any object is associated. To change the current window, use the WinGoto() function (or any other Cicode function that affects the current window).

The Cicode window does not recognize any variable names, so when you call a Cicode function, you can only pass constants (for example numbers or strings). When you call a function that expects a string, pass a string constant, for example Prompt("Hello from the Kernel"). If the string is only a single word, you do not have to use delimiters, for example Prompt(Hello). The Cicode window tries to convert whatever you enter (as arguments) into the correct data type. If it cannot convert the arguments, it passes either 0 (zero) or an empty string to the function.

---

**Note:** Some Cicode functions are implemented as label macros by the compiler. These macros allow backward compatibility when the number of arguments to a function has been changed. Because the Cicode window does not expand macros, you cannot call these functions directly. You need to use the macro expansion. If the function you are trying to use cannot be found, try again by adding an underscore (\_) to the front of the function name, for example \_DevClose(1).

---

You can also shut down the Plant SCADA system from this window by using the Shutdown() function.

## See Also

[Kernel Commands](#)

[Display the Kernel Window](#)

## Cls

Clears text from the current window (the Shell window or Cicode window), and moves the cursor to the top left-hand corner.

## Syntax

- **Cls**

Use this command to clear the current window when it has become cluttered (from displaying debug data or too many commands).

Use **Cls Main** to clear the Main window.

## See Also

[Kernel Commands](#)

[Display the Kernel Window](#)

## Ctapi

This command enables logging of server-side CtAPI debugging information for the communication sessions to various CtAPI clients. Output is to the syslog.dat file. This command results in the same outcome as setting the parameter [\[CtAPI\]Debug](#) to 1 (true).

**Note:** This command is designed to assist qualified technical support personnel with system diagnosis.

---

## Syntax

**Ctapi <0 or 1>**

1 = CtAPI logging enabled

0 = CtAPI logging disabled

## See Also

[Kernel Commands](#)

[Display the Kernel Window](#)

## Debug

Enables the debugging of raw data that is transferred between Plant SCADA and a selected driver. Protocol traffic is displayed in the Kernel window and logged to the SysLog.DAT file.

## Syntax

**Debug<Port> <Mode> [<Display>]**

Where:

- **<Port>**  
A port name configured in the project (using the Ports form)
- **<Mode>**

The mode:

- ALL - Trace low-level communication traffic to the Kernel window.
- READ - Trace the low-level communication traffic of read commands to the Kernel window.
- WRITE - Trace the low-level communication traffic of write commands to the Kernel window.
- ERROR - Trace any low-level communication traffic that contains a protocol error. This mode only generates traces when an error is detected, so you can leave this option on for long periods of time (to find difficult problems).
- OFF - Stop the debug trace of any type of command.

**Note:** The TO and FROM modes are now obsolete.

• <Display>

Optionally the display scenario:

- MONO - Send the debug to a monochrome monitor (if one is attached) as well as the Kernel.
- MONOONLY - Send the debug to the monochrome monitor only.

To place a port in debug mode, enter DEBUG followed by the port name and the mode you require. If you do not know the name of the port, enter DEBUG (without any arguments), and Plant SCADA displays a list of available ports.

Only the I/O Server communicates with the I/O Devices, so this command is generally used only on the I/O Server.

When you enable a debug trace mode, Plant SCADA displays protocol traffic in the Kernel window and logs it to the SysLog.DAT file. This tends to reduce Plant SCADA's performance (as there may be a lot of data), and therefore not enable debug trace on an I/O Server that is important to your current operation. Use this command only during commissioning or on a non-vital section. Excessive use of this command may cause the I/O Device to go offline.

## **WARNING**

### **UNINTENDED EQUIPMENT OPERATION**

Do not enable or use the Debug Trace mode in an operational environment. This mode is only for use during commissioning.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

When the debug trace is sent to a Monochrome monitor, it is displayed directly from the interrupt routine of the driver and therefore at a much faster rate. This trace (if MONOONLY is used) causes less CPU overload of Plant SCADA while the trace is active, and provides instantaneous output. This method is useful if you are developing your own driver and your driver crashes before the debug trace is displayed in the Kernel.

You can use the [Shell](#) command to create an extra command window while the trace is active. This allows you to enter more commands (in the new window).

You can use the [Pause](#) command to stop the debug output (to view the data).

## Diag Cicodestack

This command sends a report on the call stacks for all running Cicode to the relevant debug.log file.

## Syntax

### Diag Cicodestack

## See Also

[Kernel Commands](#)

[Display the Kernel Window](#)

## DriverTrace

Controls the listing of driver control blocks (DCBs) between the I/O server and drivers. It can be useful in debugging a driver, for example, it can help determine why a driver is unable to fully initialize.

This command supports the same functionality as the Citect.ini parameter [\[Debug\]DriverTrace](#), though the traces can be applied dynamically during a session. The Kernel command also provides an additional DUMP option when running on an I/O server (see below).

**Note:** Running syslog traces can draw heavily on a CPU usage. monitor the impact on CPU performance when implementing a large number of traces.

## Syntax

**DriverTrace** [OFF|CMDS|VER[BOSE]|ERR[OR]|PORT=<name>|MASK=<xxxxxxxx>|DUMP]

Where:

- **blank**

Returns the current DriverTrace settings. This can be useful to determine the current mask or port settings before implementing a new trace. Just key DriverTrace into the Kernel and hit the return key to view the current settings.

- **OFF**

Turns the DriverTrace off.

- **CMDS**

Turns the DriverTrace on, but does not display the contents of the data buffer.

**Note:** Specific driver commands need to be enabled with the Kernel command DriverTrace[Mask], or the DriverTraceMask INI parameter.

- **VER[BOSE]**

Turns the DriverTrace on, and displays the contents of the data buffer.

**Note:** Specific driver commands need to be enabled with the Kernel command DriverTrace[Mask], or the DriverTraceMask INI parameter.

- **ERR[OR]**

Turns the DriverTrace on, but only traces DCBs with errors (DCBs are the internal data structures used for communication between the I/O server and a driver).

- **PORT**

Allows traces to be limited to a particular driver port, by defining a port name. The default setting, PORT=\*, will trace all ports.

- **MASK**

A 4-byte hexadecimal number that represents a bit mask used to either include or exclude driver commands from the DriverTrace. The driver commands and their values are as follows:

Command	Bit Position
CTDRV_INIT	00000001
CTDRV_OPEN	00000002
CTDRV_INIT_CHANNEL	00000004
CTDRV_INIT_UNIT	00000008
CTDRV_READ	00000010
CTDRV_WRITE	00000020
CTDRV_CONVERT	00000040
CTDRV_CANCEL	00000080
CTDRV_CPU	00000100
CTDRV_DATABASE	00000200
CTDRV_STOP_UNIT	00000400
CTDRV_STOP_CHANNEL	00000800
CTDRV_CLOSE	00001000
CTDRV_FORMAT	00002000
CTDRV_STATS	00004000
CTDRV_DEBUG	00008000
CTDRV_INFO	00010000
CTDRV_STATUS_UNIT	00020000
CTDRV_INIT_CARD	00040000
CTDRV_UPDATE_INFO	00080000

Command	Bit Position
CTDRV_UI_READ	00100000
CTDRV_UI_WRITE	00200000
CTDRV_EXIT	00400000
CTDRV_UNITACTIVATES	01000000
CTDRV_SUBSCRIPTIONS	02000000
CTDRV_EVENTUPDATES	04000000
CTDRV_STATUS_DISCONNECT	40000000

For example, the value you would use to include only the CTDRV\_OPEN, CTDRV\_INIT\_UNIT and CTDRV\_READ commands would be: 0000001A.

Most users will want to exclude the CPU function call, as this happens often. Do this by setting a mask of 7fffffeff. The default <mask> is 7FFFFFFF.

- **DUMP**

Sends a list to the I/O server's syslog.dat file that provides a snapshot of the driver control blocks (DCBs) in the various I/O server queues.

## Examples

```
-> 07f96fdc Cmd: 03 CTDRV_INIT_UNIT ,MOCKOPC, Port: PORT1, Unit: IODev1
(UR0,N1)
| 07f96fdc UnitType: 0 (0x0), UnitAddr: 0 (0x0), BitWidth: 1, UnitCount: 16
<-07f96fdc Cmd: 03 CTDRV_INIT_UNIT ErrDriver 23 (0x17) and took 0ms
-> 07ff1584 Cmd: 04 CTDRV_READ ,DISKDRV, Port: DISKDRV, Unit: IODevDisk
(UR1,N2)
| 07ff1584 UnitType: 1 (0x1), UnitAddr: 1 (0x1), BitWidth: 16, UnitCount: 5,
RawType: INTEGER
<+07ff1584 Cmd: 04 CTDRV_READ ErrDriver 0 (0x0) and took 0ms
<+07ff1584 UnitType: 1 (0x1), UnitAddr: 1 (0x1), BitWidth: 16, UnitCount: 5,
RawType: INTEGER
<+07ff1584 000: 1 0 0 0 5
~> 00000000 Cmd: 25 CTDRV_SUBSCRIBE ,MOCKOPC, Port: PORT1, Unit: IODev1
(UR0,N1)
>-00000000 SUBSCRIBE Tag=Tag4 UpdateRate=500ms
~< 000003e9 Cmd: 26 CTDRV_EVENTUPDATES,MOCKOPC, Port: PORT1, Unit: IODev1
(UR0,N1)
<-000003e9 DS Event UPDATE_MODE=ALL Tag=Tag4 RawValue=0x00
Timestamp=<time_not_set> RawQual=0x0000 DSError=0 (0x0)
```

Explanation of arrows used above

-> Flags information going down to the driver

|

<- Flags information back from the driver straight away

<+ Flags information back from the driver asynchronously (i.e. after some small time delay)

~> Flags subscription based calls into the driver

>-

~< Flags subscription based updated from the driver

<-

#### (URx,Ny) addition to UNIT and Data driver traces

UR stands for Unit Record number and is 0 based, so a value of 3 would be the 4th device in the IODevice settings. N stands for the (Network) Number in the IODevice settings. The use of this is to distinguish between redundant units which may use the same unit name. Thus the trace will positively confirm which unit is in use.

## Syntax

[Page General](#)

### General Statistics

Alarm DB Status	The status of the alarm database within the current Plant SCADA process. The status can be one of the following: <ul style="list-style-type: none"><li>• Initializing - the alarm database is initializing.</li><li>• Main - the alarm database is running as a main node.</li><li>• Standby - the alarm database is running as a standby node.</li><li>• Invalid - the alarm database encounters an invalid runtime condition. For example, a connection interruption.</li><li>• Shutdown - the alarm database is shutting down.</li></ul>
Server Name	The server name of this computer or, if it is a client, the name of the primary server this client talks to.
Node Name	The computer name of this computer. You can set this through the Setup Wizard. This is only used if you have Plant SCADA in a networking configuration.

Time	The (current) time of day and the date.
CPU Index	An indication of the performance of the Computer. This number provides a rough indication of the performance of the computer. On a Compaq 486/25M it will be 25.
Running	The total time Plant SCADA has been running
Stat Reset	The time since the Cicode command to reset the statistics was run.
Memory Total	The total amount of free memory (including virtual memory).
Memory Physical	The total amount of free physical memory. The physical RAM that is free on the computer (not including virtual memory).
Memory Resources	The % of free Windows system resources.
Scheduler Cycles	<p>The number of times that the Plant SCADA scheduler is looking for a task to execute. A good indication of how fast the computer can respond to an event. This number depends on the speed of the computer and the CPU resources that Plant SCADA is using.</p> <p>This value is completely different depending on whether you are running 32-bit or 16-bit system. This is because Plant SCADA can use the 32-bit operating system to perform process scheduling, an operation that Plant SCADA needs to perform itself in the 16-bit environment.</p> <p>16-bit: The busier Plant SCADA is, the lower the number. Typical values of 10,000 to 50,000; a highly loaded system may drop to below 1000.</p> <p>32-bit: The busier Plant SCADA is, the higher the number. Typical values of 100 to 1000; a highly loaded system may rise above 5000.</p>
CPU Usage	<p>The percentage of the total available computer processing power that is being used on this computer.</p> <p>As the percentage increases to a high level, the performance of Plant SCADA may level off or become sluggish. If the CPU usage is consistently very high (greater than 70%), there could be a problem with your system or you may be overloading the CPU. For best performance, run your system between 0% and 40%.</p>

Tasks Per Sec	The number of tasks per second that the Plant SCADA scheduler is executing, to show how busy Plant SCADA is. This number will be between 30 and 200 tasks per second. If the computer is an I/O Server, the task number is higher (because each protocol uses many tasks).
Task Late Time	This field indicates how late tasks may be running. Plant SCADA uses a DeltaCheckTask to monitor long running tasks. If tasks are determined to be running later than the current displayed value, then the new value is displayed. If less than the previous time, then the displayed value will be an average of the values. If tasks frequently run late, it is likely that the system is overloaded and it will not be acting on values and information at the right time.
Lost Errors	Plant SCADA keeps track of internal errors in its local error buffers. The Lost Errors counter is incremented when an error is detected and there is no buffer in which to put the alert message. This number should normally be 0 (zero). If this field is incrementing, you may have a problem with your system.

### I/O Server Statistics

The following statistics are only incremented if the computer is configured as an I/O Server:

Read Requests	<p>The first number is the total number of read requests sent to the I/O Server from client Plant SCADA computers, including the local Plant SCADA client. This number continues to increment from 0 (to billions) depending on how fast clients are requesting data and how long the server has been running.</p> <p>The second number is more useful - it records the read requests per second. This value also depends on how fast the clients are requesting data from the I/O Server, and should be between 5 and 400 requests per second</p>
Physical Reads	<p>The first number is the total number of physical reads made to the I/O Devices. Because the I/O Server can optimize the number of read requests made to the I/O Devices, this number is usually smaller than the number of read requests. This number is similar to the read requests and increments forever.</p> <p>The second number is the number of physical reads per second (that the I/O Server is performing). The rate depends on the clients and how fast the server</p>

	can communicate to the I/O Devices (typically 5 to 200).
Blocked Reads	The total number of times a request was made for the same I/O Device address while the I/O Server was already reading that address. The server blocks the two requests together as an optimization.
Digital Reads	The total number of digital points that the I/O Server has read from I/O Devices.
Digital Reads per Sec	The number of digital reads per second that the I/O Server is processing. This provides a general indication of performance. It is dependent on the protocol.
Write Requests	<p>The first number is the total number of write requests sent to the I/O Server from client Plant SCADA computers, including the local Plant SCADA client. The second number is the write requests per second (that the I/O Server is performing).</p> <p>The number of requests depends on the rate at which clients are sending write requests to the I/O Server (typically 0 to 20). If the number of requests continually exceeds 10, then this may be causing performance to decline (usually caused by Cicode performing too many writes to the I/O Devices).</p>
Physical Writes	<p>The first number is the total number of physical writes made to the I/O Devices. Because the I/O Server can optimize the number of write requests made to the I/O Devices, this number is usually smaller than the number of write requests. The second number is the number of physical writes per second (that the I/O Server is performing).</p> <p>The number of writes depends on the rate at which clients are sending write requests to the I/O Server (typically 0 to 20). If the number of requests continually exceeds 10, then this may be causing performance to decline (usually caused by Cicode performing too many writes to the I/O Devices).</p>
Blocked Writes	The total number of times a request was made for the same I/O Device address while the I/O Server was already writing that address. The server blocks the two requests together as an optimization.
Register Reads	The total number of register points that the I/O Server has read from I/O Devices.

Register Reads per Sec	The number of register reads per second that the I/O Server is processing. This provides a general indication of performance. It is dependent on the protocol.
Cache Reads	The number of read requests serviced from the read cache.
Cache Reads(%)	<p>The percentage of reads serviced from the cache. If the cache read % is large, (for example greater than 40%), the I/O Device cache timeout could be set too high. Try reducing the I/O Device cache time to bring the % cache below 40%.</p> <p>The % of read cache depends on the configuration of your Plant SCADA system and the number of clients connected. If you have many clients looking at the same I/O Device data, the cache % may be very high, however this does not usually impact performance. For example, if you have 10 Plant SCADA clients viewing the same page, a cache read of 90% would be acceptable.</p>
Cache Flush	The number of times a cache buffer was flushed because a write request was directed to the same location. When you write to the I/O Device and that address is in the read cache, Plant SCADA flushes the data from the cache. The next time the data is read, it is reloaded from the I/O Device to reflect the new value.
Cache RD Ahead	The number of read-ahead updates made to the cache buffer. When read ahead caching is enabled, the I/O Server will try to read any I/O Device data which is coming close to cache 'timeout' time. The I/O Server will only read this data if the communication channel to the I/O Device is idle - to give higher priority to other read requests.
Cache Buffers	The number of active cache buffers allocated. Each block of data that is read from the I/O Device requires a cache buffer when stored in the cache. The number of cache buffers active at once depends on the dynamic operation of the Plant SCADA computers and their project configurations (typically 0 to 100).
Cache Short	The number of times the cache needed to allocate additional buffers but no buffers were available. When this happens the server cannot cache the data. This does not generate errors but it does lower performance. If this field increments too quickly,

	increase the available memory.
Response Times	<p>The time taken by the I/O Server to process read and write requests (i.e. the time from when a request arrives at the server to when it is sent back to the client). This time depends on the physical response time of the I/O Device and how long the request had to wait in a queue for other requests to be completed. This time increases as the server's loading increases, and is a good indication of the total system response.</p> <p>The average, minimum, and maximum times are displayed. Typical values depend on the I/O Device protocol, however Plant SCADA should have an average response of 500 to 2000 ms. Slower protocols or a heavily loaded system may make the response time higher, but be able to get response times of less than two seconds even for very large systems.</p>

**Licensing Statistics**

Points	The maximum number of I/O points that can exist in your Plant SCADA system. The combined Static and Dynamic count cannot exceed this number. The point limit is part of the Plant SCADA software protection, and is programmed into your license.
Max Full	The maximum number of fully functional Plant SCADA computers (full server licenses) that can exist in your Plant SCADA system. This number is part of the Plant SCADA software protection, and is programmed into your license.
Current Full	The current number of fully functional Plant SCADA computers (full server licenses) that are running in your Plant SCADA system.
Peak Full	The peak number of fully functional Plant SCADA computers (full server licenses) that your Plant SCADA system has experienced since it was re-started.
Max Mngr	The maximum number of View-only Clients that can exist in your Plant SCADA system. This number is part of the Plant SCADA software protection, and is programmed into your license.
Current Mngr	The current number of View-only Clients that are running in your Plant SCADA system.
Peak Mngr	The peak number of View-only Clients that your Plant SCADA system has experienced since it was re-started.

Max Dsp	The maximum number of Display-only Clients that can exist in your Plant SCADA system. This number is part of the Plant SCADA software protection, and is programmed into your license.
Current Dsp	The current number of Display-only Clients that are running in your Plant SCADA system.
Peak Dsp	The peak number of Display-only Clients that your Plant SCADA system has experienced since it was re-started.

[Kernel Commands](#)

[Display the Kernel Window](#)

## Page Driver

Displays information about each driver in the Plant SCADA system. This window is only displayed if the Plant SCADA computer is configured as an I/O Server with physical I/O Devices attached.

## Syntax

### Page Driver

Use Page Up and Page Down keys to scan the driver list.

### Driver Statistics

Port Name	The name of the physical port the driver is using for communication.
Protocol	The name of the protocol.
Title	The protocol title and version string. Protocol drivers for Plant SCADA Versions 3.xx, 4.xx, and 5.xx, are Version 2.0 type drivers.
Read Requests	The first number is the total number of read requests sent to the driver from every client Plant SCADA computer, including the local Plant SCADA client. The second number is the read requests per second (that the I/O Server is performing).
Physical Reads	The first number is the total number of physical reads made to the I/O Devices. Because the I/O Server can optimize the number of read requests made to the I/O Devices, this number is usually smaller than the

	number of read requests. The second number is the number of physical reads per second (that the I/O Server is performing).
Blocked Reads	The total number of times a request was made for the same I/O Device address while the driver was already reading or about to read that address. The driver blocks the two requests together as an optimization.
Digital Reads	The total number of digital points that the I/O Server has read from every I/O Device.
Digital Reads per Sec	The number of digital reads per second that the I/O Server is processing. This provides a general indication of performance. It is dependent on the protocol.
Write Requests	The first number is the total number of write requests sent to the driver from every client Plant SCADA computer, including the local Plant SCADA client. The second number is the write requests per second (that the I/O Server is performing).
Physical Writes	The first number is the total number of physical writes made to the I/O Devices. Because the I/O Server can optimize the number of write requests made to the I/O Devices, this number is usually smaller than the number of write requests. The second number is the number of physical writes per second (that the I/O Server is performing).
Blocked Writes	The total number of times a request was made for the same I/O Device address while the driver was already writing that address. The driver blocks the two requests together as an optimization.
Register Reads	The total number of register points that the I/O Server has read from every I/O Device.
Register Reads per Sec	The number of register reads per second that the I/O Server is processing. This provides a general indication of performance. It is dependent on the protocol.
Cache Reads	The number of read requests serviced from the read cache.
Cache Reads(%)	The percentage of reads serviced from the cache. If the cache read % is large (for example greater than 40%), the I/O Device cache timeout could be set too high. Try reducing the I/O Device cache time to bring

	<p>the % cache below 40%.</p> <p>The % of read cache depends on the configuration of your Plant SCADA system and the number of clients connected. If you have many clients looking at the same I/O Device data, the cache % may be very high, however this does not cause a problem. For example, if you have 10 Plant SCADA clients viewing the same page, a cache read of 90% would be acceptable.</p>
Error Count	The total number of errors encountered by the driver.
Short buffers	The number of times the server needed a buffer for the driver but none were available. This can reduce communication performance and result in loss of requests. Increase available memory if this field increments too quickly (that is, more than 10 per minute).
Driver Errors	The number of low-level driver errors encountered before retries were performed. This field may continue to increment even if no errors are reported because the driver retries and it may complete the command on the second attempt. If this field increments quickly (i.e. 10 or more per minute) without other errors being reported, you may have a low-level error that affects performance.
Out of Buffers	The number of times the driver requires a buffer but none were available. The driver needs to discard the data. If this field increments too quickly, increase the number of pending commands the driver can process. This field only increments with client drivers. I/O Device drivers do not require pending buffers.
Time Outs	The number of timeouts encountered by the driver during operations. This field may continue to increment with no visual errors as the driver retries the operation. If this field increments excessively, there may be a communication problem.
Retries	The number of retries executed by the driver. If this field is incrementing, there may be a communication problem.
Maximum Pending Commands	This is the number of requests that are kept in a buffer waiting to be serviced by the protocol. There is a pre defined default value for this for every protocol. If a protocol is capable of handling multiple requests or commands at a time then this number may be high. If

	<p>the protocol is capable of only handling 1 command at a time then this will probably be 1 or 2.</p>
Blocking Size (Bytes)	<p>This is the range that the I/O Driver will use when blocking read or write requests together at runtime. The default value for this is typically set after quite a lot of experimentation. The value is calculated as the optimum range of data that the I/O Device can respond to, to get the fastest response times from your I/O Device.</p> <p>For example, if the Blocking Size is 100 and you have a graphics page that has Address1 and Address 99 on it, Plant SCADA will read both of these addresses in one request. If you have Address 1 and Address 101 on the page Plant SCADA will issue 2 separate read requests. The block size may not be the maximum packet size for the protocol, since a particular type of I/O Device may respond faster to smaller requests of data than larger requests.</p> <p>There is one important consideration when using this method; many I/O Devices need to have their Memory tables created by the user. If the user does not define every memory address in a range, then Plant SCADA may try and read a block of memory from the I/O Device that does not exist (giving a hardware alarm). This is because Plant SCADA will ask for the whole range of addresses between the starting address and the ending address. So, if in our previous example the I/O Device did not have address 76, it would report back to Plant SCADA that it could not read address 76. The I/O Driver does not know that it doesn't need this address and will retry the command, and in some cases will eventually put the I/O Device offline.</p> <p>Confirm that you always have defined the memory addresses that Plant SCADA will need to read.</p>
Timeout Period (ms)	<p>This is the period of time that the I/O Driver will wait before re-requesting data, if no answer comes from the I/O Device.</p>
Maximum Retries	<p>The number of times the I/O Driver will attempt to get data from the I/O Device.</p> <p>Combining this with Timeout gives you the total period before Plant SCADA will put an I/O Device offline.</p> <p>If the Timeout=2000 and Retry=2 then Plant SCADA</p>

	will wait 2 seconds for a response, then retry, wait 2 seconds, retry, wait 2 seconds, Offline. Total time between losing communications and deciding it is offline is now 6 seconds. You can modify these parameters, but if you set them too low you will generate unneeded retries and possibly get I/O Device Offline messages.
Poll Time (ms)	This is the time in milliseconds that Plant SCADA will check the port for data or write data to the port. If this is 0 then the protocol is operating in Interrupt mode.
Transmit Delay (ms)	This is the time that Plant SCADA will hold a packet of data between receiving a response from the last request and sending the new request. This is usually 0, however some protocols can become saturated and start to misbehave. In these cases the default value has been calculated while the protocol was being tested, and modifying this value to something smaller will cause problems. However, making it bigger will only have a very slight impact on the overall response times in your system, but may make the communications more stable.
Watchtime (seconds)	This is the period of time that Plant SCADA will wait after deciding an I/O Device is offline before trying to re-establish communications. This is typically 30 seconds. It can be made smaller but not be made smaller than the period that Timeout and Retry will be - otherwise you will not be able to re-establish communications with an I/O Device.
Response Times	The time taken by the driver to process read and write requests (i.e. the time taken to process a single read or write operation to the I/O Device). This time depends only on the physical response time of the I/O Device, because no queue waiting time is included. This field reflects any tuning of the communication channel (for example increasing the baud rate will reduce the response time).  The average, minimum and maximum times are displayed.
Channel Usage	This field displays the percentage of the total capacity of the hardware channel that is currently being used. The I/O Server tries to keep the utilization as high as possible, however if the client Plant SCADA computers are requesting data slower than the channel can supply, the total will be below 100%. It is possible for

	the channel usage to rise above 100% as some I/O Device drivers can process more than one command at the same time (having two or more commands using the channel at the same time).
Bytes Per Second	The number of bytes transferred (each second) by the driver. This number provides a simple performance indication that is useful when tuning the driver.
Special Variables	By enabling verbose mode (press V) or by pressing the down arrow, twenty special variables are displayed. The meaning of these variables is driver-specific.

## Page Queue

Queues are the main data structure used in Plant SCADA, and this allows the various queues active on the system to be displayed.

## Syntax

**Page Queue [<Name>]**

Where:

<Name>

The name of a specific queue to display (optional). If the name does not match an existing queue, the first queue is shown.

To view the different queues, press the page up and page down keys.

On each page, the handle of the queue being viewed, its name, and its length is displayed. The number of queues and entries within these depends entirely on the custom configuration of Citect32 and the individual project.

Queue formats can vary but several common formats exist.

### **Example**

Queue Sleep

Handle 5 Length 49

	Name	Hnd	State	Prty	CPU	Min	Max	Avg	Count
U	Anm.Animate	9	sleep	user	0.4	0.000	0.003	0.000	1134
U	Tran.Task.Delay	15	sleep	user	0.0	0.000	0.000	0.000	2231
U	DISKDRV \\ WatchDog	22	sleep	user	0.0	0.000	0.000	0.000	7
U	Alarm.Heart	57	sleep	user	0.0	0.000	0.000	0.000	1
U	Alarm.ServerMoni	69	sleep	user	0.0	0.000	0.000	0.000	3
U	Report.Heart	72	sleep	user	0.0	0.000	0.000	0.000	1
U	Alarm.HardRelease	70	sleep	user	0.0	0.000	0.000	0.000	3
U	Trend.Client	55	sleep	user	0.0	0.000	0.000	0.000	95
U	Spl.Task	45	sleep	user	0.0	0.000	0.000	0.000	96

This is the most common queue type. Column meanings are as follows:

- **Mode (Name hidden):** U for user-space task, and S for system tasks.
- **Name:** The name of the task.
- **Hnd :** The internal handle for the task.
- **State:** The state of the task, it can be one of: Free, Curr, Ready, Sleep, Wait, Susp and Dodgy.
- **Prty:** The priority of the item in the queue. It can be one of; Low, User and High.
- **CPU:** Shows the percentage of CPU time used by this task.

- **Min:** Minimum response time for the task (from statistics).
- **Max:** Maximum response time for the task (from statistics).
- **Avg:** Average response time.
- **Count:** The number of times this task has been run.

## Page RDB

Displays information about each of Plant SCADA's runtime databases (RDBs).

## Syntax

### Page RDB

Use the Page Up and Page Down keys to move between the tables.

The runtime databases contain your compiled project configuration information. There are two types of RDB; resident and non-resident.

Resident databases are loaded at Plant SCADA startup and remain in memory. Examples of resident databases are Alarms, Trends, Reports, and Functions. The names of resident databases start with the underscore character (\_).

Non-resident databases are those that are associated with pages. These databases are loaded (and unloaded) as necessary - when the page is displayed.

Each database is divided into 10 (or so) tables; <name>, TEXT, REQUEST, PIECE, CODE, SCALE, RUN, WRITE, FUNC, SYMB, and <name>.

## Page Table

Contains information about Plant SCADA's runtime data structures. Currently there are about 50 tables of information, most of which are only relevant in specific circumstances.

## Syntax

### Page Table [<Name>]

Where:

<Name>

The name of a specific table to display (optional). If the name does not match an existing table, the first table is shown.

The Table window that appears hosts a number of tables. Use the Page Up and Page Down keys to navigate through the table list. Use Up Arrow and Down Arrow keys to scroll the data for the table that is currently displayed.

The table MASTER\_TABLE displays a list of every table. The following tables are particularly useful:

- [Page Table Accum.ReloadError](#)
- [Page Table Alarm.ReloadError](#)
- [Page Table Broadcast](#)
- [Page Table Cicode](#)
- [Page Table CSAToPSI.Subs](#)
- [Page Table Data.Connection](#)
- [Page Table Data.Recordset](#)
- [Page Table OPCServerConnections](#)
- [Page Table Page](#)
- [Page Table PerformanceCounter](#)
- [Page Table Platform.Sessions](#)
- [Page Table Profile](#)
- [Page Table Report.ReloadError](#)
- [Page Table SQL](#)
- [Page Table Stats](#)
- [Page Table Tran](#)
- [Page Table Trend.ReloadError](#)
- [Page Table Users](#)

## See Also

[Kernel Commands](#)

[Display the Kernel Window](#)

## Page Table Accum.ReloadError

Displays the accumulator records in the runtime system that did not reload properly with the latest server online change.

Field	Description
Name	Record name, truncated after 32 characters
Status	Showing the nature and the status of the record update in the format of

Field	Description
	"[Add   Modify   Delete] ( [succeeded   failed] )"
Time	The time when the record was updated.
Error code	<p>The error code of the record update.</p> <p>A positive value indicates that an issue was detected when updating the record during the latest server online change.</p>

**See Also**[Page Table](#)

## Page Table Alarm.ReloadError

Displays the alarm records in the runtime system that did not reload properly with the latest server online change.

Field	Description
Name	Alarm record name, truncated after 32 characters.
Type	Alarm type, i.e. Digital, Analog, Advanced, Multi-Digital, Time Stamped, TS-Digital or TS-Analog.
Status	Showing the nature and the status of the record update in the format of "[Add   Modify   Delete] ( [succeeded   failed] )"
Time	The time when the record was updated.
Error code	<p>The error code of the record update.</p> <p>A positive value indicates that an issue was detected when updating the record during the latest server online change.</p>
AcqError	<p>The acquisition error code.</p> <p>A positive value indicates that there is an issue with acquiring the alarm tag value from I/O Server.</p>
State	The current state of the alarm.

## See Also

[Page Table](#)

# Page Table Broadcast

Displays the number of broadcasts on a running instance of a client or server.

Field	Description
MsgType	The broadcast message type.
Broadcasts	The number of broadcasts from when the instance started.
BroadcastsLast5Mins	The number of broadcasts in the last 5 minutes.

## See Also

[Page Table](#)

# Page Table Cicode

This table contains a list of Cicode tasks currently running. It contains the task name, handle and running state, as well as some statistics. CPU\_Time is the total time that the task has run for - it is incremented each time the task runs. The CPU is the percentage of total available CPU that the task is using (fast tasks often have 00 CPU).

## See Also

[Page Table](#)

# Page Table CSAtoPSI.Subs

Displays a list of client tag subscriptions. The Page table CSAtoPSI.Subs contains the following columns:

Field	Description
TagName	String representing the tag or tag element.
Handle	The handle for the subscription.
Value	The current value of the tag.
Timestamp	The timestamp of the last change for the tag.

Field	Description
Quality	The quality of the tag value.
ValueChanges	The number of value changes the tag has had.

## See Also

[Page Table](#)

# Page Table Data.Connection

This table displays a list of current database connections. The Page table users contains the following columns:

Field	Description
Dbc	The handle to the connection.
St	The connection state.
Rn	The number of recordsets.
Qn	The number of executed queries.
Min	The min execution time(s).
Avg	The average execution time(s).
Max	The max execution time(s).
Connect	The connection string (shown only in verbose mode).
Select	The last executed query (shown only in verbose mode).

## See Also

[Page Table](#)

# Page Table Data.Recordset

This table displays a list of recordsets. The Page table users contains the following columns:

Field	Description
Rs	The handle to the recordset.
Dbc	The handle to the DB connection object.
IsDev	"is device" flag.
IsDef	"is default" flag.
Col	The number of columns.
Row	The number of rows.
Connect	The connection string (shown only in verbose mode).
Select	The executed query (shown only in verbose mode).

## See Also

[Page Table](#)

# Page Table OPCServerConnections

Displays information about the OPC DA Server.

Field	Description
OPC Handle	This is the handle the OPC server uses to reference a particular OPC connection. This handle can be cross referenced with log file entries.
Index	This is the server object index, which is incremented each time a new client connects.
#Groups	The number of groups created within the OPC server instance. This number includes both active and inactive groups.
#Items	The number of items creates within the OPC server instances. This number is the total of all active/inactive items in all groups.
#Reads	The number of reads that have been requested for items.
#Writes	The number of writes that have been request for items.

Field	Description
#Updates	The number of updates that have been received for subscribed items.

**See Also**[Page Table](#)

## Page Table Page

This table lists the windows currently displayed in the client.

**Note:** This table does not exist if the current process does not have a role of display client.

Field	Description
Window	The window number that can be obtained from the WinNumber() function. Be aware that this is not the same as the window handle, returned from the WndFind() function.
Parent	The window number of its parent.
Child	The first child window number.
Next	The number of next child (sibling) in the child link of its parent.
RdbPage	The handle of page RDB (Plant SCADA Runtime Database).
FPS	The frames attempted to be rendered per second of the window.
Page	The page name.

**See Also**[Page Table](#)

## Page Table PerformanceCounter

Displays the performance counters that are holding an instance in the current Plant SCADA runtime process.

Field	Description
Category	The performance counter category name (omitting the "Citect.Platform." prefix to save space).
Counter	The performance counter name.
Instance	The performance counter instance name (omitting the process signature, i.e. procid: #####).
Value	The current value of the performance counter.
State	The current state of the performance counter, either "Enabled" or "Disabled".

To enable some counters, you need to manually adjust the following parameters:

- [\[Debug\]EnablePSICounters](#)
- [\[Debug\]EnableTaskFrameworkCounters](#)
- [\[Debug\]EnableTransportCounters](#).

In most cases, this will only be required if you are following instructions from Technical Support.

## See Also

[Page Table](#)

# Page Table Platform.Sessions

This table shows a list of platform sessions supporting client/server communications.

There are two modes for viewing the table: Standard and Verbose. The Standard mode shows information for every session in a tabular format. It can be scrolled using the up/down arrow keys, the top row indicates the currently selected session. Extended information for the selected session can be viewed by toggling to Verbose mode by pressing the "v" key. Once in Verbose mode, the selected session can be changed using the Page Up/ Page Down keys.

In standard mode the Platform.Session table contains the following columns:

Field	Description
Name	The name of the session.
Type	This is either: <b>Client</b> - indicates a client session <b>Server</b> - indicates a server session.
Mode	This is either: <b>Named Pipe</b> - local session

Field	Description
	<b>Null</b> - in-proc <b>Host</b> - TCP/IP.
Remote	The remote address if it is a client session.
State	The current state of the session.
Security Info	If a secure TCP/IP session, a combination of the SSL Protocol, Cipher Algorithm and Hash algorithm used. If a secure local session, "Local ACL" is displayed. An in-process session will not show any information.

## See Also

[Page Table](#)

# Page Table Profile

Displays the information generated once.

**Note:** Use the +/- keys to sort the information. The name of the column by which the information is sorted is displayed in uppercase letters. Sort order details (ascending/descending) are mentioned in the table below.

Field	Description
Function / FUNCTION	The name of the function. Built-in functions are identified with "*", for example "AlarmCountEquipment *". Special functions are identified with "@", for example "Page Animation @". When the column title is uppercase, the rows are sorted by this column (ascending).
Called / CALLED	The number of times the function was called during the profiling period. When the column title is uppercase, the rows are sorted by this column (descending).
Incl(s) / INCL(S)	The number of seconds the function was running for during the profiling period. This includes any time spent inside other functions called by this function. When the column title is uppercase, the rows are sorted by this column (descending).
Excl(s) / EXCL(S)	The number of seconds the function was running for during the profiling period. This excludes any time

Field	Description
	spent inside other functions called by this function. When the column title is uppercase, the rows are sorted by this column (descending).
Incl(%)	The time spent in this function as a percentage of the profiling period. This includes any time spent inside other functions called by this function.
Excl(%)	The time spent in this function as a percentage of the profiling period. This excludes any time spent inside other functions called by this function.
Incl(ms)	The time spent in this function divided by the number of times this function is called during the profiling period. This gives an average time per call in milliseconds. This includes any time spent inside other functions called by this function. This value is capped at 9999.999 milliseconds.
Excl(ms)	The time spent in this function divided by the number of times this function is called during the profiling period. This gives an average time per call in milliseconds. This excludes any time spent inside other functions called by this function. This value is capped at 9999.999 milliseconds.

**Note:** The Inclusive values are useful for identifying an area of concern from the top down, but being inclusive, the values contain all time spent (including when the Cicode is dormant). Therefore this needs to be considered when analyzing the data. For background Cicode tasks that run indefinitely, the inclusive figures will likely be high, as the function does not stop running. If the same function is launched in multiple background tasks concurrently, the Incl(%) value will be higher than 100%, as it is being run in parallel.

## See Also

[Page Table](#)

# Page Table Report.ReloadError

Displays the report records in the runtime system that did not reload properly with the latest server online change.

Field	Description
Name	Record name, truncated after 32 characters
Status	Showing the nature and the status of the record

Field	Description
	update in the format of: "[Add   Modify   Delete] ( [succeeded   failed] )"
Time	The time when the record was updated.
Error code	The error code of the record update. A positive value indicates that an issue was detected when updating the record during the latest server online change.

**See Also**[Page Table](#)

## Page Table SQL

This table shows the following details for each SQL connection:

Field	Description
Dbc	The handle to the DB connection object.
Stmt	The handle to the statement.
Fmt	The handle to the format definition.
Connect	The connection string.
Select	The last executed query.
QryActv	Indication that the query is active (set to TRUE between SQLExec and SQLEnd).
TrnActv	Indication that the transaction is active (shown only in verbose mode).

**See Also**[Page Table](#)

## Page Table Stats

This table contains the cycle and execution times of every task that is running in Plant SCADA. The Execution time

is the time taken for the entire task to run. The Cycle time is the time between when a task starts and when it starts again. The CPU is the percentage of total available CPU that the task is using (fast tasks often have 00 CPU).

The Plant SCADA 0 entry is the display task (graphics page updates) for the main window. That is, the total time taken for the Client to request data from the I/O Server, the I/O Server to get the data and send it back to the Client, and the Client to update the display.

---

**Note:** Plant SCADA 0 corresponds to the display task for the main window. Plant SCADA 1 for the first child window, Plant SCADA 2 for the third, and so on.

---

The CodeX entries correspond to Cicode tasks, where X is the handle of the task. You can find out which task corresponds to which handle by viewing Cicode table.

---

**Note:** There will be a Trend Acq entry for every different trend sampling period you have defined in your project.

---

## See Also

[Page Table](#)

## Page Table Tran

This table shows a list of channels of communication between Plant SCADA components. A tran exists between exactly two separate components. A client tran initiates a connection, a server tran waits for a connection. Client and server in this context bears no relation to the type of component that owns the tran.

There are two modes for viewing the tran table: Standard and Verbose. The Standard mode shows information for every tran in a tabular format. It can be scrolled using the up/down arrow keys, the top row indicates the currently selected tran. Extended information for the selected tran can be viewed by toggling to Verbose mode by pressing the "v" key. Once in Verbose mode, the tran to display can be changed using the Page Up/Page Down keys.

In standard mode the tran table contains the following columns:

Field	Description
Name	<p>The name and type of communication channel truncated to 20 characters:</p> <ul style="list-style-type: none"><li>• Client Format: &lt;cluster name&gt;&lt;service name&gt; Examples: Cluster1Alarm, Cluster1Report, Cluster1Trend</li><li>• Server Format: &lt;server name&gt;&lt;cluster name&gt; Examples: AlarmServer1Cluster1, ReportServer1Cluster1, TrendServer1Cluster1</li><li>• Dedicated (Client and Server) Format: @@&lt;cluster name&gt;&lt;server name&gt; Examples: @@Cluster1.AlarmServer1, @@Cluster1.ReportServer1,</li></ul>

Field	Description
	<p>@@Cluster1.TrendServer1</p> <ul style="list-style-type: none"> <li>• Platform (Client and Server) Format: &lt;server name&gt;&lt;cluster name&gt; Examples: AlarmServer1Cluster1, IOServerCluster1</li> </ul>
Node	<p>Either the node to which the tran is connected, or the status of the connection:</p> <ul style="list-style-type: none"> <li>• <b>&lt;call&gt;</b> The client tran is attempting to connect.</li> <li>• <b>&lt;listen&gt;</b> The server tran is waiting to be connected.</li> <li>• <b>&lt;disabled&gt;</b> The tran is currently disabled.</li> <li>• <i>node name</i> The tran has connected and is online. The value is the name of the node/computer to which the tran is connected. This could be the current computer or a different computer depending on the TCP/ IP configuration of the project.</li> </ul>
Type	<p>This is either:</p> <ul style="list-style-type: none"> <li>• <b>Client</b> - indicates a client tran. This tran actively attempts to connect to a server tran.</li> <li>• <b>Server</b> - indicates a server tran. This tran passively waits for a connection attempt from a client tran.</li> <li>• <b>SerRnd</b> - indicates a server-to-server redundant tran. This is the connection between the primary and standby servers when a project is configured for server redundancy.</li> </ul>
Mode	<p>This is either:</p> <ul style="list-style-type: none"> <li>• <b>Local</b> This tran connects two components which exist in the same process. For instance, when Plant SCADA is run in single process mode, every server component runs in the same process as the client. In this case, the connections between these components would be marked as Local.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>• <b>OutPro</b> (Out of Process) This tran either has an established connection or is attempting to establish a connection between two components via TCP/IP. The components exist in different processes. They may exist on the same computer or on different computers.</li> <li>• <b>OutPrD</b> (Out of Process Dedicated) A dedicated connection exists between the client and each server process on a single machine when Plant SCADA is run in multi-process mode. These trans use named pipe connections to verify that a communication path exists between every Plant SCADA component running on one computer regardless of the project's TCP/IP configuration. Dedicated connections do not exist between different computers.</li> <li>• <b>Platfo</b> (Platform Tran) This tran uses the Platform networking module as the transport layer between components. For version 7.0, it is only used to connect to the I/O Server. <b>Note:</b> There are client-side Alarm Server platform trans which will show up in the Tran Table. The server-side Alarm Server platform trans were not necessary or implemented for version 7.0 so these client-side trans will remain in a state of Connecting. They can be ignored.</li> <li>• <b>Remote</b> This server tran is waiting for a connection attempt via TCP/IP. Upon connection, this mode changes to OutPro.</li> </ul>
Hnd	This value represents the handle number in the tran table of the record.
Cnt	<p>This value indicates the number of times the tran has established a connection. Specifically it counts the number of times the tran receives the MSG_OPEN message. This value has no meaning for local trans for which it remains 0.</p> <p>If the number is high, it can indicate that your network is dropping and then re-establishing connections. However, it could also mean that the server has been running for a long time and many clients have started</p>

Field	Description
	and stopped, thereby closing and opening sessions.
Send	This value displays the number of messages that have been sent by the tran.
Rec	This value displays the number of messages that have been received by the tran.
Wait	This value represents the number of times the tran had to wait to get a buffer in order to send a message.
Stack	<p>This value indicates the protocol number. Historically, this incorporated the NetBIOS LanA numbers with the TCP/IP protocol stacks. However, NetBIOS support was removed for version 7.0 while TCP/IP support was enhanced to include redundant Network Interface Cards (NIC).</p> <p>The Stack value displays an index (1-based) which indicates on which redundant IP address the server tran is listening or connected. Its value is only used for out-of-process TCP/IP server trans; it has no meaning for every other tran.</p>
Service	This column displays the type of the service used by the tran (regardless of the tran mode). The valid services are Alarm, IO, Report and Trend.
State	<p>This is the current state of the tran. Valid states are:</p> <ul style="list-style-type: none"> <li>• <b>Online</b> - The tran is online.</li> <li>• <b>Offline</b> - The tran is offline.</li> <li>• <b>Connecting (client trans only)</b> - The client tran is connecting to the listed component.</li> <li>• <b>Disconnecting</b> - The tran is disconnecting from the listed component.</li> <li>• <b>Listening (server trans only)</b> - The server tran is listing to a client tran.</li> <li>• <b>Disabled</b> - The tran connection is disabled.</li> </ul>
Access	<p>This is the current status of the connection. It can be:</p> <ul style="list-style-type: none"> <li>• <b>No Access</b> - This tran connection does not have access to the listed component. This indicates that either the component is not running, or the listed component does not have permissions to access</li> </ul>

Field	Description
	<p>it.</p> <ul style="list-style-type: none"> <li>• <b>Trusted</b>- The tran connection with the listed component has been authenticated using "Server Password".</li> <li>• <b>Authenticated</b> - The tran connection with the listed component has been authenticated using the logged-on user credentials.</li> </ul>
Security Info	<p>Displays the description of the security certificate applied.</p> <p>More information about security is available via <a href="#">Page Table Platform.Sessions</a>.</p>

## Page Table Trend.ReloadError

Displays the alarm records in the runtime system that did not reload properly with the latest server online change.

Field	Description
Name	Trend record name, truncated after 32 characters.
Type	Trend type, i.e. Periodic, Event or Periodic Event.
Status	Showing the nature and the status of the record update in the format of "[Add   Modify   Delete] ( [succeeded   failed] )"
Time	The time when the record was updated.
Error code	The error code of the record update. A positive value indicates that an issue was detected when updating the record during the latest server online change.
AcqError	The acquisition error code. A positive value indicates that there is an issue with acquiring the trend tag value from I/O Server or reading from trend archive.

Field	Description
Archive	The trend archive file name.

# Page Table Users

This table displays a list of users currently logged into the system either locally or remotely. The Page table users contains the following columns:

Field	Description
Name	The user name for a particular user.
Last Login	Time at which user last logged in.
Last Logout	Time at which user last logged out.
Num connected	Number of references, both internal and external.
Default	Indicates whether user is the default user for the Plant SCADA process. Only one user can be a default user.
Logged In	Indicates if user is currently logged in.
Local User	Indicates if user is the local user of the current process. Only one user can be the current processes local user.

[Page Table](#)

## Page Unit

Displays information about I/O devices in a Plant SCADA system. This information is only displayed if the Plant SCADA computer is configured as an I/O server. Only the I/O devices connected to the I/O server are included.

## Syntax

### Page Unit

Use the Page Up and Page Down keys to scan the I/O devices for this I/O server. To view redundant I/O devices on other I/O servers, use Verbose mode.

**I/O Device Information**

Unit	The name of the I/O device defined in the project.
IO Server	The name of the I/O server that is servicing this I/O device.
Comment	A description of the I/O device.
Unit Network No	The I/O device number defined in the project.
PLC Number	The physical I/O device address defined in the project.
Port Name	The communication port to which the I/O device is connected.
Protocol	The protocol used for communication with the I/O device.
Unit Status	<p>The status of the I/O device. Only I/O devices that are serviced by this I/O Server are shown, and their redundant I/O devices if page is shown in Verbose mode.</p> <p>The unit status can be one of the following:</p> <ul style="list-style-type: none"> <li>• RUNNING - Indicates that the communication link with the I/O device is good.</li> <li>• STANDBY - Indicates that the communication link with the I/O device is good, but communication with that I/O device is currently being performed by another port. This port is in standby mode.</li> <li>• STARTING - Indicates that the server is currently establishing a communication link (with the I/O device).</li> <li>• STOPPING - Indicates that the server is currently relinquishing control of the communication link (with the I/O device).</li> <li>• OFFLINE - Indicates that the server cannot establish a communication channel with the I/O device. If a standby port or server is available, Plant SCADA tries to communicate to the I/O device using that port.</li> <li>• REMOTE - Indicates that the status of the I/O device is OK, but it is not currently connected.</li> </ul> <p><b>Note:</b> If running the Kernel on the I/O server, you will get the current status of the I/O device. If running the Kernel on a client elsewhere, you will get the last known status.</p>

Primary	<p>Indicates if the I/O device is configured to be in primary mode.</p> <ul style="list-style-type: none"> <li>• Yes = Primary</li> <li>• No = Standby.</li> </ul> <p>If the I/O device is in primary mode, the server starts a communication channel with the I/O device as soon as the server is activated. If an I/O device is in standby mode, the I/O device remains inactive when the server starts (until a primary I/O device becomes inoperative).</p>
Priority	<p>The relative priority configured for this I/O device. This field is only relevant for redundant I/O devices.</p> <p>The standby I/O device with the highest priority will take over from the primary when required, the next highest priority will take over from that device if required. Be aware that the highest priority will have the lowest priority value.</p>

All of the following fields are not shown when the I/O device is running in Memory Mode.

Generic Error	The last generic error code returned by the driver. Because most protocol drivers have their own special errors, they cannot be recognized by the I/O server. The drivers convert their special errors into generic errors that can be identified by the server.
Error Handle	This field is for internal diagnostics.
Driver Error	The driver-specific error code. Each driver has its own special error codes. Refer to the driver specific errors (for the particular protocol) for an explanation of each of the error codes.
Error Message	The alert message associated with the generic error code.
Error Count	The total number of errors from the I/O device.
Restarts	The number of times the server has tried to establish a connection with the I/O device. This number is normally 1, because the server establishes a connection at startup. If this field displays a number greater than 1, there is a problem with the communication channel.
Response Times	The time taken by the driver to process read and write requests (i.e. the time taken to process a single read

	<p>or write operation to the I/O device). This time depends only on the physical response time of the I/O device, because no queue waiting time is included. This field reflects any tuning of the communication channel (for example doubling the baud rate will half the response time). The average, minimum, and maximum times are displayed.</p> <p><b>Note:</b> One I/O device with a slow response may slow down your entire system. For example, if you have an I/O device with a response of 2000 ms, any pages in your system that use data from that device, will have a minimum update time of 2000 ms.</p>
Cached	This field indicates if the I/O device data is cached. Caching may impact communications with the physical device.
Cache Timeout	If the I/O device is cached, this field displays the cache timeout value. Data is held in the cache for this timeout period before being discarded and re-read from the I/O device. Only read data is cached.
Blocking Constant	The current blocking constant value for this I/O device, as specified in the protocol. This value influences how requested I/O is blocked together.

The following fields are only shown when the I/O device is not in memory mode and configured for scheduled dial-up remote mode.

Dial-up Connection	<p>The status and history of the dial-up connection.</p> <ul style="list-style-type: none"> <li>• SUCCESS - The number of successful dial-up attempts.</li> <li>• FAIL - The number of unsuccessful dial-up attempts.</li> <li>• TOTAL - The total number of dial-up attempts.</li> <li>• NEXT - The time of the next scheduled dial-up attempt.</li> </ul>
Total Connect Time	Accumulated time over all connections.
Average Connect Time	Average time per connection.
Subscription Management	<In Progress>
Unit State	An I/O device can have <n> level redundancy with a Primary and multiple Standbys on one or more I/O servers. The Unit State for a specific I/O device can be

	<p>one of the following:</p> <ul style="list-style-type: none"><li>• GLOBAL ACTIVE - The highest priority redundant online I/O device, across all I/O servers. Be aware that the highest priority will have the lowest priority value.</li><li>• LOCAL ACTIVE - The highest priority redundant online I/O device, on this I/O server.</li><li>• INACTIVE - The I/O device is either offline, or online and not Local Active.</li><li>• FORCE ACTIVE - A Local Active unit forced into operation when receiving subscription requests.</li></ul>
Active Subscriptions	The number of client tag subscriptions serviced for this I/O device.
Poll Reads Total	The accumulated number of poll reads issued to physical device to service tag subscriptions.

[Kernel Commands](#)

[Display the Kernel Window](#)

## Pause

Pauses debug output in the Kernel window.

This is a toggle command. Using it a second time will restart debug output.

## Syntax

**Pause**

## See Also

[Kernel Commands](#)

[Display the Kernel Window](#)

## Shell

Opens a new command (shell) window.

## Syntax

### Shell

You can use shell windows in a similar manner to a Main window. Shell windows are useful for displaying debugging information, or entering commands when the Main window is displaying debug trace data. You can close the shell windows by selecting Close from the window's system icon or with the [Exit](#) command.

## See Also

[Kernel Commands](#)

[Display the Kernel Window](#)

### Stats

Resets system statistics (used in the page general, page drivers, page table (stats), and page I/O Device windows) to 0 (zero).

## Syntax

### Stats

This command allows you to reset the statistics after Plant SCADA has been running for a long time, and therefore provides an indication of the statistics now (instead of an average over the total time that Plant SCADA has been running).

**Note:** Some I/O Server statistics are automatically reset every few minutes.

## See Also

[Kernel Commands](#)

[Display the Kernel Window](#)

### Tran

Enables logging for tran activity messages in the syslog.dat file. Tran refers to a connection between one Plant SCADA server/client component and another. A client tran initiates a connection, a server tran waits for a connection. Client and server in this context bears no relation to the type of component that owns the tran.

This command operates as a toggle. Using it the first time will turn logging on, using it again will turn it off.

You can use [Page Table Tran](#) to view the details for existing trans, including the name and handle.

### LOSS OF CONTROL

It is possible to overload your system if tran logging is used excessively. Do not enable tran logging except on the advice of Technical Support.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

## Syntax

**Tran <Name>**

Or

**Tran <Handle>**

Where:

- <Name> = a component name and type of communication channel (truncated to 20 characters).

For example:

Client

Format: <cluster name><service name>

Examples: Cluster1Alarm, Cluster1Report, Cluster1Trend

Server

Format: <server name><cluster name>

Examples: AlarmServer1Cluster1, ReportServer1Cluster1, TrendServer1Cluster1

Dedicated (Client and Server)

Format: @@<cluster name><server name>

Examples: @@Cluster1.AlarmServer1, @@Cluster1.ReportServer1, @@Cluster1.TrendServer1

Platform (Client and Server)

Format: <server name><cluster name>

Examples: AlarmServer1Cluster1, IOServerCluster1

- <Handle> = a numerical value for a tran available from [Page Table Tran](#).

## See Also

[Kernel Commands](#)

[Display the Kernel Window](#)

## Write Log

This command sends a customized message to the syslog.dat file associated with the current process.

It allows real-time activity to be recorded in a log file. For example, you could add the message "Disconnecting PLC123 now".

## Syntax

**Write Log <Message>**

<Message> = User-defined text.

## See Also

[Kernel Commands](#)

[Display the Kernel Window](#)

## Write Modules

This command lists all the loaded native process modules into the debug.log file associated with the current instance of Plant SCADA.

This information can be used to confirm which DLL versions are being used and their current location (as a path).

For example:

```
(00020000) - (00102FFF) v8.50.0.xxx C:\Program Files (x86)\AVEVA Plant SCADA\Bin\  
Citect32.exe  
(06430000) - (066C8FFF) v8.50.0.xxx C:\Program Files (x86)\AVEVA Plant SCADA\Bin\  
ctEng32.dll
```

## Syntax

**Write Modules** or **Write Mod**

## See Also

[Kernel Commands](#)

[Display the Kernel Window](#)

## System Tuning

Plant SCADA is designed for optimal performance, so it is not necessary for most users to tune their system. However, special circumstances might require that you adjust your system for optimal performance. The Kernel allows you to locate areas that need tuning, and the tuning itself is usually done through parameters. For example, you can improve performance of the client by using the [\[Page\]ScanTime](#) and [\[Alarm\]ScanTime](#) parameters.

## See Also

[Cache Tuning](#)

## Cache Tuning

Tune the cache large enough so that unnecessary reads are not generated, and small enough that old data is not returned while keeping the communication channel busy. If the cache is too large, the communication channel might become idle for a while and so waste its bandwidth. Also if the cache is too large, a Plant SCADA client might start to short cycle on reads request, which will generate unnecessary network or internal traffic load.

Read short cycling occurs when a client requests data from the I/O Server, and the data is returned from the

cache, so it is returned quickly. The client will process the data (display it on screen) then ask for the same data again. If the I/O Server again returns the same data from the cache, the client will process the same data again which is redundant and a waste of CPU and the network (to transmit the request and response). When short cycling starts to occur, the CPU and network loading will rise while the PLC communication traffic will start to fall.

To tune the cache you need to balance the cache time between unnecessary reads and short cycling. The method described below assumes you know how to use the Plant SCADA debugging [The Kernel](#).

1. Turn off unit caching, use the CACHE command in the Kernel so you don't have to re-compile your project.
2. Run one Plant SCADA client only on the network, use the Client in the I/O Server for the test.
3. Display a typical page to generate normal PLC loading for your system.
4. In the Kernel use the STATS command to reset the Plant SCADA statistics.
5. In the Kernel display the page 'PAGE TABLE STATS'. This page shows the cycle and execution time of various Plant SCADA tasks, some of which consume PLC data. The tasks called 'Citect  $n$ ' where  $n$  is a number are the tasks which get data from the PLC and display on screen. Look at the Avg Cycle time, this is the third column from the left. Assume that the Avg cycle time is 1200 ms. This will mean that the current page is gathering PLC data and displaying its data on the screen in 1200 ms.
6. Always set the cache time below this average cycle time to minimize short cycling. On average set it to less than half this time, that is 600 ms.
7. Set the cache time to half the cycle time (600 ms). You might not see any improvement in performance with a single client, as caching will only improve performance with multiple clients. You might see improvements if you are also running trends, alarms or reports which are requesting the same data.
8. Add another Plant SCADA client that is displaying the same data. Reset the STATS and check the Average cycle time. Each new client will not increase the cycle time, it will drop slightly. Also look at PAGE GENERAL, to see that each new client services its reads from the cache; i.e., the % cache reads increases.
9. If the average cycle time drops to less than half the original time then short cycling is occurring and you need to decrease the cache time until this stops.

Tuning the cache is a trial and error process - as you change it, the read cycle time will also change. The cache time will also depend on what the current PLC traffic is. The current traffic is dynamic as Plant SCADA will only read what is needed depending on the current page, trend, alarm and reports running. Monitor the average cycle time under lower loading conditions and set the cache as low as necessary to stop or help prevent short cycling.

## Log Viewer

The Log Viewer allows you to view logged messages for AVEVA components that have the Operations Control Logger enabled. For Plant SCADA, this includes the following components:

- Plant SCADA Studio
- Plant SCADA Runtime (see also [Monitor Runtime](#))
- Deployment Server/Deployment Client
- OPC UA Server (Connectivity Service)
- AVEVA Industrial Graphics (Connectivity Service)
- AVEVA Enterprise Licensing
- AVEVA Platform Common Services.

You can use filter, mark, find, time range and other functions to specify which messages are shown in the Log Viewer.

The Log Viewer is an MMC snap-in that operates within AVEVA's Operations Control Management Console.

#### To display Log Viewer messages:

1. From the Windows **Start** menu, select **Operations Control Management Console** from the **AVEVA** program group.
2. Locate the **Log Viewer** within the console tree.
3. To view the messages for any locally installed components, select **Local** within the **Default Group** branch.

The Operations Control Management Console is supported by its own documentation, which includes information explaining how to use the Log Viewer. To access this information, open **AVEVA Help** from the **AVEVA** program group in the Windows **Start** menu.

[Log Files](#)

## Running the System as a Windows Service

Plant SCADA can be run as a Windows™ service, allowing for unattended operation of a system's servers.

This offers the following benefits:

- Automated server operation on hardware startup
- Continuous server operation across multiple user logins.

For example, you may want to operate Plant SCADA as a distributed system across a number of server computers that are locked in a secure room. Each server could be configured to automatically run as a service on startup, meaning access to the server room is not necessary for normal system operation. Each server will also be able to run continuously without the need for a user to log in.

To run Plant SCADA as a service, you need to configure the service named "Plant SCADA Runtime Manager" in Microsoft Management Console on each server computer. For more information, see [Configure a System to Run as a Windows Service](#).

By default, Plant SCADA operates under the "NT SERVICE\Citect Runtime Manager" virtual service account when running as a service. In some circumstances, this may not be suitable. For example, if your system includes an OPC DA Server, you will need to specify a particular user account to run the service (see [Running as a Service Under a Specific User Account](#)).

---

**Note:** If you have configured a Plant SCADA OPC DA server on a computer that is running Plant SCADA as a Windows service, you will need to make the additional configuration changes. See [Running an OPC DA Server as a Service](#).

When Plant SCADA is operating as a service, the Runtime Manager will operate in "service mode". For more information about service mode and its limitations, see [Operate Runtime Manager in Service Mode](#).

You cannot debug Cicode for a process that is running as a Windows service.

---

**Note:** When you launch a display client on a computer that is running Plant SCADA as a Windows service, the

---

client will request an additional control client license from the system. If this occurs on a machine with a valid license that has been obtained locally, you will be granted the additional license automatically.

---

## Configure a System to Run as a Windows Service

When you install Plant SCADA on a computer, a service named "Plant SCADA Runtime Manager" is also installed. Operation of this service is managed using the Computer Management console, a component of the Windows™ operating system.

You can operate the Plant SCADA Runtime Manager in two ways:

- Manual operation - where the service is controlled by a user via the Computer Management console
- Automatic operation - where the service is set to run whenever the host computer starts.

Typically you would configure the service to run automatically to allow a dedicated server to become operational without any user interaction.

---

**Note:** If you plan to operate Plant SCADA as a service on multiple computer across a distributed system, you need to configure the Plant SCADA Runtime Manager service on each computer.

---

### To configure the Plant SCADA Runtime Manager service:

1. Open **Services** in the Microsoft™ Computer Management console (for more information, refer to the operating system documentation provided by Microsoft).
2. Locate Plant SCADA Runtime Manager in the list of included services. The **Status** column will indicate the current operational state of the service.
3. To manually start the service, right click on it and select **Start** from the menu that appears.

Or:

Double-click on the service to open the Plant SCADA Runtime Manager Properties dialog, and select the **Start** button on the **General** tab.

You can also use these methods to **Stop** and **Restart** the service.

4. To set the service to start automatically, open the Plant SCADA Runtime Manager Properties and set the **Startup Type** field to **Automatic**. The service will automatically start the next time the computer is turned on.

---

**Note:** If you attempt to switch a computer between service mode and normal operation, you will need to close down any local display clients and the Runtime Manager before you attempt to restart Plant SCADA in a different mode of operation.

---

## See Also

[Running as a Service Under a Specific User Account](#)

## Running as a Service Under a Specific User Account

By default, Plant SCADA operates under the "NT SERVICE\Citect Runtime Manager" virtual service account when running as a service.

In some circumstances, this will not be appropriate as a specific user (or type of user) may be required to

support particular functionality at runtime. For example:

- An OPC DA server uses specific DCOM settings that are not compatible with the local system accounts or the "NT SERVICE\Citect Runtime Manager" virtual service account.  
An OPC DA client will also be impacted by this incompatibility with DCOM.
- The PS Direct driver requires that the runtime user is part of the administrators group.

If you are faced with this type of situation, you may need to specify a particular user account under which the Plant SCADA service will operate.

#### To specify the user account that operates the Plant SCADA service:

1. Open **Services** in the Microsoft™ Computer Management console (for more information, refer to the operating system documentation provided by Microsoft).
2. Locate Plant SCADA Runtime Manager in the list of services.
3. Double-click on the service to open the Plant SCADA Runtime Manager Properties dialog.
4. Go to the **Log On** tab, and select the **This Account** option.
5. Enter the name and password for the account that will operate the service.

#### See Also

[Running an OPC DA Server as a Service](#)

### Running an OPC DA Server as a Service

By default, Plant SCADA operates under the "NT SERVICE\Citect Runtime Manager" virtual service account when running as a service. This is not suitable for a system that includes an OPC DA server, as this type of server uses specific DCOM settings that are not compatible with the virtual service account.

To address this situation, you need to make the following configuration changes on the computer where an OPC DA server will run as a service:

- Specify a particular user account under which the Plant SCADA service will operate (see [Running as a Service Under a Specific User Account](#)).
- In the DCOM settings for the OPC DA server, confirm that the same user account is used as the identity that operates the server.

#### To specify the DCOM identity that operates the OPC DA server:

1. Open the **Component Services** console (for more information, refer to the operating system documentation provided by Microsoft™).
2. In the list of Component Services, open the **My Computer** branch, then the **DCOM Config** directory.
3. Right-click on the SCADA OPC DA Server and select **Properties**.
4. Go to the **Identity** tab, and select the **This User** option.
5. Enter the name and password for the account that is configured to operate Plant SCADA as a service.

The OPC DA server will now operate as a service with appropriate DCOM credentials.

**Note:** If you need to return Plant SCADA to normal operation (that is, you will no longer run it as a service), you will need to set the DCOM identity for the OPC DA Server back to **Interactive user**.

## See Also

[Using an OPC DA Server](#)

[OPC DA Server DCOM Settings](#)

## Time Synchronization

To maintain time synchronization, Plant SCADA installs a Windows service, **TimeSyncService**. It runs on a virtual service account. This service maintains the time on the local computer associated with one or more time sources. A time source is a computer on which the time service runs.

A time synchronization utility is provided by Plant SCADA to assist you to configure time synchronization, and control the service as part of your administration environment. The dialog stores and reads settings in the **TimeSyncConfig.xml** file, which is installed in the Plant SCADA Config directory by default (see [View a Project's Folders](#)).

You can use the configuration utility to specify an alternative path to the config file, such as a network share. This can be useful where you have multiple computers using the same configuration data as you only need to make changes on one machine.

To display the Time Synchronization Configuration dialog box, navigate to Windows™ **Start** menu | Programs | AVEVA Plant SCADA, and run **Time Synchronization Config**.

## Time Synchronization Dialog Box

The fields available on the Time Synchronization dialog are described in the following table.

Field	Description
Current status	Displays the status of the TimeSync Windows service, as displayed in service properties under computer management. You may click the Start Service button if the service is stopped, or Stop Service if it is running. If the service is identified as being disabled, the button is also disabled. To enable the service use the Windows administrative tools as either automatic or manual startup.
Startup type	Identifies if the service is started manually, or automatically. If the service is disabled, use the Windows administrative tools to enable the service as either automatic or manual startup.
TCP/IP Port	The network port the service uses to listen for connections from clients.
Last synchronization	Displays the value of the <b>LastSyncTime</b> registry setting.

Field	Description
	This is the Local time at which the last successful synchronization occurred.
Current local time	Displays the current time on the local computer, updating in every second.
Log information events	Controls whether the service writes events of type 'Information' to the event log. The default is unchecked so that only alerts (called "warnings" in the software) and errors are recorded.
Keep this computer's time synchronized	Select this check box to enable the computer to be a time client. This allows you to enter the poll time and list of time servers with which to synchronize.
Synchronize every	Enter a number in hours and minutes between 000:01 and 168:59 (inclusive) to specify the period between synchronization that needs to occur. The default value is 24:00.
Synchronize Now	Click to synchronize immediately.
Synchronize with first available	Displays a list of computers, and the current time on those computers if available. The display is updated in every second.
Add	Displays a dialog box to enter the Computer Name, IPv4 address or IPv6 address of a server. Click <b>OK</b> to add the server to the "Synchronize with first available" list.
Remove	Select a computer from the list above, and click "Remove" to remove it from the list.

**Note:** When you add a time source to the list, the current time on that machine will be displayed, provided the service is running on that remote machine and listening on the same port number. If "Not available" then the service is not running, or is running and using a different port number, or that port number is being blocked by a firewall. The column in the list box is provided as a diagnostics function to confirm that the machine names entered can be synchronized against. The time displayed in this box is an approximate only.

## Runtime - Frequently Asked Questions

### Q: How do I run a Cicode function on startup?

**A:** Specify the Cicode function with the Setup Wizard (in Custom mode). Use the **Startup Functions Setup** page. See [Startup Functions Configuration](#) in the Plant SCADA documentation for details.

**Q: How do I run a report on startup?**

A: Plant SCADA searches for a report called "Startup" when it starts up. If Plant SCADA locates this report, it is run automatically. You can change the name of the default startup report with the Setup Wizard (in Custom mode). Use the **Startup report** field on the Reports Setup page. See [Reports Configuration](#) in the Plant SCADA documentation for details.

**Q: How do I remove the Cancel button from the Startup Message Box?**

A: Use the Setup Wizard (in Custom mode). De-select the **Display Cancel button on startup** option on the Security Setup - Miscellaneous page. See [Miscellaneous Security Configuration](#) in the Plant SCADA documentation for details.

**Q: How do I remove the Shutdown command from the Control menu?**

A: Use the Setup Wizard (in Custom mode). De-select the **Shutdown on menu** option on the Security Setup - Control Menu page. See [Control Menu Security Configuration](#) in the Plant SCADA documentation for details.

**Q: How do I remove Plant SCADA Studio/Graphics Builder commands from the Control Menu?**

A: Use the Setup Wizard (in Custom mode). De-select the **Plant SCADA Studio on menu** option on the Plant SCADA Runtime control menu page. See [Control Menu Security Configuration](#) in the Plant SCADA documentation for details.

# Runtime Client Tools

Plant SCADA includes a set client tools that are designed to operate in the runtime environment. They include:

- **Process Analyst** - displays trend and/or alarm tag data (both real-time and historical) for system analysis during runtime (see [Process Analyst](#))
- **Scheduler** — allows you to view and manage schedule entries for a selected piece of equipment to enable automated operation of a Plant SCADA system (see [Schedules](#)).

## See Also

[Runtime Manager](#)

## Process Analyst

Process Analyst allows operators to view trend and/or alarm tag data (both real-time and historical) for comparison and analysis during runtime through their existing Plant SCADA server architecture.

**Note:** You can access the Process Analyst documentation from the Process Analyst main toolbar and the Process Analyst Properties dialog box.

## See Also

[The Process Analyst Interface](#)

[Pens](#)

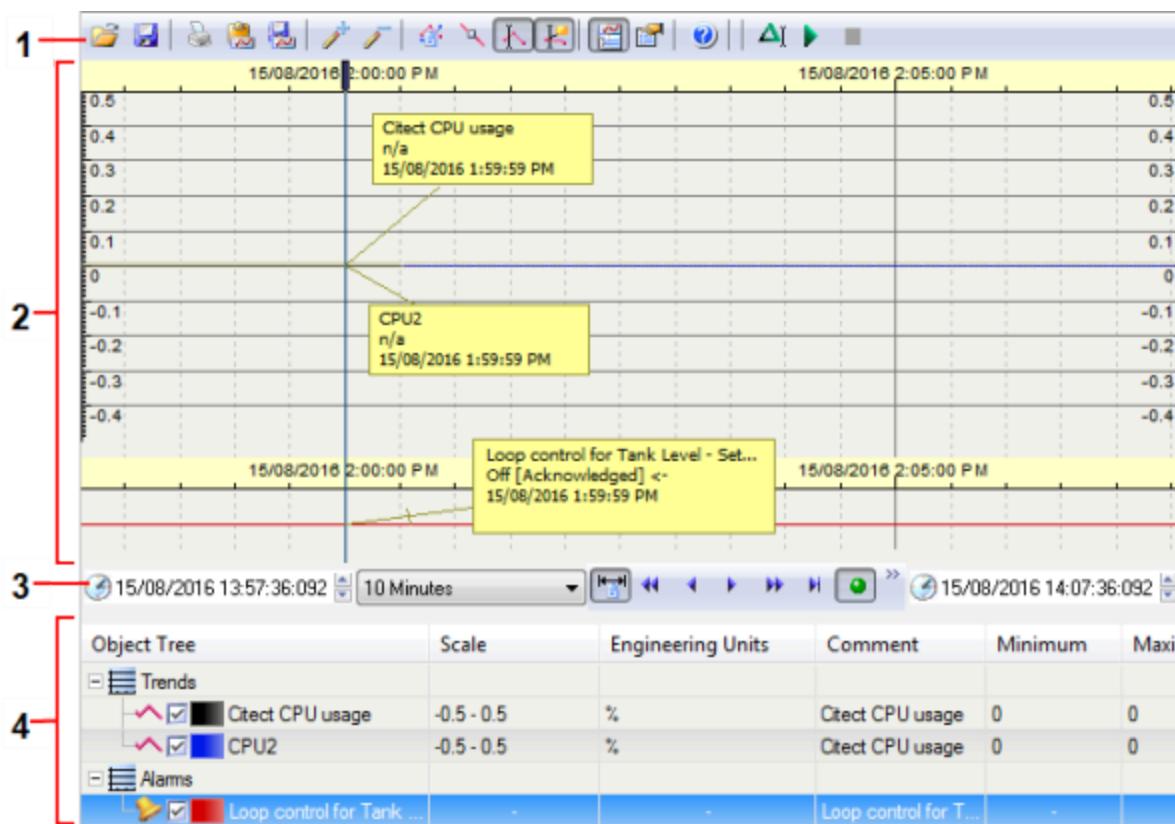

[Cursors](#)

[Interacting with the Process Analyst](#)

[Configure the Process Analyst at Runtime](#)

## The Process Analyst Interface

The Process Analyst interface comprises the following components:

#### 1. Main toolbar

Contains commands for performing general operations in the Process Analyst, such as opening views, printing reports, and so on. You can customize this toolbar. See [The Main Toolbar](#).

#### 2. Chart view

The chart view displayed runtime and historical data using a set of pens that draw sample values against time. Pens can be grouped within the chart view using panes.

#### 3. Navigation toolbar

Contains commands that allow an operator to travel forward or backward through trends, as well as other navigation-related tasks. You can customize this toolbar.

#### 4. Object view

When displayed, the object view presents information about your Process Analyst pens, such as name, color, scale, and so on.

## See Also

[The Chart View](#)

[The Object View](#)

[The Navigation Toolbar](#)

[The Main Toolbar](#)

[Process Analyst Properties Dialog Box](#)

## The Chart View

The chart view is where Process Analyst pens draw sample values against time. Pens can be grouped in the chart view using one or multiple **panes**.

The chart view displays a date/time axis at the top of each pane.

A vertical (value) axis may also appear at the left-hand edge of the pane. (The value axis is shown only for analog pens.)

### About the date/time axis

The date/time axis displays time using the current locale format specified in your computer date/time settings. If the millisecond component is necessary, it is appended to the end in the format "<xxx>ms." Since the local time zone is determined from the current computer settings, these settings need to be configured accurately. The date/time axis will accommodate daylight savings transitions.

**Note:** In order for the Process Analyst to indicate that Daylight Savings is in effect, the **Automatically adjust clock for daylight saving changes** option on the Windows™ Date and Time properties needs to be enabled.

The date/time axis can also display data using the universal time coordinate (UTC) format. You can switch between local or UTC time as you like (see [Configure Pen Axes](#)).

The date/time axis is divided into major and minor time intervals, which change dynamically depending upon the time span. In the illustration above, the major intervals are 1 minute apart, and the minor are 5 seconds apart.

Note the following:

- When the axis time span is 1 minute or less, the format of the axis labels includes milliseconds and the date is removed.
- When the axis time span is 1 week or above, the time is removed and only the date is displayed.

By default, the date/time axis displays a time span of 10 minutes; the major intervals represent 5 minutes, and the minor intervals 30 seconds.

### About the vertical (value) axis

Like the date/time axis, the value axis consists of major and minor intervals, but they represent value intervals

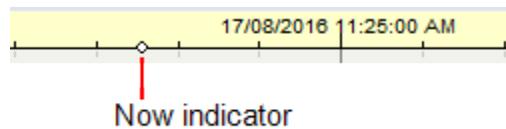

rather than date and time. The intervals are calculated automatically by the Process Analyst.

The axis displayed reflects the values for the primary selected pen.

By default the vertical axis will use the engineering scale from the tag of the selected pen. The vertical axis also supports autoscaling. When autoscaling is enabled, the vertical axis automatically adjusts its limits to accommodate new samples as they are added to each individual pen.

You can scroll and scale the vertical axis; for details, see [Scroll the Chart](#) and [Scale the Chart](#). You can also configure the appearance of the vertical axis; for details, see [Configure Pen Axes](#).

The Now Indicator is a small white circle on the date/time axis that indicates the current time based on the computer's time settings.

The position of the Now indicator is refreshed according to the value specified in the [Configure General Properties](#) field in the Process Analyst Control Properties dialog box. See Also [Synchronize to Now](#).

Process Analyst pens also use gridlines as a visual guide to help an operator determine the value of trends. Major gridlines are solid lines; minor gridlines are dashed lines. Analog pens have vertical and horizontal gridlines; alarm and digital pens only have vertical gridlines. The display of gridlines changes dynamically according to the selected time span. See [Configure Pen Gridlines](#).

## The Object View

The Object View provides a tabular view of the pens displayed in the Process Analyst. You can use the Object View to access information about the pens on the chart, along with information about associated tags. When displayed, the Object View is located under the navigation toolbar.

Object Tree	Scale	Engineering Units	Comment	Min
- Trends				
Citect CPU usage	-0.5 - 0.5	%	Citect CPU usage	0
CPU2	-0.5 - 0.5	%	Citect CPU usage	0
- Alarms				
Loop control for Tank ...	-	-	Loop control for T...	

The **Object Tree** column displays a hierarchically arranged view of the panes and pens on the chart. The column uses the following icons:

Icon	Object
	Pane
	Analog pen
	Digital pen
	Alarm pen

The check box next to a pen icon controls whether the pen is visible on the chart. The gradient-filled color box to the left of the pen name indicates the pen's line color as it appears on the chart.

Clicking a pen in the Object View selects that pen. There is always one pen selected in each pane. In the example above, the primary selected pen (Loop Control for Tank...) is highlighted in blue; the pen selected in the Trends pane (CPU2) is highlighted in gray. See [Pen Selection](#).

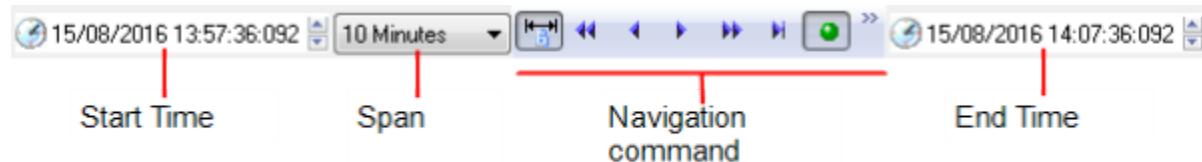

The columns that appear in the Object View table are configurable. An operator can select the columns they require from a predefined list. For more information, see [Configuring the Object View](#).

## See Also

[Use the Object View](#)

## The Navigation Toolbar

The Navigation Toolbar contains commands to allow an operator to travel forward or backward through trends, as well as other navigation-related tasks.

A **Start Time Picker** is located on the left-hand side of the navigation toolbar, an **End Time Picker** is located on the right. You can use these to [Specify a Start Time and End Time](#).

If a time picker control is using Daylight Savings time, the clock to the left of the control will have a shaded segment.

The **Span Picker** contains commonly used predefined time spans that you can select from a drop-down menu. The time span of the trend display represents the difference between the start time and the end time. Selecting a time span adjusts the start time and leaves the end time as it is. To set a time span that is not included in the list of predefined times, see [Set a Nonstandard Time Span](#). See also [Lock/Unlock the Time Span](#).

The Navigation Toolbar also includes a set of commands buttons. You can use these buttons to perform the following tasks:

- [Navigate Time](#)
- [Synchronize to Now](#)
- [Toggle Autoscrolling](#)
- [Zoom In/Zoom Out](#)
- [Undo Last Zoom](#)
- [Toggle Box Zoom](#)
- [Edit Vertical Scale](#).

You can also [Configuring Toolbars](#) to contain different items.

## The Main Toolbar

The Process Analyst main toolbar is located above the chart view. The main toolbar contains commands that allow you to perform general operations, such as save and load Process Analyst [Working with Views](#), print trend reports, add or remove pens, display or hide cursors and labels, and so on.

Toolbar commands can be customized; for details, see [Configuring Toolbars](#).

The table below describes the items that are included on the main toolbar by default.

Item	Description
	<b>Load View.</b> Loads a saved view from file. For details, see <a href="#">Load a View</a> .
	<b>Save View.</b> Saves a view to file. For details, see <a href="#">Saving a View</a> .
	<b>Print.</b> Displays the standard Windows Print dialog box for printing trend reports. For details, see <a href="#">Printing and Exporting</a> .
	<b>Copy to Clipboard.</b> Copies visible pens to the Windows Clipboard. For details, see <a href="#">Copying Data to the Clipboard</a> .
	<b>Export to File.</b> Exports visible pens to an Excel-compatible file. For details, see <a href="#">Copying Data to File</a> .
	<b>Add Pen.</b> Displays the Add New Pen(s) dialog box for adding a pen. For details, see <a href="#">Add Pens</a> .
	<b>Remove Pen.</b> Deletes the currently selected pen from the trend display. For details, see <a href="#">Delete Pens</a> .
	<b>Lock/Unlock Pens.</b> Toggles the locking of pens. For details, see <a href="#">Lock/Unlock Pens</a> .
	<b>Show/Hide Points.</b> Toggles the display of points representing where sample data was recorded in the archive. For details, see <a href="#">Pens</a> .
	<b>Show/Hide Cursors.</b> Toggles the display of cursors. For details, see <a href="#">Cursors</a> .
	<b>Show/Hide Cursor Labels.</b> Toggles the display of cursor labels. For details, see <a href="#">Using Cursor Labels</a> .
	<b>Toggle Object View.</b> Toggles the display of the Object View. For details, see <a href="#">The Object View</a> .
	<b>Properties.</b> Displays the Properties dialog box for

Item	Description
	configuring the Process Analyst control. For details, see <a href="#">Configure the Process Analyst at Runtime</a> .
	<b>Help.</b> Displays the Process Analyst online Help.

## See Also

[The Navigation Toolbar](#)

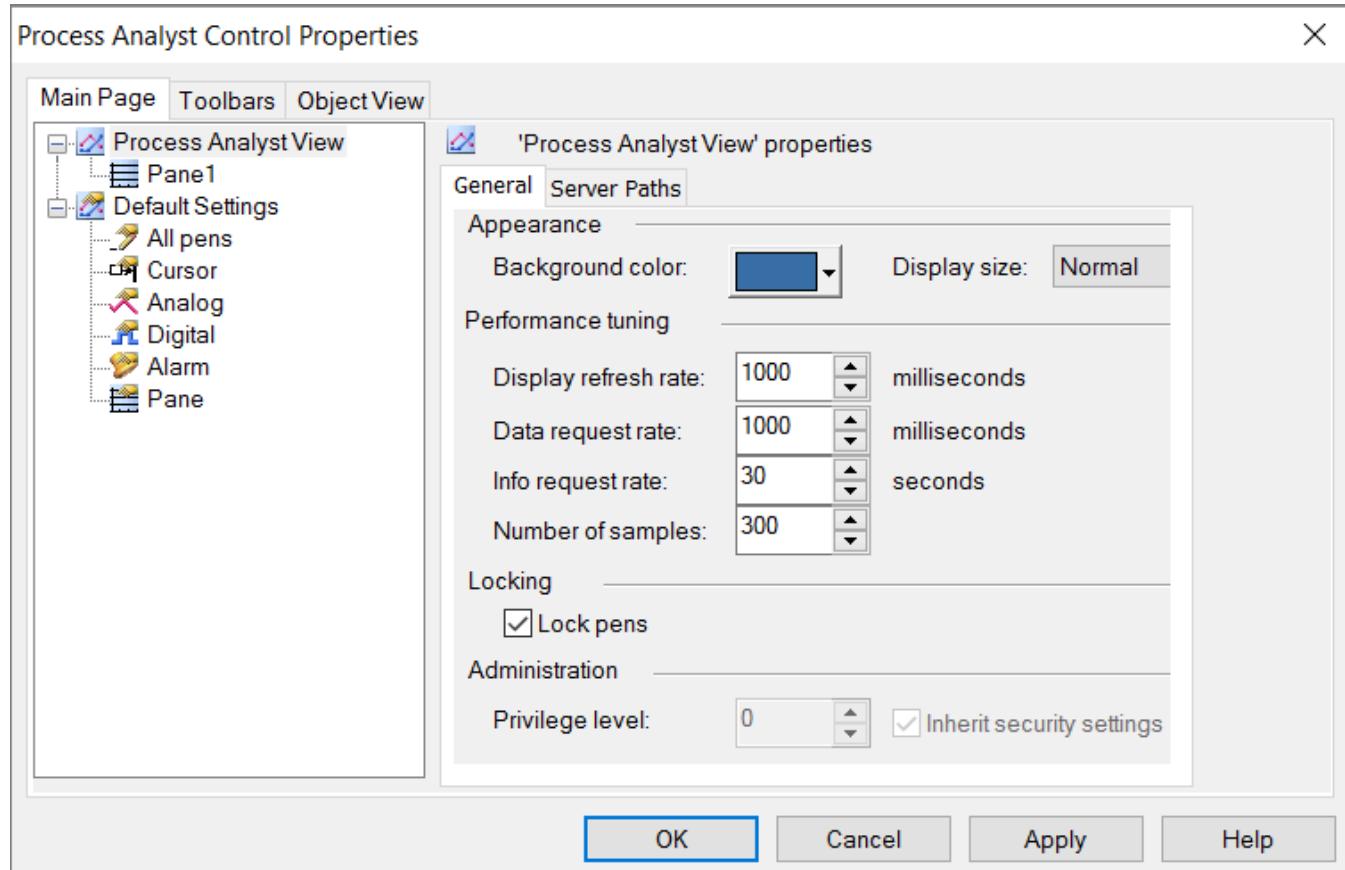

## Process Analyst Properties Dialog Box

You use the Process Analyst Properties dialog box to configure Process Analyst views. You can also configure chart-wide properties.

The Properties dialog box has three tabs: Main page, Toolbars, and Object View.

### Main page

You use the Main page of the Properties dialog box to configure general properties and access the server path properties. The Main page looks like this:

The list on the left-hand side contains the property tree, a hierarchical list of Process Analyst interface components. Selecting an item displays the property controls for that component on the right. The pens in the property tree indicate the information that the pen is trending. See [Configure General Properties](#) and [Configure Server Paths](#).

## Toobars

You use the Toolbars page to configure the main toolbar and navigation toolbar. Operators and Users can configure the toolbars at run time and design time. Use the Toolbars page to configure the toolbars; for details, see [Configuring Toolbars](#).

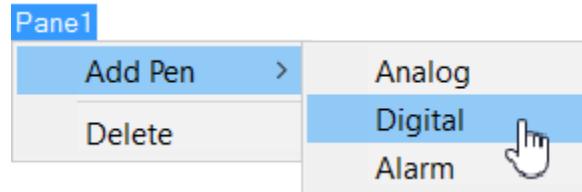

## Object View

You use the Object View page to configure the Object View. Operators and Users can select (at run time and design time) the columns they want to display, as well as change the column width and display order. Users can define new columns and edit existing columns at design time.

See [Configuring the Object View](#).

## Using the Property Tree Right-click Menu

Right-clicking an item in the property tree displays the shortcut menu for that item, as shown below.

The tasks you can perform vary depending on your privilege level: if you don't have the necessary privilege at run time to perform an action, that control is disabled/removed. For example, the right-click menu removes the Add Pen option at run time if you don't have the privilege to add a pen. Commands that are unavailable appear "grayed-out." The right-click menu contains the following options:

Right-click this item...	Actions
Chart	Add Pane - add a new pane. Add Cursor - add a new cursor.
Pane	Add Digital - adds a new digital pen. Add Analog - adds a new analog pen. Add Alarm - adds a new alarm pen. Note: After adding a pen from this menu, configure the data connection by clicking the Connection tab and typing the name of the tag into the Tag text box. Delete - deletes the pane.
Pen	Delete - deletes the pen.

Right-click this item...	Actions
Cursor	Delete - deletes the cursor.

Use the Main page for the following:

- [Configure Chart-wide Properties](#)
- [Configure Chart Panes](#)
- [Configure Pens](#)
- [Configure Cursors](#)
- [Configure Defaults](#)

## Pens

Process Analyst pens draw sample values against time. Each pen has its own colored line in the chart view (and can contain other graphical elements).

Sample markers (or points) are drawn on the line to indicate where data was recorded in the archive. The style of the line indicates the quality of the data (see [Data Quality](#)). The style of the sample marker indicates the compaction of the sample (see [Data Compaction](#)).

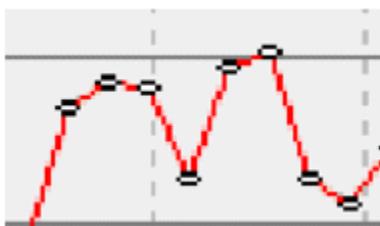

### The Process Analyst supports three types of pen:

- **Analog pens**

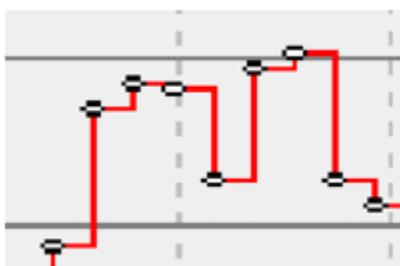

The Process Analyst control typically uses analog pens to represent variable or numerical data. Only analog pens have a value (vertical) axis, which the data is plotted against.

Analog pens have two types of interpolation that allow you to specify how to connect data samples on a trend line:

- **Straight** - a line is drawn directly between the points or sample values like this:

- **Stepped** - the lines drawn always maintain the value of the previous sample until a sample with a different value arrives, in which case a vertical line is drawn:

See Also [Interpolated Samples](#).

- **Digital pens**

The Process Analyst control typically uses digital pens to represent binary data. Values on the pen are restricted to 0 or 1. Any value equal to or greater than 0.5 is set to 1; other values are set to 0. A fill color is used to indicate where the data is 1, as shown here:

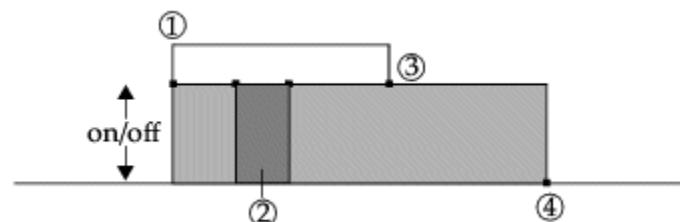

By default, the layout of digital pens is stacked. For details, see [Pen Layout](#).

- **Alarm pens**

The Process Analyst uses alarm pens to graphically display the history of Plant SCADA alarms over time. The alarm's on/off transition state changes and acknowledgment are represented graphically in the alarm pen display.

When an alarm is on, it is represented by a bar filled with color. The color indicates different states. The line above represents operator acknowledgment of the alarm.

The diagram below illustrates how an alarm pen displays the information of an alarm tag:

1. The alarm is turned on in its initial state and is unacknowledged.
2. The alarm changes to a different state, but is still unacknowledged.
3. The alarm is acknowledged.
4. The alarm is turned off.

The Process Analyst allows the appearance of pens to be configured during run time and design time. You can configure the line color, width, and fill color. For details, see:

- [Configure Analog and Digital Pens](#)
- [Configure Alarm Pens](#).

---

**Note:** To configure default appearance settings for a particular type of pen, go to the Process Analyst Properties dialog and select the pen type in the property tree under **Default Settings**.

---

## See Also

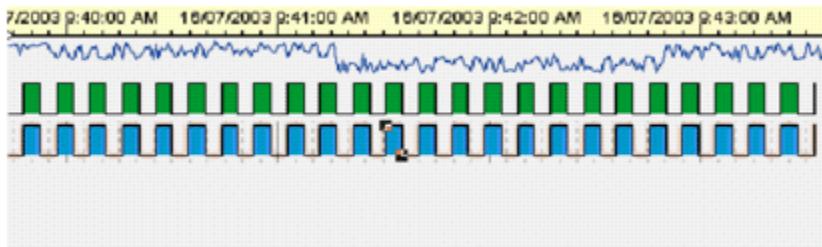

[Pen Layout](#)

[Pen Selection](#)

## Pen Layout

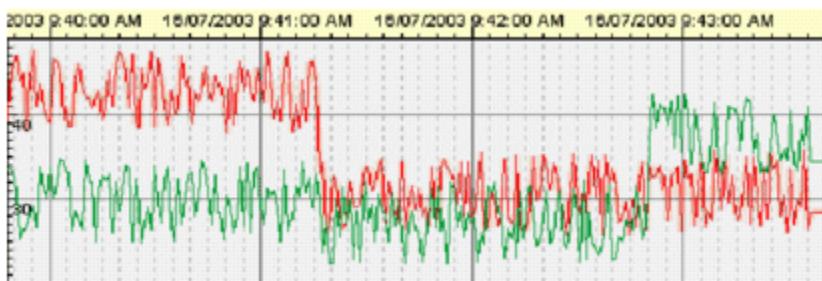

You can display pens in the Process Analyst by stacking or overlaying.

- In **stacked** mode, a user-specified amount of vertical real-estate is allocated to the pen, and with this, stacked pens are laid out under each other on the pane, starting from the top of the pane under the date/time axis, like this:

Here, three pens (one analog and two digital) are stacked under each other. Stacking applies to every type of pens.

- In **unstacked** mode, pens are drawn on top of each other. The order in which the pens were added to the pane governs the drawing order: the last pen added is the topmost pen drawn. When a pen is selected, it is brought to the front of any other pens displayed

Here, two analog pens are overlaid. You can also overlay digital and alarm pens.

You can have any mix of stacked and unstacked pens on a pane.

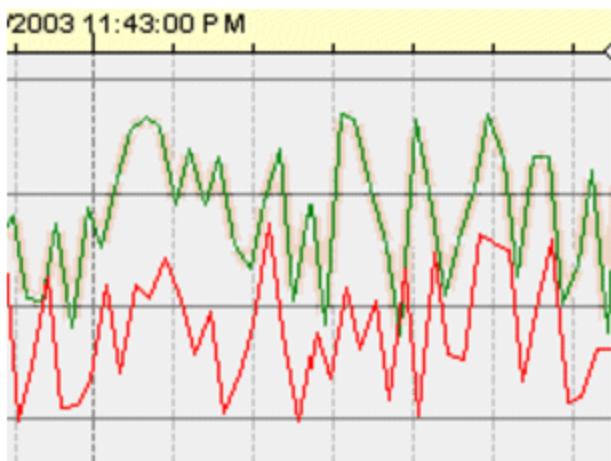

## Pen Selection

Each pane on the Process Analyst can have one selected pen. The axes that are displayed on a pane are that of the selected pen. The last pen selected across every pane is referred to as the *primary* selected pen.

You can select a Process Analyst pen in several ways:

- By clicking on the pen's graphical elements (i.e., the pen line).
- If the pens are stacked, by clicking the background under the pen line.
- By selecting the pen in the Object View.

The selection of a pen is indicated by a subtle halo effect surrounding the pen line. In the example shown here, the top (green) pen is selected, indicated by the halo surrounding the pen:

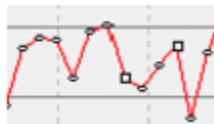

The halo does not appear if there is only one pen on the pane. Selecting a pen on a pane also causes the same pen to be highlighted in the Object View. Selecting a pen causes that pen to be drawn in front of other pens on the pane.

## Data Compaction

Data compaction is the visual representation of multiple data points that are not distinguishable due to their rate of occurrence across the currently selected time span.

Data is compacted by grouping raw samples together and visually representing them as one sample. Sample compaction is indicated on the graph by using different sample markers. For example, in the illustration below, the two sample markers that appear as squares actually represent multiple raw samples.

The following illustration zooms in on the second multiple sample. It shows that what appeared to be a single sample actually consists of several raw samples:

The Process Analyst uses the following default point styles for single and multiple samples:

Sample compaction	Point Type
Single	● Ellipse
Multiple	□ Rectangle
Interpolated	▲ Triangle (see <a href="#">Interpolated Samples</a> ).

## See Also

[Request Modes](#)

## Interpolated Samples

Normally samples are only single or multiple. But there is a specific situation in which an interpolated sample is used to correct a graph that only occurs with event trends.

The frequency of the data stored in an event trend can vary dramatically; for example, where several samples are within one display period, followed by no samples for a long time.

A multiple sample will be drawn with a value calculated from the samples within the period. But the value after that period will be whatever the last sample in the period was. So an interpolated sample is added at the start of the next display period to correct the graph.

## See Also

[Request Modes](#)

## Request Modes

When [Data Compaction](#) is used to create a graphical representation of multiple values, a calculation needs to take place to determine the value and time stamp of the value displayed. The Process Analyst provides the following options for this calculation:

- **Average** - The value will be an average of the individual samples within the multiple sample, as will the timestamp. This is the default calculation method.
- **Maximum**: The value will be the maximum value out of the individual samples within the multiple sample. The timestamp will be that of the individual sample that was the maximum.
- **Minimum**: The value will be the minimum value out of the individual samples within the multiple sample. The timestamp will be that of the individual sample that was the minimum.
- **Newest**: The value will be the latest arrived value out of the individual samples within the multiple sample. The timestamp will be that of the individual sample that was the newest.

## Data Quality

Process Analyst pens use the same sample quality values as Plant SCADA trend and alarm samples. There are four sample quality values:

- **Good** - Samples were recorded in the trend archive as good.
- **NA** - When Plant SCADA is unable to obtain a sample or the data retrieved was invalid, an N/A sample will be recorded in the trend archive.
- **Gated/Disabled** - For trends, when the trigger of a trend is off, a value of "Gated" is recorded in the trend archive. For alarms, this sample quality value indicates that the alarm has been disabled.

The Process Analyst uses the following default line styles to indicate data quality:

Quality	Line style
Good	Solid ———
NA	None
Gated	Dot ······

Consider the following examples:

Data sample	Description
	This example shows several single samples. The third sample has a quality of N/A, indicated by the break in the trend line.
	Here the quality of the third sample is gated, indicated by the broken line connecting these samples.

With multiple samples, the quality of the last sample in the group determines how the line is drawn. Consider the following examples:

	This example shows that the third sample is a multiple sample. The quality of the third (multiple) sample and the next sample are N/A, indicated by the break in the trend line.
	Here the quality of the third multiple sample is gated, indicated by the broken line connecting the samples.

The line style indicating the data quality is configurable during run time and design time; for details, see [Configure Pen Quality](#).

## Cursors

A cursor enables an operator to determine the value of a pen at a given point in time by dragging the cursor to the specific point on the pen line. A [Using Cursor Labels](#) is used to display the value.

An Operator can define many of the properties of cursors and cursor labels. For details, see [Configure Cursors](#).

In this example the cursor intersects three pens; the cursor labels (the yellow rectangles) display the corresponding pen values.

To move a cursor, drag the cursor line left or right. As the cursor moves, the cursor labels move with the cursor and are updated continuously, reflecting the position of the cursor.

**Note:** The cursor extends across every configured pane.

A line connects the cursor label to the associated pen line. The line has three main states:

State	Style	Example
Intersection within pen data	Line	
Intersection before or after pen data	Line with indicator	
No intersection and no data	Invisible line	

#### To show/hide a cursor:

- Click **Show/Hide Cursor** on the main toolbar. You can display additional cursors by using the Properties dialog box.

You can display as many cursors as you want. To add a cursor, right-click the root item (**Process Analyst View**) in the property tree in the Properties dialog box, and choose **Add Cursor**.

## Using Cursor Labels

Each cursor has one cursor label for each pen displayed. The cursor label displays the value of the pen at the point where the cursor intersects with the pen data.

An alarm pen label value has the following format:

*State [acknowledgement]*

*State* refers to the alarm state at the point of intersection, and *acknowledgement* refers to the acknowledged state of the alarm at the point of intersection.

### To display cursor labels:

- Click **Show/Hide Cursor Labels** on the main toolbar.

This table summarizes how to use cursor labels:

Task	Description
Move a cursor label	Click the cursor label and drag the label to a new location.
Change the size of cursor labels	Click the cursor label you want to re-size. Place the mouse cursor on one of the sizing boxes, and drag the label to the new size. If you drag the corner of the label, the label text resizes to an optimal size for the label.
Lock or unlock the cursor labels	Click the <b>Lock/Unlock Cursor Labels</b> . When on, this command causes cursor labels to be "frozen" in the position.

The cursor label displays the following information:

Cursor field	Applies to	Description
Pen Name	All Pen types	Displays the non-unique Process Analyst pen name
Value/Quality	All Pen types	Displays the value of the pen at the point the cursor intersects with the pen data
Date-Time Stamp	All Pen types	Displays the date/time stamp at the point the cursor intersects with the date/time axis.
Alarm Sample Comment	Alarms	Comment bound to an alarm sample.

The fields are displayed in the cursor label using the order defined above using the format specified for the

vertical axis. For example, if your vertical axis format is "km/h", the label reads "<value> km/h".

The label displays the following values when the quality of the data is not good:

<b>Cursor value</b>	<b>Description</b>
NA	At the point of intersection the pen has no available data for display.
Gated	At the point of intersection the pen's data has been gated.
Disabled	At the point of intersection the alarm tag of the pen was disabled.

The label value can also contain a directional indicator that functions as follows:

<b>Cursor value</b>	<b>Description</b>
<value> ->	The cursor is to the left of the first available sample for this pen.
<- <value>	The cursor is to the right of the last available sample for this pen.

## Mouse Pointers

When using the Process Analyst, the mouse pointer changes shape to indicate the operations you can perform at that time.

<b>Mouse pointer</b>	<b>Region</b>	<b>Description</b>
	Pen line	The mouse pointer looks like this when the pointer is on a pen. Clicking the mouse at this point selects the pen.
	Pen line/pen background	The mouse pointer looks like this when the mouse is over a pen's background and both horizontal and vertical scrolling are enabled. Clicking and dragging at this point results in the free movement of the pen. Scrolling the mouse wheel results in horizontal-only movement.
	Horizontal axis	The mouse pointer looks like this when the pointer is on the horizontal axis and horizontal scaling is enabled. Clicking and

Mouse pointer	Region	Description
		dragging (or scrolling the mouse wheel) will result in the axis being scaled.
	Pen line/pen background	The mouse pointer looks like this when the pointer is on the horizontal axis and only horizontal scrolling is enabled. Clicking and dragging (or scrolling the mouse wheel) will result in the axis being scrolled.
	Vertical axis	The mouse pointer looks like this when the pointer is on the vertical axis and vertical scaling is enabled. Clicking and dragging (or scrolling the mouse wheel) will result in the axis being scaled.
	Vertical axis	The mouse pointer looks like this when the pointer is on the vertical axis and only vertical scrolling is enabled. Clicking and dragging (or scrolling the mouse wheel) will result in the axis being scrolled.
	Box Zoom mode	The mouse pointer looks like this when Box Zoom mode is enabled. See <a href="#">Toggle Box Zoom</a> .

## Interacting with the Process Analyst

This section describes the ways in which an operator can interact with the Process Analyst during runtime.

It includes the following topics:

- [Add Pens](#)
- [Delete Pens](#)
- [Lock/Unlock Pens](#)
- [Specify a Start Time and End Time](#)
- [Shift and Fit Time Units](#)
- [Scroll the Chart](#)
- [Scale the Chart](#)
- [Lock/Unlock the Time Span](#)
- [Navigate Time](#)

- [Synchronize to Now](#)
- [Toggle Autoscrolling](#)
- [Zoom In/Zoom Out](#)
- [Undo Last Zoom](#)
- [Toggle Box Zoom](#)
- [Set a Nonstandard Time Span](#)
- [Edit Vertical Scale](#)
- [Reset to Default Span](#)
- [Use the Object View](#)
- [Using Instant Trends with Process Analyst.](#)

You can use the right-click (context) menu to quickly access frequently used commands. This menu is context-sensitive, providing relevant commands for different regions of the display. The right-click menu appears when you click any of the following regions:

- Horizontal axis
- Vertical axis
- Background
- Pen

## Add Pens

The Process Analyst allows operators to search the trend tags and alarm tags that are defined on a Plant SCADA trends or alarms server. You can use the search results to add pens to the current trend display.

You use the Add New Pens dialog box to add a new pen to your trend display. To display the Add Pens dialog box, click **Add Pens** on the main toolbar.

### Adding a new pen:

To identify the item you would like a pen represent, you need to initially define a search to determine what is available. You can then select a particular item from the search results.

1. Search the available data on the SCADA server:
  - a. Select the **Type** of data you want to search for. The options are **Alarms** or **Trends**.
  - b. Type in a **Tag**, **Cluster** or **Comment** filter to help refine the search results. Be aware that if the type selected is Alarm, the Comment filter will not be available.

The filters have basic wildcard and Boolean search functionality. You can use the keywords AND, OR and NOT with wildcard strings, as well as group Boolean terms using parentheses. Searches are not case sensitive.

For example, entering "L\*" in the Tag Filter returns tags beginning with the letter "L" in every cluster. Entering "L\* OR H\*" will find tags beginning with "L" or "H". More complex examples include "L\* OR (H\* AND NOT \*G)". This would return tags that start with "L" or any that start with "H", but do not end in "G". If you leave a field blank, each item of the selected type will be retrieved.
- c. Click **Search**. The results are returned in the **Search results** list.

The results are not sorted: the tags appear in the order they were configured in Plant SCADA. The cluster associated with each tag is also displayed. The Process Analyst displays only the tags in clusters that this client has access to. In a system with more than one cluster, if a tag is not configured with a cluster, it is listed once for each cluster.

2. The Search Result list displays up to 100 entries at a time. If your search returns more than 100 results, use the **First**, **Prev**, **Next**, and **Last** buttons to navigate your search results.
3. Select one or more items from the **Search Results** list. You can use the **Ctrl** and/or **Shift** keys to select multiple tags.
4. Select the destination pens to Add **Add pens to**. Pens can be added to any existing pane, or to a new pane.
5. Select a **Pen Type**. A trend tag can be represented by an analog or digital pen. An alarm tag can be represented by an alarm pen only.
6. Select how to resolve the pen name:
  - **Comment**- applies the tag comment as the pen name. If the tag does not have a comment specified, a name is automatically generated.
  - **Tag**- applies the tag name as the pen name.
  - **Auto**-applies an automatically generated name to the pen using the format *Pen<X>* where *X* is an incremented number, starting with the first available number.
7. Click **Add**. This moves the selected items in the Search Results list into the Selected Items list. The Selected Items list contains the tags that will be added as pens to the Process Analyst. You can perform multiple searches to add tags into the Selected Items list.

---

**Note:** To remove a tag from the Selected Items list, highlight the item you want to move, and then click **Remove**.

---

8. To view details about a selected tag, click **Show Detail**. A Pen Details dialog box appears, showing defined information for the selected tag.
9. Click **OK**. Your selected tags appear on the trend display as pens.

## See Also

[Delete Pens](#)

## Delete Pens

Operators can delete pens from the trend display at any time.

---

**Note:** Deleting a pen is different than hiding the pen from display by using the Visibility check box in the Object View. For details, see [Use the Object View](#).

---

### To remove a pen:

1. [Pen Selection](#) you want to delete.
2. Click **Remove Pen** in the main toolbar.

The pen is deleted from the display.

## See Also

[Add Pens](#)

## Lock/Unlock Pens

By default, the Process Analyst locks together the time span and position in time (horizontal axis) of every pen. However, you can unlock the pens, allowing the pens to be displayed across different positions in time and/or time spans.

For example, you could unlock pens to compare a previous month's data for a tag with the data for this month. You would do this by adding two pens to a pane that represent the same tag, then unlocking the pens, and adjusting the time positions for each pen as necessary.

To control pen locking and unlocking, you use the **Lock/Unlock Pens** button on the main toolbar.

This option is also available on the right-click (context) menu.

Locking and unlocking has the following behavior:

- When pens are locked, every time-related operation is applied to every pen.
- When pens are unlocked, every time-related operation is applied to the primary selected pen.
- Synchronization applies every pen regardless of their being locked or unlocked.

When transitioning from locked to unlocked, the time span and position in time of every pen are synchronized to match that of the primary selected pen.

## See Also

[Add Pens](#)

[Delete Pens](#)

## Specify a Start Time and End Time

You can specify a start time and an end time for the trend display by using the date/time pickers. The start time picker is located on the left-hand side of the navigation toolbar, the end time picker on the right.

The date/time picker formats the date and time using the settings obtained from your computer for the currently logged in user. The date/time picker displays time in 24-hour format (*dd/mm/yyyyhhmm:ssnnn*) where:

- *dd* represents days
- *mm* represents months
- *yyyy* represents years
- *hh* represents hours
- *mm* represents minutes

- *ss* represents seconds
- *nnn* represents milliseconds (added automatically to the time)

### To change the date or time in the date/time picker:

1. Click the element of the date or time you want to change in the start time picker or the end time picker.
2. Do either of the following:
  - Type in a time explicitly.
  - Press the **Up arrow key** or **Down arrow key** to increment or decrement the value respectively.

**Note:** You can use the **Left arrow** and **Right arrow** keys to move between time elements.

---

## Shift and Fit Time Units

You can manipulate the start time and end time by using special keyboard shortcuts. Using these shortcuts, you can do the following:

- Shift by unit
- Fit to unit.

### Shift by unit

Shifting date or time by unit allows you to change the opposite date/time element to the one selected by the corresponding date or time component. For example, if you shift by unit the month time element in the start time, the month time element in the end time increments by one month exactly, including days, minutes, and seconds. This also works for months that have different end days.

#### To shift by unit:

1. Press and hold down the **Shift** key.
2. Click a date or time element in the date/time picker. The opposite time picker changes by the base time amount of the selected time element.

### Fit to unit

Fitting date or time to unit allows you to synchronize the selected time element to the zero position of that time element in the start time and end time. For example, an operator clicks on the *hh* time element of the Start picker, which shows 19:30:05.123. After **Ctrl + click**, the Start hour time element shows 19:00:00.000, and the End time element shows 20:00:00.000. Now the time span represents exactly one hour, synchronized on the hour.

#### To fit to unit:

1. Press and hold the **Ctrl** key.
2. Click a date or time element in the date/time picker. Both the start time and end time element are synchronized to zero based on the date/time element selected.

## Scroll the Chart

The Process Analyst allows you to scroll through data in both the horizontal and vertical directions by dragging the mouse or spinning the mouse wheel.

### To scroll by dragging:

1. Click and hold down the left mouse button on the pen (or background) that you want to scroll.
2. Drag the mouse in the direction you want to scroll:
  - **Horizontal axis:** drag right to move backward in time, drag left to move forward.
  - **Vertical axis:** drag up to scroll down the axis, drag down to scroll up the axis.
3. Release the left mouse button to complete the scrolling.

### To scroll by using the mouse wheel:

1. Click the pen or background that you want to scroll.
2. Spin the mouse wheel in the direction you want to scroll:
  - **Horizontal axis:** spin up to move backward, spin down to move forward.
  - **Vertical axis:** spin up to scroll up the axis, spin down to scroll down.

You can disable scrolling in the horizontal direction, the vertical direction, or both by using the Property dialog box or the right-click (context) menu (see [Configure Pen Axes](#)).

The Process Analyst indicates whether scrolling is enabled or disabled by displaying a different-shaped mouse pointer; for details, see [Mouse Pointers](#).

## Scale the Chart

The Process Analyst allows you to change the scale of the data in both the horizontal and vertical direction by dragging the mouse or spinning the mouse wheel.

### To scale the data by dragging:

1. Click and hold down the left mouse button on the axis that you want to scale.
2. Drag the mouse in the direction you want to scale:
  - **Horizontal axis:** drag left to expand the scale, drag right to shrink.
  - **Vertical axis:** drag up to expand the scale, drag down to shrink.
3. Release the left mouse button to complete the scaling.

### To scale by using the mouse wheel:

1. Click the axis that you want to scale.
2. Spin the mouse wheel in the direction you want to scale:
  - **Horizontal axis:** spin up to shrink the axis, spin down to expand.
  - **Vertical axis:** spin up to expand the axis, spin down to shrink.

You can disable scrolling in the horizontal direction, the vertical direction, or both by using the Property dialog box or the right-click (context) menu (see [Configure Pen Axes](#)).

The Process Analyst indicates whether scaling is enabled or disabled by displaying a different-shaped mouse pointer (see [Mouse Pointers](#)).

## Lock/Unlock the Time Span

When the time span is locked and the start time and/or end time picker changed, the current time span is maintained. If the time span is unlocked, the time span is not maintained when any of the time pickers are changed.

By default, the span is locked. You can toggle span locking on or off by using the **Span Lock** button.

## See Also

[The Navigation Toolbar](#)

## Navigate Time

The navigation controls allow an operator to navigate backwards or forwards through time. The amount of time moved depends upon the time currently selected in the Span Picker. For example, if 10 minutes is selected in the Span Picker and **Back One Span** is clicked, the display moves back 10 minutes into the pen's history.

The following navigation controls are available:

Navigation control	Description
	<b>Back One Span</b> - moves back one time span.
	<b>Back Half a Span</b> - moves back half a time span.
	<b>Forward Half a Span</b> - moves forward half a time span.
	<b>Forward One Span</b> - moves forward one time span.

## See Also

[The Navigation Toolbar](#)

## Synchronize to Now

The Synchronize to Now command synchronizes every pen such that the date/time reflects "Now," which is positioned on the right-hand edge of the screen. "Now" is calculated using the current system time.

The Synchronize to command is also available from the right-click (context) menu.

## See Also

[The Navigation Toolbar](#)

## Toggle Autoscrolling

When Autoscroll is turned on, as time passes the position in time of pens moves by the same amount to keep pace; by default, the display is updated every second. The refresh rate of the display can be controlled by using the [Configure General Properties](#) property.

When Autoscroll is turned off, as time passes the position in time of pens remain fixed.

By default, Autoscroll is on. You can toggle Autoscrolling on or off by using the **Toggle Autoscrolling** button.

Using the navigation controls, including the Time Span picker, causes Autoscrolling to be turned off

The Autoscroll command is also available from the right-click (context) menu.

## See Also

[The Navigation Toolbar](#)

## Zoom In/Zoom Out

Use the Zoom In 50% and Zoom Out 50% command buttons on the [The Navigation Toolbar](#) like this:

Command	Icon	Description
Zoom In 50%		Zooms in on the displayed data, halving the span of both axes.
Zoom Out 50%		Zooms out of the displayed data, doubling the span of both axes.

**Note:** The midpoint of each axis is maintained during these zoom operations.

## See Also

[Toggle Box Zoom](#)

[Undo Last Zoom](#)

## Undo Last Zoom

The Undo Last Zoom button on the [The Navigation Toolbar](#) allows you to undo the last zoom operation, returning the display to the previous state.

## See Also

[Zoom In/Zoom Out](#)

[Toggle Box Zoom](#)

## Toggle Box Zoom

The **Toggle Box Zoom** button on the [The Navigation Toolbar](#) switches between Box Zoom mode and normal interaction mode. In Box Zoom mode, you can define an area of the chart to zoom in on for more detail.

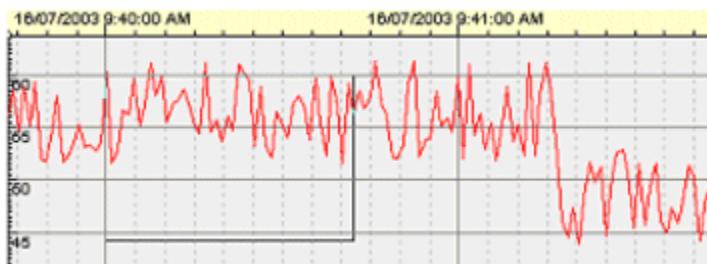

### To use Box Zoom:

1. Select the pen to zoom in on.
2. Click **Toggle Box Zoom** on the navigation toolbar.

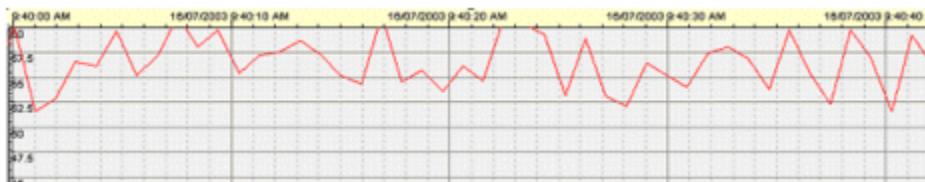

The cursor changes to a cross.

3. Click and drag the bounding box to enclose the part of the data you want to zoom in on, as shown below.

4. Release the mouse button. The display changes to a close-up of the selected data.

5. To exit Zoom mode, click the **Toggle Box Zoom** button.

Depending on whether the pens are locked or unlocked, the Toggle Box Zoom commands works differently:

- For locked pens, the zoom is applied to pens in the horizontal date/time axes. If an analog pen is being zoomed, the zoom is applied to the vertical (value) axis of non-autoscaled analog pens in the pane in which the zoom box was initiated.

- For unlocked pens, the zoom is applied only to the selected pen in both the date/time and vertical (value) axes. The value axis is only affected if autoscale is off.

**Note:** Vertical zoom is only applied to analog pens, since it has no effect with alarm or digital pens.

## See Also

[Zoom In/Zoom Out](#)

[Undo Last Zoom](#)

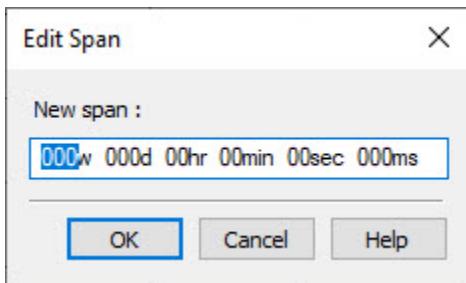

## Set a Nonstandard Time Span

Click the **Edit Span** button to display the Edit Span dialog box, which allows you to set non-standard time spans.

**To edit a nonstandard time span:**

- Click **Edit Span** on the [The Navigation Toolbar](#). The Edit Span dialog box appears.

The fields provided are: **w** = weeks, **d** = days, **hr** = hours, **min** = minutes, **sec** = seconds, and **ms** = milliseconds.

- Enter a **New span**. Click the element of the time span that you want to change, then either type in a new value, or use the **Up arrow** or **Down arrow** to specify a new value. You can use the **Right arrow** and the **Left arrow** key to move between the time elements.
- Click **OK**. The new time span is applied.

## Edit Vertical Scale

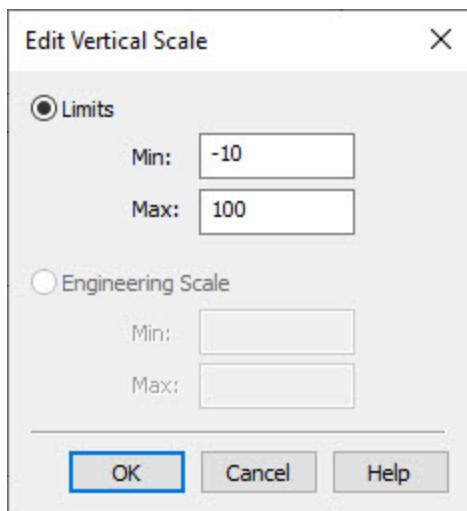

The Process Analyst allows operators to edit the vertical scale of a selected analog pen to display more appropriate values, if necessary. The vertical scale for digital or alarm pens cannot be edited.

**To edit the vertical scale:**

- Click the **Edit Vertical Scale** button on the [The Navigation Toolbar](#).

The Edit Vertical Scale dialog box appears.

2. Click the **Limits** or **Engineering Scale** option. The Limits values displayed are the current values used by the vertical scale. The Engineering Scale values are obtained from the trend tag.
3. Enter a new **Minimum** value and **Maximum** value, and then click **OK**.

## Reset to Default Span

Use the **Reset to Default Span** button to reset the time span to the default time span of the primary selected pen.

The default span can be configured by using the Property dialog box. For details, see [Configure Pen Axes](#).

[Configuring Toolbars](#)

## Use the Object View

The table describes how to perform basic functions with Object View.

Task	Description
Toggle the display of Object View on or off	Click <b>Toggle Object View</b> on the main toolbar.
Change the size of Object View	Drag the splitter bar that is located between the chart area and the Object View up or down.
Expand or collapse a tree node in the <b>Object Tree</b> column	Either click the (+) box to expand the node or the (-) box to collapse the node; or double-click the item to toggle between expanded and collapsed states. This does not affect the display of panes in the chart.

Task	Description
Select a pen	Click the pen in the Object View table. Selecting a pen in the Object View gives the focus in the chart to the selected pen, and vice versa. You can only select one pen per pane at a time (you cannot select a pane).
Display or hide a pen	Click to clear the check box to hide the pen; click the check box again to display the pen.
Dynamically change the width of a column during display	<p>Drag the column divider left or right.</p> <p><b>Note:</b> You can quickly re-size a column to fit the size of the widest item in a column by double-clicking a column separator. To re-size the column back to its original size, double-click the separator again. You can also configure the width of a column via the Process Analyst Properties dialog; for details, see <a href="#">Configuring the Object View</a>.</p>

[Configuring the Object View](#)

## Using Instant Trends with Process Analyst

At runtime from the Process Analyst you can browse variable tags or local variables directly, and subscribe for instant trending.

When you select a pen, in addition to Alarm and Trend Tags, you have the option of selecting Variable Tags or Local Variables for subscription and display on the trend graph.

---

**Note:** Displayed values will only be temporarily cached and will not be persisted.

### To use instant trends at runtime in the Process Analyst:

1. Display a page at runtime containing a Process Analyst.
2. Click on the 'Add Pens' button in the tool bar.
3. For the 'Type' field, select 'Variable Tags' or 'Local Variables'. This will allow you to browse for the tag you wish to instant trend.
4. Click the search button.
5. From the search results select which tag you wish to Instant Trend and click 'Add', as per usual.
6. Click 'OK' to add the pen to the Process Analyst.

## Configure the Process Analyst at Runtime

Many of the Process Analyst control's properties can be configured at run time to allow an operator to customize the control to suit their working preferences. To configure the Process Analyst, you use the [Process Analyst](#)

Properties Dialog Box.

[Configure Chart-wide Properties](#)

[Configure Chart Panes](#)

[Configure Pens](#)

[Configure Cursors](#)

[Configure Defaults](#)

[Configuring Toolbars](#)

[Configuring the Object View](#)

[Working with Views](#)

## Configure Chart-wide Properties

You use the Main page of the [Process Analyst Properties Dialog Box](#) to configure chart-wide properties. Select **Process Analyst** at the top of the property tree to display the Process Analyst properties page. This page contains two tabs, **General** and **Server Paths**, used to modify the following configurations:

- [Configure General Properties](#)
- [Configure Server Paths](#)

## Configure General Properties

You can configure general properties such as the background color of the chart, the refresh rate, data request rate, number of samples for pens, and specify whether chart pens are to be locked. The Administration area indicates the privilege setting for the current Operator and whether security settings are inherited from the graphics page containing the Process Analyst.

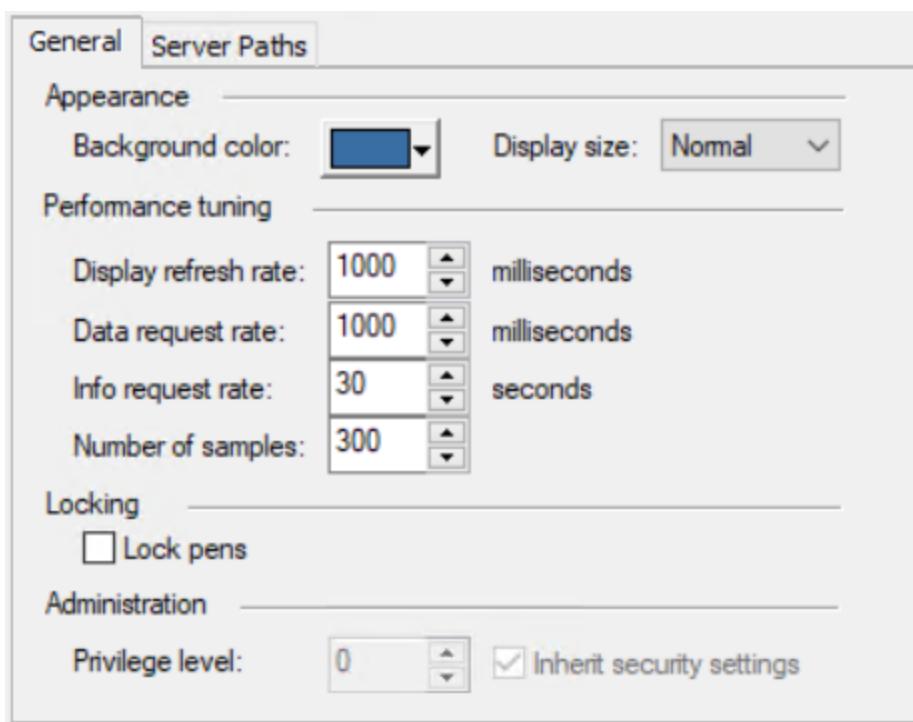

### UNACCEPTABLY SLOW PROGRAM EXECUTION

- Do not specify a Display refresh rate less than 500 ms.
- Do not specify a Number of Samples greater than 500.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

**To configure general properties:**

1. Click the **General** tab on the Main page.

2. Click the color swatch and select a **Background color**.
3. Select a **Display size**: Use this setting to set the size of the fonts and other user interface elements to suit your screen size.
4. Specify a **Display refresh rate**.

This value determines the rate at which the display data is refreshed on the display; it also controls how often the position of the Now indicator is refreshed. This control is disabled if you do not have appropriate privilege. The default value is 1000 milliseconds. The permitted range is between 10 milliseconds to 60,000 milliseconds. Specifying a rate below 500 is not recommended if your chart contains many pens, since this may negatively affect performance.

5. Specify a **Data request rate**.

This value determines the maximum frequency of data requests. The Process Analyst internally determines when a request is necessary, but you can use this property to cap the Process Analyst's performance.

This control is disabled if you do not have appropriate privilege. The default value is 1000 milliseconds. The permitted range is between 10 to 60,000 milliseconds. This property affects Trends Server performance.

6. Specify a **Info request rate**.

The Process Analyst will periodically refresh the configuration data for alarm and trend pens to reflect any changes caused by a reload on the server. This property defines (in seconds) how often the server is checked for pen configuration changes.

You can use any value between 0 and 600 (seconds); the default value is 30 (seconds). A setting of 0 (zero) means no automatic refresh will occur.

The functionality of Info Request Rate is associated with online changes.

The behavior is that Process Analyst periodically checks for changes in properties of the underlying tag of the trended pens and update them.

The periodic updates cause change in the vertical scales of analog trends and update the ENG\_ZERO and ENG\_FULL in "Engineering Scales" column as well as other available properties in the Object View.

However, once changed manually by the user, the vertical scale of an analog pen is not subsequently altered by periodic Info Requests.

When saved and restored from PAV file, the vertical scales will remain as manually changed by the user and not updated as a result of the periodic Info Requests.

#### 7. Specify a Number of Samples.

This specifies the date/time axis span of each pen in number of samples. This control is disabled if you do not have the appropriate privilege. The default value is 300. The permitted range is between 10-5000. This number is dependent on the [Trend]MaxRequestLength parameter in the Citect.ini file. The default value of [Trend]MaxRequestLength is set to 4000, this will only allow a maximum of 3330 samples to display. If you wish to display the maximum number of 5000, set the [TREND]MaxRequestLength parameter to 6004 or greater. This is calculated by the number of samples (5000) plus 20% plus an additional 4 samples.

---

**Note:** This value is closely tied to your display resolution. The default setting is ideal for screen resolutions from 1024x768 to 1280x1024. The association between Number of Samples and the display resolution occurs because for each sample shown on screen the Process Analyst attempts to leave a small gap to allow for sample markers. Because the Process Analyst shows samples when they occur, it requires less data than a traditional trend client. Retrieving data is expensive and the more data you retrieve the more time the request takes. *It is recommended that this parameter not exceed 500.*

---

The chart has a minimum resolution of one millisecond per sample. If the time span is reduced enough so that the number of samples exceeds the number of milliseconds in the time span, the number of milliseconds in the time span is used instead of the number of samples.

8. Select the **Lock pens** check box to lock your pens, or clear the check box to turn off pen-locking. For details on pen locking, see .
9. Set the **Administration Privilege Level** necessary for an operator to use this object/group. Select the **Inherit Security Settings** check box if you want security settings to be inherited from the page containing the PA, or clear the check box to overwrite security settings when a new .pav file is loaded.
10. Click **Apply**.

### **WARNING**

#### **UNACCEPTABLY SLOW PROGRAM EXECUTION**

Do not set the Administration Privilege level to zero on a running system.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

## See Also

[Exporting Pen Data](#)

## Configure Server Paths

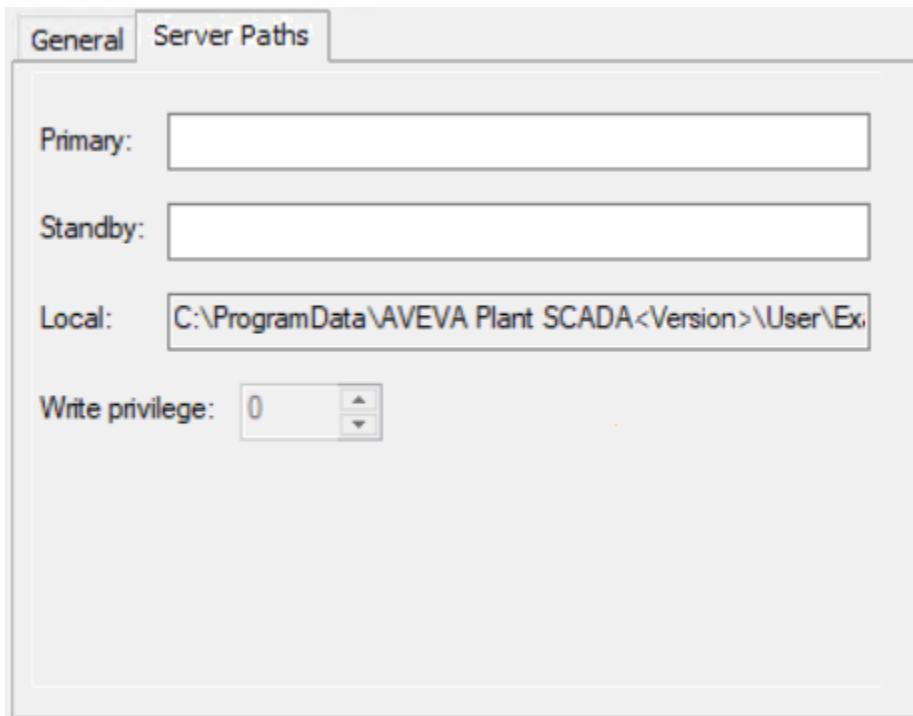

You can configure the file server locations that the Process Analyst uses to load and save Process Analyst views, and displays the current Plant SCADA run path if the Process Analyst is embedded in a running Plant SCADA system. This command is disabled at run time if you do not have the appropriate privilege. For details about saving and loading views, see [Working with Views](#) and [Process Analyst View Synchronization](#).

The Process Analyst uses four possible storage locations:

- **User** - maps to the client machine's logged-in user's **My Documents** folder. This option is available for any possible privilege and Plant SCADA mode.
- **Primary** - User-definable.
- **Secondary** - User-definable.
- **Local** - displays the current Plant SCADA run path (read-only). This text box only gets populated when the Process Analyst is running in Plant SCADA V6.0 or higher. This path is an Analyst Views subdirectory under the Plant SCADA current Run directory.

### To configure server paths:

1. Click the **Server Paths** tab on the Main page.

2. Enter the location of the **Primary** file server.
3. Enter the location of the **Standby** file server (optional). This specifies the file server to use if the primary file server is unavailable.
4. Click **Apply**.

## Configure Chart Panes

You use the Properties dialog box to configure chart panes. After adding a pane, you can configure its size relative to other panes, as well as select a different color. Pane properties can be configured during run time.

### To add a pane:

- In the property tree of the Properties dialog box, right-click the **Process Analyst view** item at the top of the tree, and then select **Add Pane**. (To remove a pane, right-click a pane in the tree and choose **Delete**.)

### To configure the chart pane:

1. In the property tree of the Properties dialog box, select the pane you want to configure. The properties for that pane appear.

**Note:** To configure defaults for your panes, select the **Pane** item in the **Default Settings** node of the property tree, not a specific pane.

2. Click the color swatch and select a new **Background color**.
3. Select a **Height** option:
  - **Variable** - Automatically calculates the pane height based on the value in the **Size** control. For example, if the chart contains two panes, selecting this option and using a **Size** value of **110** will set this pane to 110% of the size of the other pane in the chart. Fixed height panes have precedence of variable-size panes.
  - **Fixed** - Sets the pane height to the value specified in the **Size** control.
4. Specify a **Size** for the pane.
5. Click **Apply**.

## Configure Pens

The Process Analyst allows you to configure your pens to suit your preferences. Pen configuration tasks are performed by using the Properties dialog box, which is used to:

- [Configure Pen Appearance](#)
- [Configure Pen Gridlines](#)
- [Configure Pen Axes](#)
- [Configure Pen Quality](#)
- [Configure the Pen Data Connection](#)
- [Configure Cursor Labels](#).

### Configure Pen Appearance

You use the Process Analyst Properties dialog box to configure the appearance of pens. Pen appearance can be configured at run time by Operators and Users (and at design time by Users).

For details about pen appearance, see [Pens](#).

**Note:** To configure default settings for pen appearance, select **Analog**, **Digital**, or **Alarm** in the property tree under **Default Settings**, and then complete the procedure below for the type of pen you want to configure.

## See Also

[Configure Analog and Digital Pens](#)

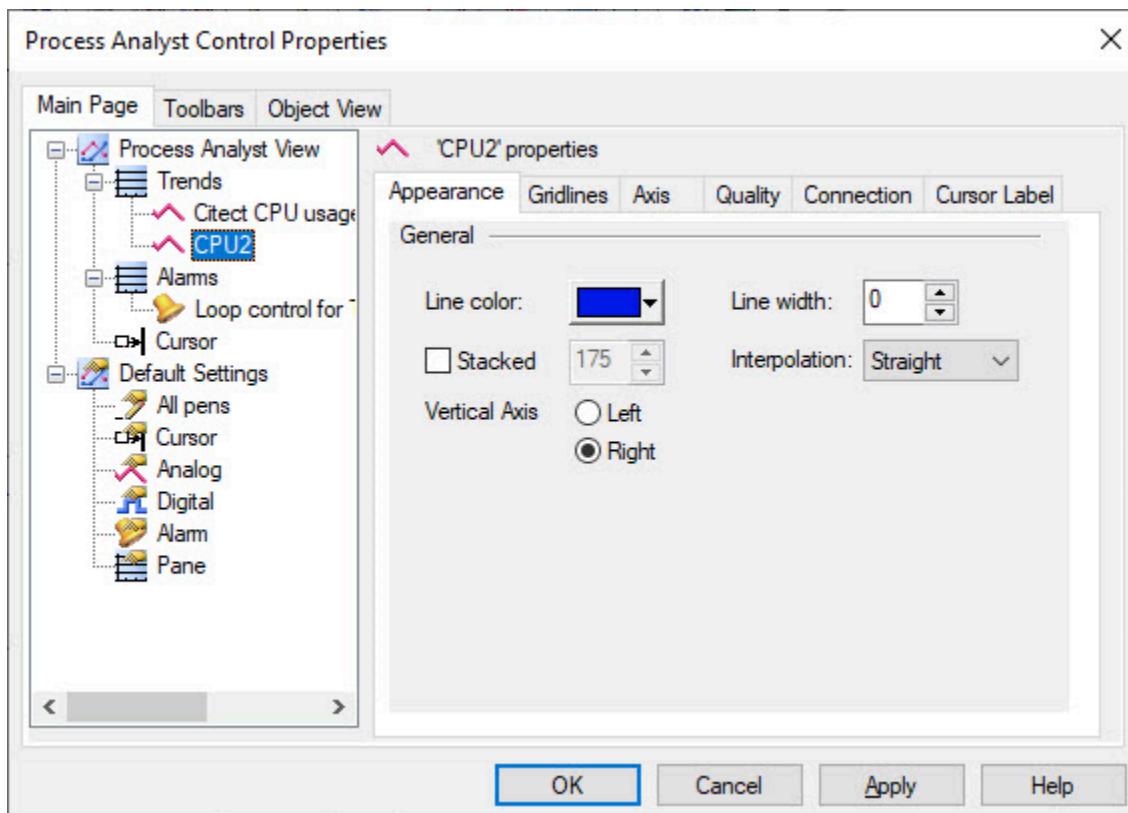

[Configure Alarm Pens](#)

### Configure Analog and Digital Pens

Configuring the appearance of analog or digital pens involves selecting the line color, stack property, line width, and either the method of interpolation (analog pens) or fill color (digital pens).

#### To configure pen appearance:

1. Select the pen you want to configure.
2. Click the **Appearance** tab to display the appearance property controls. Properties vary depending on type of pen.

3. Select a **Line color** using the color swatch.
4. Specify a **Line width**.
5. To stack a pen, select the **Stacked** option and then specify a **Height** in pixels for the stack.
6. Do one of the following:
  - For **analog pens**, choose an **Interpolation** method. **Straight** causes a line to be drawn directly between two data points. **Stepped** causes a line to be drawn between points maintaining the value of the previous sample until a sample with a different value arrives, in which case a vertical line is drawn.
  - For **analog pens**, select if the pen will display on the left or right **Vertical Axis**. You can now compare trend tag data side by side using a dual axis.

**Note:** For overlaid pens, all pen vertical axis will be visible regardless of the selection. For this reason up to two pens can be overlaid with axis on left and on right. If all axes are on one side, only the selected one will be visible

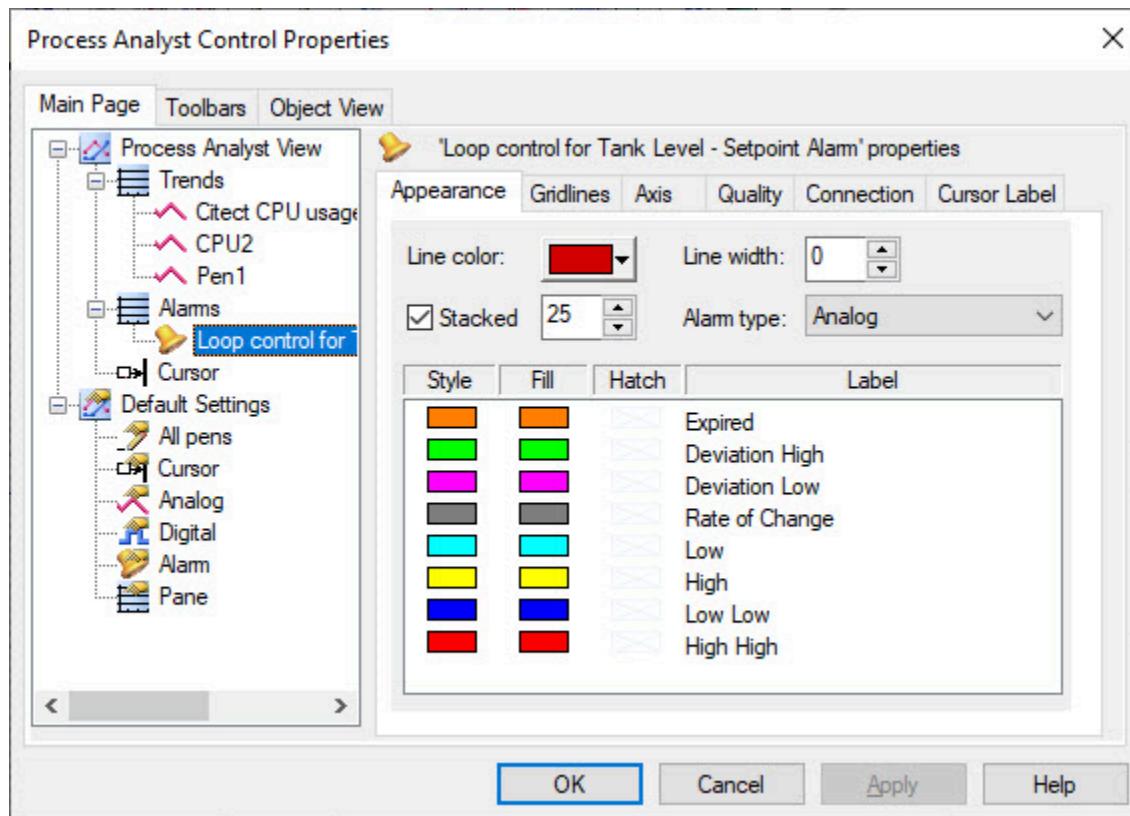

- For digital pens, select the **Filled** check box, and then select a fill color from the color swatch.
7. Click **Apply**.

## Configure Alarm Pens

Configuring the appearance of alarm pens involves selecting the line color, stack property, line width, alarm type, and the properties for that alarm type.

### To configure alarm pen appearance:

1. Select the pen you want to configure.
2. Click the **Appearance** tab to display the appearance property controls for the selected alarm pen.

3. Select a **Line color** using the color swatch.
4. Specify a **Line width**.
5. To stack a pen, select the **Stacked** option and then specify a **Height** in pixels for the stack.
6. Select an **Alarm type**. For details about the different types of alarm pen available, see [Pens](#).
7. For each **Label** for the alarm type you selected, select a **Style**, a **Fill** color, and/or a **Hatch** color by using the swatches.
8. Click **Apply**.

## Configure Pen Gridlines

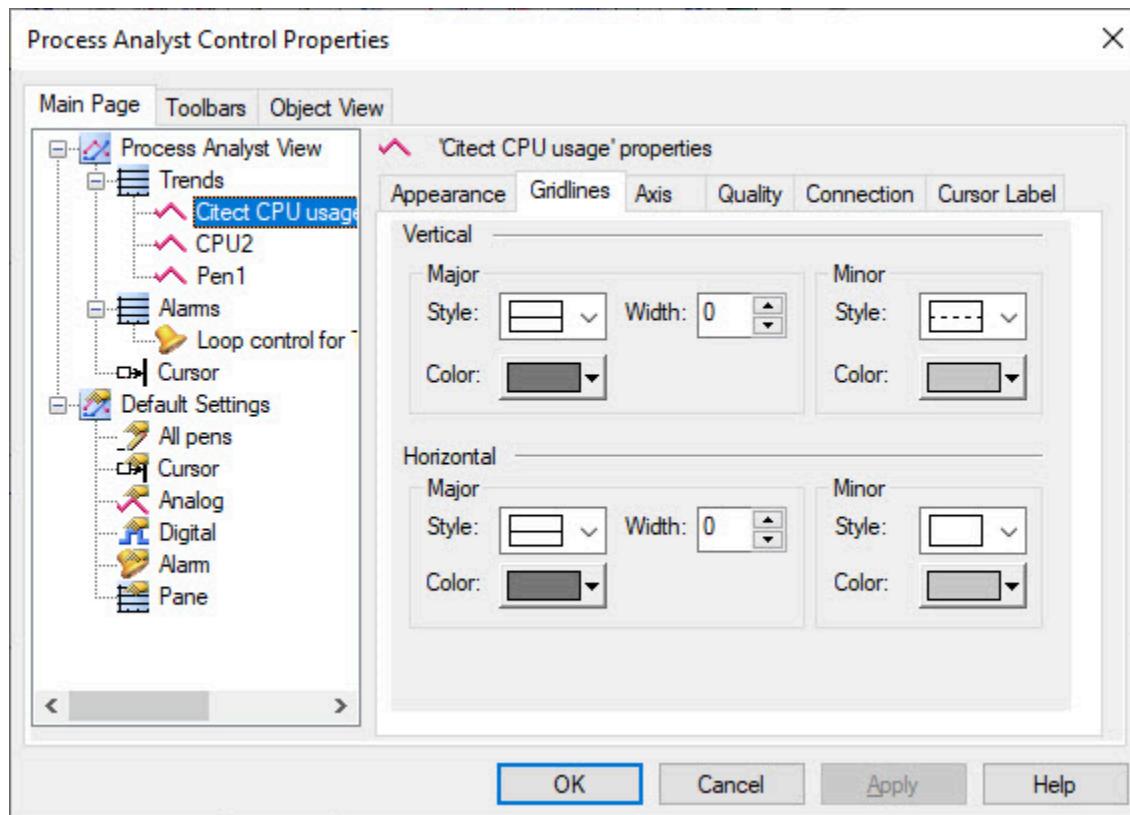

You use the Process Analyst Properties dialog box to configure the gridlines for a selected pen. Pen gridlines can be configured at run time by Operators, and at design time by Users.

For more information about pen gridlines, see [The Chart View](#).

**Note:** To configure defaults for pen gridlines, select the **All pens** item in the property tree under **Default Settings**, and then complete the procedure below.

### To configure pen gridlines:

1. Click the **Main Page** tab.
2. From the property tree list, select the pen you want to configure gridlines for.
3. Click the **Gridlines** tab to display the gridlines property controls.

4. In the **Vertical: Major** area, select a **Style**, specify a **Width**, and then select a **Color**.
5. In the **Vertical: Minor** area, select a **Style**, specify a **Width**, and then select a **Color**.
6. In the **Horizontal** area (analog pens only), select a **Style** for the minor gridline, specify a **Width**, and then select a **Color** for the major gridline.
7. Do the same if necessary for the minor gridline.
8. Click **Apply**.

## Configure Pen Axes

You use the Process Analyst Properties dialog box to configure the axis of the selected pen. A pen axis can be

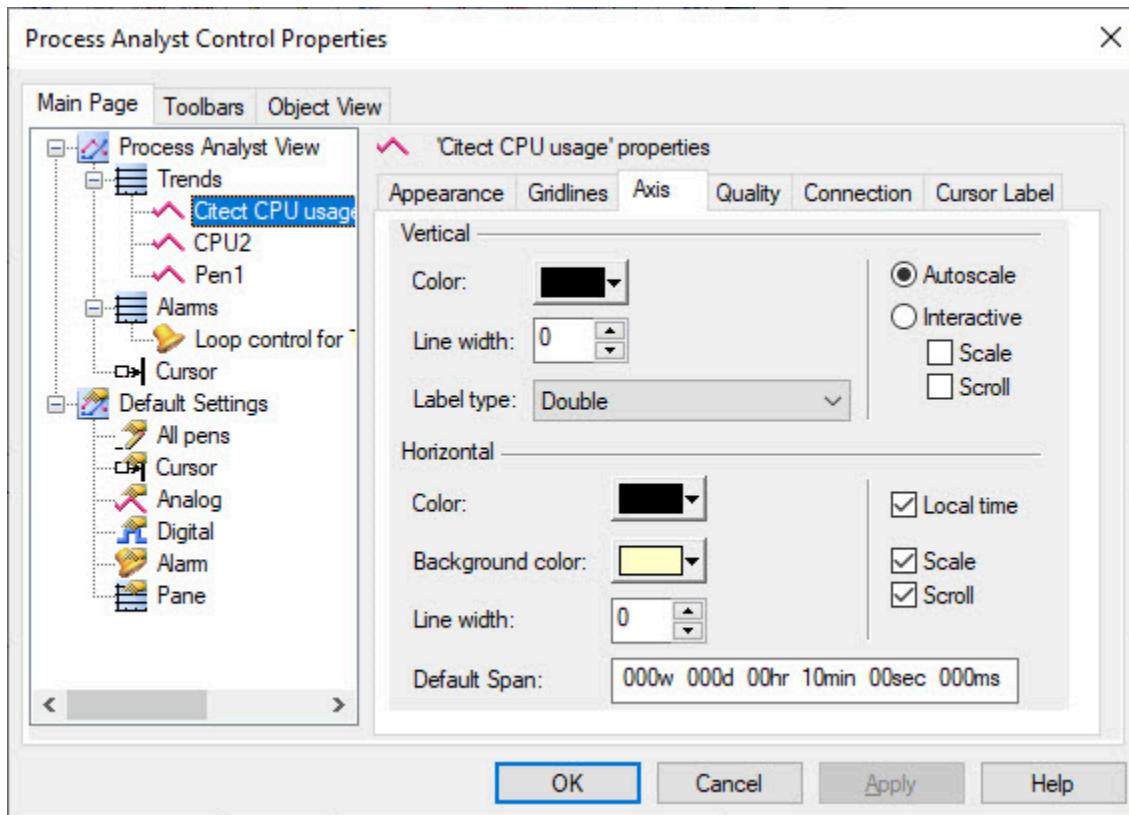

configured at run time by Operators, and at design time by Users.

You can configure the color, line width, label type, scroll and scale properties for the date/time and value axes. You can also choose whether to display time on the date/time axis using local or UTC format.

**Note:** To configure defaults for pen axes, select the **All pens** item in the property tree under **Default Settings**, and then complete the procedure below.

### To configure a pen axis:

1. Click the **Main Page** tab.
2. From the property tree list, select the pen you want to configure axes for.
3. Click the **Axis** tab to display the axis property controls.

4. In the **Vertical** area, select a **Color** by using the color swatch.
5. Enter a new **Line width**.
6. Select a **Label type**. This specifies the format to use for axis values.
7. Do one of the following (analog pens only):
  - Select the **Autoscale** option to autoscale the vertical axis.
  - Select the **Interactive** option, and then select **Scale** to be able to interactively scale the vertical axis; and/or select **Scroll** to be able to scroll the axis.

**Note:** These options are also available on the right-click (context) menu.

8. In the **Horizontal** area, select a **Color** by using the color swatch.
9. Select a **Background color** by using the color swatch.
10. Enter a new **Line width**.

11. Enter a **Default Span** to define the span you want to use for a new pen.

The default span is used by the Process Analyst when the Operator or User clicks the **Reset to Default Span** button, or if the pen is added in pen unlocked mode, or if the pen is the first one added to a display.

If you are setting the span value as a default setting for new pens, the new span value is inherited by new pens created.

12. Select the **Local Time** option to display the date/time axis in local time using your machine settings. If this option is not selected, the time is displayed in UTC format. For details about time display on the date/time axis, see [The Chart View](#).
13. Select **Scale** to be able to interactively scale the vertical axis.
14. Select **Scroll** to be able to scroll the axis.

---

**Note:** The **Scale** and **Scroll** options are also available on the right-click (context) menu.

---

15. Click **Apply**.

## Configure Pen Quality

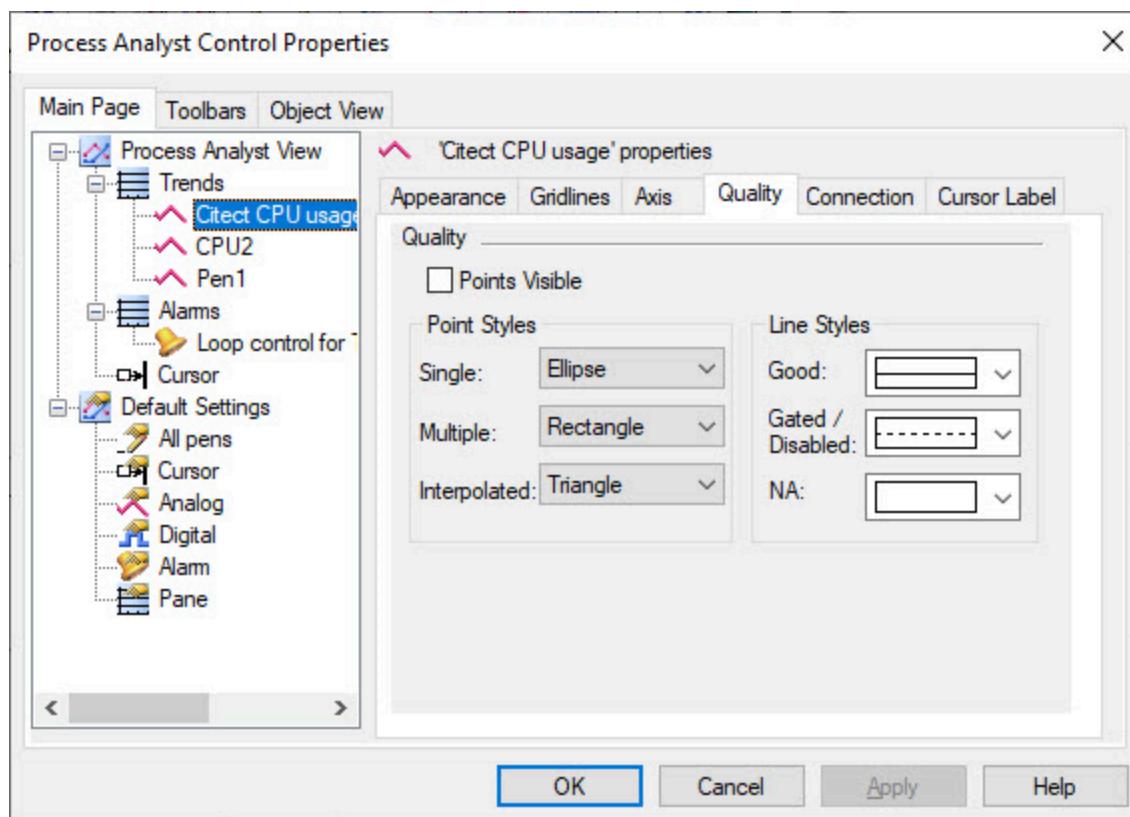

You use the Process Analyst Properties dialog box to configure the quality of the selected pen. Pen quality can be configured at run time by Operators, and at design time by Users.

Configuring the pen quality allows you to define the appearance of sample markers on a selected pen, as well as the line styles of the pen, based upon the quality of the data being trended by the Process Analyst.

For details about how the Process Analyst represents data quality, see [Data Quality](#).

### To configure pen quality:

1. Click the **Main Page** tab.
2. Select the pen you want to configure.
3. Click the **Quality** tab to display the quality property controls.

4. To enable points for the pen to be visible, select the **Points Visible** option.
5. In the **Point Styles** area, select a **Single** point style to represent a single data sample.
6. Select a **Multiple** point style to represent multiple data samples.
7. Selected an **Interpolated** point style for interpolated data samples.
8. In the **Line Styles** area, select a line style to represent a **Good** sample.
9. Select a line style to represent a **Gated/Disabled** sample.
10. Select a line style to represent an **NA** sample.
11. Click **Apply**.

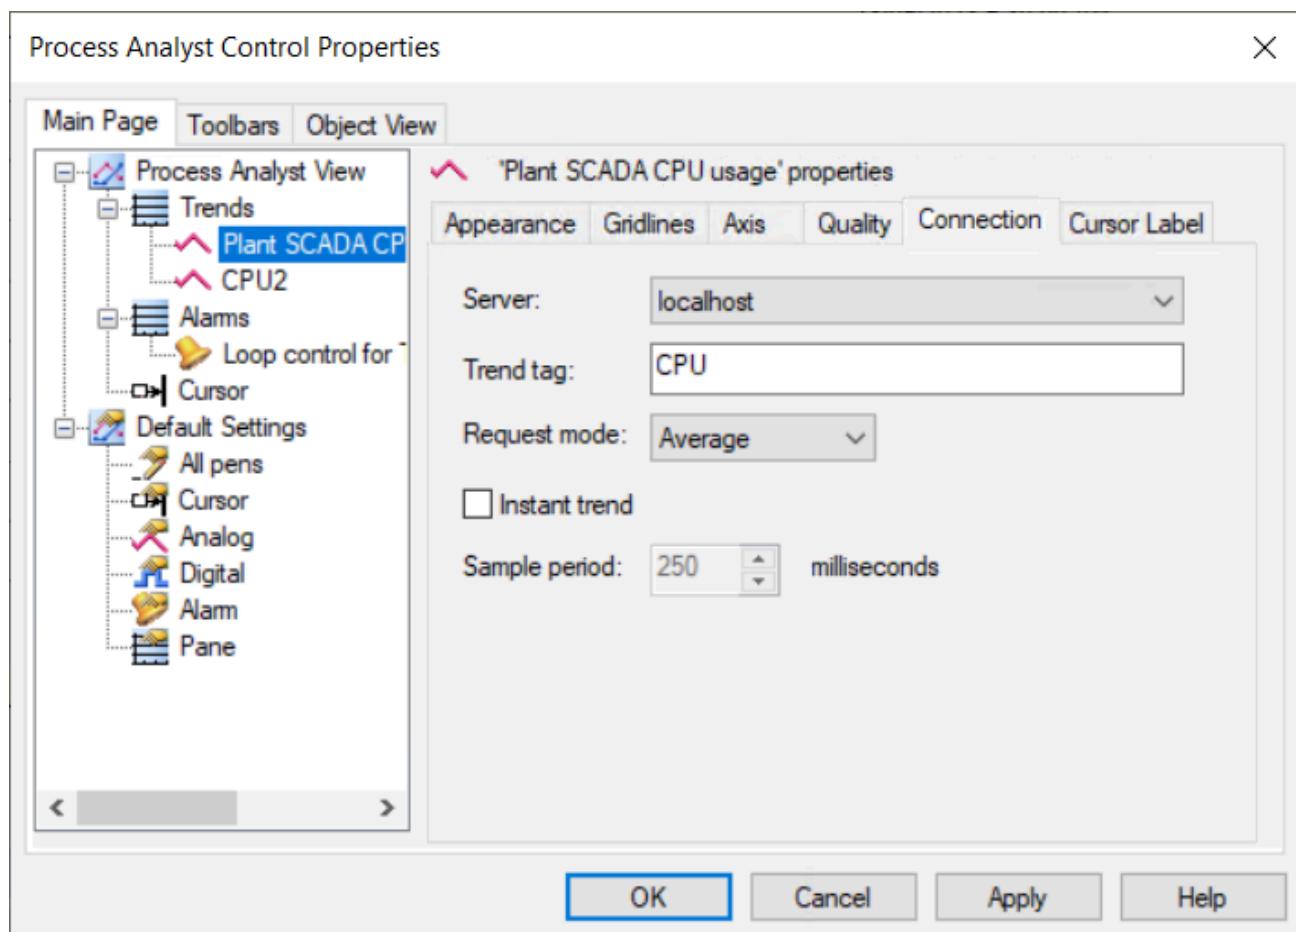

## Configure the Pen Data Connection

You use the Process Analyst Properties dialog box to configure the pen data connection. This allows you to define the server, trend tag, and request mode for the selected pen.

Pen connection can be configured at run time by Operators and Users that have the appropriate privileges.

### To configure pen data connection:

1. Select the pen you want to configure.
2. Click the **Connection** tab to display the connection property controls.

3. For the **Server** data connection, a <localhost> connection is selected by default, indicating that the Process Analyst will connect to the Plant SCADA run time client running on the same computer, and pass its requests through to the client, which will pass them onto the server.

You can also select <Unbound> for the **Server** field from the drop-down menu. An engineer can select this option to manually add samples to analog or digital pens using [IPen.AddSample](#). For example, if you are reading information from an external source, you can add samples to the display.

4. In the **Trend tag** field, enter the trend tag for the pen. In a system with more than one cluster, specify both the cluster and tag using the format <cluster name.tag name>. Omitting the cluster name will cause an error. If the system has only one cluster configured, you can just enter the tag name. The configured cluster will be assumed.
5. Select a **Request mode**. The default is Average.

The request mode defines how multiple samples are treated by the Process Analyst. Regardless of the request mode used, the timestamp for a sample is always averaged.

6. In selecting the **Instant trend** box - the process analyst requests the pen's data using the new instant trend system instead of the standard trend system, as a configured trend tag. If the Instant Trend box is selected the **Sample Period** field becomes available. The sample period is used in the instant trend cache to subscribe to the IO tag on the IO server, and sets how often the IO Device is polled to check the value of the tag on the IO server.

**Note:** A new sample will only appear in the Process Analyst for an instant trend if the tag value changes. So even if your sample period is very low, you may only get the occasional new sample displayed for when the value changes. The faster the sample period, the more precise the samples will be in the instant trend, but at

a cost of a higher load placed on the IO Device (more frequent polling).

7. Click **Apply**.

## See Also

[Data Compaction](#)

### Configure Cursor Labels

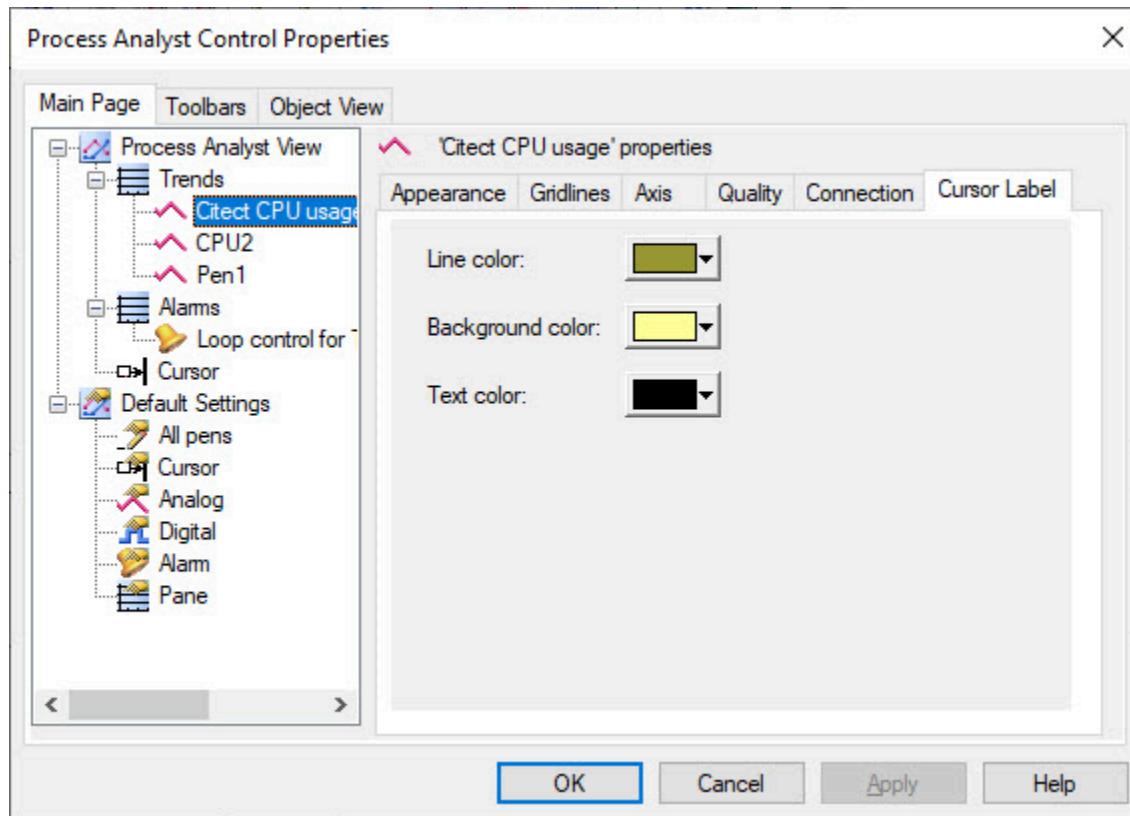

You use the Process Analyst Properties dialog box to configure the pen cursor labels. Configuring the pen cursor labels allows you to specify the color used for the lines, background, and text on the cursor label. The information shown on a cursor label is predefined and cannot be changed.

For details about cursor labels, see [Using Cursor Labels](#).

Pen cursor labels can be configured at run time by both Operators and Users that have the appropriate privileges.

#### To configure cursor labels:

1. Select the pen you want to configure.
2. Click the **Cursor Label** tab to display the connection property controls.

3. Select a **Line color** from the color swatch.
4. Select a **Background color** from the color swatch.
5. Select a **Text color** from the color swatch.

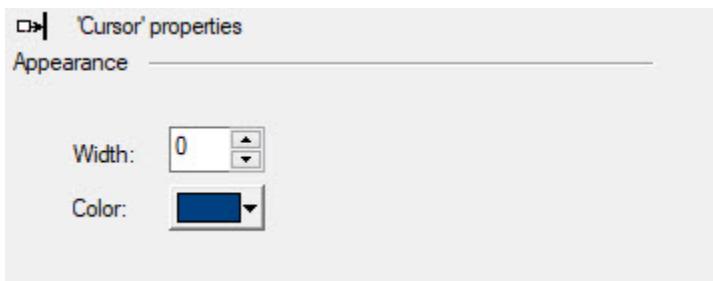

6. Click **Apply**.

## Configure Cursors

You can configure the line width and line color of a selected cursor. Changes to the cursor line color apply only to the currently selected cursor. For details on cursors, see [Cursors](#).

### To configure the cursor:

1. In the property tree of the Process Analyst Properties dialog box, click the cursor you want to configure. The **Appearance** property controls appear.

2. Type in a new **Width** value, and/or select a new **Color**.
3. Click **Apply**.

## Configure Defaults

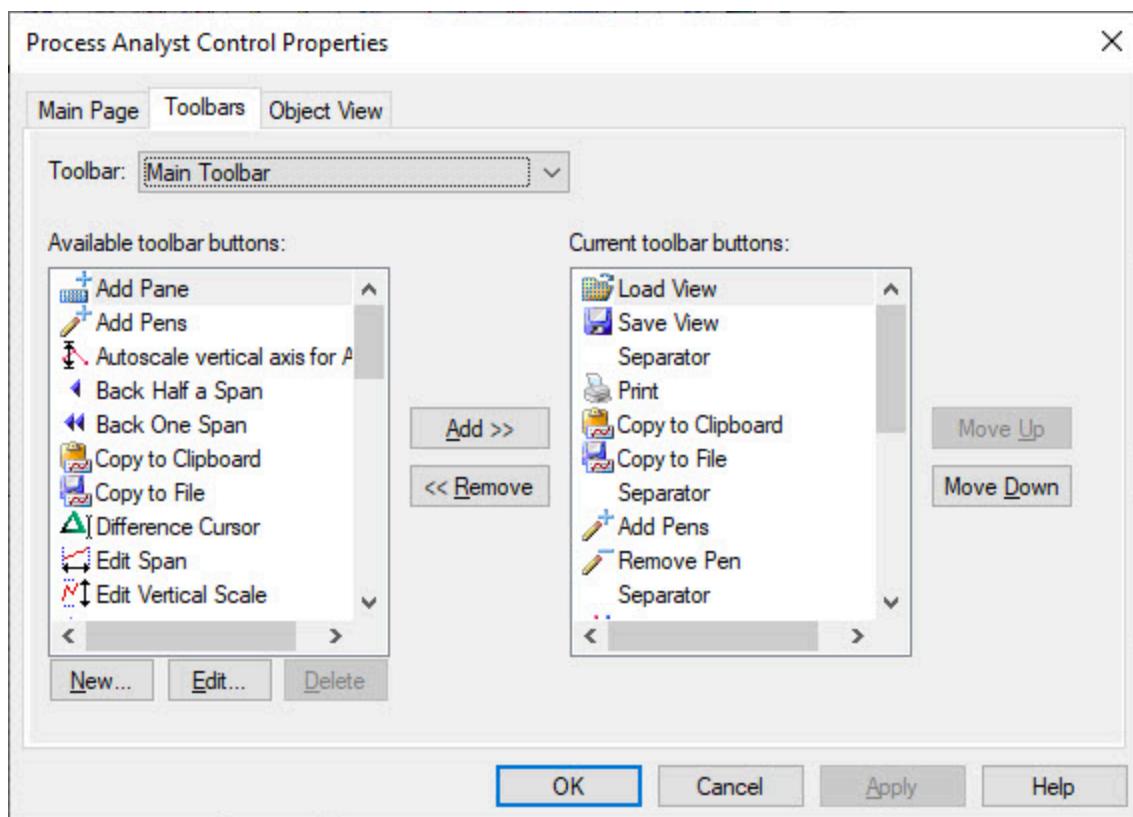

The defaults are a collection of properties that are inherited by each item (pane, pen, cursor, and so on) when that item is created. These default properties are maintained for the lifetime of the item until its properties are modified.

You configure these defaults in the same way as you configure the individual components. The Default Settings node on the property tree contains the following items:

- **All pens** - configure the gridlines, axis, quality, connection, and cursor label properties for pen types. See [Configure Pen Gridlines](#), [Configure Pen Axes](#), [Configure Pen Quality](#), [Configure the Pen Data Connection](#), and [Configure Cursor Labels](#).
- **Cursor** - configure cursor defaults. See [Configure Cursors](#).
- **Analog** - configure the appearance of analog pens. See [Configure Pen Appearance](#).
- **Digital** - configure the appearance of digital pens. See [Configure Pen Appearance](#).
- **Alarm** - configure the appearance of alarm pens. See [Configure Pen Appearance](#).
- **Pane** - configure the pane height and appearance defaults. See [Configure Chart Panes](#).

## Configuring Toolbars

The Process Analyst has two toolbars, the main toolbar and the navigation toolbar. You use the Properties dialog box to configure the toolbars.

Operators can configure the Process Analyst toolbars by:

- [Adding or Removing Toolbar Commands](#)
- [Changing the Order of Toolbar Commands.](#)

Users can perform additional tasks such as:

- [Adding New Commands](#)
- [Editing Existing Custom Commands.](#)

## Adding or Removing Toolbar Commands

Operators can add or remove toolbar commands during run time.

### To add or remove commands from a toolbar:

1. From the **Toolbar** menu, choose the toolbar you want to customize (**MainToolbar** or **Navigation Toolbar**).
2. **To add a command to the toolbar:** In the **Available toolbar buttons** list, select the command you want to add to the toolbar, and then click **Add**. The selected command moves to the **Current toolbar buttons** list.  
The **Available toolbar buttons** list contains the command buttons available in your system, including predefined as well as user-defined commands.
3. **To remove a command from the toolbar:** In the **Current toolbar buttons** list, select the command you want to remove from the toolbar, and then click **Remove**. The selected command moves to the **Available toolbar buttons** list.

## Changing the Order of Toolbar Commands

Operators can change the order of toolbar commands during run time.

### To change the order of commands:

- Select a command in the **Current toolbar buttons** list and click **Move Up** or **Move down** to move the selected command up or down the list as necessary.

## Configuring the Object View

Operators can configure the Object View to display additional pen information to the columns that are displayed by default. You configure the Object View by using the Properties dialog box.

Operators can select which columns to display, as well as change the size of existing columns and the column display order. Users can define new columns, or edit or delete existing columns; for details, see [Creating or Editing Object View Columns](#).

You can configure the Object View to display these predefined columns:

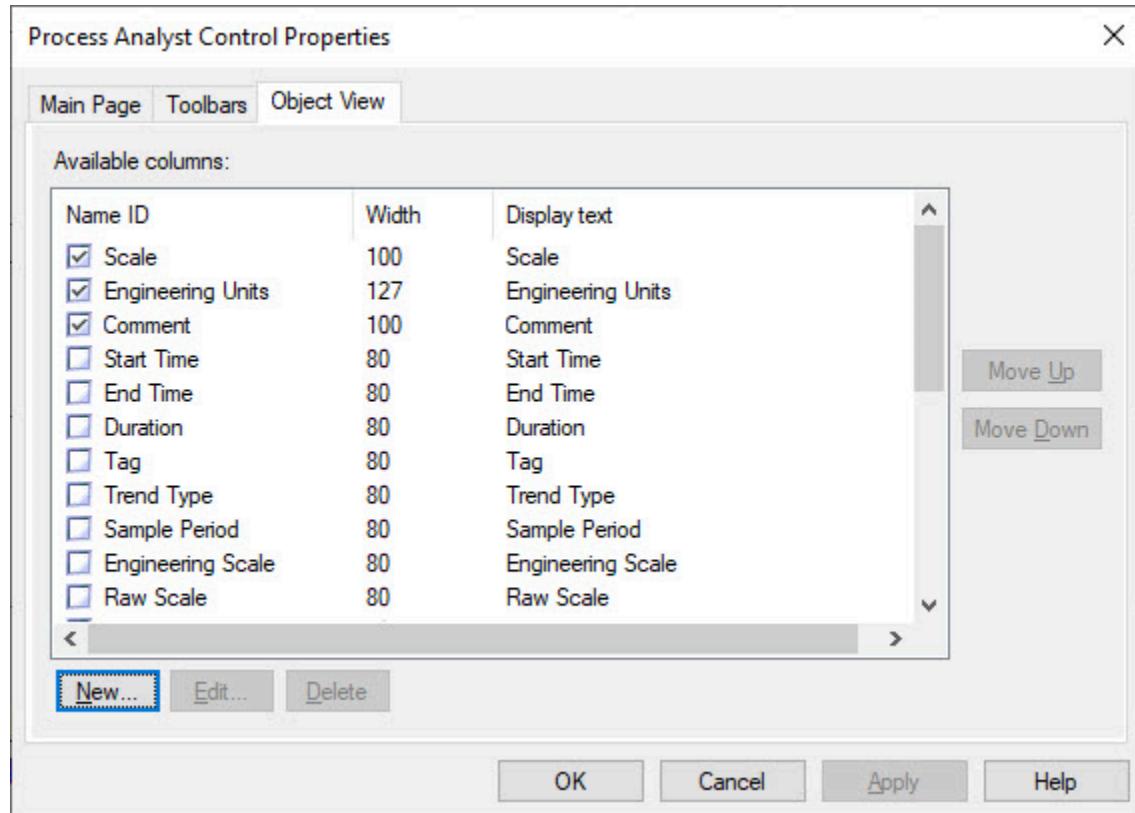

Column	Description
Scale	Vertical axis start and end position of the pen.
Engineering Units	Engineering units associated with the pen.
Comment	The trend/alarm comment defined for the pen.
Start Time	Date/time axis start position of the pen.
End Time	Date/time axis end position of the pen.
Duration	Difference between the start time and the end time.
Tag	Pen's associated trend or alarm tag.
Trend Type	Trend type of associated tag.
Sample Period	Sampling period of the associated trend tag.
Engineering Scale	Engineering scale for associated trend tag.
Raw Scale	Raw scale for associated trend tag.
Alarm Category	Category of associated alarm tag.
Alarm Description	Description of associated alarm tag.
Alarm Area	Area of associated alarm tag.
Alarm Name	Name of associated alarm tag.
Alarm Type	Alarm type of associated alarm tag.

Column	Description
Error	Displays the error of the last data request. Blank if last data request succeeded.
Minimum	Lowest displayed value (trend tags only).
Maximum	Highest displayed value (trend tags only).
Average	Average of every displayed value (trend tags only).

For information on columns that are displayed by default, see [The Object View](#).

## Object View Properties Page

The Object View properties page allows you to show or hide existing columns, create custom columns, edit existing columns, and re-order columns.

The Properties page displays the available columns for the Object View and their properties:

- **NameID** - Internal identifier, which needs to be unique.
- **Width** - Default width of the column in pixels.
- **Display Text** - Title displayed in the column header.

The check boxes in the NameID column are bound to a column's visibility: a column is visible only if the associated check box is selected.

The **Move Up** and **Move Down** buttons to the right of the **Available Columns** list box allow you to reorder columns. The order of the columns from top to bottom in the list dictates their display order from left to right in the Object View. Clicking **Move Up** or **Move Down** shifts the currently selected item up or down respectively.

## See Also

[Creating or Editing Object View Columns](#)

## Working with Views

An Operator can save the visual setup of a Process Analyst control by saving a *view*, which is saved as a Process Analyst View (.pav) file. They can also load views that have been created previously. A view saves the state of every command, as well as properties for every the Process Analyst components (pane, pen, axes, background, and so on).

To save a view or to load a view, you use the **Save View** and **Load View** commands, respectively, on the main toolbar.

## See Also

[Saving a View](#)

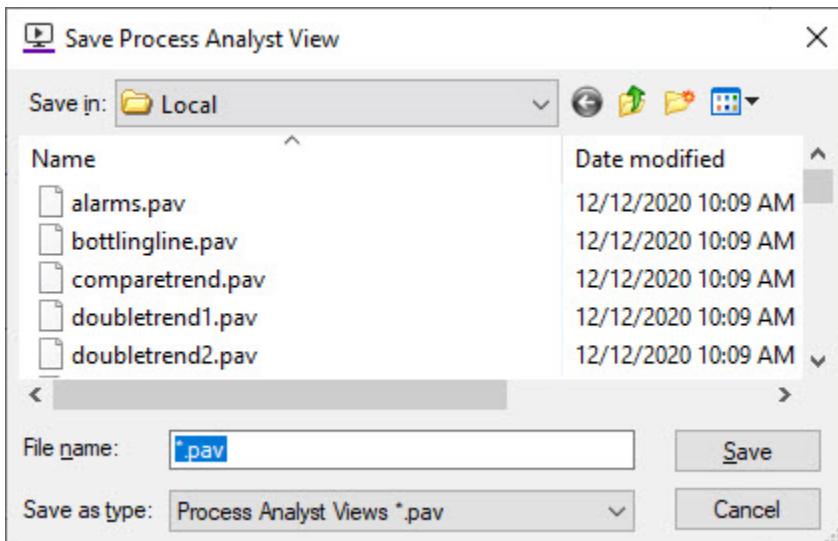

[Load a View](#)

## Saving a View

A Process Analyst view stores the trends and alarms that are being displayed, the columns being viewed in the Object View, the toolbar buttons that are available, as well as the "look and feel" of the view.

### To save a view:

1. On the main toolbar, click **Save View**. The Save Process Analyst View dialog box appears, showing the location where you can save views.

2. Choose the location where you want to save your view.

**Note:** It is your administrator's responsibility to set up the correct directories for saving views.

3. Enter a **File name** for your view, and then click **OK**.

To support redundancy, if the **Local** option is available and selected, Plant SCADA attempts to save the view to the primary, standby *and* local locations.

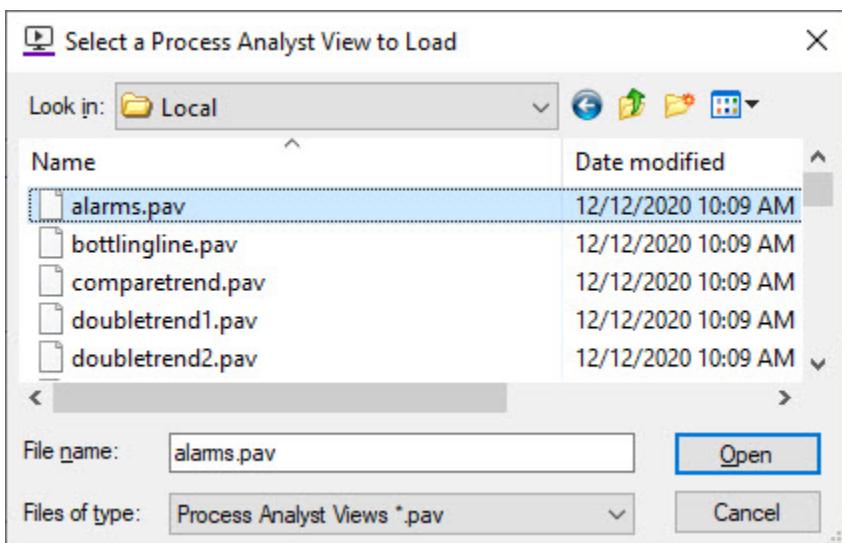

## Load a View

When loading a view, the start time and end time of a view is restored only if autoscroll is off. If autoscroll is on, pens are synchronized to "Now."

When loading a view, the only locations that are available (**My Documents**, **Primary**, and **Standby**) are those that have been configured by your administrator.

### To load a view:

1. On the main toolbar, click **Load View**. The Load dialog box appears.

2. Select a view to load, and then click **Open**. The view is loaded.

## Operator Command Reference

You use the toolbar commands on the main toolbar and navigation toolbar to perform commonly used functions for viewing and interacting with Process Analyst data, such as adding or removing pens, displaying cursors, and so on.

Process Analyst has predefined commands, grouped into the following categories:

- [View Commands](#)
- [Zoom Commands](#)
- [Navigation Commands](#)
- [Export Commands](#)

- [Interface Commands](#)
- [General Commands](#)

The toolbars in your run time environment might have been customized during implementation, so not every command might appear on your toolbars. Additionally your toolbars might have custom commands not described here. The tables describe the *default* set of commands delivered with the Process Analyst.

## View Commands

The Process Analyst has the following view commands by default:

Icon	Tooltip	Description
	Save View	Displays the Save File dialog box allowing an Operator to save a Process Analyst view to a specified location. For details, see <a href="#">Saving a View</a> .
	Load View	Displays the Load View dialog box allowing the operator to specify a view to load. For details, see <a href="#">Load a View</a> .

## See Also

- [Zoom Commands](#)
- [Navigation Commands](#)
- [Export Commands](#)
- [Interface Commands](#)
- [General Commands](#)

## Zoom Commands

The Process Analyst has the following zoom commands by default:

Icon	Tooltip	Description
	Toggle Box Zoom	Toggles the Process Analyst into box zoom mode. The mouse cursor changes to a crosshair used to define an area to zoom in on. Zoom may be canceled by right-clicking or toggling the Zoom command off. For details, see <a href="#">Toggle Box Zoom</a> .
	Zoom in 50%	Executes a horizontal and vertical zoom in of 50% of the current span(s) of the pen(s). For details, see <a href="#">Zoom In/Zoom Out</a> .
	Zoom out 50%	Executes a horizontal and vertical zoom out of 50% of the current span(s) of the pen(s). For details, see <a href="#">Zoom In/Zoom Out</a> .
	Undo Last Zoom	Undoes the last zoom operation. For details, see <a href="#">Undo Last Zoom</a> .
	Reset to Default Span	Restores the pen(s) spans to their original default settings. For details, see <a href="#">Reset to Default Span</a> .
	Edit Span	Displays the Edit Span dialog box allowing an operator to explicitly enter a time span to apply to the display. For details, see <a href="#">Set a Nonstandard Time Span</a> .
	Edit Vertical Scale	Enabled when an analog pen is selected. For details, see <a href="#">Edit Vertical Scale</a> .

## See Also

[Export Commands](#)

[Interface Commands](#)

[General Commands](#)

## Navigation Commands

The Process Analyst has the following navigation commands by default. For details about these commands, see

## Navigate Time.

Icon	Tooltip	Description
	Toggle Span Lock	Toggles the locking of the time span. A time span is the "distance" in time between the start time and end time of the chart. For details, see <a href="#">Lock/Unlock the Time Span</a> .
	Back One Span	Moves the pen(s) back in time exactly one time span. For details, see <a href="#">Navigate Time</a> .
	Back Half a Span	Moves the pen(s) back half a span. For details, see <a href="#">Navigate Time</a> .
	Forward One Span	Moves the pen(s) forward in time exactly one span. For details, see <a href="#">Navigate Time</a> .
	Forward Half a Span	Moves the pen(s) forward half a span. For details, see <a href="#">Navigate Time</a> .
	Synchronize to Now	Synchronizes pen(s) such that the end date time reflects "now" which is positioned on the right-hand edge of the screen. "Now" is calculated using the current system time. For details, see <a href="#">Synchronize to Now</a> .
	Toggle Auto-Scrolling	Toggles the automatic scrolling off and on for every pen. For details, see <a href="#">Toggle Autoscrolling</a> .

**See Also**

## Interface Commands

The Process Analyst has the following interface commands by default:

Icon	Tooltip	Description
	Show/Hide Cursor	Toggles the display of cursors. For details, see <a href="#">Cursors</a> .
	Show/Hide Cursor Labels	Toggles the display of cursor labels. Enabled only when a cursor is visible and when a pen exists. For details, see <a href="#">Using Cursor Labels</a> .
	Show/Hide Points	Toggles the display of points representing where sample data was recorded in the archive. For details, see <a href="#">Pens</a> .
	Lock/Unlock Cursor Labels	Toggles the locking/unlocking of cursor labels. Enabled only when a cursor is visible and when a pen exists. For details, see <a href="#">Using Cursor Labels</a> .
	Lock/Unlock Pens	Toggles the locking/unlocking of pens. For details, see <a href="#">Lock/Unlock Pens</a> .

Icon	Tooltip	Description
	Add Pane	Adds a new pane to the view. For details, see <a href="#">Configure Chart Panes</a> .
	Remove Pane	Removes the pane of the primary selected pen. A dialog confirms the delete. For details, see <a href="#">Configure Chart Panes</a> .
	Autoscale Vertical Axis for Analog Pens	Toggles autoscaling for the selected pen on a per-pen basis. For details, see <a href="#">Scale the Chart</a> .
	Lock/Unlock Vertical Axis Scrolling	Toggles interactive scrolling of the vertical axis and disables autoscaling. For details, see <a href="#">Scroll the Chart</a> .

## See Also

[View Commands](#)

## Printing and Exporting

You can print detailed reports of your Process Analyst trends for management reports and other purposes. You can configure Process Analyst reports to include other print options designed to maximize the business value of your reports. You can also export pen data to the Windows Clipboard or to Microsoft Excel.

---

**Note:** For details about general print options in Windows, refer to your Windows documentation.

---

## See Also

[Process Analyst Reports](#)

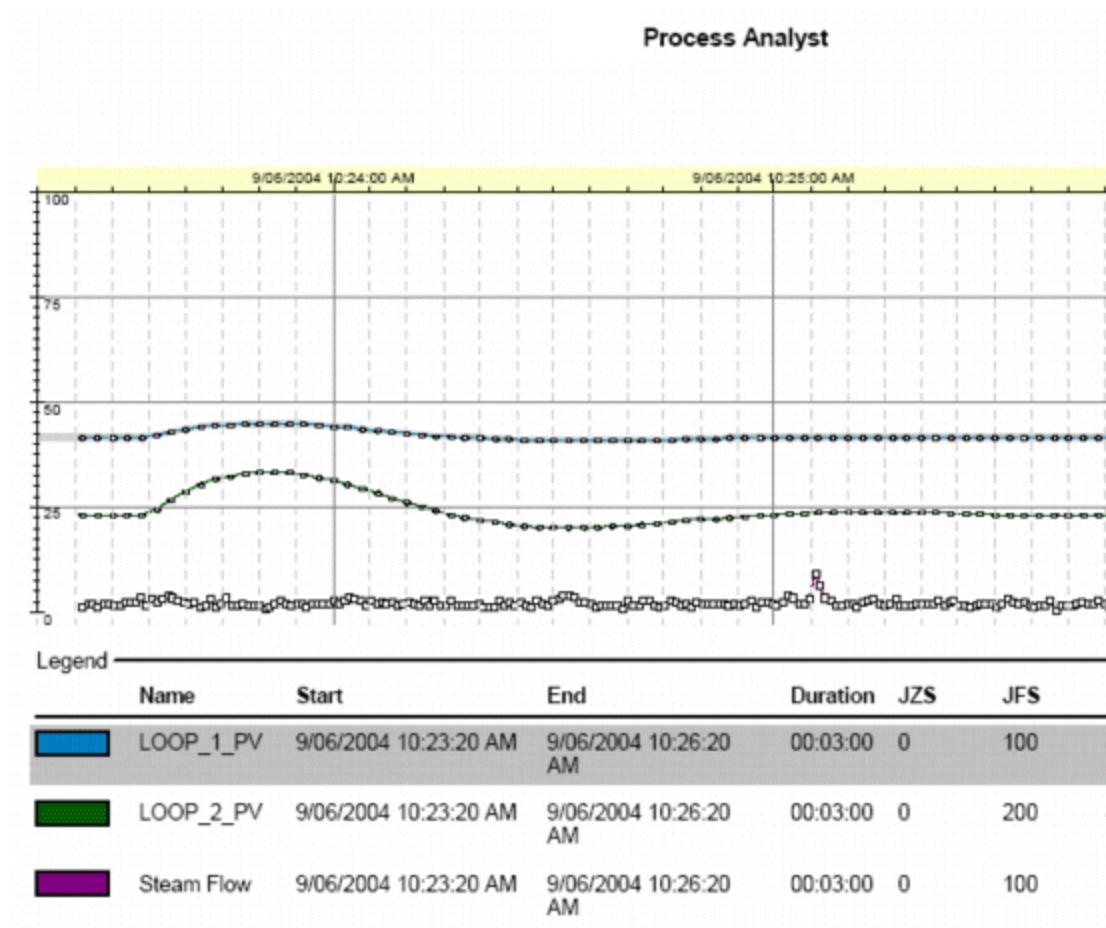

[Configure Process Analyst Report Options](#)

[Exporting Pen Data](#)

## Process Analyst Reports

Process Analyst reports are formatted automatically by the system to make optimal use of the paper size and orientation. For example, if the page is small and the report contains a lot of information, the reports will use a smaller font to try to fit the information to the page. For larger pages, a larger font will be used. Reports use an Arial font between 8-14 points.

A typical Process Analyst report looks like this:

This example shows a report of a chart titled *Process Analyst*; the chart has only one pane, which contains three analog pens. The topmost pen in the report legend is highlighted, indicating that this pen is selected; consequently, the axes shown in the report are associated with this pen. You can see that this pen is selected in the chart by the "halo" effect surrounding the pen. The color boxes on the left-hand side of the legend help you to distinguish between the pens.

#### To print a report:

- Click **Print**. The Print dialog box appears. Click the **Print** button, or choose **Print** from the right-click (context) menu.

## Configure Process Analyst Report Options

You can configure Process Analyst reports to contain such things as specific items on a report legend (pen names, durations, engineering units, for example). You can also include header information and page numbers.

You use the Print dialog box to configure Process Analyst reports. To display the Print dialog box, click **Print** on the main toolbar. After configuring your reports, click **Print** on the **General** panel of the Print dialog box to print your report.

## See Also

- [Setting up Report Legends](#)
- [Setting up Report Options](#)

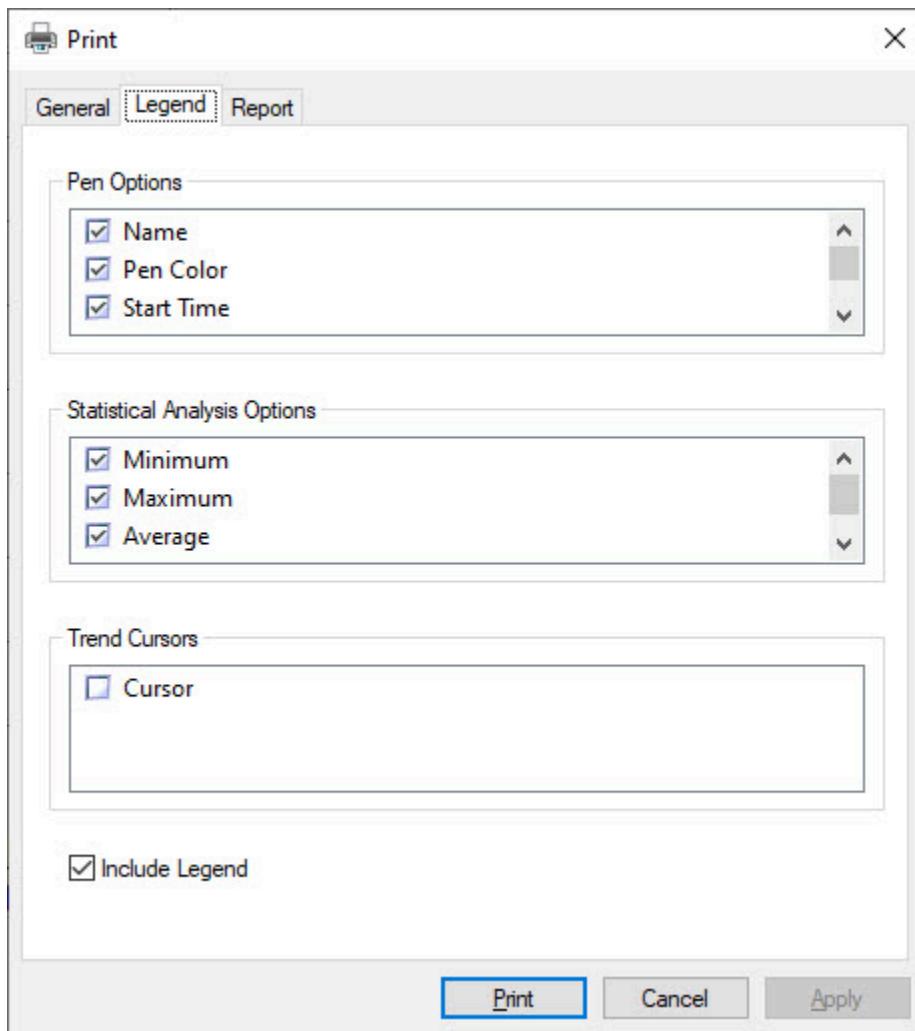

### Setting up Report Legends

You can configure your reports to include *report legends*. The information in the report legend is derived from the information properties of the underlying tag that is associated with a pen. If there are no information properties defined for a tag, this information isn't available for a legend.

You set up your report legends by using the Legend panel of the Print dialog box.

#### To set up a report legend:

1. In the Print dialog box, click the **Legend** tab. The Legend panel appears.

2. The panel shows, by default, the **Pen Options**, **Statistical Analysis Options**, and **Cursors** lists (if there is a cursor currently displayed on the chart). The options available to you might differ from the ones shown here.
3. Select the check box of the **Pen Options** you want to include in your report. For details about these options, see [Configuring the Object View](#).

4. Select the **Statistical Analysis Options** you want to include. This section is available only if the chart contains at least one analog or digital pen.
  - **Minimum** - causes the minimum value from cache to be returned. Note that this value might not be a real logged sample if the sample found is a multiple calculated sample.
  - **Maximum** - causes the maximum value from cache to be returned. Note that this value might not be a real logged sample if the sample found is a multiple calculated sample.
  - **Average** - uses time-weighted averaging to determine the average for both stepped and interpolated lines. This means that if a trend stays at a value of 10 for 1 hour and then spikes quickly at a value of 50 for a minute, the average will not be significantly affected.
5. Select the **Cursors** you want to include.
6. If you want to include a report legend, make sure the **Include Legend** check box is selected.
7. Click **Apply**.

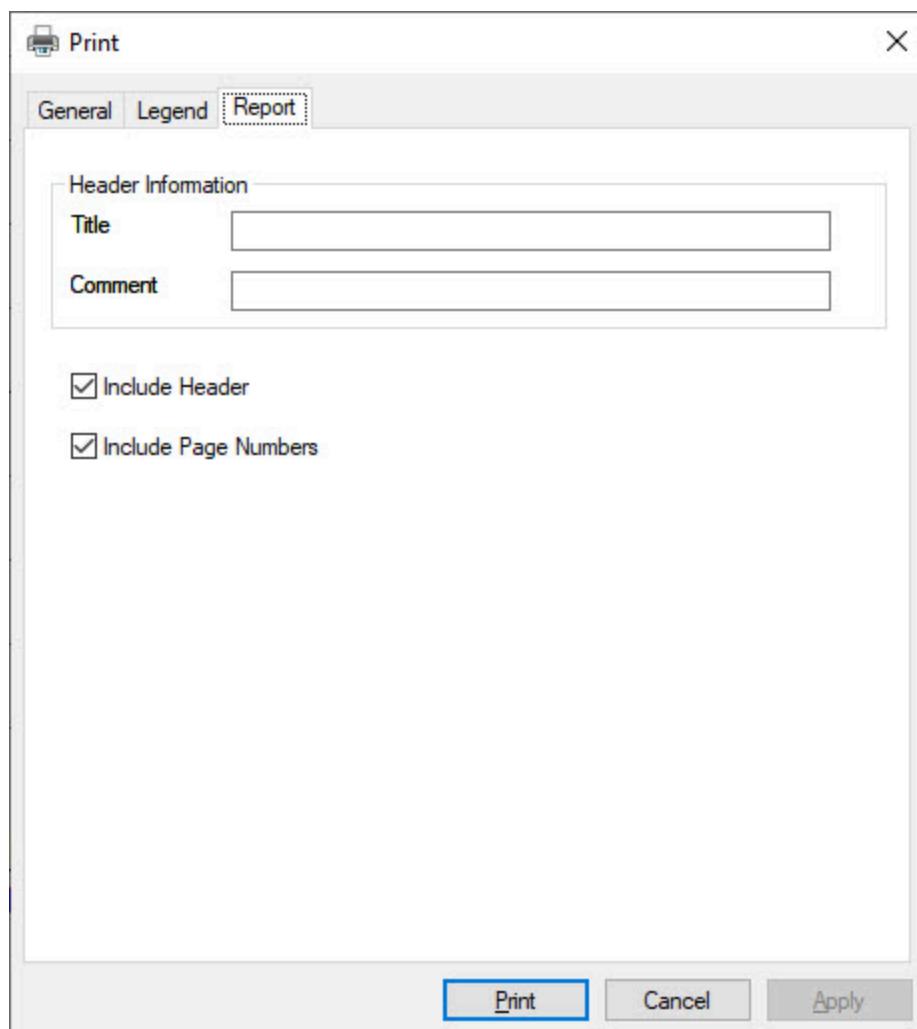

## Setting up Report Options

You can configure your reports to include a report header, which can include a report title and comment. For multiple-page reports, you can include page numbers, which appear at the bottom of each report page.

You set up your report options by using the Report panel of the Print dialog box.

### To set up report options:

1. In the Print dialog box, click the **Report** tab. The Report panel appears.

2. In the **Header Information** area, type a **Title** for the report. If necessary, include a **Comment**. Comments are printed under the report title on each report page.
3. To include a header, make sure the **Include Header** check box is selected.
4. To include page numbering, make sure the **Include Page Numbers** check box is selected.
5. Click **Apply**.

## Exporting Pen Data

You can export Process Analyst data for pens that are visible to either the Windows Clipboard (by using the **Copy to Clipboard** command) or to an Microsoft Excel-compatible file (**Copy to File**).

When you export data, it is exported using a standard format of columns that represent time, milliseconds, and then a column per pen, as shown here:

Time	Milliseconds	Pane1-Pen1	Pane1-Pen2	Pane1-Pen3
15/06/2004 01:17:25	100	NA	10	Off
15/06/2004 01:17:26	100	1	20	Low [Unacknowledged]
15/06/2004 01:17:27	100			Low [Acknowledged]
15/06/2004 01:17:28	100	3	25	Low [Acknowledged]

Export functionality doesn't simply return the sample markers displayed on the graph. Instead, it exports an interpolated value per display period from the start time to the end time of the pen. The display period can be calculated by dividing the time span of the pen by the [IProcessAnalyst.NumberofSamples\[Property\]\[Get/Set\]](#) property.

Before exporting the data, the Process Analyst sorts the timestamps for pens from the earliest to the latest sample. When the pens are unlocked and have different time spans, the data for each pen might have different timestamps. As each entry is added to a row in the table, the value of the pen at that particular timestamp is exported. If a pen does not have a sample for that timestamp, the column for that pen is left blank.

An export will also write values of NA, GATED and alarm states as localized text when necessary.

Pen columns use the format *<pane>-<pen>* where *pane* is the name of the pane that contains the pen, and *pen* is the name of the pen.

## See Also

[Copying Data to the Clipboard](#)

[Copying Data to File](#)

### Copying Data to the Clipboard

Copying pen data to the Clipboard allows you to paste the data into another application, such as an Excel spreadsheet.

#### To copy data to the Clipboard:

1. Select the pen(s) you want to copy data for.
2. Click **Copy to Clipboard**, or select **Copy** from the right-click (context) menu.

### Copying Data to File

Copying pen data to Microsoft Excel allows you to manipulate the data using spreadsheet application capabilities.

#### Note

- The Time column is an encoded (OLEDATE) double value, which holds the date and time in seconds in local

time. When exporting pen data to Excel, change the format of the Time column to dd/mm/yyyy hh:mm:ss so that the time is displayed correctly. Because the OLEDATE data type excludes milliseconds, a separate column is provided, which exports the millisecond component for each timestamp.

- The results exported are in Unicode format. use Excel 2000 and later, which support this format.

#### To copy data to file:

1. Select the pen(s) you want to copy data for.
2. Click **Copy to File**. The Save As dialog box appears.
3. Enter a filename and click **Save**. The data is exported in a delimited format.
4. Open the file you just created, and complete the Text Import Wizard.

## Customize Process Analyst

The Process Analyst integrates into the Plant SCADA system and is designed to work primarily with the Plant SCADA Graphics Builder and the run time environment. But the Process Analyst can also be embedded in custom Visual Basic and .NET applications. In these situations Plant SCADA is still necessary.

### See Also

[Configuring the Process Analyst Control from Graphics Builder](#)

[Multi-language Support](#)

[Persistence](#)

[Backing up Projects](#)

## Configuring the Process Analyst Control from Graphics Builder

Being an ActiveX control, you can insert the Process Analyst onto a Plant SCADA graphics page. To do this, do one of the following:

- In Graphics Builder, choose **Edit | Insert ActiveX Control**. The Insert ActiveX dialog box appears. Double-click the **Citect Process Analyst Control** item in the **ActiveX Controls** list box. The control is inserted onto the graphics page and the Properties dialog box appears.
- Click the **Process Analyst** button in the Graphics Builder toolbox.

After inserting the Process Analyst into a page, you can re-size it into position. To view the configuration pages for the Process Analyst, double-click the Process Analyst control. For details on configuring the design time properties for the Process Analyst, see [Configuring Design Time Properties](#).

### See Also

[Persistence](#)

## Security and Permissions

The Process Analyst integrates into the Plant SCADA security model by allowing access to certain Process Analyst features based on the privilege level of the currently logged in Operator.

The Process Analyst has nine privilege levels. Privilege level zero (0) indicates there is no security and any user can perform the function. Levels 1-8 map directly to the eight (8) privilege levels of security provided by Plant SCADA. The Process Analyst, by default, assumes the area of the page that it is situated on; this can be changed in the Graphics Builder. So if an operator has area access for the page and has privilege level 1, and the function they want to use is level 2, the function will be unavailable. If the operator had level 2, the function would then become available. The Process Analyst also supports the Plant SCADA Hierarchical Privilege security option.

Security can be applied to the following features:

- Administration; for details, see [Administration Privilege](#).
- Commands; for details, see [Command Privilege](#).
- Saving Process Analyst views (write privilege); for details, see [Write Privilege](#).

### Administration Privilege

The Process Analyst also uses an Administration privilege level to disable engineer-oriented features at run time. For example, the ability to add new custom commands and so on are disabled if the Operator does not meet the necessary privilege level. The Administration privilege level has never to be zero on a running system as this would expose properties to an Operator, which could adversely affect the performance of the client and/or server (for example, Number Of Samples property).

#### UNACCEPTABLY SLOW PROGRAM EXECUTION

Do not set the Administration Privilege level to zero on a running system.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

The features that are disabled when an operator does not meet the Administration privilege level include:

- Add Pen context menu in Property dialog box.
- New/Edit/Delete command (includes changing the privilege of commands).
- New/Delete Column.
- Data Refresh Rate property.
- Display Refresh Rate property.
- Number Of Samples property.
- Server Paths tab.
- Server field on Connection tab.
- Tag field on Connection tab.

To modify the Administration privilege level, see [Configure Chart-wide Properties](#).

## Command Privilege

The Process Analyst allows a privilege level to be assigned to each command (standard or custom command). If an Operator does not have the necessary privilege level to use that command, the associated toolbar button is disabled and cannot be executed.

## See Also

[Editing Existing Custom Commands](#)

## Write Privilege

The Process Analyst uses a concept of "write" privilege level to control whether an operator can save Process Analyst views to a location other than "My documents". These views can then be loaded into the Process Analyst later by any Operator. The write privilege is set at design time on the Server Paths property page located on the root Process Analyst node in the Property pages dialog box. If the write privilege level is set to zero (0), any operator can save to any location. If the write privilege is any other level, the Operator needs to have that privilege level to be able to save an Analyst view to a location other than "My Documents".

## Multi-language Support

The Process Analyst supports the Plant SCADA multilanguage ability of changing the user interface language dynamically at run time. If the language is changed in Plant SCADA, the Process Analyst will change its language to match.

The process of configuring the Process Analyst for multiple languages is different from that of Plant SCADA. This section describes how to localize the Process Analyst user interface and get it to work with Plant SCADA.

## See Also

[About Process Analyst Resources](#)

[Creating Your Own Process Analyst Resource.dll](#)

[Localizing the Process Analyst Resource DLL](#)

[Using Plant SCADA to Switch the Process Analyst Language](#)

[Changing the Input Language](#)

## About Process Analyst Resources

The Process Analyst uses a special file, called Resources.dll, to store its display strings and dialog boxes. This file

holds the native translations for your version of the Process Analyst; these native translations are considered the default language. For example, the Japanese version of the Process Analyst will contain Japanese resources inside the Resources.dll file.

A separate Resources.dll file is required for each individual language that you want to support in your system. Each file uses a special format to indicate the language. The Process Analyst expects the file to be named:

Resources\_<LanguageCode>.dll.

Where <LanguageCode> is the unique identifier of your dll.

For example, a French resources file will be named Resources\_fr.dll. Plant SCADA uses the RFC 1766 standard for specifying culture names.

The following files are installed with Plant SCADA:

- Resources.dll — Default
- Resources\_de.dll — German
- Resources\_en.dll — English
- Resources\_es.dll — Spanish
- Resources\_fr.dll — French
- Resources\_it.dll — Italian
- Resources\_ja.dll — Japanese
- Resources\_ko.dll — Korean
- Resources\_no.dll — Norwegian
- Resources\_pt.dll — Portuguese
- Resources\_pt-br.dll — Brazilian Portuguese
- Resources\_ru.dll — Russian
- Resources\_sv.dll — Swedish
- Resources\_zh-cn.dll — Chinese PRC

They are located by default in the following directory:

C:\Program Files (x86)\Common Files\AVEVA Plant SCADA

You can also [Creating Your Own Process Analyst Resource.dll](#).

All language Resources\*.dll files need to be placed in the same directory as the Analyst.dll file.

The example below shows a system that contains English as the default, and has alternative languages of French, German and Chinese.

- Resources.dll (default - any language, for example English)
- Resources\_fr.dll (French standard)
- Resources\_zh-CN.dll (Chinese PRC)
- Resources\_de.dll (German)

## **Creating Your Own Process Analyst Resource.dll**

To create your own resources dll, you need to do the following:

1. Install the specific languages you are localizing on your Windows system.
2. Set your system to use that specific language.

---

**Note:** To create your own resources.dll file, you will need to use Microsoft Developer Studio 6 or an equivalent tool.

[Localizing the Process Analyst Resource DLL](#)

### Localizing the Process Analyst Resource DLL

Once you have set up your system to cope with multiple languages, you can begin localizing. Do the following:

1. Open Microsoft Visual Studio.
2. Choose **File | Open**.
3. Browse to the location of the Process Analyst's Resources.dll file. By default it is located at:  
%PROGRAMFILES(X86)%\Common Files\AVEVAPlant SCADA
4. Verify that the **Files of type** menu has **Executable Files (.exe;.dll;\*.ocx)** selected.
5. Verify that the **Open as** menu has **Resources** selected.
6. Select **Resources.dll** and click **Open**.
7. Save the file under a new name. For example, if you are localizing for Japanese, use **Resources\_ja-JP.dll**. See [About Process Analyst Resources](#) for naming conventions.
8. Before changing any string, you need to change the language code for each dialog box and the string table by doing the following:
  - a. Expand the **String Table** folder in the tree.
  - b. Right-click the **String Table** entry.
  - c. Choose **Properties** from the right-click (context) menu (see below).
  - d. From the **Language** menu, select the language that you are localizing for.
  - e. Click **Close** in the top-right corner of the dialog.
  - f. Repeat these steps for each of the dialogs inside the **Dialog** folder.

Once the language code has been set for every dialog and the string table, you are ready to begin changing the text.

### Localizing dialog boxes

To localize a dialog box, do the following:

1. Expand the **Dialogs** folder in the tree.
2. Double-click a dialog to edit.
3. Select an item of text and right-click to display the properties for that item.
4. Enter your replacement text into the **Caption** field.

5. Click the **Close** button in the top-right corner of the dialog box.

Note the following:

- Controls can be repositioned or re-sized if necessary to fit your replacement text.
- Never re-size a dialog box. The size of a dialog box is set to an optimum size so that it integrates into Graphics Builder correctly.
- Dialogs 3028 and 3050 do not require translation.

## Localizing the String Table

To localize the string table, do the following:

1. Expand the **String Table** folder in the tree.
2. Double-click the **String Table** entry. This will display a table showing you the strings of the Process Analyst.
3. Double-click an entry to display the Properties dialog box.
4. Type in the replacement text in the **Caption** box.
5. Click the Close button in the top-right corner of the dialog box.

---

**Note:** When translating strings, if a string contains "%s", "%x", "%d" and so on, *do not* remove or replace those symbols as they are important to the Process Analyst.

---

## Using Plant SCADA to Switch the Process Analyst Language

Plant SCADA uses the Cicode function Login() or UserLogin(). To allow the Process Analyst to determine the language to display, you need to map your Plant SCADA language databases to the Process Analyst resource files.

To do this, add a new .ini section called [ProcessAnalyst] to the Citect.ini file on each of your Plant SCADA clients and servers, and create a mapping for each language. (This section might already exist in your Citect.ini file.) The mapping needs to use this format:

LanguagePath.<Language>=<ProcessAnalystLanguage>

Where <Language> is the name of a specific Plant SCADA language as defined in Plant SCADA Studio's **Setup** activity.

For example,

```
[ProcessAnalyst]
LanguagePath.French=fr LanguagePath.French(France)=fr
LanguagePath.Chinese=zh-CN
LanguagePath.German=de
```

The last step is to verify each of your machines contains the necessary language fonts. Windows provides facilities to add the necessary languages to your machine via the Regional and Language Options dialog box, accessible from the Control Panel. This step is necessary if you want to use Asian languages on an English operating system. See [Creating Your Own Process Analyst Resource.dll](#) for details on adding languages to your system.

With the .ini file now configured, languages installed, and the Resource.dll files in place, when either the Login() or UserLogin() Cicode functions are called, Plant SCADA and the Process Analyst will automatically change into the selected language.

## See Also

[Manually Switching Languages using IProcessAnalyst.Language](#)

### Manually Switching Languages using IProcessAnalyst.Language

The Process Analyst can also switch languages by itself using the IProcessAnalyst.Language property. You can call this property directly from Cicode.

**Note:** Using this method will only switch the Process Analyst language and not the one used by Plant SCADA. See [IProcessAnalyst.Language \[Property\] \[Get/Set\]](#).

### Changing the Input Language

When your system has been configured to use multiple languages, you will find a new icon in the system tray displayed as "EN" or similar.

**To change input language:**

1. Click EN to display the input language option menu.

2. Select the language you want to use (to work correctly with Visual Studio, to match the language you selected in Windows setup). This might display a language-specific IME editor, which allows you to select characters to use in your translations.

## Persistence

Persistence refers to saving the state (properties, pens, and so on) of the Process Analyst to disk. Plant SCADA and the Process Analyst provide the following methods of persistence:

- Saving as part of a Plant SCADA Graphics Builder page (design time)
- Save View toolbar button on the Process Analyst (run time)
- SaveToFile automation method on the Process Analyst (run time)
- Saving between Plant SCADA page transitions (run time)

### Saving while Using Graphics Builder

This feature allows you to configure the default look and/or what pens will be displayed on the Process Analyst at design time while you are designing your graphics pages in Plant SCADA's Graphics Builder.

Design time is the appropriate time to configure the appearance properties, toolbar buttons and, most importantly, the security of the Process Analyst since these will become the default settings of the Process Analyst when your page is displayed at run time.

When a page containing the Process Analyst is saved in the Graphics Builder the properties you configured on the Process Analyst will be stored within the Graphics Builder page.

---

**Note:** When defining new custom toolbar buttons, any icon you assign will be copied and also stored within the Graphics Builder page. This allows your custom toolbar buttons to work on any machine.

---

## Using the Save View Toolbar Button

This feature is valid only at run time and allows operators to save the current state of the Process Analyst (called a *view*) to a standalone file. These files can be loaded during run time, and are an efficient way to store commonly used pen configurations.

## Using the SaveToFile Automation Method

This feature is valid only at run time and allows a user to write Cicode to save the current state of the Process Analyst to a standalone file, referred to as an Analyst view. These files can be loaded during run time using the LoadFromFile automation method (or the **Load View** toolbar button).

Views are an efficient way to store commonly used pen configurations.

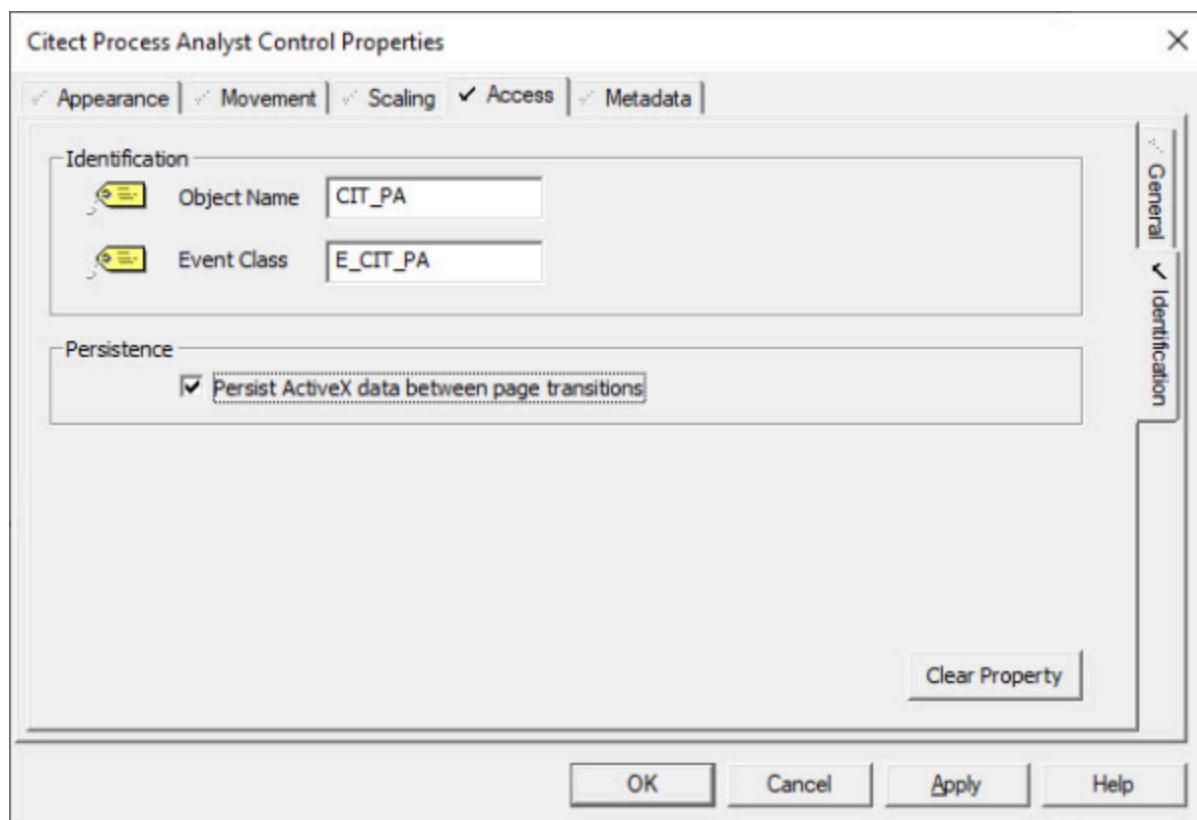

## Saving between Plant SCADA Page Transitions (Runtime)

Using Plant SCADA run time, if you modify the Process Analyst (for example, changing the timespan of a pen) and move off the page, your changes will be lost. This behavior is not always what you want, so Graphics Builder provides an option **Persist ActiveX data between page transitions** to save the state of an ActiveX control when you switch between pages.

Enabling this option causes Plant SCADA to write a temporary file to the Plant SCADA Data directory in the format of <Event class>.stg whenever you leave a page that contains an ActiveX object (for example, the Process Analyst). When you reenter the page, Plant SCADA looks for that same file and, if found, will load the settings from it. These files only exist while Plant SCADA run time is running. When you shut down Plant SCADA, the temporary \*.stg files are deleted.

### To save between page transitions:

1. Double-click the Process Analyst ActiveX control you want to change. The Properties dialog box appears.
2. Click the **Access** tab.
3. Click the **Identification** tab. The Identification panel appears.

4. In the Persistence area, select the **Persist ActiveX data between page transitions** check box, and then click **Apply**.

## Resetting Back to the Default State

You can reset the original configuration of the Process Analyst control by calling the Cicode function `ObjectResetState`. This function takes the object handle of the Process Analyst control, which you retrieve by using the Cicode function `ObjectByName`.

## Backing up Projects

When you save views to the Local storage location, the Process Analyst will create a \*.pav file in an Analyst Views subfolder under your project directory. If your project contains Analyst views, verify that the **Save sub-directories** option is selected in the Backup Project dialog box before backing up your project.

## Configuring Design Time Properties

Most Process Analyst properties can be defined or modified during run time and design time. This section describes properties that can be configured only during design time, usually by a User.

For information about configuring run time properties, see [Process Analyst Properties Dialog Box](#).

- [Editing Existing Custom Commands](#)
- [Creating or Editing Object View Columns](#)
- [Process Analyst View Synchronization](#)

### Adding New Commands

Users can define new toolbar commands during design time if they have the appropriate privilege level.

#### To add a new command:

1. On the Toolbars page of the Properties dialog box, click **New**. The New Command dialog box appears.

2. The dialog shows the unique, system-generated ID for the new command. If necessary, enter a new **ID** for the command. This ID can be used in Cicode to determine which command has been triggered or to find a specific command in the Plant SCADA system.
3. Enter the **Tooltip** text for the new command. You are limited to 64 characters. Tooltip text appears when the mouse pointer is over the toolbar command.
4. Click **Browse** and navigate to the icon to represent the new command. The icon image appears on the toolbar command button.
5. To define how the command behaves, choose a button style from the **Button style** menu:
  - **Push Button** - click the **Enabled** check box to set the default appearance of the button when the button is enabled or disabled.
  - **Toggle Button** - click **Enabled** or **Pressed** to specify the "on" appearance.

## See Also

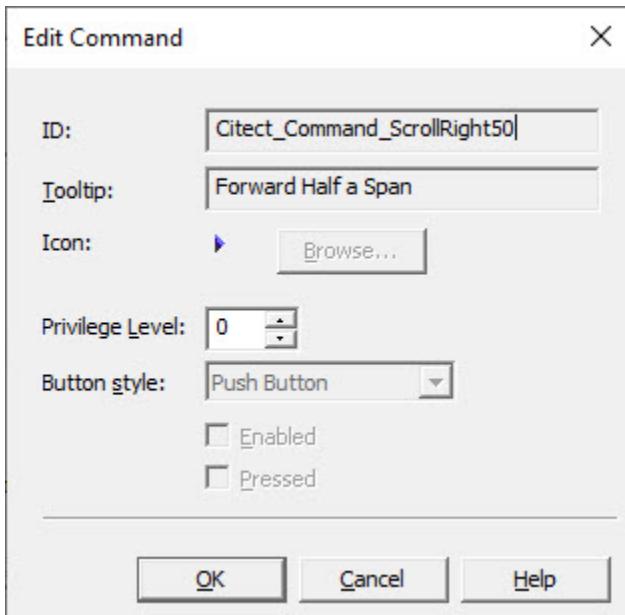

[Editing Existing Custom Commands](#)

### Editing Existing Custom Commands

Users can edit existing toolbar commands if they have the appropriate privilege level. Commands can only be edited during design time, and only fields for custom commands can be edited.

#### To edit an existing custom command

1. Open the Properties dialog box and click the **Toolbars** tab.
2. Select the command you want to edit in the **Available toolbar buttons** list box, and then click **Edit**. The Edit Command dialog box appears.

3. If necessary, click **Browse** to navigate to a new icon to use for the command.
4. If necessary, edit the **Tooltip** text. The maximum length for Tooltip text is 64 characters.
5. If necessary, choose a new button style from the **Button style** menu.

## See Also

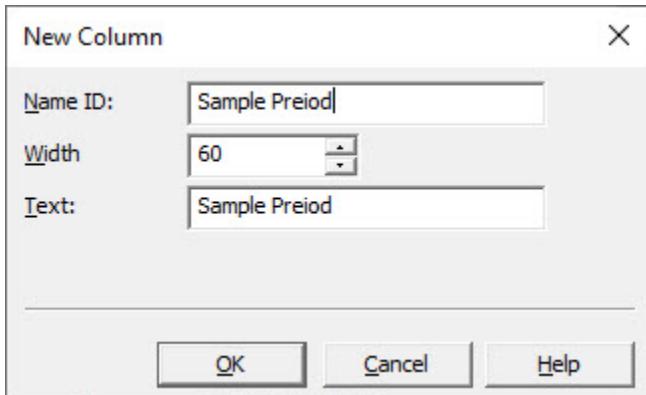

[Adding New Commands](#)

### Creating or Editing Object View Columns

Users can create or delete Object View columns (during design time), as well as edit existing columns (run time or design time). Object View columns display information about your pens. These configuration tasks are performed by using the Citect Process Analyst Properties dialog box.

**To create an Object View column:**

1. Click the **Object View** tab. The Object View panel appears.
2. Click **New**. The New Column dialog box appears.

3. Enter a **Name ID** for the column. The value is used to reference the column in code.
4. Specify a **Width**.
5. Enter the **Text** to use for the column in the Object View display.

**To delete an Object View column:**

- Select the column you want to delete and click **Delete**.

**To edit an Object View column:**

1. Select the column you want to edit, and then click **Edit**. The Edit Column dialog box appears.
2. Modify the information as necessary, and then click **OK**.

**See Also**

[Configuring the Object View](#)

**Process Analyst View Synchronization**

The Process Analyst implements a basic level of file synchronization for Process Analyst views (.pav files). This feature causes the Process Analyst to try and obtain the latest version of a .pav file before displaying it to the operator.

To achieve this, an engineer needs to first configure the Process Analyst to support Primary and Standby server locations for Analyst Views; for details, see [Configure Server Paths](#).

With these file servers in place, the Process Analyst now has a central location from which to obtain Process Analyst views. If one of the locations is unavailable, the operator can try the alternate location. When a client saves or loads a Process Analyst view, only that view on the Primary and Standby server locations will be synchronized to verify they are the same.

The table below outlines the rules of synchronization and privilege for the storage locations and client modes when loading and saving Process Analyst views.

Action	Mode	Privilege	Available Storage Locations*
Load	Normal client	Both**	The Primary and Standby options appear as configured as well as My Documents. If either are invalid or unavailable paths, they do not appear. If both are invalid or unavailable, the Local option appears. Default order is Primary, Standby, My Documents, and Local, My Documents respectively. Synchronisation occurs when loading from a Primary or Standby location.
Save	Normal client	Privileged	The Local and My Documents options are the only ones available. Local however will attempt to save to all server locations as well as the project directory. The pav file will be saved to all available locations from primary, standby and project directories. Default order: Local, My Documents.
Save	Normal client	Unprivileged	The My Documents option is the only one available.
Save	Normal client	Both**	The My Documents option is the only one available.

\* Refers to the **Look in** menu on SaveView and Load View dialog boxes.

\*\* Means both privileged and un-privileged.

When setting up file-servers to store Process Analyst views, verify that each client machine has privileges enabling it the desired read/write access to those locations.

## Using the Process Analyst Command System

This section describes how to use the Process Analyst command system.

## See Also

[Command System Overview](#)

[Custom Commands](#)

[Icons](#)

### Command System Overview

The Process Analyst provides an extensive command system allowing manipulation of common Process Analyst features, as well as providing the framework for creating custom user-defined commands.

The command system is configurable via the Toolbar property page and the automation model.

To access the command system via the automation model, call the property `GetCommandSystem()` from the [IProcessAnalyst interface](#). For details, see [IProcessAnalyst Interface](#).

### Custom Commands

Custom commands are defined in the Process Analyst, but needs to be implemented in Cicode. You define commands by using the `ICommandSystem->Create` method, or by using the **New** button on the Toolbar property page.

To implement the command, you need to respond to the event `CommandExecuted` (and optionally `UpdateCommand`). Both of these events notify you of the ID of the command which needs to be handled.

---

**Note:** Do not call commands from Cicode which will require input from the operator such as Add Pen, Open View, Save View, etc because they will hang the Plant SCADA runtime until the user closes the dialog.

---

### CommandExecuted

When an operator presses the toolbar button representing your command, it will trigger this event. This is your opportunity to execute the desired functionality of the command. This will not be triggered if the logged-in user does not meet the necessary privilege level. Be aware that this is an asynchronous operation.

### UpdateCommand

When the Process Analyst requires the Enable state or pressed states of its toolbar buttons to be refreshed, this event will be triggered. This will not be triggered if the logged-in user does not meet the necessary privilege level. This is asynchronous operation.

The state of commands (custom and pre-defined) will be saved to disk whenever the Process Analyst configuration is saved.

## See Also

[Persistence](#)

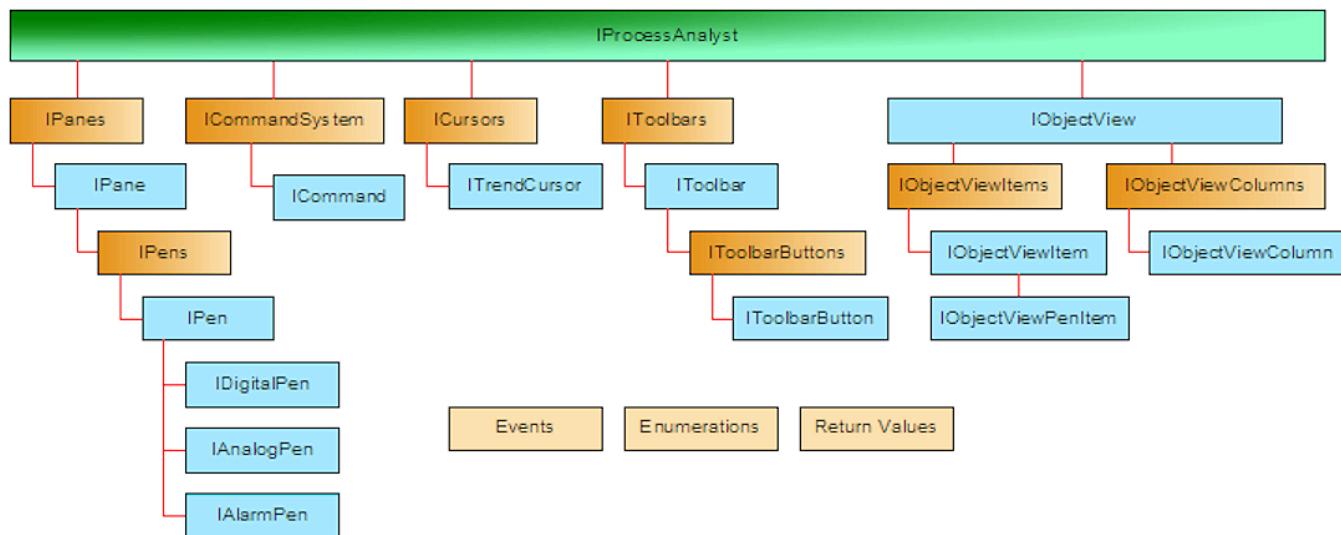

## Icons

For custom commands, the user can specify their own custom icons by pointing to a file on their hard drive. As these files may be deleted or moved over time, the Process Analyst makes an instant copy of the icon into memory when the command is added. This removes any dependence on the original icon file. When the Process Analyst configuration is saved, the icon data is also saved.

## Automation Model

The automation model allows applications or solutions to programmatically configure the Process Analyst control's appearance, performance, and behavior. The automation model also allows code, via automation events, to be attached to events fired from the Process Analyst Control and perform custom behavior.

The automation model allows almost every visual aspect of the control to be configured, as well as performance. It is simple and follows a traditional object-oriented approach (see below).

## Execution Results

Each property and method listed in the automation model will return one of the following results upon execution. The exact meaning is described in the Execution Result section for each property or method.

Execution Result	Cicode	VBA	C++
InvalidArgument	274	5	E_INVALIARG
GeneralFailure	356	2147500037	E_FAIL
PathNotFound	356	76	STG_E_PATHNOTFOUND
Success	0	-	S_OK

Errors are captured differently in Cicode and VBA. The following code examples show how to trap and handle errors in VBA and Cicode.

### [VBA]

```
Sub VBATest(myObject As Object)
    On Error Goto errHandler
    myObject.<function>
    Exit Sub
    errHandler:
    Print Err.Number, Err.Description
    Resume Next
End Sub
```

### [Cicode]

```
FUNCTION Test1(OBJECT hObject)
    ErrSet(1); // Enable User error checking (disabled HW alarm)
    IF ObjectIsValid(hObject) THEN
        _ObjectCallMethod(hObject, "<function>");
        error = IsError();
        errorMessage = IntToStr(error)
        IF (error <> 0) THEN
            Message("An error occurred", errorMessage, 0);
        END
    END
    ErrSet(0); // Enable hardware alarm reporting of errors
END
```

### AlarmType [Enumeration]

Specifies the visual representation for an alarm pen.

#### Defined As

- [VBA] Integer
- [Cicode] INT
- [C++] AlarmType

#### Members

Member Name	Description	Value
AlarmType_Digital	The tag is digital alarm	0
AlarmType_Analog	The tag is an analog alarm	1
AlarmType_Advanced	The tag is an advanced alarm	2
AlarmType_TimeStamped	The tag is a time-stamped alarm	3
AlarmType_MultiDigital	The tag is a multi-digital alarm	4
AlarmType_ArgyleAnalog	The tag is a legacy Argyle analog alarm	5
AlarmType_TimeStampedDigital	The tag is a digital time-stamped	6

Member Name	Description	Value
	alarm	
AlarmType_TimeStampedAnalog	The tag is a analog time-stamped alarm	7

### AxisLabelType [Enumeration]

Specifies how the labels are drawn on the vertical axis.

#### Defined As

- [VBA] Integer
- [Cicode] INT
- [C++] AxisLabelType

#### Members

Member Name	Description	Value
AxisLabelType_NONE	No labels will be visible on axis	0
AxisLabelType_DOUBLE	Displays in decimal format	1
AxisLabelType_INTEGER	Displays in integer format	2
AxisLabelType_PERCENT	Displays as "%"	3
AxisLabelType_AMPS	Displays as "A"	4
AxisLabelType_DEGREES	Displays as "deg"	5
AxisLabelType_FEET	Displays as "ft"	6
AxisLabelType_FEETPERMIN	Displays as "ft/min"	7
AxisLabelType_FEETPERSEC	Displays as "ft/s"	8
AxisLabelType_GALLONS	Displays as "gal"	9
AxisLabelType_GALLONSPERHR	Displays as "gal/h"	10
AxisLabelType_GALLONSPERMIN	Displays as "gal/min"	11
AxisLabelType_GALLONSPERSEC	Displays as "gal/s"	12

Member Name	Description	Value
AxisLabelType_HERTZ	Displays as "Hz"	13
AxisLabelType_KILOGRAMS	Displays as "kg"	14
AxisLabelType_KILOGRAMSPERHR	Displays as "kg/h"	15
AxisLabelType_KILOGRAMSPERMIN	Displays as "kg/min"	16
AxisLabelType_KILOGRAMSPERSEC	Displays as "kg/s"	17
AxisLabelType_KILOMETRESPERHR	Displays as "kg/h"	18
AxisLabelType_KILOPASCALS	Displays as "kPa"	19
AxisLabelType_KILOWATTS	Displays as "kW"	20
AxisLabelType_LITRES	Displays as "l"	21
AxisLabelType_LITRESPERHR	Displays as "l/h"	22
AxisLabelType_LITRESPERMIN	Displays as "l/min"	23
AxisLabelType_LITRESPERSEC	Displays as "l/s"	24
AxisLabelType_METRES	Displays as "m"	25
AxisLabelType_METRESPERMIN	Displays as "m/min"	26
AxisLabelType_METRESPERSEC	Displays as "m/s"	27
AxisLabelType_REVNS	Displays as "Rev"	28
AxisLabelType_REVSPERHR	Displays as "Rev/h"	29
AxisLabelType_REVSPERMIN	Displays as "RPM"	30
AxisLabelType_TONNES	Displays as "t"	31
AxisLabelType_TONNESPERHR	Displays as "t/h"	32
AxisLabelType_VOLTS	Displays as "V"	33
AxisLabelType_WATTS	Displays as "W"	34
AxisLabelType_LOOKUP	Displays user-defined text for label	35

**DisplaySize[Enumeration]**

Specifies the size of graphical elements in the control's design and runtime surface.

**Defined As**

- [VBA]Integer
- [Cicode]INT
- [C++]DisplaySize

**Members**

Member Name	Description	Value
DisplaySize_Normal	Refers to a normal size	0
DisplaySize_Large	Refers to a large size for use with high resolution monitors	1

**See Also**

[IProcessAnalyst.DisplaySize\[Property\]\[Get/Set\]](#)

**ErrorNotifyCode [Enumeration]**

Defines known errors that can occur during operation.

**Defined As**

- [VBA] Integer
- [Cicode] INT
- [C++] ErrorNotifyCode

**Members**

Member Name	Description	Value
ErrorNotifyCode_None	No error.	0
ErrorNotifyCode_InvalidTag	Occurs when the tag specified for the pen does not exist.	1
ErrorNotifyCode_CtapiConnectionOffline	Occurs when connections cannot be made to the Trends and/or Alarm Servers.	2
ErrorNotifyCode_Unknown	Occurs when an unknown Plant SCADA or Windows error occurs.	3
ErrorNotifyCode_NoServer	Occurs when Plant SCADA cannot find a server to get the data from.	4
ErrorNotifyCode_InvalidArgument	Occurs when an invalid argument is specified.	5
ErrorNotifyCode_OutOfMemory	Occurs when a memory error is	6

Member Name	Description	Value
	detected.	
ErrorNotifyCode_BadVersion	Occurs when the Trends and/or Alarm Servers do not match the client version.	7
ErrorNotifyCode_NoPrivilege	Occurs when the current user does not have the necessary privileges to view the data.	8

### HatchStyle [Enumeration]

Defines the filling style for Alarm pens.

#### Defined As

- [VBA] Integer
- [Cicode] INT
- [C++] HatchStyle

## Members

Member Name	Description	Value
HatchStyle_None	No pattern	0
HatchStyle_Horizontal	Horizontal line pattern	1
HatchStyle_Vertical	Vertical line pattern	2
HatchStyle_ForwardDiagonal	Forward diagonal line pattern	3
HatchStyle_BackwardDiagonal	Backward diagonal line pattern	4
HatchStyle_Cross	Cross pattern	5
HatchStyle_DiagonalCross	Diagonal cross pattern	6

## See Also

## LineStyle [Enumeration]

Defines the drawing style for a line.

### Defined As

- [VBA] Integer
- [Cicode] INT
- [C++] LineStyle

### Values

Member Name	Description	Value
LineStyle_SOLID	Draws a solid line (all line widths)	0
LineStyle_DASH	Draws a dashed line (line width 1 only)	1
LineStyle_DOT	Draws a dot line (line width 1 only)	2
LineStyle_DASHDOT	Draws a dash dot (line width 1 only)	3

Member Name	Description	Value
LineStyle_DASHDOTDOT	Draws a dash dot dot (line width 1 only)	4
LineStyle_NONE	Draws no line	5

**LineType [Enumeration]**

Defines the visual representation of the lines between samples of an analog pen.

**Defined As**

- [VBA] Integer
- [Cicode] INT
- [C++] LineType

**Members**

Member Name	Description	Value
LineType_STRAIGHT	A single line is drawn from point A to point B.	0
LineType_STEPPED	The line drawn will maintain the value of the previous sample. When the samples differ, a vertical line will be drawn to the new sample value.	1

**See Also**

[IAnalogPen.LineInterpolation \[Property\]\[Get/Set\]](#)

**PenNameMode [Enumeration]**

Defines how the pen name will be generated. It is used in conjunction with the IPens.Create method.

**Defined As**

- [VBA] Integer
- [Cicode] INT
- [C++] PenNameMode

**Members**

Member Name	Description	Value
PenNameMode_Comment	The comment field obtained from the Plant SCADA trend/alarm tag will be used as the pen name.	1
PenNameMode_TagPenNameMode_Tag	The value of the IPen.DataPoint property will be used as the pen name.	2
PenNameMode_Custom	Indicates that you will be setting the name using the IPen.Name property.	3

### **CommandExecuted [Event]**

This event is raised when a command is executed.

#### **Defined As**

- [VBA] CommandExecuted(commandId As String)
- [Cicode] CommandExecuted (OBJECT processAnalyst, STRING commandId)
- [C++] CommandExecuted (BSTR commandId)

**Parameters****commandId**

[in] Contains the unique identifier of the command that was executed.

**processAnalyst**

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

**Remarks**

Each toolbar button is associated with a command so when they are pressed this event will be raised with the unique identifier of that command. You can then use that identifier to determine which command was executed.

By using this event you can implement your own custom commands.

**Calling Syntax**

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

**[VBA]**

```
Sub myPage_AN35_CommandExecuted(commandId As String)
End Sub
.....
```

**[Cicode]**

```
FUNCTION myPage_AN35_CommandExecuted(OBJECT processAnalyst, STRING commandId)
END
```

**See Also**

[UpdateCommand \[Event\]](#)  
[ICommandSystem.Execute \[Method\]](#)

**CursorMoved [Event]**

This event is raised whenever the cursor position changes.

**Defined As**

- [VBA] CursorMoved(cursor As Object, position As Integer)
- [Cicode] CursorMoved (OBJECT processAnalyst, OBJECT cursor, INT position)
- [C++] CursorMoved (IPen\* pen, int position)

**Parameters****cursor**

[in] Refers to the cursor that has moved.

**position**

[in] Indicates the new position of the cursor.

**processAnalyst**

[in] Indicates the Process Analyst object which raised the event. (Cicode only).

#### Calling Syntax

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

### [VBA]

```
Sub myPage_AN35_CursorMoved(pen As Object, position As Integer)
End Sub
```

### [Cicode]

```
FUNCTION myPage_AN35_CursorMoved(OBJECT processAnalyst, OBJECT cursor, INT position)
END
```

### Error [Event]

This event is raised whenever an error is generated from the Process Analyst.

#### Defined As

- [VBA] Error(errorCode As Integer, errorMessage As String)
- [Cicode] Error(OBJECT processAnalyst, INT errorCode, STRING errorMessage)
- [C++] Error(ErrorNotifyCode errorCode, BSTR errorMessage)

#### Parameters

errorCode

[in] Indicates the error that occurred. See the ErrorNotifyCode enumeration.

errorMessage

[in] Contains the message associated with the error code.

processAnalyst

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

#### Calling Syntax

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

### [VBA]

```
Sub myPage_AN35_Error(errorCode As Integer, errorMessage As String)
End Sub
```

### [Cicode]

```
FUNCTION myPage_AN35_Error(OBJECT processAnalyst, INT errorCode, STRING errorMessage)
END
```

## See Also

[ErrorNotifyCode \[Enumeration\]](#)

### HorizontalAxisChanged [Event]

This event is raised when the date/time axis position or scale of a pen is changed.

#### Defined As

- [VBA] HorizontalAxisChanged(pen As Object)
- [Cicode] HorizontalAxisChanged(OBJECT processAnalyst, OBJECT pen)
- [C++] HorizontalAxisChanged(IPen\* pen)

#### Parameters

pen

[in] Refers to the pen that has changed. This will be invalid if pens are locked.

processAnalyst

[in] Indicates the Process Analyst object that raised the event (Cicode only).

#### Remarks

When the LockedPens property is True, this event is fired only once with the pen parameter marked as invalid.

#### Calling Syntax

Assumes you have a Process Analyst on a page with an event class defined as AN35\_E.

### [VBA]

```
Sub AN35_E_HorizontalAxisChanged (pen As Object)
End Sub
```

### [Cicode]

```
FUNCTION AN35_E_HorizontalAxisChanged (OBJECT processAnalyst, OBJECT pen)
END
```

## See Also

[IProcessAnalyst.LockedPens \[Property\]\[Get/Set\]](#)

[VerticalAxisChanged \[Event\]](#)

### MouseClick [Event]

This event is raised whenever a single mouse click occurs on the graphical chart area of the Process Analyst.

#### Defined As

- [VBA] MouseClick(pen As Object, button As Integer)

- [Cicode] MouseClick(OBJECT processAnalyst, OBJECT pen, INT button)
- [C++] MouseClick(IPen\* pen, int button)

#### Parameters

pen

[in] Indicates which pen the click occurred on. This object will be invalid if no pen was clicked.

button

[in] Indicates which button was clicked: 0 = Left, 1 = Right.

processAnalyst

[in] Indicates the Process Analyst object that raised the event (Cicode only).

#### Calling Syntax

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

### [VBA]

```
Sub myPage_AN35_MouseClick(pen As Object, button As Integer)
End Sub
```

### [Cicode]

```
FUNCTION myPage_AN35_MouseClick(OBJECT processAnalyst, OBJECT pen, INT button)
END
```

### MouseDoubleClick [Event]

This event is raised whenever a mouse double-click occurs on the graphical chart area of the Process Analyst.

#### Defined As

- [VBA] MouseDoubleClick(pen As Object, button As Integer)
- [Cicode] MouseDoubleClick(OBJECT processAnalyst, OBJECT pen, INT button)
- [C++] MouseDoubleClick(IPen pen, int button)

#### Parameters

pen

[in] Indicates which pen the double-click occurred on. This object will be invalid if no pen was double-clicked.

button

[in] Indicates which button was double-clicked: 0 = Left, 1 = Right.

processAnalyst

[in] Indicates the Process Analyst object that raised the event (Cicode only).

#### Calling Syntax

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

**[VBA]**

```
Sub myPage_AN35_MouseDoubleClick(pen As Object, button As Integer)
End Sub
```

**[Cicode]**

```
FUNCTION myPage_AN35_MouseDoubleClick(OBJECT processAnalyst, OBJECT pen, INT button)
END
```

**OVColumnAdded [Event]**

This event is raised whenever a column is added to the ObjectView.

**Defined As**

- [VBA] OVColumnAdded(name As String)
- [Cicode] OVColumnAdded(OBJECT processAnalyst, STRING name)
- [C++] OVColumnAdded(BSTR name)

**Parameters**

item

[in] The name of the column that has been added

processAnalyst

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

**Calling Syntax**

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

**[VBA]**

```
Sub myPage_AN35_OVColumnAdded(name As String)
End Sub
```

**[Cicode]**

```
FUNCTION myPage_AN35_OVColumnAdded(OBJECT processAnalyst, STRING name)
END
```

**OVColumnRemoved [Event]**

This event is raised whenever a column is removed to the ObjectView.

**Defined As**

- [VBA] OVColumnRemoved(name As String)
- [Cicode] OVColumnRemoved(OBJECT processAnalyst, STRING name)
- [C++] OVColumnRemoved(BSTR name)

**Parameters****item**

[in] The name of the column that has been removed.

**processAnalyst**

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

**Calling Syntax**

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

**[VBA]**

```
Sub myPage_AN35_OVColumnRemoved(name As String)
End Sub
```

**[Cicode]**

```
FUNCTION myPage_AN35_OVColumnRemoved(OBJECT processAnalyst, STRING name)
END
```

**OVItemAdded [Event]**

This event is raised whenever an item is added to the ObjectView.

**Defined As**

- [VBA] OVItemAdded(item As Object)
- [Cicode] OVItemAdded (OBJECT processAnalyst, OBJECT item)
- [C++] OVItemAdded (IObjectViewItem\* item)

**Parameters****item**

[in] A reference to the item that was added to the ObjectView.

**processAnalyst**

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

**Calling Syntax**

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

**[VBA]**

```
Sub myPage_AN35_OVItemAdded(item As Object)
End Sub
```

**[Cicode]**

```
FUNCTION myPage_AN35_OVItemAdded(OBJECT processAnalyst, OBJECT item)
END
```

## OVItemChecked [Event]

This event is raised whenever an item is checked in the ObjectView.

### Defined As

- [VBA] OVItemChecked(item As Object)
- [Cicode] OVItemChecked(OBJECT processAnalyst, OBJECT item)
- [C++] OVItemChecked(IObjectViewItem\* item)

### Parameters

item

[in] A reference to the item that was checked in the ObjectView.

processAnalyst

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

### Calling Syntax

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

## [VBA]

```
Sub myPage_AN35_OVItemChecked(item As Object)
End Sub
```

## [Cicode]

```
FUNCTION myPage_AN35_OVItemChecked(OBJECT processAnalyst, OBJECT item)
END
```

## OVItemRemoved [Event]

This event is raised whenever an item is added to the ObjectView.

### Defined As

- [VBA] OVItemRemoved(item As Object)
- [Cicode] OVItemRemoved(OBJECT processAnalyst, OBJECT item)
- [C++] OVItemRemoved(IObjectViewItem\* item)

### Parameters

item

[in] A reference to the item that was removed from the ObjectView.

processAnalyst

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

### Calling Syntax

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

**[VBA]**

```
Sub myPage_AN35_OVItemRemoved(item As Object)
End Sub
```

**[Cicode]**

```
FUNCTION myPage_AN35_OVItemRemoved(OBJECT processAnalyst, OBJECT item)
END
```

**OVItemSelected [Event]**

This event is raised whenever an item is selected in the ObjectView.

**Defined As**

- [VBA] OVItemSelected(item As Object)
- [Cicode] OVItemSelected(OBJECT processAnalyst, OBJECT item)
- [C++] OVItemSelected(IObjectViewItem\* item)

**Parameters**

item

[in] A reference to the item that was selected in the ObjectView.

processAnalyst

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

**Calling Syntax**

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

**[VBA]**

```
Sub myPage_AN35_OVItemSelected(item As Object)
End Sub
```

**[Cicode]**

```
FUNCTION myPage_AN35_OVItemSelected(OBJECT processAnalyst, OBJECT item)
END
```

**PenCreated [Event]**

This event is raised whenever a pen is either created via the automation model, or added through the Add Pen dialog at run time.

**Defined As**

- [VBA] PenCreated(pen As Object)
- [Cicode] PenCreated(OBJECT processAnalyst, OBJECT pen)

- [C++] PenCreated(IPen\* pen)

**Parameters**

pen

[in] Refers to the pen that was created.

processAnalyst

[in] Indicates the Process Analyst object which raised the event. (Cicode only).

**Calling Syntax**

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

**[VBA]**

```
Sub myPage_AN35_PenCreated(pen As Object)
End Sub
```

**[Cicode]**

```
FUNCTION myPage_AN35_PenCreated(OBJECT processAnalyst, OBJECT pen)
END
```

**PenDeleted [Event]**

This event is raised whenever a pen is deleted either by automation or via the interface.

**Defined As**

- [VBA] PenDeleted(penName As String)
- [Cicode] PenDeleted(OBJECT processAnalyst, STRING penName)
- [C++] PenDeleted(BSTR penName)

**Parameters**

penName

[in] Contains the name of the pen that was deleted.

processAnalyst

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

**Calling Syntax**

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35

**[VBA]**

```
Sub myPage_AN35_PenDeleted(penName As String)
End Sub
```

## [Cicode]

```
FUNCTION myPage_AN35_PenDeleted(OBJECT processAnalyst, STRING penName)
END
```

## PenRenamed [Event]

This event is raised whenever a pen is renamed via automation or through the user interface.

### Defined As

- [VBA] PenRenamed(pen As Object)
- [Cicode] PenRenamed(OBJECT processAnalyst, OBJECT pen)
- [C++] PenRenamed(IPen\* pen)

### Parameters

pen

[in] Refers to the pen that was renamed.

processAnalyst

[in] Indicates the Process Analyst object which raised the event. (Cicode only).

### Calling Syntax

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

## [VBA]

```
Sub myPage_AN35_PenRenamed(pen As Object)
End Sub
```

## [Cicode]

```
FUNCTION myPage_AN35_PenRenamed(OBJECT processAnalyst, OBJECT pen)
END
```

## PenSelectionChanged [Event]

This event is raised whenever the selection changes in the Process Analyst.

### Defined As

- [VBA] PenSelectionChanged (pen As Object)
- [Cicode] PenSelectionChanged (OBJECT processAnalyst, OBJECT pen)
- [C++] PenSelectionChanged (IPen\* pen)

### Parameters

pen

[in] Refers to the pen that now has primary selection. This maybe invalid if the last pen was deleted from the

view.

**processAnalyst**

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

#### Remarks

Selection can change via user interaction (such as clicking on pens, deleting/adding pens) and automation.

#### Calling Syntax

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

### [VBA]

```
Sub myPage_AN35_PenSelectionChanged(pen As Object)
End Sub
```

### [Cicode]

```
FUNCTION myPage_AN35_PenSelectionChanged(OBJECT processAnalyst, OBJECT pen)
END
```

### PropertyChanged [Event]

This event is raised whenever a property that has been subscribed to has changed.

#### Defined As

- [VBA] PropertyChanged(interfaceName As String, propertyName As String)
- [Cicode] PropertyChanged (OBJECT processAnalyst, STRING interfaceName, STRING propertyName)
- [C++] PropertyChanged (BSTR interfaceName, BSTR propertyName)

#### Parameters

**interfaceName**

[in] Indicates which interface the property which has changed belongs to.

**propertyName**

[in] Indicates which property has changed.

**processAnalyst**

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

#### Remarks

For this event to be raised you need to subscribe to one or more properties.

#### Calling Syntax

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

### [VBA]

```
Sub myPage_AN35_PropertyChanged(interfaceName As String, propertyName As String)
End Sub
```

## [Cicode]

```
FUNCTION myPage_AN35_PropertyChanged(OBJECT processAnalyst, STRING interfaceName,  
STRING propertyName)  
END
```

## See Also

[IProcessAnalyst.SubscribeForPropertyChange \[Method\]](#)  
[IProcessAnalyst.UnsubscribePropertyChange \[Method\]](#)

## UpdateCommand [Event]

This event is raised whenever the Process Analyst needs to refresh the state of its toolbars.

### Defined As

- [VBA] UpdateCommand(commandId As String)
- [Cicode] UpdateCommand(OBJECT processAnalyst, STRING commandId)
- [C++] UpdateCommand(BSTR commandId)

### Parameters

commandId

[in] Contains the unique identifier of the command that needs to be refreshed.

processAnalyst

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

### Remarks

This event is only raised for custom commands. use this event as an opportunity to update the enable and/or the pressed state of the toolbar button associated with the command.

This event will be raised frequently so limit the amount of code executed in response to this event.

An Update will be triggered in at least the following scenarios:

- Selection changes
- Command execution

### Calling Syntax

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

## [VBA]

```
Sub myPage_AN35_UpdateCommand(commandId As Integer)  
End Sub
```

## [Cicode]

```
FUNCTION myPage_AN35_UpdateCommand(OBJECT processAnalyst, INT commandId)
END
```

## VerticalAxisChanged [Event]

This event is raised whenever the vertical axis position or scale of a pen is changed.

### Defined As

- [VBA] VerticalAxisChanged(pen As Object)
- [Cicode] VerticalAxisChanged(OBJECT processAnalyst, OBJECT pen)
- [C++] VerticalAxisChanged(IPen\* pen)

### Parameters

pen

[in] Refers to the pen that has changed.

processAnalyst

[in] Indicates the Process Analyst object which raised the event. (Cicode only)

### Calling Syntax

Assumes you have a Process Analyst on a page with an event class defined as myPage\_AN35.

## [VBA]

```
Sub myPage_AN35_VerticalAxisChanged (pen As Object)
End Sub
```

## [Cicode]

```
FUNCTION myPage_AN35_VerticalAxisChanged (OBJECT processAnalyst, OBJECT pen)
END
```

## See Also

### ViewLoadedSaved[Event]

This event is raised whenever a view is either loaded or saved via the automation model, or through the Load/Save dialog at run time.

### Defined As

- [VBA] ViewLoadedSaved(sViewLocation As String, bIsLoaded As Boolean)
- [Cicode] ViewLoadedSaved(OBJECT processAnalyst, STRING sViewLocation, INT bIsLoadedSaved)
- [C++] ViewLoadSaved(BSTR sViewLocation, VARIANT\_BOOL bIsLoaded)

### Parameters

sViewLocation

[in] Refers to the new view location.

bIsLoadedSaved

[in] Refers to whether this event is triggered by Load (-1, or VARIANT\_TRUE) or Save (0, or VARIANT\_FALSE).

processAnalyst

[in] Indicates the Process Analyst object which raised the event. (Cicode only).

#### Calling Syntax

Assumes your Process Analyst's Event Class Name has been defined as myPage\_AN35.

### [VBA]

```
Sub myPage_AN35_ViewLoadedSaved(pen As Object, isLoading as Boolean)
End Sub
```

### [Cicode]

```
FUNCTION myPage_AN35_ViewLoadedSaved(OBJECT processAnalyst, STRING sViewLocation, INT
bIsLoaded)
END
```

### Properties (3)

- [IAlarmPen.LineColor \[Property\]\[Get/Set\]](#)
- [IAlarmPen.LineWidth \[Property\]\[Get/Set\]](#)
- [IAlarmPen.AlarmType \[Property\]\[Get/Set\]](#)

## IAlarmPen.AlarmType [Property][Get/Set]

Gets or Sets the display type of this alarm pen.

### Defined As

- [VBA] Long AlarmType
- [Cicode] INT AlarmType
- [C++] AlarmType AlarmType

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

### Remarks

This AlarmType also dictates the number of alarm states, and their descriptions.

### Calling Syntax

This example assumes there is a valid alarm pen object to be passed into the example methods.

### [VBA]

```
Sub Example(alarmPen As Object)
.....Dim alarmType As Long
.....Getting Property value
.....alarmType = alarmPen.AlarmType
.....`Setting Property value to Analog
.....alarmPen.AlarmType = 1
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hAlarmPen)
.....// Getting property value
.....INT eAlarmType = _ObjectGetProperty(hAlarmPen, "AlarmType");
.....// Setting property to Analog
....._ObjectSetProperty(hAlarmPen, "AlarmType", 1);
END
```

### See Also

[IAlarmPen.AlarmType \[Property\]\[Get/Set\]](#)

## IAlarmPen.GetFillColor [Method]

Gets the color used to fill the pen for the specified state.

### Defined As

- [VBA] GetFillColor(state as Long) as Long
- [Cicode] INT GetFillColor(INT state)
- [C++] HRESULT GetFillColor(int state, OLE\_COLOR\* color)

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

### Parameters

state

[in] The state for which fill color to retrieve (0 to 8).

### Remarks

The color value can be calculated using the following formula: color = (65536 \* Blue) + (256 \* Green) + (Red). Where red, green and blue are 0-255.

### Calling Syntax

This example assumes there is a valid AlarmPen object to be passed into the example methods.

**[VBA]**

```
Sub Example(alarmPen As Object)
.....Dim fillColor As Long
.....fillColor = alarmPen.GetFillColor(0)
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hAlarmPen)
.....INT nFillColor = _ObjectCallMethod(hAlarmPen, "GetFillColor" , 0);
END
```

## IAlarmPen.GetHatchColor [Method]

Gets the color used to draw the outline and hatching for the specified state.

**Defined As**

- [VBA] GetHatchColor(state as Long) as Long
- [Cicode] INT GetHatchColor(INT state)
- [C++] HRESULT GetHatchColor(int state, OLE\_COLOR\* color)

**Execution Result**

If the function succeeds, the return value will be Success. If the state is out of range, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

**Parameters**

state

[in] The state for which hatch color to retrieve (0 to 8).

**Remarks**

The color value can be calculated using the following formula:

color = (65536 \* Blue) + (256 \* Green) + (Red)

where red, green, and blue are 0-255.

**Calling Syntax**

This example assumes there is a valid AlarmPen object to be passed into the example methods.

**[VBA]**

```
Sub Example(alarmPen As Object)
.....Dim hatchColor As Long
.....hatchColor = alarmPen.GetHatchColor(0)
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hAlarmPen)
....INT nHatchColor = _ObjectCallMethod(hAlarmPen, "GetHatchColor" , 0);
END
```

## IAlarmPen.GetHatchStyle [Method]

Gets the hatch style used when drawing the boxes for the specified state.

**Defined As**

- [VBA] GetHatchStyle(state as Long) as Long
- [Cicode] INT GetHatchStyle(INT state)
- [C++] HRESULT GetHatchStyle(int state, HatchStyle\* color)

**Parameters**

state

[in] The state for which you would like to retrieve a hatch style (0 to 8).

**Execution Result**

If the function succeeds the return value will be Success. If the state is out of range then the return value will be InvalidArgument. If the pen is deleted the return value will be GeneralFailure.

**Remarks**

The color value can be calculated using the following formula: color = (65536 \* Blue) + (256 \* Green) + (Red). Where red, green and blue are 0-255.

**Calling Syntax**

This example assumes there is a valid AlarmPen object to be passed into the example methods.

**[VBA]**

```
Sub Example(alarmPen As Object)
....Dim hatchStyle As Long
....hatchStyle = alarmPen.GetHatchStyle(0)
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hAlarmPen)
....INT nHatchStyle = _ObjectCallMethod(hAlarmPen, "GetHatchStyle", 0);
END
```

**See Also**

[IAlarmPen.GetHatchStyle \[Method\]](#)

## IAlarmPen.LineColor [Property][Get/Set]

Gets or Sets the color that will be used to draw the pen line.

### Defined As

- [VBA] Long LineColor
- [Cicode] INT LineColor
- [C++] OLE\_COLOR LineColor

### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted the return value will be GeneralFailure.

### Remarks

The color value can be calculated using the following formula:

$$\text{color} = (65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$$

where red, green, and blue are 0-255.

### Calling Syntax

This example assumes there is a valid alarm pen object to be passed into the example methods.

### [VBA]

```
Sub Example(alarmPen As Object)
.....Dim lineColor As Long
.....`Getting Property value
.....lineColor = alarmPen.LineColor
.....`Setting Property to red
.....alarmPen.LineColor = 255
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hAlarmPen)
.....// Getting property value
.....INT nLineColor = _ObjectGetProperty(hAlarmPen, "LineColor");
.....// Setting property to red
....._ObjectSetProperty(hAlarmPen, "LineColor", 255);
END
```

## IAlarmPen.LineWidth [Property][Get/Set]

Gets or sets the width in pixels of the pen line when it is drawn.

### Defined As

- [VBA] Long LineWidth

- [Cicode] INT LineWidth
- [C++] int LineWidth

#### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted the return value will be GeneralFailure.

#### Limits

- Minimum = 0
- Maximum = 8

#### Calling Syntax

This example assumes there is a valid alarm pen object to be passed into the example methods.

### [VBA]

```
Sub Example(alarmPen As Object)
.....Dim lineWidth As Long
.....`Getting Property value
.....lineWidth = alarmPen.LineWidth
.....`Setting Property value
.....alarmPen.LineWidth = 5
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hAlarmPen)
.....// Getting property value
.....INT nLineWidth = _ObjectGetProperty(hAlarmPen, "LineWidth");
.....// Setting property value
....._ObjectSetProperty(hAlarmPen, "LineWidth", 5);
END
```

## IAlarmPen.SetFillColor [Method]

Sets the color used to fill the pen for the specified state.

#### Defined As

- [VBA] SetFillColor(state as Long, color as Long)
- [Cicode] INT SetFillColor(INT state, INT color)
- [C++] HRESULT SetFillColor(int state, OLE\_COLOR color)

#### Parameters

##### state

[in] The state for which you would like to assign a fill color (0 to 8).

##### color

[in] The fill color that you would like used to for this specific state.

#### Execution Result

If the function succeeds, the return value will be Success. If the state is out of range, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Remarks

The color value can be calculated using the following formula:

color = (65536 \* Blue) + (256 \* Green) + (Red)

where red, green, and blue are 0-255.

#### Calling Syntax

This example assumes there is a valid AlarmPen object to be passed into the example methods.

### [VBA]

```
Sub Example(alarmPen As Object)
.....Dim fillColor As Long
.....`Setting FillColor to Red
.....alarmPen.SetFillColor(0, 255)
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hAlarmPen)
.....// Setting FillColor to Red
....._ObjectCallMethod(hAlarmPen, "SetFillColor" ,0, 255);
END
```

## IAlarmPen.SetHatchColor [Method]

Sets the color used to draw the outline and hatching for the specified state.

#### Defined As

- [VBA] SetHatchColor(state as Long, color as Long)
- [Cicode] INT SetHatchColor (INT state, INT color)
- [C++] HRESULT SetHatchColor (int state, OLE\_COLOR color)

#### Parameters

state

[in] The state for which you would like to assign a hatch color (0 to 8).

color

[in] The color that you would like to be used for a specified states hatch.

#### Execution Result

If the function succeeds the return value will be Success. If the state is out of range then the return value will be InvalidArgument. If the pen is deleted the return value will be GeneralFailure.

**Remarks**

The color value can be calculated using the following formula:

$$\text{color} = (65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$$

where red, green, and blue are 0-255.

**Calling Syntax**

This example assumes there is a valid AlarmPen object to be passed into the example methods.

**[VBA]**

```
Sub Example(alarmPen As Object)
.....Dim hatchColor As Long
.....`Setting HatchColor to Red
.....alarmPen.SetHatchColor(0, 255)
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hAlarmPen)
.....// Setting HatchColor to Red
....._ObjectCallMethod(hAlarmPen, "SetHatchColor",0, 255);
END
```

## IAlarmPen.SetHatchStyle [Method]

Sets the hatch style used for drawing the specified state.

**Defined As**

- [VBA] SetHatchStyle(state as Long, HatchStyle as Long)
- [Cicode] INT SetHatchStyle (INT state, INT hatchStyle)
- [C++] HRESULT SetHatchStyle (int state, HatchStyle hatchStyle)

**Parameters****state**

[in] The state for which you would like to assign a hatch style.

**hatchStyle**

[in] The hatch style that will be used for the specified state.

**Execution Result**

If the function succeeds the return value will be Success. If the state is out of range then the return value will be InvalidArgument. If the pen is deleted the return value will be GeneralFailure.

**Remarks**

The color value can be calculated using the following formula:  $\text{color} = (65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$ . Where red, green and blue are 0-255.

**Calling Syntax**

This example assumes there is a valid AlarmPen object to be passed into the example methods.

### [VBA]

```
Sub Example(alarmPen As Object)
.....`Setting HatchStyle
.....alarmPen.SetHatchStyle(0, 1)
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hAlarmPen)
.....// Setting HatchStyle
....._ObjectCallMethod(hAlarmPen, "SetHatchStyle" ,0, 1);
END
```

### See Also

[IAlarmPen.GetHatchStyle \[Method\]](#)

[IAnalogPen Interface](#)

#### Defined As

- [VBA] Object
- [Cicode] OBJECT
- [C++] IAnalogPen

#### Methods (0)

#### Properties (3)

- [IAnalogPen.LineColor \[Property\]\[Get/Set\]](#)
- [IAnalogPen.LineInterpolation \[Property\]\[Get/Set\]](#)
- [IAnalogPen.LineWidth \[Property\]\[Get/Set\]](#)

## IAnalogPen.LineColor [Property][Get/Set]

Gets or Sets the color that will be used to draw the pen line.

#### Defined As

- [VBA] Long LineColor
- [Cicode] INT LineColor
- [C++] OLE\_COLOR LineColor

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Remarks

The color value can be calculated using the following formula:

color = (65536 \* blue) + (256 \* green) + (red)

where red, green, and blue are 0-255.

#### Calling Syntax

This example assumes there is a valid AnalogPen object to be passed into the example methods.

### [VBA]

```
Sub Example(analogPen As Object)
.....Dim lineColor As Long
.....`Getting Property value
.....lineColor = analogPen.LineColor
.....`Setting Property to red
.....analogPen.LineColor = 255
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hAnalogPen)
.....// Getting property value
.....INT nLineColor = _ObjectGetProperty(hAnalogPen, "LineColor");
.....// Setting property to red
....._ObjectSetProperty(hAnalogPen, "LineColor", 255);
END
```

## IAnalogPen.LineInterpolation [Property][Get/Set]

Gets or sets the drawing style used for drawing the connecting lines between points for this analog pen.

#### Defined As

- [VBA] Long LineInterpolation
- [Cicode] INT LineInterpolation
- [C++] LineType LineInterpolation

#### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted the return value will be GeneralFailure.

#### Remarks

The LineInterpolation mode dictates how the two points of a line are joined when drawn. If Stepped, there will be two lines joining each point, one horizontal and one vertical. If Straight, only one line is used to directly connect the two points.

#### Calling Syntax

This example assumes there is a valid Analog Pen object to be passed into the example methods.

### [VBA]

```
Sub Example(analogPen As Object)
.....Dim lineInterpolation As Long
.....`Getting Property value
.....lineInterpolation = analogPen.LineInterpolation
.....`Setting Property value
.....analogPen.LineInterpolation = 1
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hAnalogPen)
.....// Getting property value
.....INT nInterpolation = _ObjectGetProperty(hAnalogPen, "LineInterpolation");
.....// Setting property value
....._ObjectSetProperty(hAnalogPen, "LineInterpolation", 1);
END
```

### See Also

[LineType \[Enumeration\]](#)

## IAnalogPen.LineWidth [Property][Get/Set]

Gets or sets the width in pixels of the pen line when it is drawn.

#### Defined As

- [VBA] Long LineWidth
- [Cicode] INT LineWidth
- [C++] int LineWidth

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Limits

- Minimum = 0
- Maximum = 8

#### Calling Syntax

This example assumes there is a valid Analog Pen object to be passed into the example methods.

**[VBA]**

```
Sub Example(analogPen As Object)
.....Dim lineWidth As Long
.....`Getting Property value
.....lineWidth = analogPen.LineWidth
.....`Setting Property value
.....analogPen.LineWidth = 5
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hAnalogPen)
.....// Getting property value
.....INT nLineWidth = _ObjectGetProperty(hAnalogPen, "LineWidth");
.....// Setting property value
....._ObjectSetProperty(hAnalogPen, "LineWidth", 5);
END
```

**ICommand Interface**

Inbuilt Commands are listed below:

ID	Description
Citect_Command_LoadConfig	Displays the "Load File" dialog. The user can then specify a configuration file to load into the Process Analyst Control.
Citect_Command_SaveConfig	Displays the "Save File" dialog allowing the user to specify a location to save the current Process Analyst Configuration to.
Citect_Command_ToggleZoom	Toggles the Process Analyst into box-zoom mode. The mouse cursor will be changed into the cross hair. The Zoom is cancelled with a right mouse click, or toggling this command button again
Citect_Command_ZoomIn50	Executes a horizontal and vertical zoom in of 50% of the current spans(s) of the pen(s).
Citect_Command_ZoomOut50	Executes a horizontal and vertical zoom out of 50% of the current spans(s) of the pen(s).
Citect_Command_ZoomUndo	Undoes the last zoom operation
Citect_Command_SpanReset	Restores the pen(s) spans to their original default settings.
Citect_Command_SpanEdit	Displays a dialog allowing the operator to explicitly enter a span to apply to the pen(s).

<b>ID</b>	<b>Description</b>
Citect_Command_ScaleEdit	Edit Vertical Scale
Citect_Command_ScrollLeft100	Moves the pen(s) back in time exactly one span. 'Span' refers to the distance in time between the 'Start' and 'End' of the time-axis.
Citect_Command_ScrollLeft50	Moves the pen(s) back half a span.
Citect_Command_ScrollRight100	Moves the pen(s) forward in time exactly one span. 'Span' refers to the distance in time between the 'Start' and 'End' of the time-axis
Citect_Command_ScrollRight50	Moves the pen(s) forward half a span.
Citect_Command_SynchroniseToNow	Synchronises pens such that the end date time reflects "now" which is positioned on the right hand edge of the screen. "Now" is calculated using the current system time
Citect_Command_ToggleAutoScroll	Toggles the automatic scrolling off and on for pens
Citect_Command_CopyToFile	Exports visible pens to an Excel compatible file.
Citect_Command_CopyToClipboard	Exports visible pens to the clipboard.
Citect_Command_ToggleCursorVisibility	Shows or Hides cursors. If no cursor exists a cursor will be created. Note: Showing a cursor will automatically make the labels visible.
Citect_Command_ToggleCursorLabels	Shows or Hides cursor labels.
Citect_Command_ToggleCursorLabelsLock	Locks or Unlocks the movement of the labels with the cursor.
Citect_Command_TogglePensLock	Allows or disallows the independent movement of pens against each other.
Citect_Command_AddPane	Adds a new pane to the view
Citect_Command_RemovePane	Removes the pane of the primary selected pen. A dialog will confirm the delete.
Citect_Command_TogglePenAutoScale	Toggles the auto-scaling behaviour for the selected pen. This is on a per pen basis. Applying this will remove the Vertical axis scrolling.
Citect_Command_ToggleVerticalScrollLock	Toggles interactive scrolling of the vertical axis. Applying this will remove the autoscale behaviour.
Citect_Command_AddPen	Displays the add pen dialog

ID	Description
Citect_Command_PenRemove	Removes the selected pen from the display.
Citect_Command_ToggleObjectView	When pressed, the Object View will be displayed at the bottom of the Process Analyst Control. When unpressed, the Object View will be hidden and the Process Analyst Control will expand to take up the vacant space
Citect_Command_Print	Displays the print dialog, allowing the user to print the current state of the Process Analyst Control
Citect_Command_RefreshData	Refreshes the selected pen, or pens (if locked)
Citect_Command_Properties	Displays the properties dialog

**Defined As**

- [VBA] Object
- [Cicode] OBJECT
- [C++] ICommand

**Methods (0)****Properties (6)**

[ICommand.CommandId \[Property\]\[Get\]](#)  
[ICommand.ButtonType \[Property\]\[Get\]](#)  
[ICommand.Enabled \[Property\]\[Get/Set\]](#)  
[ICommand.Pressed \[Property\]\[Get/Set\]](#)  
[ICommand.Tooltip \[Property\]\[Get\]](#)

# ICommand.Tooltip [Property][Get]

Gets this commands Tooltip text.

**Defined As**

- [VBA] String Tooltip
- [Cicode] STRING Tooltip
- [C++] VARIANT\_BOOL Tooltip

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is invalid, the return value will be InvalidArgument. If the command has been deleted, the return value will be GeneralFailure.

**Remarks**

This returns the text that is displayed in a tooltip window when the mouse pointer hovers over the command's

button.

#### Calling Syntax

This example assumes there is a valid Command object as retrieved from a Process Analyst's CommandSystem.  
(for example, VBA: ProcessAnalyst.CommandSystem.Item(1))

#### [VBA]

```
Sub Example(Command As Object)
Dim tooltip As String
`Getting Property value
tooltip = Command.Tooltip
End Sub
```

#### [Cicode]

```
FUNCTION Example(OBJECT hCommand)
// Getting property value
STRING sTooltip = _ObjectGetProperty(hCommand, "Tooltip");
END
```

## ICommand.ButtonType [Property][Get]

Gets this commands button type.

#### Defined As

- [VBA] Long ButtonType
- [Cicode] INT ButtonType
- [C++] ToolbarButtonType ButtonType

#### Execution Results

If the property get succeeds, the return value will be Success. If the return value is invalid, the return value will be InvalidArgument. If the command has been deleted, the return value will be GeneralFailure.

#### Remarks

The return value meaning is as follows:

- ToolbarButtonType\_Push = 0
- ToolbarButtonType\_Toggle = 1
- ToolbarButtonType\_Separator = 2

#### Calling Syntax

This example assumes there is a valid Command object as retrieved from a Process Analyst's CommandSystem.  
(for example, VBA: ProcessAnalyst.CommandSystem.Item(1))

**[VBA]**

```
Sub Example(Command As Object)
Dim buttonType As Long
`Getting Property value
buttonType = Command.ButtonType
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCommand)
// Getting property value
INT nButtonType = _ObjectGetProperty(hCommand, "ButtonType");
END
```

## ICommand.CommandId [Property][Get]

Gets the CommandId of this command.

**Defined As**

- [VBA] String CommandId
- [Cicode] STRING hCommandId
- [C++] BSTR CommandId

**Calling Syntax**

This example assumes there is a valid Command object as retrieved from a Process Analyst's CommandSystem (for example, VBA: ProcessAnalyst.CommandSystem.Item(1)).

**[VBA]**

```
Sub Example(Command As Object)
Dim commandId As String
`Getting Property value
commandId = Command.CommandId
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCommand)
// Getting property value
STRING sCommandId = _ObjectGetProperty(hCommand, "CommandID");
END
```

**See Also**

[ICommand Interface](#)

# ICommand.Enabled [Property][Get/Set]

Gets this commands enabled state.

## Defined As

- [VBA] Boolean Enabled
- [Cicode] INT Enabled
- [C++] VARIANT\_BOOL Enabled

## Execution Result

If the property get succeeds, the return value will be Success. If the return value is invalid, the return value will be InvalidArgument.

## Limits

- True (-1): Enabled
- False (0): Disabled

## Remarks

The setting of this property is only valid for custom commands.

## Calling Syntax

This example assumes there is a valid Command object as retrieved from a Process Analyst's CommandSystem. (for example, VBA: ProcessAnalyst.CommandSystem.Item(1))

## [VBA]

```
Sub Example(Command As Object)
Dim enabled As Boolean
`Getting Property value
enabled = Command.Enabled
`Setting Property value
Command.Enabled = True
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hCommand)
// Getting property value
INT nEnabled = _ObjectGetProperty(hCommand, "Enabled");
// Setting property value
_ObjectSetProperty(hCommand, "Enabled", -1);
END
```

# ICommand.Pressed [Property][Get/Set]

Gets and Sets this command's Pressed state.

**Defined As**

- [VBA] Boolean Pressed
- [Cicode] INT Pressed
- [C++] VARIANT\_BOOL Pressed

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Limits**

- True (-1): Pressed
- False (0): Impressed

**Remarks**

This is only useful for toggle buttons, indicating whether or not the button is in a pressed down state. The setting of this property is only valid for custom commands.

**Calling Syntax**

This example assumes there is a valid Command object as retrieved from a Process Analyst's CommandSystem.  
(for example, VBA: ProcessAnalyst.CommandSystem.Item(1))

**[VBA]**

```
Sub Example(Command As Object)
Dim pressed As Boolean
`Getting Property value
pressed = Command.Pressed
`Setting Property value
Command.Pressed = True
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCommand)
// Getting property value
INT Pressed = _ObjectGetProperty(hCommand, "Pressed");
// Setting property value
_ObjectSetProperty(hCommand, "Pressed", -1);
END
```

## ICommand.Privilege [Property][Get]

Gets the privilege necessary to gain access to this command.

**Defined As**

- [VBA] Integer Privilege

- [Cicode] INT Privilege
- [C++] int Privilege

### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is invalid, the return value will be InvalidArgument. If the command has been deleted, the return value will be GeneralFailure.

### Remarks

This is the necessary privilege level of the currently logged in Plant SCADA user to enable the state of this command, and hence allow access through the user interface. If the currently logged in Plant SCADA user doesn't have this privilege, any buttons tied to this command will be disabled.

### Calling Syntax

This example assumes there is a valid Command object as retrieved from a Process Analyst's CommandSystem.  
(for example, VBA: ProcessAnalyst.CommandSystem.Item(1))

## [VBA]

```
Sub Example(Command As Object)
Dim privilege As Integer
`Getting Property value
privilege = Command.Privilege
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hCommand)
// Getting property value
INT Privilege = _ObjectGetProperty(hCommand, "Privilege");
END
```

## ICommandSystem Interface

### Defined As

- [VBA] Object
- [Cicode] OBJECT
- [C++] ICommandSystem

### Methods (3)

- [ICommandSystem.Create \[Method\]](#)
- [ICommandSystem.Execute \[Method\]](#)
- [ICommandSystem.Remove \[Method\]](#)

### Properties (4)

- [ICommandSystem.Count \[Property\]\[Get\]](#)

- ICOMMANDSYSTEM.ITEM [PROPERTY][GET]
- ICOMMANDSYSTEM.\_NEWENUM [PROPERTY][GET]
- ICOMMANDSYSTEM.ITEMBYID [PROPERTY][GET]

## ICommandSystem.\_NewEnum [Property][Get]

This allows "For... Each... Next" integration in VB.

### Calling Syntax

This example assumes there is a valid CommandSystem object as retrieved from a Process Analyst. (for example, VBA: ProcessAnalyst.CommandSystem). This property is not applicable to Cicode.

### [VBA]

```
Sub Example(CommandSystem As Object)
Dim command As Object
Dim count Object
`Using Property
For Each command In CommandSystem
count = count + 1
Next command
End Sub
```

## ICommandSystem.Count [Property][Get]

Gets the number of commands in the command system.

### Defined As

- [VBA] Long Count
- [Cicode] INT Count
- [C++] int Count

### Execution Result

If the property get succeeds, the return value will be Success.

### Calling Syntax

This example assumes there is a valid CommandSystem object as retrieved from a Process Analyst. (for example, VBA: ProcessAnalyst.CommandSystem).

### [VBA]

```
Function Example(CommandSystem As Object)
Dim count As Long
`Getting Property value
count = CommandSystem.Count
End Function
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCommandSystem)
// Getting property value
INT nCount = _ObjectGetProperty(hCommandSystem, "Count");
END
```

# ICommandSystem.Create [Method]

Creates a new Command object that is added to the CommandSystem.

**Defined As**

- [VBA] object Create (commandID As String, buttonType As Integer, tooltip As String, iconPath As String, privilege As Integer)
- [Cicode] OBJECT Create (STRING commandID, INT buttonType, STRING tooltip, STRING iconPath, INT Privilege)
- [C++] HRESULT Create (BSTR commandID, ToolbarButtonType ButtonType, BSTR tooltip, BSTR iconPath, int privilege, ICommand\*\* Val)

**Parameters****commandID**

[in] A unique identifier for this command (1-64 characters).

**buttonType**

[in] A value representing a button type.

- ToolbarButtonType\_Push = 0
- ToolbarButtonType\_Toggle = 1
- ToolbarButtonType\_Separator = 2

**tooltip**

[in] The text to be displayed as a tooltip for this command (1-64 characters).

**iconPath**

[in] The path to an icon file that will be used as this command's picture.

**privilege**

[in] A privilege value necessary by the Plant SCADA user to gain access to this command (0-8).

**Execution Result**

If the method succeeds, the return value is Success. If an argument is invalid or out of range, the return value is InvalidArgument. If the command was not created, the return value is GeneralFailure.

**Remarks**

The commandID cannot begin with the prefix "Citect\_".

**Calling Syntax**

This example assumes there is a valid CommandSystem object as retrieved from a Process Analyst. (for example,

VBA: ProcessAnalyst.CommandSystem).

## [VBA]

```
Sub Example(CommandSystem As Object)
Dim command As Object
Set command = CommandSystem.Create("Custom_CommandID1", 0, "Some tooltip text",
"c:\someicon.ico", 5)
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hCommandSystem)
OBJECT hCommand = _ObjectCallMethod(hCommandSystem, "Create", "Custom_CommandID1", 0, "Some
tooltip text", "c:\someicon.ico", 5);
END
```

# ICommandSystem.Execute [Method]

Executes the specified command's action.

### Defined As

- [VBA] Execute (commandId As String)
- [Cicode] Execute (STRING commandId)
- [C++] HRESULT Execute(BSTR commandId)

### Parameters

commandId

[in] The unique ID of the command whose action is to be executed.

### Execution Result

If this method succeeds, the return value will be Success. If the command is invalid, the return value will be InvalidArgument.

### Remarks

If the current Operator does not have the correct privilege, the command will not execute.

### Calling Syntax

This example assumes there is a valid CommandSystem object as retrieved from a Process Analyst. (for example, VBA: ProcessAnalyst.CommandSystem).

## [VBA]

```
Sub Example(CommandSystem As Object)
CommandSystem.Execute("Citect_Command_AddPen")
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCommandSystem)
    _ObjectCallMethod(hCommandSystem, "Execute", "Citect_Command_AddPen");
END
```

[ICommand Interface](#)

## ICommandSystem.Item [Property][Get]

Gets the Command at a supplied index location in this collection.

**Defined As**

- [VBA] Item(index As Long) as Object
- [Cicode] OBJECT Item(INT index)
- [C++] Item(int index, ICommand\* Item)

**Parameters**

index

[in] Indicates the index location of the command to return from this collection. (One based)

**Execution Result**

If the property get succeeds, the return value will be Success. If the index is out of range, the return value will be InvalidArgument.

**Calling Syntax**

This example assumes there is a valid CommandSystem object as retrieved from a Process Analyst. (for example, VBA: ProcessAnalyst.CommandSystem).

**[VBA]**

```
Sub Example(CommandSystem As Object)
Dim command As Object
`Getting Property value
Set command = CommandSystem.Item(1)
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCommandSystem)
// Getting property value
OBJECT hCommand = _ObjectCallMethod(hCommandSystem, "get_Item", 1);
END
```

# ICommandSystem.ItemById [Property][Get]

Gets the Command at a supplied index location in this collection.

## Defined As

- [VBA] Object Command
- [Cicode] OBJECT hCommand
- [C++] ICommand\* Command

## Parameters

commandId

[in] Indicates command ID of the command to return from this collection.

## Calling Syntax

This example assumes there is a valid CommandSystem object as retrieved from a Process Analyst. (for example, VBA: ProcessAnalyst.CommandSystem).

## [VBA]

```
Sub Example(CommandSystem As Object)
Dim command As Object
`Getting Property value
Set command = CommandSystem.ItemById(Citect_Command_AddPen)
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hCommandSystem)
// Getting property value
OBJECT hCommand = _ObjectCallMethod
(hCommandSystem, "get_ItemById", Citect_Command_AddPen);
END
```

## See Also

[ICommand Interface](#)

# ICommandSystem.Remove [Method]

Removes the specified command.

## Defined As

- [VBA] Remove (commandId As String)
- [Cicode] Remove (STRING CommandId)
- [C++] HRESULT Remove(BSTR CommandId)

**Parameters****commandId**

[in] The ID of the command to be removed.

**Calling Syntax**

This example assumes there is a valid CommandSystem object as retrieved from a Process Analyst. (for example, VBA: ProcessAnalyst.CommandSystem).

**[VBA]**

```
Sub Example(CommandSystem As Object)
CommandSystem.Remove("MyCommand1")
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCommandSystem)
    _ObjectCallMethod(hCommandSystem, "Remove", "MyCommand1");
END
```

**ICursors Interface****Defined As**

- [VBA] Object
- [Cicode] OBJECT
- [C++] ICursors

**Methods (2)**

- [ICursors.Create \[Method\]](#)
- [ICursors.RemoveAll \[Method\]](#)

**Properties (4)**

- [ICursors.Item \[Property\]\[Get\]](#)
- [ICursors.\\_NewEnum \[Property\]\[Get\]](#)
- [ICursors.Count \[Property\]\[Get\]](#)
- [ICursors.ItemByName \[Property\]\[Get\]](#)

## ICursors.\_NewEnum [Property][Get]

Retrieves an enumerator for the cursors collection.

**Defined As**

- [VBA] Object \_NewEnum()
- [C++] HRESULT get\_\_NewEnum(LPUNKNOWN \*pVal)

#### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the collection is deleted, the return value will be GeneralFailure.

#### Remarks

Provided for the implementation of For Each...Next loops in VBA (See Calling Syntax, below). This property cannot be used in Cicode.

#### Calling Syntax

This example assumes you have a valid reference to the cursors collection and that there are cursors in the collection.

### [VBA]

```
Sub Example(cursors As Object)
Dim cursor As Object
Dim count As Integer = 0
For Each cursor In cursors
Set count = count + 1
Next
End Sub
```

## ICursors.Count [Property][Get]

Returns the number of cursors in the collection.

#### Defined As

- [VBA] Integer Count()
- [Cicode] INT Count()
- [C++] HRESULT get\_Count (long \*pCount)

#### Execution Result

If the property get succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the collection is deleted the return value will be GeneralFailure.

#### Remarks

This property may be used in conjunction with the Item property to iterate through the collection in Cicode.

#### Calling Syntax

This example assumes you have a valid reference to the cursors collection.

### [VBA]

```
Sub Example(cursors As Object)
Dim cursorCount As Integer
```

```
cursorCount = cursors.Count
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hCursors)
INT cursorCount;
cursorCount = _ObjectGetProperty(hCursors, "Count");
END
```

# ICursors.Create [Method]

Creates a new TrendCursor at the given location.

### Defined As

- [VBA] Object Create(name As String, position As Integer)
- [Cicode] OBJECT Create(STRING name, INT position)
- [C++] HRESULT Create(BSTR name, int position, ITrendCursor\*\* ppTrendCursor)

### Parameters

name

[in] The desired unique name of the new cursor. This needs to be between 1 and 250 characters.

position

[in] The initial position of the new cursor. This value is given as the number of pixels from the left of the Process Analyst graph view.

### Execution Result

If the function succeeds, the return value will be Success. If the name is out of range, the return value will be InvalidArgument. If the name is not unique, the return value will be InvalidArgument.

If an unexpected error occurs, the return value will be GeneralFailure.

### Remarks

The cursor name needs to be unique. Attempting to create a cursor with a name that is already in use will result in error and the new cursor will not be created.

### Calling Syntax

## [VBA]

```
Sub Example(cursors As Object)
Dim newCursor As Object
newCursor = cursors.Create("Cursor1", 100)
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hCursors)
```

```
OBJECT hNewCursor = _ObjectCallMethod(hCursors, "Create", "Cursor1", 100);
END
```

## ICursors.Item [Property][Get]

Retrieves the Cursor from the collection at the specified index.

### Defined As

- [VBA] Object Item(index As Integer)
- [Cicode] OBJECT get\_Item(INT index)
- [C++] HRESULT get\_Item (long index, ITrendCursor \*\*cursor)

### Parameters

index

[in] The index of the necessary cursor.

### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

If the index is out of range, the return value will be InvalidArgument. If the collection is deleted, the return value will be GeneralFailure.

### Remarks

The index for the collection is 1 based. The valid range for this parameter is between 1 and the total number of cursors.

### Calling Syntax

This example assumes you have a valid reference to the cursors collection and that there are two items in the collection.

### [VBA]

```
Sub Example(hCursors As Object)
Dim hSecondCursor As Object
Set hSecondCursor = hCursors.Item(2)
End Sub
```

### [Cicode]

```
Sub Example(OBJECT hCursors)
OBJECT hSecondCursor = _ObjectCallMethod(hCursors, "get_Item", 2);
END
```

## ICursors.ItemByName [Property][Get]

Retrieves the Cursor at the specified index.

**Defined As**

- [VBA] Object ItemByName(name As String)
- [Cicode] OBJECT get\_ItemByName(STRING name)
- [C++] HRESULT get\_ItemByName (BSTR name, ITrendCursor \*\*cursor)

**Parameters**

name

[in] The name of the necessary cursor.

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the cursor is not found, the return value will be InvalidArgument.

If the collection is deleted, the return value will be GeneralFailure.

**Calling Syntax**

This example assumes you have a valid reference to the cursors collection, and that there is a cursor in the collection named "MyCursor".

**[VBA]**

```
Sub Example(cursors As Object)
Dim cursor As Object
Set cursor = cursors.ItemByName("MyCursor")
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCursors)
OBJECT hCursor = _ObjectCallMethod(hCursors, "get_ItemByName", "MyCursor");
END
```

## ICursors.RemoveAll [Method]

Removes every cursor from the collection.

**Defined As**

- [VBA] RemoveAll()
- [Cicode] RemoveAll()
- [C++] HRESULT RemoveAll()

**Execution Result**

If the function succeeds the return value will be Success. If an unexpected error occurs, the return value will be GeneralFailure.

**Calling Syntax**

This example assumes there is a valid Cursors object to be passed into the example methods.

**[VBA]**

```
Sub Example(cursors As Object)
cursors.RemoveAll
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCursors)
    _ObjectCallMethod(hCursors, "RemoveAll");
End Sub
```

**IDigitalPen Interface****Defined As**

- [VBA] Object
- [Cicode] OBJECT
- [C++] IDigitalPen

**Methods (0)****Properties (4)**

- [IDigitalPen.FillColor \[Property\]\[Get/Set\]](#)
- [IDigitalPen.LineColor \[Property\]\[Get/Set\]](#)
- [IDigitalPen.LineWidth \[Property\]\[Get/Set\]](#)
- [IDigitalPen.Fill \[Property\]\[Get/Set\]](#)

## IDigitalPen.Fill [Property][Get/Set]

Gets or sets whether the pen fill is displayed.

**Defined As**

- [VBA] Boolean Fill
- [Cicode] INT Fill
- [C++] VARIANT\_BOOL Fill

**Execution Result**

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted the return value will be GeneralFailure.

**Remarks**

If the pen is filled, the area under the pen line will be filled with the color specified by the FillColor property.

**Limits**

- True (-1): = Fill is displayed
- False (0): = Fill is hidden

#### Calling Syntax

This example assumes there is a valid digital pen object to be passed into the example methods.

#### [VBA]

```
Sub Example(digitalPen As Object)
    Dim fill As Boolean
    'Getting Property value
    fill = digitalPen.Fill
    'Setting Property value
    digitalPen.Fill = True
End Sub
```

#### [Cicode]

```
FUNCTION Example(OBJECT hDigitalPen)
    // Getting property value
    INT nFill = _ObjectGetProperty(hDigitalPen, "Fill");
    // Setting property value
    _ObjectSetProperty(hDigitalPen, "Fill", -1);
END
```

#### See Also

[IDigitalPen.FillColor \[Property\]\[Get/Set\]](#)

## IDigitalPen.FillColor [Property][Get/Set]

Gets or Sets the color that will be used to fill the area under the line when the value is 1.

#### Defined As

- [VBA] Long FillColor
- [Cicode] INT FillColor
- [C++] OLE\_COLOR FillColor

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Remarks

The color value can be calculated using the following formula:

$$\text{color} = (65536 * \text{blue}) + (256 * \text{green}) + (\text{red})$$

where red, green, and blue are 0-255. The area under the line is filled with this color if the value of the Fill

property is True (-1).

#### Calling Syntax

This example assumes there is a valid DigitalPen object to be passed into the example methods.

#### [VBA]

```
Sub Example(digitalPen As Object)
    Dim fillColor As Long
    `Getting Property value
    fillColor = digitalPen.FillColor
    `Setting Property to red
    digitalPen.FillColor = 255
End Sub
```

#### [Cicode]

```
FUNCTION Example(OBJECT hDigitalPen)
    // Getting property value
    INT nFillColor = _ObjectGetProperty(hDigitalPen, "FillColor");
    // Setting property to red
    _ObjectSetProperty(hDigitalPen, "FillColor", 255);
END
```

#### See Also

[IDigitalPen.Fill \[Property\]\[Get/Set\]](#)

## IDigitalPen.LineColor [Property][Get/Set]

Gets or Sets the color that will be used to draw the pen line.

#### Defined As

- [VBA] Long LineColor
- [Cicode] INT LineColor
- [C++] OLE\_COLOR LineColor

#### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted the return value will be GeneralFailure.

#### Remarks

The color value can be calculated using the following formula:  $color = (65536 * Blue) + (256 * Green) + (Red)$ . Where red, green and blue are 0-255.

#### Calling Syntax

This example assumes there is a valid DigitalPen object to be passed into the example methods.

**[VBA]**

```
Sub Example(digitalPen As Object)
Dim lineColor As Long
`Getting Property value
lineColor = DigitalPen.LineColor
`Setting Property to red
digitalPen.LineColor = 255
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hDigitalPen)
// Getting property value
INT nLineColor = _ObjectGetProperty(hDigitalPen, "LineColor");
// Setting property to red
_ObjectSetProperty(hDigitalPen, "LineColor", 255);
END
```

## IDigitalPen.LineWidth [Property][Get/Set]

Gets or sets the width in pixels of the pen line when it is drawn.

**Defined As**

- [VBA] Long LineWidth
- [Cicode] INT LineWidth
- [C++] int LineWidth

**Execution Result**

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted the return value will be GeneralFailure.

**Limits**

- Minimum = 0
- Maximum = 8

**Calling Syntax**

This example assumes there is a valid Digital Pen object to be passed into the example methods.

**[VBA]**

```
Sub Example(digitalPen As Object)
Dim lineWidth As Long
`Getting Property value
lineWidth = digitalPen.LineWidth
`Setting Property value
digitalPen.LineWidth = 5
```

```
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hDigitalPen)
// Getting property value
INT nLineWidth = _ObjectGetProperty(hDigitalPen, "LineWidth");
// Setting property value
_ObjectSetProperty(hDigitalPen, "LineWidth", 5);
END
```

## IObjectView Interface

### Defined As

- [VBA] Object
- [Cicode] OBJECT
- [C++] IObjectView

### Methods (0)

### Properties (7)

- IObjectView.Visible [Property][Get/Set]
- IObjectView.Height [Property][Get/Set]
- IObjectView.BackgroundColor [Property][Get/Set]
- IObjectView.ForeColor [Property][Get/Set]
- IObjectView.Columns [Property][Get]
- IObjectView.Items [Property][Get]
- IObjectView.SelectedItem [Property][Get]

## IObjectView.BackgroundColor [Property][Get/Set]

Gets or Sets the background color of the ObjectView. This number is treated as an OLE\_COLOR inside the Process Analyst.

### Defined As

- [VBA] Long BackgroundColor
- [Cicode] INT BackgroundColor
- [C++] OLE\_COLOR BackgroundColor

### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

### Remarks

The color value can be calculated using the following formula: color = (65536 \* Blue) + (256 \* Green) + (Red). Where red, green and blue are 0-255.

#### Calling Syntax

This example assumes that there is an IObjectView object being passed in as a parameter.

#### [VBA]

```
Sub Example(objectView As Object)
Dim backgroundColor As Long
`Getting Property value
backgroundColor = objectView.BackgroundColor
`Setting Property value to red
objectView.BackgroundColor = 255
End Sub
```

#### [Cicode]

```
FUNCTION Example(OBJECT hObjectView)
// Getting property value
INT nBackgroundColor =
_ObjectGetProperty(hObjectView, "BackgroundColor");
// Setting Property to Red
_ObjectSetProperty(hObjectView, "BackgroundColor", 255);
END
```

## IObjectView.Columns [Property][Get]

Gets the automation object representing the collection of columns currently visible in the ObjectView.

#### Defined As

- [VBA] Object Columns
- [Cicode] OBJECT Columns
- [C++] IObjectViewColumns\* Columns

#### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

#### Calling Syntax

This example assumes that there is an IObjectView object being passed in as a parameter.

#### [VBA]

```
Sub Example(objectView As Object)
Dim columns As Object
`Getting Property value
Set columns = objectView.Columns
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hObjectView)
// Getting property value
OBJECT hColumns = _ObjectGetProperty(hObjectView, "Columns");
END
```

## IOBJECTVIEW.ForeColor [Property][Get/Set]

Gets or Sets the Fore color (text and color box outlines) of the ObjectView. This number is treated as an OLE\_COLOR inside the Process Analyst.

**Defined As**

- [VBA] Long ForeColor
- [Cicode] INT ForeColor
- [C++] OLE\_COLOR ForeColor

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Remarks**

The color value can be calculated using the following formula: color = (65536 \* Blue) + (256 \* Green) + (Red). Where red, green and blue are 0-255.

**Calling Syntax**

This example assumes that there is an IObjectView object being passed in as a parameter.

**[VBA]**

```
Sub Example(objectView As Object)
Dim foreColor As Long
`Getting Property value
foreColor = objectView.ForeColor
`Setting Property value to red
objectView.ForeColor = 255
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hObjectView)
INT nForeColor = 0;
// Getting property value
nForeColor = _ObjectGetProperty(hObjectView, "ForeColor");
// Setting Property to red
_ObjectSetProperty(hObjectView, "ForeColor", 255);
END
```

# IObjectView.Height [Property][Get/Set]

Gets or Sets the height in pixels of the Object View window.

## Defined As

- [VBA] Long Height
- [Cicode] INT Height
- [C++] int Height

## Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. A height value less than 0 will be InvalidArgument.

## Limits

- Height needs to be 0 or greater.

## Remarks

As the ObjectView and chart both share the same window, by enlarging the ObjectView, you make the Chart smaller and vice versa.

## Calling Syntax

This example assumes that there is an IObjectView object being passed in as a parameter.

## [VBA]

```
Sub Example(objectView As Object)
Dim height As Long
`Getting Property value
height = objectView.Height
`Setting Property value
objectView.Height = 25
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hObjectView)
INT nHeight = 0;
// Getting property value
nHeight = _ObjectGetProperty(hObjectView, "Height");
// Setting Property to false
_Object SetProperty(hObjectView, "Height", 25);
END
```

# IObjectView.Items [Property][Get]

Gets the automation object representing the collection of items at the root of the ObjectView tree.

**Defined As**

- [VBA] Object Items
- [Cicode] OBJECT Items
- [C++] IObjectViewItems\* Items

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Remarks**

The method will provide a list of the pane items in tree. Each pane item has an Items property which allows access to the pen items listed under it.

**Calling Syntax**

This example assumes that there is an IObjectView object being passed in as a parameter.

**[VBA]**

```
Sub Example(objectView As Object)
Dim items As Object
`Getting Property value
Set items = objectView.Items
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hObjectView)
// Getting property value
OBJECT hItems = _ObjectGetProperty(hObjectView, "Items");
END
```

## IObjectView.SelectedItem [Property][Get]

Gets the current primary selection in the ObjectView. This is the pen item that was last selected.

**Defined As**

- [VBA] Object SelectedItem
- [Cicode] OBJECT SelectedItem
- [C++] IObjectViewItem\* SelectedItem

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Calling Syntax**

This example assumes that there is an IObjectView object being passed in as a parameter.

**[VBA]**

```
Sub Example(objectView As Object)
Dim selectedItem As Object
`Getting Property value
Set selectedItem = objectView.SelectedItem
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hObjectView)
// Getting property value
OBJECT hSelectedItem = _ObjectGetProperty(hObjectView, "SelectedItem");
END
```

## IObjectView.Visible [Property][Get/Set]

Gets or Sets the visibility of the Object View window.

**Defined As**

- [VBA] Boolean Visible
- [Cicode] INT Visible
- [C++] VARIANT\_BOOL Visible

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Limits**

- True (-1): Visible
- False (0): Hidden

**Remarks**

By hiding the ObjectView, the chart gains the real estate previously held by it, and likewise the chart loses real estate when the ObjectView gets shown.

**Calling Syntax**

Assume that there is an IObjectView object being passed in as a parameter.

**[VBA]**

```
Sub Example(objectView As Object)
Dim visible As Boolean
`Getting Property value
visible = objectView.Visible
`Setting Property value
objectView.Visible = False
```

End Sub

**[Cicode]**

```
FUNCTION Example(OBJECT hObjectView)
INT bVisible = 0
// Getting property value
bVisible = _ObjectGetProperty(hObjectView, "Visible");
// Setting Property to false
_ObjectSetProperty(hObjectView, "Visible", 0);
END
```

**IObjectViewColumn Interface****Defined As**

- [VBA] Object
- [Cicode] OBJECT
- [C++] IObjectViewColumn

**Methods (0)****Properties (3)**

- IObjectViewColumn.Name [Property][Get]
- IObjectViewColumn.Text [Property][Get]
- IObjectViewColumn.Width [Property][Get/Set]

# IObjectViewColumn.Name [Property][Get]

Retrieves the unique identifier of this column.

**Defined As**

- [VBA] String Name
- [Cicode] STRING Name
- [C++] BSTR Name

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Calling Syntax**

This example assumes there is a valid column as retrieved from an ObjectView. (for example, VBA: objectView.Columns.Item(1)).

**[VBA]**

```
Sub Example(objectViewColumn As Object)
Dim name As String
`Getting Property value
name = objectViewColumn.Name
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hObjectViewColumn)
// Getting property value
STRING name = _ObjectGetProperty(hObjectViewColumn, "Name");
END
```

## IOBJECTVIEWCOLUMN.TEXT [Property][Get]

Gets the Text that is being displayed for this columns header.

**Defined As**

- [VBA] String Text
- [Cicode] STRING Text
- [C++] BSTR Text

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Calling Syntax**

This example assumes there is a valid column as retrieved from an ObjectView. (for example, VBA: objectView.Columns.Item(1)).

**[VBA]**

```
Sub Example(objectViewColumn As Object)
Dim text As String
`Getting Property value
text = objectViewColumn.Text
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hObjectViewColumn)
// Getting property value
STRING text = _ObjectGetProperty(hObjectViewColumn, "Text");
END
```

# IObjectViewColumn.Width [Property][Get/Set]

Gets or Sets the width in pixels of this column.

## Defined As

- [VBA] Long Width
- [Cicode] INT Width
- [C++] int Width

## Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the width is out of range, the result will be InvalidArgument.

## Limits

A valid width is 0-1000.

## Calling Syntax

This example assumes there is a valid column as retrieved from an ObjectView. (for example, VBA: objectView.Columns.Item(1)).

## [VBA]

```
Sub Example(objectViewColumn As Object)
Dim width As Long
`Getting Property value
width = objectViewColumn.Width
`Setting Property value
objectViewColumn.Width = 150
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hObjectViewColumn)
// Getting property value
INT width = _ObjectGetProperty(hObjectViewColumn, "Width");
_ObjectSetProperty(hObjectViewColumn, "Width", 150);
END
```

## IObjectViewColumns Interface

### Defined As

- [VBA] Object
- [Cicode] OBJECT
- [C++] IObjectViewColumns

### Methods (4)

- IObjectViewColumns.Add [Method]
- IObjectViewColumns.Hide [Method]
- IObjectViewColumns.Remove [Method]
- IObjectViewColumns.Show [Method]

#### Properties (4)

- IObjectViewColumns.Count [Property][Get]
- IObjectViewColumns.Item [Property][Get]
- IObjectViewColumns.ItemByName [Property][Get]
- IObjectViewColumns.\_NewEnum [Property][Get]

## IObjectViewColumns.\_NewEnum [Property][Get]

This allows "For... Each... Next" integration in VB.

#### Calling Syntax

This example assumes there is a valid Columns collection as retrieved from an ObjectView. (for example, VBA: objectView.Columns). This property is not applicable in Cicode.

#### [VBA]

```
Sub Example(Columns As Object)
Dim column As Object
Dim count Object
`Using Property
For Each column In Columns
count = count + 1
Next column
End Sub
```

## IObjectViewColumns.Add [Method]

Adds a visible custom column to the ObjectView.

#### Defined As

- [VBA] Add(name As String, DisplayText As String, Width As Long)
- [Cicode] Add(STRING name, STRING DisplayText, INT Width)
- [C++] HRESULT Add (BSTR name, BSTR text, int width)

#### Parameters

name

[in] The string ID uniquely identifying this column (1-64).

text

[in] The title to be displayed in the column header (0-256).

width

[in] The width of this column in pixels (0-1000).

#### Execution Result

If the method succeeds, the return value will be Success. If an argument is out of range, the return value will be InvalidArgument. If the column cannot be added, the return value is GeneralFailure.

#### Calling Syntax

This example assumes there is a valid Columns collection as retrieved from an ObjectView. (for example, VBA: objectView.Columns).

### [VBA]

```
Sub Example(Columns As Object)
Columns.Add "NameID", "New Column", 120;
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hColumns)
_ObjectCallMethod(hColumns, "Add", "NameID", "New Column", 120);
END
```

### See Also

[OVColumnAdded \[Event\]](#)

## IObjectViewColumns.Count [Property][Get]

Gets the number of Columns in this columns collection.

#### Defined As

- [VBA] Long Count
- [Cicode] INT Count
- [C++] int Count

#### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

#### Calling Syntax

This example assumes there is a valid Columns collection as retrieved from an ObjectView. (for example, VBA: ObjectView.Columns).

**[VBA]**

```
Function Example(Columns As Object)
Dim count As Long
`Getting Property value
count = Columns.Count
End Function
```

**[Cicode]**

```
FUNCTION Example(OBJECT hColumns)
// Getting property value
INT nCount = _ObjectGetProperty(hColumns, "Count");
END
```

## IObjectViewColumns.Hide [Method]

Makes the specified column hidden within the Object View.

**Defined As**

- [VBA] Hide(columnName As String)
- [Cicode] Hide(STRING columnName)
- [C++] HRESULT Hide(BSTR columnName)

**Parameters**

columnName

[in] The string ID uniquely identifying the column you want to hide

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the field cannot be set, GeneralFailure is returned.

**Calling Syntax**

This example assumes there is a columns Collection from an ObjectView. (for example, VBA: objectView.Columns).

**[VBA]**

```
Sub Example(columns As Object)
columns.Hide "Error"
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hColumns)
_ObjectCallMethod(hColumns, "Hide", "Error");
END
```

## See Also

[IObjectViewColumns.Show \[Method\]](#)

# IObjectViewColumns.Item [Property][Get]

Gets the ObjectViewItem at a supplied index location in this collection.

### Defined As

- [VBA] Item(index As Long) as Object
- [Cicode] OBJECT Item(INT index)
- [C++] Item(int index, IObjectViewColumn\* Item)

### Parameters

index

[in] Indicates the index location of the column to return from this collection. (One based)

### Calling Syntax

This example assumes there is a valid Columns collection as retrieved from an ObjectView (for example, VBA: objectView.Columns).

## [VBA]

```
Sub Example(Columns As Object)
Dim column As Object
`Getting Property value
Set column = Columns.Item(1)
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hColumns)
// Getting property value
OBJECT hColumn = _ObjectCallMethod(hColumns, "get_Item", 1);
END
```

# IObjectViewColumns.ItemByName [Property][Get]

Returns a reference to the column object with the given name from this column's collection.

### Defined As

- [VBA] ItemByName(columnName As String) as Object
- [Cicode] OBJECT ItemByName(STRING columnName)
- [C++] ItemByName(STRING columnName, IObjectViewColumn\* Item)

**Parameters****columnName**

[in] Indicates the unique name of the column item to return from this collection.

**Execution Results**

If the method succeeds, the return value will be Success. If the column cannot be found, the return value will be InvalidArgument.

**Calling Syntax**

This example assumes there is a valid Columns collection object to be passed into the example methods.

**[VBA]**

```
Sub Example(columns As Object)
Dim column As Object
`Getting Property value
Set column = columns.ItemByName("Duration")
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hColumns)
// Getting property value
OBJECT hColumn = _ObjectCallMethod(hColumns, "get_ItemByName", "Duration");
END
```

## IObjectViewColumns.Remove [Method]

Removes the specified custom column from the Object View columns.

**Defined As**

- [VBA] Remove(columnName As String)
- [Cicode] OBJECT Remove(STRING columnName)
- [C++] Remove(STRING columnName)

**Parameters****columnName**

[in] Indicates the unique name of the column to remove from this collection.

**Execution Results**

If the method succeeds, the return value will be Success. If the column cannot be found, the return value will be InvalidArgument.

**Remarks**

Only user created custom columns can be removed.

**Calling Syntax**

This example assumes there is a valid Columns collection object to be passed into the example methods.

**[VBA]**

```
Sub Example(columns As Object)
Dim column As Object
`Getting Property value
Set column = columns.Remove("MyCustomColumn"
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hColumns)
// Getting property value
OBJECT hColumn = _ObjectCallMethod(hColumns, "get_ItemByName",
"MyCustomColumn");
END
```

## IOBJECTVIEWCOLUMNS.SHOW [Method]

Makes the specified column visible within the Object View.

**Defined As**

- [VBA] Show(columnName As String)
- [Cicode] Show(STRING columnName)
- [C++] HRESULT Show(BSTR columnName)

**Parameters**

columnName

[in] The string ID uniquely identifying the column you want to make visible

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the field cannot be set, then GeneralFailure is returned.

**Calling Syntax**

This example assumes there is a columns Collection from an ObjectView. (for example, VBA: objectView.Columns).

**[VBA]**

```
Sub Example(columns As Object)
columns.Show "Error"
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hColumns)
_ObjectCallMethod(hColumns, "Show", "Error");
END
```

## See Also

### IObjectViewItem Interface

#### Defined As

- [VBA] Object
- [Cicode] OBJECT
- [C++] IObjectViewItem

#### Methods (2)

- [IObjectViewItem.GetField \[Method\]](#)
- [IObjectViewItem.PutField \[Method\]](#)

#### Properties (3)

- [IObjectViewItem.Expanded \[Property\]\[Get/Set\]](#)
- [IObjectViewItem.Tag \[Property\]\[Get/Set\]](#)
- [IObjectViewItem.Items \[Property\]\[Get\]](#)

## IObjectViewItem.Expanded [Property][Get/Set]

Gets or Sets the expanded state of an item in the ObjectView. This change is reflected immediately in the visualization of the ObjectView.

#### Defined As

- [VBA] Boolean Expanded
- [Cicode] INT Expanded
- [C++] VARIANT\_BOOL Expanded

#### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

#### Limits

- True (-1): Expanded
- False (0): Collapsed

#### Calling Syntax

This example assumes there is a valid Item as retrieved from an Items Collection from an ObjectView. (for example, VBA: objectView.Items.Item(1)).

**[VBA]**

```
Sub Example(objectViewItem As Object)
Dim expanded As Boolean
`Getting Property value
expanded = objectViewItem.Expanded
`Setting Property value
objectViewItem.Expanded = False
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hObjectViewItem)
// Getting property value
INT nExpanded = _ObjectGetProperty(hObjectViewItem, "Expanded");
// Setting Property
_ObjectSetProperty(hObjectViewItem, "Expanded", 0);
END
```

## IOBJECTVIEWITEM.GETFIELD [Method]

Returns the string value of a displayed field for a specified column on this item.

The IObjectViewItem interface is hierarchical to two levels - pane and then pen. The result of the GetField method will depend on what type of item it is called on. To access the fields for a pen, for example, you have to first get the items collection for the pane item, then get the pen item.

**Defined As**

- [VBA] GetField(ColumnName As String) as String
- [Cicode] STRING GetField (STRING ColumnName)
- [C++] HRESULT GetField (BSTR ColumnName, BSTR \*Val)

**Parameters**

ColumnName

[in] The string ID uniquely identifying the column whose field value is being queried for.

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the ColumnName does not exist, InvalidArgument will be returned.

**Calling Syntax**

This example gets the Scale property of the first pen in the first pane. It assumes there is a valid Item as retrieved from an Items Collection from an ObjectView. (for example, VBA: objectView.Items.Item(1))

**[VBA]**

```
Sub Example()
Dim paneItem As Object
Dim penItem As Object
```

```
Dim fieldValue As String
Set paneItem = Test_CPA.ObjectView.Items.Item(1) ' Get the first pane of the ObjectView
Set penItem = paneItem.Items.Item(1) ' Get the first pen from the first pane
penItem.GetField "Scale", fieldValue ' Get the value of the scale field
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hObjectView)
OBJECT hPaneItems = _ObjectGetProperty(hObjectView, "Items");
OBJECT hPaneItem = _ObjectCallMethod(hPaneItems, "get_Item", 1);
// Get the first pane of the ObjectView
OBJECT hPenItems = _ObjectGetProperty(hPaneItem, "Items");
// Get the collection of pens from the first pane
OBJECT hPenItem = _ObjectCallMethod(hPenItems, "get_Item", 1);
// Get the first Pen item
STRING sValue;
_ObjectCallMethod(hPenItem, "GetField", "Scale", sValue);
// Get the value of the scale field
END
```

# IOBJECTVIEWITEM.ITEMS [Property][Get]

Gets the automation object representing the collection of child items under this item.

### Defined As

- [VBA] Object Items
- [Cicode] OBJECT Items
- [C++] IObjectViewItem\* Items

### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

### Remarks

Pane nodes are currently the only nodes that can have children.

### Calling Syntax

This example assumes there is a valid item as retrieved from an ObjectView. (for example, VBA: objectView.Items.Item(1). This will be a pane).

## [VBA]

```
Sub Example(objectViewItem As Object)
Dim items As Object
`Getting Property value
Set items = objectViewItem.Items
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hObjectViewItem)
// Getting property value
OBJECT hItems = _ObjectGetProperty(hObjectViewItem, "Items");
END
```

## IObjectViewItem.PutField [Method]

Sets the display string in a field's cell for a specified column on this item.

The IObjectViewItem interface is hierarchical to two levels - pane and then pen. The scope of the PutField method will depend on what type of item it is called on. To set fields for a pen, for example, you have to first get the items collection for the pane item, then get the pen item.

**Defined As**

- [VBA] PutField(columnName As String, fieldValue as String)
- [Cicode] PutField (STRING columnName, STRING fieldValue)
- [C++] HRESULT PutField (BSTR columnName, BSTR fieldValue)

**Parameters**

columnName

[in] The string ID uniquely identifying the column whose field value is being set.

fieldValue

[in] The string you would like to be displayed in the field for this column/pen intersection.

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the field cannot be set, then GeneralFailure is returned.

**Calling Syntax**

This example writes the value "someValue" to the CustomColumn field of the first pen in the first pane. It assumes there is a valid Item as retrieved from an Items Collection from an ObjectView. (for example, VBA: objectView.Items.Item(1)).

**[VBA]**

```
Sub Example()
Dim paneItem As Object
Dim penItem As Object
Set paneItem = Test_CPA.ObjectView.Items.Item(1)
' Get the first pane of the ObjectView
Set penItem = paneItem.Items.Item(1)
' Get the first pen from the first pane
penItem.PutField "CustomColumn", "someValue"
'set the value of the CustomColumn field
End Sub
```

**[Cicode]**

```

FUNCTION Example(OBJECT hObjectView)
OBJECT hPaneItems = _ObjectGetProperty(hObjectView, "Items");
OBJECT hPaneItem = _ObjectCallMethod(hPaneItems, "get_Item", 1);
// Get the first pane of the ObjectView
OBJECT hPenItems = _ObjectGetProperty(hPaneItem, "Items");
// Get the collection of pens from the first pane
OBJECT hPenItem = _ObjectCallMethod(hPenItems, "get_Item", 1);
// Get the first Pen item
_ObjectCallMethod(hPenItem, "PutField", "CustomColumn", "someValue");
// Set the value of the CustomColumn field
END

```

## IOBJECTVIEWITEM.TAG [Property][Get/Set]

Gets or Sets a user specified piece of data to associate with this Item.

**Defined As**

- [VBA] <Any Type> Tag
- [Cicode] <Any Type> Tag
- [C++] VARIANT Tag

**Remarks**

The user can associate any variant of data with a pen. This is handy for associating some custom data with a pen item, and then having direct access to it whenever any events with a pen item target occur.

**Calling Syntax**

This example assumes there is a valid Item as retrieved from an Items Collection from an ObjectView. (for example, VBA: objectView.Items.Item(1)).

**[VBA]**

```

Sub Example(objectViewItem As Object)
Dim tag As Variant
`Getting Property value
tag = objectViewItem.Tag
`Setting Property value to red
objectViewItem.Tag = tag
End Sub

```

**[Cicode]**

```

FUNCTION Example(OBJECT hObjectViewItem)
// Getting property value
INT nTag = _ObjectGetProperty(hObjectViewItem, "Tag");
// Setting Property to red
_ObjectSetProperty(hObjectView, "Tag", nTag);
END

```

## IObjectViewItems Interface

### Defined As

- [VBA] Object
- [Cicode] OBJECT
- [C++] IObjectViewItems

### Methods (0)

### Properties (3)

- IObjectViewItems.Count [Property][Get]
- IObjectViewItems.Item [Property][Get]
- IObjectViewItems.\_NewEnum [Property][Get]

## IObjectViewItems.\_NewEnum [Property][Get]

This allows For.. Each.. Next integration in VB.

### Calling Syntax

This example assumes there is a valid Items collection as retrieved from an ObjectView. (for example, VBA: objectView.Items). This property is not applicable to Cicode.

### [VBA]

```
Sub Example(Items As Object)
Dim item As Object
Dim count Object
`Using Property
For Each item In Items
count = count + 1
Next Item
End Sub
```

## IObjectViewItems.Count [Property][Get]

Gets the number of child items under this item.

### Defined As

- [VBA] Long Count
- [Cicode] INT Count
- [C++] int Count

### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will

be InvalidArgument.

#### Calling Syntax

This example assumes there is a valid Items collection as retrieved from an ObjectView. (for example, VBA: objectView.Items)

#### [VBA]

```
Sub Example(Items As Object)
Dim count As Long
`Getting Property value
count = Items.Count
End Sub
```

#### [Cicode]

```
FUNCTION Example(OBJECT hItems)
// Getting property value
INT nCount = _ObjectGetProperty(hItems, "Count");
END
```

## IObjectViewItem[Property][Get]

Gets the ObjectViewItem at a supplied index location in this collection.

#### Defined As

- [VBA] Item(index As Long) as Object
- [Cicode] OBJECT Item(INT index)
- [C++] Item(int index, IObjectViewItem\* Item)

#### Parameters

index

[in] Indicates the index location of the child item to return from this collection. (One based)

#### Calling Syntax

This example assumes there is a valid Items collection as retrieved from an ObjectView. (for example, VBA: objectView.Items).

#### [VBA]

```
Sub Example(Items As Object)
Dim item As Object
`Getting Property value
Set item = Items.Item(1)
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hItems)
// Getting property value
OBJECT hItem = _ObjectCallMethod(hItems, "get_Item", 1);
END
```

**IObjectViewPenItem Interface****Defined As**

- [VBA] Object
- [Cicode] OBJECT
- [C++] IObjectViewPenItem

**Methods (0)****Properties (3)**

- IObjectViewPenItem.BlockColor [Property][Get]
- IObjectViewPenItem.Checked [Property][Get/Set]
- IObjectViewPenItem.Selected [Property][Get]

## IObjectViewPenItem.BlockColor [Property][Get]

Gets the color representing this item in the ObjectView.

**Defined As**

- [VBA] Long BlockColor
- [Cicode] INT BlockColor
- [C++] OLE\_COLOR BlockColor

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Remarks**

The color value can be calculated using the following formula:  $\text{color} = (65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$  where red, green, and blue are 0-255.

**Calling Syntax**

This example assumes there is a valid pen item as retrieved from an ObjectView. (for example, VBA: ObjectView.Items.Item(1).Items.Item(1) This will be a pen).

**[VBA]**

```
Sub Example(objectViewPenItem As Object)
```

```
Dim blockColor As Long
`Getting Property value
blockColor = objectViewPenItem.BlockColor
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hObjectViewPenItem)
// Getting property value
INT blockColor = _ObjectGetProperty(hObjectViewItem, "BlockColor");
END
```

## IOBJECTVIEWPENITEM.CHECKED [Property][Get/Set]

Gets or Sets whether or not this pen item is checked.

#### Defined As

- [VBA] Boolean Checked
- [Cicode] INT Checked
- [C++] VARIANT\_BOOL Checked

#### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

#### Limits

- True (-1): Checked
- False (0): Unchecked

#### Remarks

This reflects the pens visibility property directly, and any sets to this property will reflect immediately in the update of the Process Analyst display.

#### Calling Syntax

This example assumes there is a valid pen item as retrieved from an ObjectView. (for example, VBA: objectView.Items.Item(1).Items.Item(1) This will be a pen).

### [VBA]

```
Sub Example(objectViewPenItem As Object)
Dim checked As Boolean
`Getting Property value
checked = objectViewPenItem.Checked
`Setting Property value
objectViewPenItem.Checked = False
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hObjectViewItem)
// Getting property value
INT checked = _ObjectGetProperty(hObjectViewItem, "Checked");
// Setting property value
_ObjectSetProperty(hObjectViewItem, "Checked", 0);
END
```

**See Also**

[OVItemChecked \[Event\]](#)

## IObjectViewPenItem.Selected [Property][Get]

Gets whether or not this pen is the selected pen in its pane.

**Defined As**

- [VBA] Boolean Selected
- [Cicode] INT Selected
- [C++] VARIANT\_BOOL Selected

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Limits**

- True (-1): Selected
- False (0): Unselected

**Remarks**

Each Pane has one selected pen. It is visually emphasized by a vertical gradient fill.

**Calling Syntax**

This example assumes there is a valid pen item as retrieved from an ObjectView. (for example, VBA: objectView.Items.Item(1).Items.Item(1) This will be a pen).

**[VBA]**

```
Sub Example(objectViewPenItem As Object)
Dim selected As Boolean
`Getting Property value
selected = objectViewPenItem.Selected
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hObjectViewItem)
// Getting property value
INT selected = _ObjectGetProperty(hObjectViewItem, "Selected");
END
```

## IPane Interface

### Defined As

- [VBA] Object
- [Cicode] OBJECT
- [C++] IPanes

### Methods (1)

- IPane.Delete [Method]

### Properties (6)

- IPane.Height [Property][Get/Set]
- IPane.Collection [Property][Get]
- IPane.Name [Property][Get/Set]
- IPane.BackgroundColor [Property][Get/Set]
- IPane.FixedHeight [Property][Get/Set]
- IPane.Pens [Property][Get]

## IPane.BackgroundColor [Property][Get/Set]

Gets or Sets the color of this Pane.

### Defined As

- [VBA] Long BackgroundColor
- [Cicode] INT BackgroundColor
- [C++] OLE\_COLOR BackgroundColor

### Execution Result

If the property get/set succeeds, the return value will be Success. If the pane is deleted, the return value will be GeneralFailure.

### Remarks

The color value can be calculated using the following formula: color = (65536 \* Blue) + (256 \* Green) + (Red). Where red, green and blue are 0-255.

### Calling Syntax

This example assumes there is a valid Pane object to be passed into the example methods.

### [VBA]

```
Sub Example(Pane As Object)
Dim backgroundColor As Long
`Getting Property value
backgroundColor = Pane.BackgroundColor
`Setting Property value to red
Pane.BackgroundColor = 255
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPane)
// Getting property value
INT nColor = _ObjectGetProperty(hPane, "BackgroundColor");
// Setting property value
_ObjectSetProperty(hPane, "BackgroundColor", 255);
END
```

## IPane.Collection [Property][Get]

Returns a reference to the Panes collection that this Pane belongs to.

### Defined As

- [VBA] Object Collection
- [Cicode] OBJECT Collection
- [C++] IPanes\* Collection

### Execution Result

If the property get succeeds the return value will be Success. If the pane is deleted the return value will be GeneralFailure.

### Calling Syntax

This example assumes there is a valid Pane object to be passed into the example methods.

### [VBA]

```
Sub Example(pane As Object)
Dim panes As Object
`Getting Property value
Set panes = pane.Collection
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPane)
```

```
// Getting property value
OBJECT hPanes = _ObjectGetProperty(hPane, "Collection");
END
```

## See Also

[IPanes Interface](#)

# IPane.Delete [Method]

Removes this Pane from the collection and the display.

### Defined As

- [VBA] Delete()
- [Cicode] Delete()
- [C++] HRESULT Delete()

### Execution Result

If the method succeeds, the return value will be Success. If the pane is already deleted, the return value will be GeneralFailure.

### Remarks

Any pen associated with the pane will also be deleted.

### Calling Syntax

This example assumes there is a valid Pane object to be passed into the example methods.

## [VBA]

```
Sub Panes(Pane As Object)
Pane.Delete()
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPane)
_ObjectCallMethod(hPane, "Delete");
END
```

# IPane.FixedHeight [Property][Get/Set]

Gets or Sets whether this pane has a fixed height.

### Defined As

- [VBA] Boolean FixedHeight

- [Cicode] INT FixedHeight
- [C++] VARIANT\_BOOL FixedHeight

### Execution Result

If the property get/set succeeds, the return value will be Success. If the pane is deleted, the return value will be GeneralFailure.

### Limits

- True (-1): Height is fixed
- False (0): Height is variable

### Remarks

When this property is true, the pane's Height reflects the pixel value size as gotten from the Pane's Height property. If the FixedHeight property is false, the Height property value is used as a ratio of the available 'Variable' real estate (all the left over room in the Process Analyst after Fixed Height panes have been added) which is shared out between the Variable Height panes.

### Calling Syntax

This example assumes there is a valid Pane object to be passed into the example methods.

## [VBA]

```
Sub Example(pane As Object)
Dim fixedHeight As Boolean
`Getting Property value
fixedHeight = pane.FixedHeight
`Setting Property value
pane.FixedHeight = True
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPane)
// Getting property value
INT bFixedHeight = _ObjectGetProperty(hPane, "FixedHeight");
// Setting property value
_ObjectSetProperty(hPane, "FixedHeight", -1);
END
```

## See Also

[IPane.Height \[Property\]\[Get/Set\]](#)

# IPane.Height [Property][Get/Set]

Gets or Sets the height of this pane.

### Defined As

- [VBA] Long Height
- [Cicode] INT Height
- [C++] int Height

### Execution Result

If the property get/set succeeds, the return value will be Success. If the height is out of range (16-1000), the return value will be InvalidArgument. If the pane is deleted, the return value will be GeneralFailure.

### Remarks

This property affects the visible height of the Pane in two different ways based on the Boolean value of the FixedHeight property. If the FixedHeight property is True, the Pane takes on a pixel height equivalent to the Height property value. Every pen inside the Pane is adjusted to fit. If the FixedHeight property is False, the Height property value is used as a ratio of the available 'Variable' real estate (all the left over room in the Process Analyst after Fixed Height panes have been added) which is shared out between the Variable Height panes.

### Calling Syntax

This example assumes there is a valid Pane object to be passed into the example methods.

## [VBA]

```
Sub Example(Pane As Object)
Dim height As Long
`Getting Property value
height = Pane.Height
`Setting Property value
Pane.Height = 250
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPane)
// Getting property value
INT nHeight = _ObjectGetProperty(hPane, "Height");
// Setting property value
_ObjectSetProperty(hPane, "Height", 250);
END
```

## See Also

[IPane.FixedHeight \[Property\]\[Get/Set\]](#)

# IPane.Name [Property][Get/Set]

Gets or Sets the name of this pane.

### Defined As

- [VBA] String Name
- [Cicode] STRING Name

- [C++] BSTR Name

#### Execution Result

If the property get/set succeeds, the return value will be Success. If a pane of the same name exists, the return value will be InvalidArgument. If the panes collection is deleted, the return value will be GeneralFailure.

#### Limits

Name needs to be between 1-250 characters.

#### Remarks

Pane names needs to be unique.

#### Calling Syntax

This example assumes there is a valid Pane object to be passed into the example methods.

### [VBA]

```
Sub Example(pane As Object)
Dim name As String
`Getting Property value
name = pane.Name
`Setting Property value
pane.Name = "Alarms"
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPane)
// Getting property value
STRING sName = _ObjectGetProperty(hPane, "Name");
// Setting property value
_ObjectSetProperty(hPane, "Name", "Alarms");
END
```

## IPane.Pens [Property][Get]

Gets a reference to the pens collection object containing the pens for this pane.

#### Defined As

- [VBA] Object Pens
- [Cicode] OBJECT Pens
- [C++] IPens\* Pens

#### Execution Result

If the property get succeeds the return value will be Success. If the pane is deleted the return value will be GeneralFailure.

#### Calling Syntax

This example assumes there is a valid Pane object to be passed into the example methods.

**[VBA]**

```
Sub Example(pane As Object)
Dim pens As Object
`Getting Property value
Set pens = pane.Pens
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPane)
// Getting property value
OBJECT hPens = _ObjectGetProperty(hPane, "Pens");
END
```

## IPanes.\_NewEnum [Property][Get]

This allows For.. Each.. Next integration in VB.

**Calling Syntax**

This example assumes there is a valid Panes collection object to be passed into the example methods. This property is not applicable to Cicode.

**[VBA]**

```
Sub Example(Panes As Object)
Dim pane As Object
Dim count As Long
`Using Property
For Each pane In Panes
count = count + 1
Next pane
End Sub
```

## IPanes.Count [Property][Get]

Gets the number of Panes in this collection.

**Defined As**

- [VBA] Long Count
- [Cicode] INT Count
- [C++] int Count

**Execution Result**

If the property get succeeds, the return value will be Success. If the panes collection is deleted, the return value will be GeneralFailure.

**Calling Syntax**

This example assumes there is a valid Panes collection object to be passed into the example methods.

**[VBA]**

```
Sub Example(Panes As Object)
Dim count As Long
`Getting Property value
count = Panes.Count
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPanes)
// Getting property value
INT nCount = _ObjectGetProperty(hPanes, "Count");
END
```

## IPanes.Create [Method]

Adds a pane to this collection and returns a reference to it.

**Defined As**

- [VBA] Create(name as String) as Object
- [Cicode] OBJECT Create (STRING name)
- [C++] HRESULT Create(BSTR name, IPane\*\* pane)

#### Parameters

name

[in] The name to give to the pane (0-250 characters).

#### Execution Result

If the method succeeds, the return value will be Success. If a pane of the same name exists, the return value will be InvalidArgument. If the panes collection is deleted, the return value will be GeneralFailure.

#### Remarks

When this method succeeds it will return a reference to the new IPane object.

#### Calling Syntax

This example assumes there is a valid Panes collection object to be passed into the example methods.

### [VBA]

```
Sub Example(Panes As Object)
Dim pane As Object
Set pane = Panes.Create("Alarm Pane")
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPanes)
OBJECT hPane = _ObjectCallMethod(hPanes, "Create", "Alarm Pane");
END
```

## IPanes.Item [Property][Get]

Gets the Pane at the given index in this Pane collection.

#### Defined As

- [VBA] Item(index As Long) as Object
- [Cicode] OBJECT Item(INT index)
- [C++] Item(int index, IPane\* Item)

#### Parameters

index

[in] Indicates the location of the Pane item to return from this collection. (One based)

#### Execution Result

If the property get succeeds the return value will be Success. If the index is out of range then the return value will be InvalidArgument. If the panes collection is deleted the return value will be GeneralFailure.

#### Calling Syntax

This example assumes there is a valid Panes collection object to be passed into the example methods.

### [VBA]

```
Sub Example(Panes As Object)
Dim pane As Object
`Getting Property value
Set pane = Panes.Item(1)
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPanes)
// Getting property value
OBJECT hPane = _ObjectCallMethod(hPanes, "get_Item", 1);
END
```

[IPane Interface](#)

## IPanes.ItemByName [Property][Get]

Returns a reference to the pane object with the given name from this Panes collection.

#### Defined As

- [VBA] ByName(name As String) as Object
- [Cicode] OBJECT ByName(STRING name)
- [C++] ByName(STRING name, IPane\* Item)

#### Parameters

name

[in] Indicates the name of the Pane item to return from this collection.

#### Execution Result

If the property get succeeds, the return value will be Success. If the pane cannot be found, the return value will be InvalidArgument. If the panes collection is deleted, the return value will be GeneralFailure.

#### Calling Syntax

This example assumes there is a valid Panes collection object to be passed into the example methods.

**[VBA]**

```
Sub Example(Panes As Object)
Dim pane As Object
`Getting Property value
Set pane = Panes.ItemByName("Alarm Pane")
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPanes)
// Getting property value
OBJECT hPane = _ObjectCallMethod(hPanes, "get_ItemByName", "Alarm Pane");
END
```

## IPanes.RemoveAll [Method]

Removes every Pane from this Pane collection.

**Defined As**

- [VBA] RemoveAll()
- [Cicode] RemoveAll()
- [C++] HRESULT RemoveAll()

**Execution Result**

If the method succeeds, the return value will be Success. If the panes collection is deleted, the return value will be GeneralFailure.

**Calling Syntax**

This example assumes there is a valid Panes collection object to be passed into the example methods.

**[VBA]**

```
Sub Panes(Buttons As Object)
Panes.RemoveAll()
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPanes)
_ObjectCallMethod(hPanes, "RemoveAll");
END
```

## IPen.AddSample

Adds a temporary sample to a pen.

**Note:** The pen you are adding samples to needs to have the **Server** field in the **Data Connection** properties set to <Unbound>. See [Configure the Pen Data Connection](#).

### Defined As

- [VBA] AddSample(value As Double, timeStamp as Date, milli as Integer, qualityType as Integer, compactionType as Integer)
- [Cicode] AddSample(REAL value, DATE timeStamp, INT milli, INT qualityType, INT compactionType)
- [C++] HRESULT AddSample(double value, DATE timeStamp, short milli, QualityType qualityType, QualityCompactionType compactionType)

## Parameters

value

[in] Indicates the value of the sample that will be added.

timeStamp

[in] Indicates at what time the sample will occur in UTC time.

milli

[in] Indicates the millisecond component of the time stamp (0 to 999).

qualityType

[in] Indicates the quality of the sample that will be added.

compactionType

[in] Indicates what display type the sample will be represented as.

## Execution Result

If the function succeeds, the return value will be Success. If an argument is bad, the return value will be InvalidArgument. If an argument is out of range, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure. If any other unexpected error occurs, the return value will be GeneralFailure.

## Remarks

You can only add samples to analog or digital pens.

This function has limited use as the samples added are stored in a temporary cache; they can be cleared anytime by time span changes, data refresh calls, or automation. You can change this behavior using [IPen.ClearOnResolutionChange \[Property\]\[Get/Set\]](#).

## Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
Dim timeStamp As Date
timestamp = Now
pen.AddSample 75.0, timeStamp, 100, 0, 0
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT iCitectTime;
REAL rOleTime;
iCitectTime = TimeCurrent(); // Returns seconds since 1970
rOleTime = TimeToOleDate(iCitectTime, 1); // Convert to OLE UTC time
_ObjectCallMethod(hPen, "AddSample", 75.0, rOleTime, 100, 0, 0);
END
```

## See Also

[QualityType \[Enumeration\]](#)

QualityCompactionType [Enumeration]

## IPen.AxisBackgroundColor [Property][Get/Set]

Gets or sets the background color of the axis of this pen.

### Defined As

- [VBA] Long BackgroundColor
- [Cicode] INT BackgroundColor
- [C++] OLE\_COLOR BackgroundColor

### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

### Remarks

The background is the area underneath the axis lines and values.

To calculate the integer value necessary for a color apply the following formula  $(65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$ . Where Red, Green and Blue are 0-255

### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim backgroundColor As Long
`Getting Property value
backgroundColor = pen.AxisBackgroundColor
`Setting Property value to Red
pen.AxisBackgroundColor = 255
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT backgroundColor;
// Getting current property value
backgroundColor = _ObjectGetProperty(hPen, "AxisBackgroundColor");
// Setting Property to Red
_ObjectSetProperty(hPen, "AxisBackgroundColor", PackedRGB(255, 0, 0));
END
```

## IPen.BlockRepaint [Property][Get/Set]

Use this property to halt or continue any drawing updates to this pen.

**Defined As**

- [VBA] Boolean BlockRepaint
- [Cicode] INT BlockRepaint
- [C++] VARIANT\_BOOL BlockRepaint

**Execution Result**

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

**Remarks**

This property is useful if you are modifying several properties at once as it will help reduce flicker and the amount of processing necessary. Simply set the property to True (-1), change as many properties as you want, and then set the property to False (0).

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim blockRepaint As Boolean
`Getting Property value
blockRepaint = pen.BlockRepaint
`Setting Property value
pen.BlockRepaint = True
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
INT bBlockRepaint;
// Getting current property value
bBlockRepaint = _ObjectGetProperty(hPen, "BlockRepaint");
// Setting Property
_ObjectSetProperty(hPen, "BlockRepaint", -1);
END
```

## IPen.Clear [Method]

Clears every sample belonging to this pen from the internal cache. (Note: This does not remove logged samples from the server)

**Defined As**

- [VBA] Clear()
- [Cicode] Clear()
- [C++] HRESULT Clear()

**Execution Result**

If the function succeeds the return value will be Success. If the pen is deleted then the return value will be GeneralFailure.

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
pen.Clear
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
    _ObjectCallMethod(hPen, "Clear");
END
```

## IPen.ClearOnResolutionChange [Property][Get/ Set]

Controls whether the Process Analyst Control will automatically clear the data cache in response to human interaction methods that result in a data resolution change, for example, when the user manipulates the horizontal axis scaling. In normal operation this property is set to TRUE by default. Turning the property to FALSE will result in the action not clearing the data cache. This property can only be changed when the DataPoint property is not bound (that is, Empty). Once the cache is full it will roll samples off the back as new samples arrive. This property is useful when the pen is unbound and the AddSample method is used.

**Defined As**

- [VBA] Boolean ClearOnResolutionChange
- [Cicode] INT ClearOnResolutionChange
- [C++] VARIANT\_BOOL ClearOnResolutionChange

**Execution Result**

If the property get/set succeeds the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be AccessDenied.

**Limits**

- True (-1): User action clears the data cache
- False (0): User action does not clear the data cache

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim ResoChange As Boolean
`Getting Property value
ResoChange = pen.ClearOnResolutionChange
`Setting Property value
pen.ClearOnResolutionChange = False
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
INT bResoChange;
// Getting current property value
bResoChange = _ObjectGetProperty(hPen, "ClearOnResolutionChange");
// Setting Property
_ObjectSetProperty(hPen, "ClearOnResolutionChange", 0);
END
```

## IPen.Collection [Property][Get]

Returns a reference to the Pens collection object that this pen belongs to.

**Defined As**

- [VBA] Object Collection
- [Cicode] OBJECT Collection
- [C++] IPen\* Collection

**Execution Result**

If the property get succeeds the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim pens As Object
`Getting Property value
Set pens = pen.Collection
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
OBJECT pens;
```

```
// Getting current property value
pens = _ObjectGetProperty(hPen, "Collection");
END
```

## IPen.DataPoint [Property][Get/Set]

Get or Set the trend/alarm tag which this pen is bound to.

### Defined As

- [VBA] String DataPoint
- [Cicode] STRING DataPoint
- [C++] BSTR DataPoint

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the tag is greater than 79 characters, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

### Remarks

This property works in conjunction with the DataServer property. This property can be changed during the lifetime of the pen. Changing the DataPoint property will result in the data cache being cleared and a new data request issued. A request for the tag's information will also be issued.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim tag As String
`Getting Property value
tag = pen.DataPoint
`Setting Property value
pen.DataPoint = "LOOP_1_PV"
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
STRING tag;
// Getting current property value
tag = _ObjectGetProperty(hPen, "DataPoint");
// Setting Property
_ObjectSetProperty(hPen, "DataPoint", "LOOP_1_PV");
END
```

## See Also

[IPen.DataServer \[Property\]\[Get/Set\]](#)

# IPen.DataServer [Property][Get/Set]

Get or Set the server that this pen is bound to.

### Defined As

- [VBA] String DataServer
- [Cicode] STRING DataServer
- [C++] BSTR DataServer

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the server connection cannot be found, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

### Remarks

This property currently only supports two options, "localhost" and "" (empty string), which indicates an unbound connection. Local host means the pen will use the local Plant SCADA client to source data from the Plant SCADA Trends/Alarm Servers.

This property works in conjunction with the DataPoint property. This property can be changed during the lifetime of the pen.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
Dim server As String
`Getting Property value
server = pen.DataServer
`Setting Property value
pen.DataPoint = "localhost"
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
STRING server;
// Getting current property value
server = _ObjectGetProperty(hPen, "DataServer");
// Setting Property
_ObjectSetProperty(hPen, "DataServer", "localhost");
END
```

## See Also

[IPen.DataPoint \[Property\]\[Get/Set\]](#)

# IPen.Delete [Method]

Deletes the pen from the Process Analyst.

### Defined As

- [VBA] Delete()
- [Cicode] Delete()
- [C++] HRESULT Delete()

### Execution Result

If the function succeeds, the return value will be Success. If the pen is already deleted, the return value will be GeneralFailure.

### Remarks

Calling this method will mark the pen for deletion, meaning any further calls to methods or properties on the pen will result in a GeneralFailure error. The pen will be removed from the display immediately after making this call.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
pen.Delete
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
_ObjectCallMethod(hPen, "Delete");
END
```

## See Also

[IPen.IsDeleted \[Property\]\[Get\]](#)

# IPen.GetDefaultSpan [Method]

Returns the default time span for this pen as a series of time components.

### Defined As

- [VBA] GetDefaultSpan(weeks As Integer, days As Integer, hours As Integer, minutes As Integer, seconds As Integer, milliseconds As Integer)
- [Cicode] GetDefaultSpan (INT weeks, INT days, DATE hours, INT minutes, INT seconds, INT milliseconds)
- [C++] HRESULT GetDefaultSpan (short\* weeks, short\* days, short\* hours, short\* minutes, short\* seconds, short\* milliseconds)

### Parameters

weeks

[out] Indicates the number of weeks in the span.

days

[out] Indicates the number of days in the span.

hours

[out] Indicates the number of hours in the span.

minutes

[out] Indicates the number of minutes in the span.

seconds

[out] Indicates the number of seconds in the span.

milliseconds

[out] Indicates the number of milliseconds in the span.

### Execution Result

If the function succeeds, the return value will be Success. If an argument is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure. If any other unexpected error occurs, the return value will be GeneralFailure.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
Dim weeks As Integer
Dim days As Integer
Dim hours As Integer
Dim minutes As Integer
Dim seconds As Integer
Dim milliseconds As Integer
pen.GetDefaultSpan weeks, days, hours, minutes, seconds, milliseconds
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT weeks;
INT days;
INT hours;
INT minutes;
```

```
INT seconds;
INT milliseconds;
_ObjectCallMethod(hPen, "GetDefaultSpan", weeks, days, hours, minutes,
seconds, milliseconds);
END
```

## See Also

[IPen.SetDefaultSpan \[Method\]](#)  
[IPen.ResetToDefaultSpan \[Method\]](#)

# IPen.GetHorizontalAxisTimeSpan [Method]

Returns the start and end time of this pen in local or UTC time format.

### Defined As

- [VBA] GetHorizontalAxisTimeSpan(startTime As Date, startMs as Integer, endTime as Date, endMs as Integer, localTime as Boolean)
- [Cicode] GetHorizontalAxisTimeSpan (REAL startTime, INT startMs, REAL endTime, INT endMs, INT localTime)
- [C++] HRESULT GetHorizontalAxisTimeSpan (DATE\* startTime, short\* startMs, DATE\* endTime, short\* endMs, VARIANT\_BOOL localTime)

### Parameters

startTime

[out] This will contain the beginning date and time without milliseconds of the time span.

startMs

[out] This will contain the milliseconds component of the start time.

endTime

[out] This will contain the end date and time without milliseconds.of the time span.

endMs

[out] This will contain the milliseconds component of the end time.

localTime

[in] Indicates whether the times returned are in local time or UTC. True = -1, False (0) = UTC.

### Execution Result

If the function succeeds, the return value will be Success. If an argument is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure. If any other unexpected error occurs, the return value will be GeneralFailure.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
```

```
Dim startDate As Date
Dim endDate As Date
Dim startMs As Integer
Dim endMs As Integer
pen.GetHorizontalAxisTimeSpan startDate, startMs, endDate, endMs, True
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
REAL startDate;
REAL endDate;
INT startMs;
INT endMs;
_ObjectCallMethod(hPen, "GetHorizontalAxisTimeSpan", startDate, startMs,
endDate, endMs, -1);
END
```

## See Also

# IPen.GetInformation [Method]

Returns information associated with this pen.

### Defined As

- [VBA] GetInformation(name As String) As String
- [Cicode] STRING GetInformation(STRING name)
- [C++] HRESULT GetDefaultSpan (BSTR name, BSTR\* value)

### Parameters

name

[in] Specify the pen information attribute you want to get the value for. See Remarks below for supported attributes.

value

[out] Indicates the value of the specified information attribute.

### Execution Result

If the function succeeds, the return value will be Success. If an argument is bad, the return value will be InvalidArgument. If the attribute does not exist, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure. If any other unexpected error occurs, the return value will be GeneralFailure.

### Information Attributes

Attribute	Returns	Applies to
Alarm Area	Alarm tag field	Alarm
Alarm Category	Alarm tag field	Alarm
Alarm Desc	Alarm tag field	Alarm
Alarm Name	Alarm tag field	Alarm
Alarm Type	Alarm tag field	Alarm
Comment	Alarm/Trend tag comment field	All
Duration	Process Analyst time span	All
End Time	Process Analyst axis end time	All
Engineering Full Scale	Trend tag field	Analog, Digital
Engineering Units	Trend tag field	Analog, Digital
Engineering Zero Scale	Trend tag field	Analog, Digital
Error	Process Analyst error status	All
Full Scale	Process Analyst vertical axis max scale	Analog,
Name	Process Analyst pen name	All
Raw Full Scale	Trend tag field	Analog, Digital
Raw Zero Scale	Trend tag field	Analog, Digital
Sample Period	Trend tag field	Analog, Digital
Start Time	Process Analyst axis start time	All
Tag	Process Analyst source binding field	All
Trend Type	Trend tag field	Analog, Digital
Zero Scale	Process Analyst vertical axis min scale	Analog
Scale	Process Analyst vertical axis scale range	Analog, Digital
Engineering Scale	Engineering scale range	Analog, Digital

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim duration As String
duration = pen.GetInformation "Duration"
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
STRING duration;
duration = _ObjectCallMethod(hPen, "GetInformation", "Duration");
END
```

## IPen.GetStatistic [Method]

Returns the result of a specified Process Analyst statistical operation.

**Defined As**

- [VBA] GetStatistic(name As String, value As String)
- [Cicode] GetStatistic(STRING name, STRING value)
- [C++] HRESULT GetStatistic(BSTR name, BSTR\* value)

**Parameters**

name

[in] Specify the statistic attribute you want to get the value for. See Remarks below for supported attributes.

value

[out] Indicates the value of the specified statistic attribute.

**Execution Result**

If the function succeeds, the return value will be Success. If an argument is bad, the return value will be InvalidArgument. If the attribute does not exist, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure. If any other unexpected error occurs, the return value will be GeneralFailure.

**Information Attributes**

Attribute	Returns	Applies to
Average	Process Analyst real-time average	Analog, Digital
Maximum	Process Analyst real-time maximum	Analog
Minimum	Process Analyst real-time minimum	Analog

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim average As String
pen.GetStatistic "Average", average
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
STRING average;
average = _ObjectCallMethod(hPen, "GetStatistic", "Average");
END
```

## IPen.GetVerticalAxisSpan [Method]

Returns the current span of the pen's vertical axis.

**Defined As**

- [VBA] GetVerticalAxisSpan(startValue As Double, endValue As Double)
- [Cicode] GetVerticalAxisSpan (REAL startValue, REAL endValue)
- [C++] HRESULT GetVerticalAxisSpan (double\* startValue, double\* endValue)

**Parameters**

startValue

[out] The current lower bound of the vertical axis.

endValue

[out] The current upper bound of the vertical axis.

**Execution Result**

If the function succeeds, the return value will be Success. If an argument is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure. If any other unexpected error occurs, the return value will be GeneralFailure.

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim startValue As Double
Dim endValue As Double
pen.GetVerticalAxisSpan startValue, endValue
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
REAL startValue;
REAL endValue;
_ObjectCallMethod(hPen, "GetVerticalAxisSpan", startValue, endValue);
END
```

**See Also**

[IPen.PutVerticalAxisSpan \[Method\]](#)

## IPen.GoToNow [Method]

Synchronizes the end time of the pen's span with your computer's current local time. The start time will also be moved to maintain the pen's current time span.

**Defined As**

- [VBA] GoToNow()
- [Cicode] GoToNow()
- [C++] HRESULT GoToNow()

**Execution Result**

If the function succeeds, the return value will be Success. If the pen is deleted, the return value will be GeneralFailure.

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
pen.GoToNow
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
_ObjectCallMethod(hPen, "GoToNow");
END
```

## IPen.Height [Property][Get/Set]

Get or Set the physical height in pixels that the pen will allocate for itself when displayed in Stacked mode.

**Defined As**

- [VBA] Integer Height
- [Cicode] INT Height
- [C++] double Height

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If height set is out of range (16 - 1000), the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Remarks

This property is ignored when the pen is not in Stacked mode.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim height As Boolean
`Getting Property value
height = pen.Height
`Setting Property value
pen.Height = 75
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT height;
// Getting current property value
height = _ObjectGetProperty(hPen, "Height");
// Setting Property
_ObjectSetProperty(hPen, "Height", 75);
END
```

### See Also

[IPen.Stacked \[Property\]\[Get/Set\]](#)

## IPen.HorizontalAxisColor [Property][Get/Set]

Gets or sets the color used to draw the line, labels, and interval markers of the horizontal axis of this pen.

#### Defined As

- [VBA] Long HorizontalAxisColor
- [Cicode] INT HorizontalAxisColor
- [C++] OLE\_COLOR HorizontalAxisColor

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

### Remarks

To calculate the integer value necessary for a color apply the following formula:

$$(65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$$

where Red, Green, and Blue are 0-255.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
Dim color As Long
`Getting Property value
color = pen.HorizontalAxisColor
`Setting Property value to Red
pen.HorizontalAxisColor = 255
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT color;
// Getting current property value
color = _ObjectGetProperty(hPen, "HorizontalAxisColor");
// Setting Property to Red
_ObjectSetProperty(hPen, "HorizontalAxisColor", PackedRGB(255, 0, 0));
END
```

## See Also

[IPen.VerticalAxisColor \[Property\]\[Get/Set\]](#)

# IPen.HorizontalAxisResize [Property][Get/Set]

Gets or sets whether this pen allows the operator to interactively scale the horizontal axis using the mouse.

### Defined As

- [VBA] Boolean HorizontalAxisResize
- [Cicode] INT HorizontalAxisResize
- [C++] VARIANT\_BOOL HorizontalAxisResize

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value

will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Limits

- True (-1): Axis can be re-sized
- False (0): Axis cannot be re-sized

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim re-size As Boolean
`Getting Property value
re-size = pen.HorizontalAxisResize
`Setting Property value
pen.HorizontalAxisResize = False
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT bResize;
// Getting current property value
bResize = _ObjectGetProperty(hPen, "HorizontalAxisResize");
// Setting Property
_ObjectSetProperty(hPen, "HorizontalAxisResize",0);
END
```

### See Also

[IPen.VerticalAxisResize \[Property\]\[Get/Set\]](#)

## IPen.HorizontalAxisScroll [Property][Get/Set]

Gets or sets whether this pen allows the operator to interactively scroll the horizontal axis using the mouse.

#### Defined As

- [VBA] Boolean HorizontalAxisScroll
- [Cicode] INT HorizontalAxisScroll
- [C++] VARIANT\_BOOL HorizontalAxisScroll

#### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

#### Limits

- True (-1): Axis can be scrolled
- False (0): Axis cannot be scrolled

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

#### [VBA]

```
Sub Example(pen As Object)
Dim scroll As Boolean
`Getting Property value
scroll = pen.HorizontalAxisScroll
`Setting Property value
pen.HorizontalAxisScroll = False
End Sub
```

#### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT bScroll;
// Getting current property value
bScroll = _ObjectGetProperty(hPen, "HorizontalAxisScroll");
// Setting Property
_ObjectSetProperty(hPen, "HorizontalAxisScroll", 0);
END
```

#### See Also

[IPen.VerticalAxisScroll \[Property\]\[Get/Set\]](#)

## IPen.HorizontalAxisWidth [Property][Get/Set]

Gets or sets the width of the horizontal axis line and the associated interval markers.

#### Defined As

- [VBA] Integer HorizontalAxisWidth
- [Cicode] INT HorizontalAxisWidth
- [C++] short HorizontalAxisWidth

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Limits

A valid width is 0-8 pixels.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim width As Integer
`Getting Property value
width = pen.HorizontalAxisWidth
`Setting Property value
pen.HorizontalAxisWidth = 3
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
INT width;
// Getting current property value
width = _ObjectGetProperty(hPen, "HorizontalAxisWidth");
// Setting Property
_ObjectSetProperty(hPen, "HorizontalAxisWidth", 3);
END
```

**See Also**

[IPen.VerticalAxisWidth \[Property\]\[Get/Set\]](#)

## IPen.HorizontalGridlinesColor [Property][Get/Set]

Gets or sets the color used to draw the major horizontal gridlines.

**Defined As**

- [VBA] Long HorizontalGridlinesColor
- [Cicode] INT HorizontalGridlinesColor
- [C++] OLE\_COLOR HorizontalGridlinesColor

**Execution Result**

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

**Limits**

A valid width is 0-8 pixels.

**Remarks**

To calculate the integer value necessary for a color apply the following formula  $(65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$ . Where Red, Green and Blue are 0-255

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim color As Long
`Getting Property value
color = pen.HorizontalGridlinesColor
`Setting Property value to Red
pen.HorizontalGridlinesColor = 255
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
INT color;
// Getting current property value
color = _ObjectGetProperty(hPen, "HorizontalGridlinesColor");
// Setting Property to Red
_ObjectSetProperty(hPen, "HorizontalGridlinesColor", PackedRGB(255, 0, 0));
END
```

**See Also**

[IPen.HorizontalMinorGridlinesColor \[Property\]\[Get/Set\]](#)

## IPen.HorizontalGridlinesStyle [Property][Get/Set]

Gets or sets the line style used to draw the major horizontal gridlines.

**Defined As**

- [VBA] Long HorizontalGridlinesStyle
- [Cicode] INT HorizontalGridlinesStyle
- [C++] LineStyle HorizontalGridlinesStyle

**Execution Result**

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the style is out of range, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim style As Long
`Getting Property value
style = pen.HorizontalGridlinesStyle
`Setting Property value to Dot
```

```
pen.HorizontalGridlinesColor = 2
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT style;
// Getting current property value
style = _ObjectGetProperty(hPen, "HorizontalGridlinesStyle");
// Setting Property to Dot
_ObjectSetProperty(hPen, "HorizontalGridlinesStyle", 2);
END
```

## See Also

[IPen.HorizontalMinorGridlinesColor \[Property\]\[Get/Set\]](#)

# IPen.HorizontalGridlinesWidth [Property][Get/ Set]

Gets or sets the line width used when drawing the major horizontal gridlines.

### Defined As

- [VBA] Integer HorizontalGridlinesWidth
- [Cicode] INT HorizontalGridlinesWidth
- [C++] short HorizontalGridlinesWidth

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the width is out of range, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
Dim width As Integer
`Getting Property value
width = pen.HorizontalGridlinesWidth
`Setting Property value
pen.HorizontalGridlinesWidth = 3
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
INT width;
// Getting current property value
width = _ObjectGetProperty(hPen, "HorizontalGridlinesWidth");
// Setting Property to
_ObjectSetProperty(hPen, "HorizontalGridlinesWidth", 3);
END
```

## IPen.HorizontalMinorGridlinesColor [Property][Get/Set]

Gets or sets the color used to draw the minor horizontal gridlines.

**Defined As**

- [VBA] Long HorizontalMinorGridlinesColor
- [Cicode] INT HorizontalMinorGridlinesColor
- [C++] OLE\_COLOR HorizontalMinorGridlinesColor

**Execution Result**

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

**Remarks**

To calculate the integer value necessary for a color apply the following formula:

$$(65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$$

where Red, Green, and Blue are 0-255.

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim color As Long
`Getting Property value
color = pen.HorizontalMinorGridlinesColor
`Setting Property value to Red
pen.HorizontalMinorGridlinesColor = 255
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
INT color;
// Getting current property value
```

```
color = _ObjectGetProperty(hPen, "HorizontalMinorGridlinesColor");
// Setting Property to Red
_ObjectSetProperty(hPen, "HorizontalMinorGridlinesColor",
PackedRGB(255, 0, 0));
END
```

## See Also

[IPen.HorizontalGridlinesColor \[Property\]\[Get/Set\]](#)

# IPen.HorizontalMinorGridlinesStyle [Property][Get/Set]

Gets or sets the line style used to draw the minor horizontal gridlines.

### Defined As

- [VBA] Long HorizontalMinorGridlinesStyle
- [Cicode] INT HorizontalMinorGridlinesStyle
- [C++] LineStyle HorizontalMinorGridlinesStyle

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the style is out of range, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
Dim style As Long
`Getting Property value
style = pen.HorizontalMinorGridlinesStyle
`Setting Property value to Dot
pen.HorizontalMinorGridlinesColor = 2
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT style;
// Getting current property value
style = _ObjectGetProperty(hPen, "HorizontalMinorGridlinesStyle");
// Setting Property to Dot
_ObjectSetProperty(hPen, "HorizontalMinorGridlinesStyle", 2);
END
```

## See Also

[IPen.HorizontalGridlinesStyle \[Property\]\[Get/Set\]](#)  
[LineStyle \[Enumeration\]](#)

# IPen.HorizontalScrollBy [Method]

Scrolls the horizontal axis by the specified factor.

### Defined As

- [VBA] HorizontalScrollBy(factor As Double)
- [Cicode] HorizontalScrollBy(REAL factor)
- [C++] HRESULT HorizontalScrollBy(double factor)

### Parameters

factor

[in] Controls the direction and amount the axis will be scrolled. A negative value will move the axis back in time; a positive value will move the axis forward in time. The value is a percentage representing the current viewable span. So if the pen span is 1 hour, and you specify a factor of 0.5, you will move the time span 30 minutes into the future.

### Execution Result

If the function succeeds, the return value will be Success. If the argument is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
` Move the pen span back one complete span into history
pen.HorizontalScrollBy -1.0
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
// Move the pen span back one complete span into history
_ObjectCallMethod(hPen, "HorizontalScrollby", -1.0);
END
```

## See Also

[IPen.VerticalScrollBy \[Method\]](#)

# IPen.HorizontalZoom [Method]

Zooms centrally into the time span by the given factor.

## Defined As

- [VBA] HorizontalZoom(factor As Double)
- [Cicode] HorizontalZoom(REAL factor)
- [C++] HRESULT HorizontalZoom(double factor)

## Parameters

factor

[in] Controls the direction and amount the axis will be zoomed. Acceptable zoom values are 0 to 1 (Zoom out) and > 1 (zoom in).

## Execution Result

If the function succeeds the return value will be Success. If the argument is bad then the return value will be InvalidArgument. If the argument is out of range then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

## Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
` Zoom out 50%
pen.HorizontalZoom 0.5
` Undo the Zoom
pen.HorizontalZoom 1.5
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
// Zoom out 50%
_ObjectCallMethod(hPen, "HorizontalZoom", 0.5);
// Undo the Zoom
_ObjectCallMethod(hPen, "HorizontalZoom", 2.0);
END
```

## See Also

[IPen.VerticalZoom \[Method\]](#)

## IPen.InstantTrend [Property][Get/Set]

Get or set whether pen data is to be retrieved for an instant trend. If set to True, the pen's DataPoint property needs to specify the name of a Variable Tag or a Local Variable.

### Defined As

- [VBA] Boolean InstantTrend
- [Cicode] INT InstantTrend
- [C++] VARIANT\_BOOL InstantTrend

### Allowable values

True(-1): Data will be retrieved for an instant trend

False(0): Data will be retrieved as for a normal trend or alarm

### See Also

[IPen.SamplePeriod \[Property\]\[Get/Set\]](#)

## IPen.IsDeleted [Property][Get]

Returns whether this pen has been marked for deletion. That is, whether someone has called the Delete method on it or deleted it from the display.

### Defined As

- [VBA] Boolean IsDeleted
- [Cicode] INT IsDeleted
- [C++] VARIANT\_BOOL IsDeleted

### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim deleted As Boolean
deleted = pen.IsDeleted
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
INT bDeleted;
bDeleted = _ObjectGetProperty(hPen, "IsDeleted");
END
```

**See Also**

[IPen.Delete \[Method\]](#)

## IPen.isSelected [Property][Get]

Returns whether this pen has been selected in the Process Analyst.

**Defined As**

- [VBA] Boolean isSelected
- [Cicode] INT isSelected
- [C++] VARIANT\_BOOL isSelected

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim selected As Boolean
selected = pen.isSelected
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
INT bSelected;
bSelected = _ObjectGetProperty(hPen, "isSelected");
END
```

**See Also**

[IPen.Select \[Method\]](#)

# IPen.LocalTime [Property][Get/Set]

Get or Set whether the axis will display time in the computers current local format or in UTC (Universal Time Coordinate).

## Defined As

- [VBA] Boolean LocalTime
- [Cicode] INT LocalTime
- [C++] VARIANT\_BOOL LocalTime

## Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

## Limits

- True (-1): Local format
- False (0): UTC format

## Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim localTime As Boolean
`Getting Property value
localTime = pen.LocalTime
`Display time in UTC
pen.LocalTime = False
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT bLocalTime;
// Getting current property value
bLocalTime = _ObjectGetProperty(hPen, "LocalTime");
// Display time in UTC
_ObjectSetProperty(hPen, "LocalTime", 0);
END
```

# IPen.Name [Property][Get/Set]

Get or Set the name of this pen.

## Defined As

- [VBA] String Name
- [Cicode] STRING Name
- [C++] BSTR Name

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the length of the name is wrong then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

#### Remarks

The Process Analyst will use this name extensively throughout the user interface to reference this pen.

The name of the pen does not have to be unique, but it needs to be between 1 and 250 character long.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim name As String
`Getting Property value
name = pen.Name
`Setting property value
pen.Name = "NicePen"
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
STRING name;
// Getting current property value
name = _ObjectGetProperty(hPen, "Name");
// Setting property value
_ObjectSetProperty(hPen, "Name", "NicePen");
END
```

## IPen.PointsVisible [Property][Get/Set]

Gets or Sets whether the sample points are displayed or hidden on the pen.

#### Defined As

- [VBA] Boolean PointsVisible
- [Cicode] INT PointsVisible
- [C++] VARIANT\_BOOL PointsVisible

#### Execution Results

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value

will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Limits

- True(-1): Points are visible
- False(0): Points are hidden

#### Remarks

By default this property is False, meaning that any point type you have set using the SetQualityCompactionPointType function will be hidden.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim visible As Boolean
`Getting Property value
visible = pen.PointsVisible
`Setting Property value
pen.PointsVisible = True
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT visible;
// Getting current property value
visible = _ObjectGetProperty(hPen, "PointsVisible");
// Setting Property value
_ObjectSetProperty(hPen, "PointsVisible", -1);
END
```

### See Also

[IPen.SetQualityCompactionPointType \[Method\]](#)

## IPen.PutHorizontalAxisTimeSpan [Method]

Sets the start and end time of this pen.

#### Defined As

- [VBA] PutHorizontalAxisTimeSpan(startTime As Date, startMs as Integer, endTime as Date, endMs as Integer)
- [Cicode] PutHorizontalAxisTimeSpan (REAL startTime, INT startMs, REAL endTime, INT endMs)
- [C++] HRESULT PutHorizontalAxisTimeSpan (DATE\* startTime, short\* startMs, DATE\* endTime, short\* endMs)

## Parameters

### startTime

[in] Indicates the beginning date and time without milliseconds of the time span in UTC format.

### startMs

[in] Indicates the milliseconds component of the start time.

### endTime

[in] Indicates the end date and time without milliseconds of the time span in UTC format.

### endMs

[in] This will contain the milliseconds component of the end time.

## Execution Result

If the function succeeds the return value will be Success. If an argument is bad then the return value will be InvalidArgument. If an argument is out of range then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure. If any other unexpected error occurs the return value will be GeneralFailure.

## Remarks

The Process Analyst only supports setting its axis in UTC (Universal Co-ordinated Time) format. This means you need to convert from local to UTC format yourself to make the axis display correctly in local time. Cicode provides several functions to do these conversions.

## Limits

The horizontal axis has an upper limit of 1/1/2100 12:00:00.000 and a lower limit of 1/1/1900 12:00:00.000. The minimum span is 100 milliseconds. The maximum span is 200 years.

## Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
Dim startDate As Date
Dim endDate As Date
Dim startMs As Integer
Dim endMs As Integer
startDate = CDate("16/6/2004 11:30:00")
endDate = CDate("16/6/2004 12:29:00")
startMs = 0
endMs = 0
pen.PutHorizontalAxisTimeSpan startDate, startMs, endDate, endMs
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
REAL startDate;
REAL endDate;
startDate = StrToDate("16/6/04") + StrToTime("9:30:00");
endDate = StrToDate("16/6/04") + StrToTime("10:29:00");
startDate = TimeToOLEDate(startDate, 0); // Convert to UTC
```

```
endDate = TimeToOLEDate(endDate, 0); // Convert to UTC
_ObjectcallMethod(hPen, "PutHorizontalAxisTimeSpan", startDate, 0, endDate, 0);
END
```

## See Also

[IPen.GetHorizontalAxisSpan \[Method\]](#)

# IPen.PutVerticalAxisSpan [Method]

Sets the current position and span of the pens' vertical axis.

### Defined As

- [VBA] GetVerticalAxisSpan(startValue As Double, endValue As Double)
- [Cicode] GetVerticalAxisSpan (REAL startValue, REAL endValue)
- [C++] HRESULT GetVerticalAxisSpan (double\* startValue, double\* endValue)

### Parameters

startValue

[in] Indicates the new lower bound of the vertical axis.

endValue

[in] Indicates the new upper bound of the vertical axis.

### Execution Result

If the function succeeds, the return value will be Success. If an argument is bad, the return value will be InvalidArgument. If an argument is out of range, or the span is out of range, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

### Limits

The vertical axis has a upper limit of 1+e10 and a lower limit of 1-e10. However, the maximum span supported is 1+e10. The minimum span is 0.00001.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
pen.PutVerticalAxisSpan 200.5, 300.34
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
_ObjectCallMethod(hPen, "PutVerticalAxisSpan", 200.5, 300.34);
END
```

## See Also

[IPen.GetVerticalAxisSpan \[Method\]](#)

# IPen.RefreshData [Method]

Clears every sample belonging to this pen from the internal cache and then issues a new request for data.

### Defined As

- [VBA] RefreshData()
- [Cicode] RefreshData ()
- [C++] HRESULT RefreshData ()

### Execution Result

If the function succeeds the return value will be Success. If the pen is deleted then the return value will be GeneralFailure.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
pen.RefreshData
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
    _ObjectCallMethod(hPen, "RefreshData");
END
```

# IPen.RequestMode [Property][Get/Set]

Get or Set how multiple samples will be calculated on the server.

### Defined As

- [VBA] Integer RequestMode
- [Cicode] INT RequestMode
- [C++] RequestMode RequestMode

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the mode is out of range, the return value will be InvalidArgument. If the pen is

deleted, the return value will be GeneralFailure.

#### Remarks

When the pen makes a request for data and samples need to be compacted, it will use this mode to determine how the compaction will occur.

Changing this mode will clear the data cache and issue a new request for data.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim requestMode As Integer
`Getting Property value
requestMode = pen.RequestMode
`Setting mode to minimum
pen.RequestMode = 1
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT requestMode;
// Getting current property value
requestMode = _ObjectGetProperty(hPen, "RequestMode");
// Setting mode to minimum
_ObjectSetProperty(hPen, "RequestMode", 1);
END
```

### See Also

[RequestMethod \[Enumeration\]](#)

## IPen.ResetToDefaultSpan [Method]

Resets the span of this pen to its default span.

#### Defined As

- [VBA] ResetToDefaultSpan()
- [Cicode] ResetToDefaultSpan()
- [C++] HRESULT ResetToDefaultSpan()

#### Execution Result

If the function succeeds, the return value will be Success. If the pen is deleted, the return value will be GeneralFailure.

#### Remarks

The default span of pens is 10 minutes. This can be modified by using IPen.SetDefaultSpan.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

#### [VBA]

```
Sub Example(pen As Object)
pen.ResetToDefaultSpan
End Sub
```

#### [Cicode]

```
FUNCTION Example(OBJECT hPen)
_ObjectCallMethod(hPen, "ResetToDefaultSpan");
END
```

#### See Also

[IPen.GetDefaultSpan \[Method\]](#)  
[IPen.SetDefaultSpan \[Method\]](#)

## IPen.SamplePeriod [Property][Get/Set]

Determine how frequently data is collected for an instant trend. If the sample period for a pen is changed, existing samples for the pen may be discarded.

#### Defined As

- [VBA] Long SamplePeriod
- [Cicode] INT SamplePeriod
- [C++] int SamplePeriod

#### Limits

- Minimum = 50 milliseconds
- Maximum = 60000 milliseconds (1 minute)
- Default = the scan rate of the page which hosts the Process Analyst control.

#### See Also

[IPen.InstantTrend \[Property\]\[Get/Set\]](#)

# IPen.Select [Method]

Makes this pen the primary selected pen.

## Defined As

- [VBA] Select()
- [Cicode] Select()
- [C++] HRESULT Select()

## Execution Result

If the function succeeds, the return value will be Success. If the pen is deleted, the return value will be GeneralFailure.

## Remarks

Calling this method will also trigger [PenSelectionChanged \[Event\]](#).

## Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
pen.Select
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
_ObjectCallMethod(hPen, "Select");
END
```

# IPen.SetDefaultSpan [Method]

Sets the default time span for this pen.

## Defined As

- [VBA] SetDefaultSpan(weeks As Integer, days As Integer, hours As Integer, minutes As Integer, seconds As Integer, milliseconds As Integer)
- [Cicode] SetDefaultSpan (INT weeks, INT days, DATE hours, INT minutes, INT seconds, INT milliseconds)
- [C++] HRESULT SetDefaultSpan (short weeks, short days, short hours, short minutes, short seconds, short milliseconds)

## Parameters

weeks

[in] Indicates the number of weeks in the span.

days

[in] Indicates the number of days in the span.

hours

[in] Indicates the number of hours in the span.

minutes

[in] Indicates the number of minutes in the span.

seconds

[in] Indicates the number of seconds in the span.

milliseconds

[in] Indicates the number of milliseconds in the span.

#### Execution Result

If the function succeeds the return value will be Success. If an argument is bad then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
    ' Set span to 2 hours and 30 minutes
    pen.GetDefaultSpan 0, 0, 2, 30, 0, 0
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
// Set span to 2 hours and 30 minutes
_ObjectCallMethod(hPen, "SetDefaultSpan", 0, 0, 2, 30, 0, 0);
END
```

### See Also

## IPen.SetQualityCompactionPointType [Method]

Use this function to indicate what visual cue to display for single and multiple samples.

#### Defined As

- [VBA] SetQualityCompactionPointType(compactionType As Integer, pointType As Integer)
- [Cicode] SetQualityCompactionPointType(INT compactionType, INT pointType)
- [C++] HRESULT SetQualityCompactionPointType(QualityCompactionType compactionType, PointType

pointType)

#### Parameters

compactionType

[in] Indicates which sample compaction type you want to set the visual cue for.

pointType

[in] Indicates which visual cue to use for the selected compaction type.

#### Execution Result

If the function succeeds the return value will be Success. If an argument is bad, the return value will be InvalidArgument. If an argument is out of range, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
    ' Set single samples to look like triangles
    pen.SetQualityCompactionPointType 0, 5
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
// Set single samples to look like triangles
_ObjectCallMethod(hPen, "SetQualityCompactionPointType", 0, 5);
END
```

## IPen.SetQualityLineStyle [Method]

This function can be used to change the type of line drawn for each of the quality states defined by the Process Analyst for this Pen only.

#### Defined As

- [VBA] SetQualityLineStyle(qualityType As Integer, lineStyle As Integer)
- [Cicode] SetQualityLineStyle(INT qualityType, INT lineStyle)
- [C++] HRESULT SetQualityLineStyle(QualityType qualityType, LineStyle lineStyle)

#### Parameters

**qualityType**

[in] Indicates which quality type you want to set the visual cue for.

**lineStyle**

[in] Indicates which line style visual cue to use for the selected quality type.

**Execution Result**

If the function succeeds the return value will be Success. If an argument is bad then the return value will be InvalidArgument. If an argument is out of range then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

**Remarks**

When a sample is added to the display, its quality value indicates how the line drawn from that sample to the next one will be displayed.

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
    ' Set lines drawn after NA samples to be drawn as dash_dot
    pen.SetQualityLineStyle 1, 3
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
// Set lines drawn after NA samples to be drawn as dash_dot
_ObjectCallMethod(hPen, "SetQualityLineStyle", 1, 3);
END
```

**See Also**

[QualityType \[Enumeration\]](#)

[LineStyle \[Enumeration\]](#)

## IPen.SetVerticalAxisLabelValue [Method]

This function can be used to display custom text for a particular value on the Vertical Axis.

**Defined As**

- [VBA] SetVerticalAxisLabelValue(value As Double, label As String)
- [Cicode] SetVerticalAxisLabelValue(REAL value, STRING label)
- [C++] HRESULT SetVerticalAxisLabelValue(double value, BSTR label)

**Parameters**

value

[in] Indicates which value you want to replace with a custom label.

label

[in] Indicates the text that will be displayed instead of the specified value.

#### Execution Result

If the function succeeds the return value will be Success. If an argument is bad then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
    ' Change the vertical axis to display High High instead of 95
    pen.SetVerticalAxisLabelValue 95, "High High"
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
// Change the vertical axis to display High High instead of 95
_ObjectCallMethod(hPen, "SetVerticalAxisLabelValue", 95, "High High");
END
```

## IPen.Stacked [Property][Get/Set]

Get or Set whether the pen is visually displayed stacked or overlaid.

#### Defined As

- [VBA] Boolean Stacked
- [Cicode] INT Stacked
- [C++] VARIANT\_BOOL Stacked

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Limits

- True (-1): Stacked
- False (0): Overlaid

#### Remarks

When stacked, pens will be drawn under each other; when overlaid, the pens will be drawn over the top of each other.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

#### [VBA]

```
Sub Example(pen As Object)
Dim stacked As Boolean
`Getting Property value
stacked = pen.Stacked
`Setting Property value
pen.Stacked = True
End Sub
```

#### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT bStacked;
// Getting current property value
bStacked = _ObjectGetProperty(hPen, "Stacked");
// Setting property value
_ObjectSetProperty(hPen, "Stacked", -1);
END
```

## IPen.TrendCursorLabelFillColor [Property][Get/ Set]

Gets or sets the fill color used for any cursor label associated with this pen.

#### Defined As

- [VBA] Long TrendCursorLabelFillColor
- [Cicode] INT TrendCursorLabelFillColor
- [C++] OLE\_COLOR TrendCursorLabelFillColor

#### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

#### Remarks

To calculate the integer value necessary for a color apply the following formula  $(65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$ . Where Red, Green and Blue are 0-255.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

#### [VBA]

```
Sub Example(pen As Object)
Dim color As Long
```

```
`Getting Property value
color = pen.TrendCursorLabelFillColor
`Setting Property value to Red
pen.TrendCursorLabelFillColor = 255
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT color;
// Getting current property value
color = _ObjectGetProperty(hPen, "TrendCursorLabelFillColor");
// Setting Property to Red
_ObjectSetProperty(hPen, "TrendCursorLabelFillColor", PackedRGB(255, 0, 0));
END
```

# IPen.TrendCursorLabelLineColor [Property][Get/ Set]

Gets or sets the border color used for any cursor label associated with this pen.

### Defined As

- [VBA] Long TrendCursorLabelLineColor
- [Cicode] INT TrendCursorLabelLineColor
- [C++] OLE\_COLOR TrendCursorLabelLineColor

### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

### Remarks

To calculate the integer value necessary for a color apply the following formula  $(65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$ . Where Red, Green and Blue are 0-255.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
Dim color As Long
`Getting Property value
color = pen.TrendCursorLabelLineColor
`Setting Property value to Red
pen.TrendCursorLabelLineColor = 255
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
INT color;
// Getting current property value
color = _ObjectGetProperty(hPen, "TrendCursorLabelTextColor");
// Setting Property to Red
_ObjectSetProperty(hPen, "TrendCursorLabelTextColor", PackedRGB(255, 0, 0));
END
```

## IPen.TrendCursorLabelTextColor [Property][Get/ Set]

Gets or sets the text color used for any cursor label associated with this pen.

**Defined As**

- [VBA] Long TrendCursorLabelTextColor
- [Cicode] INT TrendCursorLabelTextColor
- [C++] OLE\_COLOR TrendCursorLabelTextColor

**Execution Result**

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

**Remarks**

To calculate the integer value necessary for a color apply the following formula  $(65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$ . Where Red, Green and Blue are 0-255.

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim color As Long
`Getting Property value
color = pen.TrendCursorLabelTextColor
`Setting Property value to Red
pen.TrendCursorLabelTextColor = 255
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
INT color;
// Getting current property value
color = _ObjectGetProperty(hPen, "TrendCursorLabelTextColor");
// Setting Property to Red
```

```
_ObjectSetProperty(hPen, "TrendCursorLabelTextColor", PackedRGB(255, 0, 0));
END
```

## IPen.VerticalAxisAutoscale [Property][Get/Set]

Gets or sets whether the vertical axis will automatically calculate its physical limits based on the sample values within its internal cache.

### Defined As

- [VBA] Boolean VerticalAxisAutoscale
- [Cicode] INT VerticalAxisAutoscale
- [C++] VARIANT\_BOOL VerticalAxisAutoscale

### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

### Remarks

Setting this property will turn off interactive Scrolling (IPen.HorizontalAxisScroll) and Scaling (IPen.HorizontalAxisResize).

### Limits

- True (-1): Autoscale enabled
- False (0): Autoscale disabled

### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim autoScale As Long
`Getting Property value
autoScale = pen.VerticalAxisAutoscale
`Setting Property value
pen.VerticalAxisAutoscale = True
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT autoScale;
// Getting current property value
autoScale = _ObjectGetProperty(hPen, "VerticalAxisAutoscale");
// Setting Property
_ObjectSetProperty(hPen, "VerticalAxisAutoscale", -1);
END
```

# IPen.VerticalAxisColor [Property][Get/Set]

Gets or sets the color used to draw the line, labels and interval markers of the vertical axis of this pen.

## Defined As

- [VBA] Long VerticalAxisColor
- [Cicode] INT VerticalAxisColor
- [C++] OLE\_COLOR VerticalAxisColor

## Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

## Remarks

To calculate the integer value necessary for a color apply the following formula  $(65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$ . Where Red, Green and Blue are 0-255.

## Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
Dim color As Long
`Getting Property value
color = pen.VerticalAxisColor
`Setting Property value to Red
pen.VerticalAxisColor = 255
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT color;
// Getting current property value
color = _ObjectGetProperty(hPen, "VerticalAxisColor");
// Setting Property to Red
_ObjectSetProperty(hPen, "VerticalAxisColor", PackedRGB(255, 0, 0));
END
```

## See Also

[IPen.HorizontalAxisColor \[Property\]\[Get/Set\]](#)

# IPen.VerticalAxisLabelType [Property][Get/Set]

Gets or sets a unit type which can be applied to the axis labels. This allows numbers on the axis to display with

their unit. For example, setting the unit to "kg" will display "10 Kg" on the axis.

#### Defined As

- [VBA] Integer VerticalAxisLabelType
- [Cicode] INT VerticalAxisLabelType
- [C++] AxisLabelType VerticalAxisLabelType

#### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

#### Remarks

Label Types are fixed and cannot be added to.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim labelType As Integer
`Getting Property value
labelType = pen.VerticalAxisLabelType
`Setting Property value to Percent
pen.VerticalAxisLabelType= 3
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT labelType;
// Getting current property value
labelType = _ObjectGetProperty(hPen, "VerticalAxisLabelType");
// Setting Property to Percent
_ObjectSetProperty(hPen, "VerticalAxisLabelType", 3);
END
```

### See Also

[AxisLabelType \[Enumeration\]](#)

## IPen.VerticalAxisResize [Property][Get/Set]

Gets or sets whether this pen allows the operator to interactively scale the vertical axis by using the mouse.

#### Defined As

- [VBA] Boolean VerticalAxisResize
- [Cicode] INT VerticalAxisResize

- [C++] VARIANT\_BOOL VerticalAxisResize

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Limits

- True (-1): Enable re-size
- False (0): Disable re-size

#### Remarks

This only applies to analog pens.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim re-size As Boolean
`Getting Property value
re-size = pen.VerticalAxisResize
`Setting Property value
pen.VerticalAxisResize = False
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT bResize;
// Getting current property value
bResize = _ObjectGetProperty(hPen, "VerticalAxisResize");
// Setting Property
_ObjectSetProperty(hPen, "VerticalAxisResize",0);
END
```

### See Also

[IPen.HorizontalAxisScroll \[Property\]\[Get/Set\]](#)

## IPen.VerticalAxisScroll [Property][Get/Set]

Gets or sets whether this pen allows the operator to interactively scroll the vertical axis by using the mouse.

#### Defined As

- [VBA] Boolean VerticalAxisScroll
- [Cicode] INT VerticalAxisScroll

- [C++] VARIANT\_BOOL VerticalAxisScroll

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Limits

- True (-1): Enable scrolling
- False (0): Disable scrolling

#### Remarks

This only applies to analog pens.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim scroll As Boolean
`Getting Property value
scroll = pen.VerticalAxisScroll
`Setting Property value
pen.VerticalAxisScroll = False
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT bScroll;
// Getting current property value
bScroll = _ObjectGetProperty(hPen, "VerticalAxisScroll");
// Setting Property
_ObjectSetProperty(hPen, "VerticalAxisScroll", 0);
END
```

### See Also

[IPen.HorizontalAxisScroll \[Property\]\[Get/Set\]](#)

## IPen.VerticalAxisWidth [Property][Get/Set]

Gets or sets the width of the vertical axis line and the associated interval markers.

#### Defined As

- [VBA] Integer VerticalAxisWidth
- [Cicode] INT VerticalAxisWidth

- [C++] short VerticalAxisWidth

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Limits

A valid width is 0-8 pixels.

#### Remarks

This only applies to analog pens.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim width As Integer
`Getting Property value
width = pen.VerticalAxisWidth
`Setting Property value
pen.VerticalAxisWidth = 3
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT width;
// Getting current property value
width = _ObjectGetProperty(hPen, "VerticalAxisWidth");
// Setting Property
_ObjectSetProperty(hPen, "VerticalAxisWidth", 3);
END
```

### See Also

[IPen.HorizontalAxisWidth \[Property\]\[Get/Set\]](#)

## IPen.VerticalGridlinesColor [Property][Get/Set]

Gets or sets the color used to draw the major vertical gridlines.

#### Defined As

- [VBA] Long VerticalGridlinesColor
- [Cicode] INT VerticalGridlinesColor
- [C++] OLE\_COLOR VerticalGridlinesColor

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Remarks

To calculate the integer value necessary for a color apply the following formula  $(65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$ . Where Red, Green and Blue are 0-255.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim color As Long
`Getting Property value
color = pen.VerticalGridlinesColor
`Setting Property value to Red
pen.VerticalGridlinesColor = 255
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT color;
// Getting current property value
color = _ObjectGetProperty(hPen, "VerticalGridlinesColor");
// Setting Property to Red
_ObjectSetProperty(hPen, "VerticalGridlinesColor", PackedRGB(255, 0, 0));
END
```

### See Also

[IPen.VerticalMinorGridlinesColor \[Property\]\[Get/Set\]](#)

## IPen.VerticalGridlinesStyle [Property][Get/Set]

Gets or sets the line style used to draw the major vertical gridlines.

#### Defined As

- [VBA] Long VerticalGridlinesColor
- [Cicode] INT VerticalGridlinesColor
- [C++] LineStyle VerticalGridlinesColor

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the style is out of range, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

#### Calling Syntax

Assumes you have passed a valid pen object into the function.

### [VBA]

```
Sub Example(pen As Object)
Dim style As Long
`Getting Property value
style = pen.VerticalGridlinesColor
`Setting Property value to Dot
pen.VerticalGridlinesColor = 2
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT style;
// Getting current property value
style = _ObjectGetProperty(hPen, "VerticalGridlinesStyle");
// Setting Property to Dot
_ObjectSetProperty(hPen, "VerticalGridlinesStyle", 2);
END
```

### See Also

[IPen.VerticalMinorGridlinesStyle \[Property\]\[Get/Set\]](#)

[LineStyle \[Enumeration\]](#)

## IPen.VerticalGridlinesWidth [Property][Get/Set]

Gets or sets the line width used when drawing the major vertical gridlines.

### Defined As

- [VBA] Integer VerticalGridlinesWidth
- [Cicode] INT VerticalGridlinesWidth
- [C++] short VerticalGridlinesWidth

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the width is out of range, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

### Limits

A valid width is 0-8 pixels.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim width As Integer
`Getting Property value
width = pen.VerticalGridlinesWidth
`Setting Property value
pen.VerticalGridlinesWidth = 3
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
INT width;
// Getting current property value
width = _ObjectGetProperty(hPen, "VerticalGridlinesWidth");
// Setting Property t
_ObjectSetProperty(hPen, "VerticalGridlinesWidth", 3);
END
```

# IPen.VerticalMinorGridlinesColor [Property][Get/ Set]

Gets or sets the color used to draw the minor vertical gridlines.

**Defined As**

- [VBA] Long VerticalMinorGridlinesColor
- [Cicode] INT VerticalMinorGridlinesColor
- [C++] OLE\_COLOR VerticalMinorGridlinesColor

**Execution Result**

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

**Remarks**

To calculate the integer value necessary for a color apply the following formula  $(65536 * \text{Blue}) + (256 * \text{Green}) + (\text{Red})$ . Where Red, Green and Blue are 0-255.

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
Dim color As Long
`Getting Property value
color = pen.VerticalMinorGridlinesColor
`Setting Property value to Red
```

```
pen.VerticalMinorGridlinesColor = 255
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT color;
// Getting current property value
color = _ObjectGetProperty(hPen, "VerticalMinorGridlinesColor");
// Setting Property to Red
_ObjectSetProperty(hPen, "VerticalMinorGridlinesColor", PackedRGB(255, 0, 0));
END
```

## See Also

[IPen.VerticalGridlinesColor \[Property\]\[Get/Set\]](#)

# IPen.VerticalMinorGridlinesStyle [Property][Get/ Set]

Gets or sets the line style used to draw the minor vertical gridlines.

### Defined As

- [VBA] Long VerticalMinorGridlinesStyle
- [Cicode] INT VerticalMinorGridlinesStyle
- [C++] LineStyle VerticalMinorGridlinesStyle

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the style is out of range, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
Dim style As Long
`Getting Property value
style = pen.VerticalMinorGridlinesStyle
`Setting Property value to Dot
pen.VerticalMinorGridlinesColor = 2
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPen)
INT style;
// Getting current property value
style = _ObjectGetProperty(hPen, "VerticalMinorGridlinesStyle");
// Setting Property to Dot
_ObjectSetProperty(hPen, "VerticalMinorGridlinesStyle", 2);
END
```

**See Also**

## IPen.VerticalScrollBy [Method]

Scrolls the vertical axis by the specified factor.

**Defined As**

- [VBA] VerticalScrollBy(factor As Double)
- [Cicode] VerticalScrollBy(REAL factor)
- [C++] HRESULT VerticalScrollBy(double factor)

**Parameters**

factor

[in] Controls the direction and amount the axis will be scrolled. A negative value will move the axis in the negative direction. A positive value will move the axis forward in the positive direction. The value is a percentage representing the current viewable span. So if the pen span is 100 units (10 to 110), and you specify a factor of 0.5 then you will move the span 50 units (60 to 160).

**Execution Result**

If the function succeeds the return value will be Success. If the argument is bad then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

**Calling Syntax**

Assumes you have passed a valid pen object into the function.

**[VBA]**

```
Sub Example(pen As Object)
` Move the pen span forward one complete span
pen.VerticalScrollBy 1.0
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
// Move the pen span forward one complete span
_ObjectCallMethod(hPen, "VerticalScrollby", 1.0);
END
```

## See Also

[IPen.HorizontalScrollBy \[Method\]](#)

# IPen.VerticalZoom [Method]

Zooms centrally into the time span by the given factor on the vertical axis

### Defined As

- [VBA] VerticalZoom(factor As Double)
- [Cicode] VerticalZoom (REAL factor)
- [C++] HRESULT VerticalZoom (double factor)

### Parameters

#### factor

[in] Controls the direction and amount the axis will be zoomed. Acceptable zoom values are 0 to 1 (Zoom out) and > 1 (zoom in).

### Execution Result

If the function succeeds the return value will be Success. If the argument is bad then the return value will be InvalidArgument. If the argument is out of range then the return value will be InvalidArgument. If the pen is deleted then the return value will be GeneralFailure.

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
` Zoom out 50%
pen.VerticalZoom 0.5
` Undo the Zoom
pen.VerticalZoom 1.5
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
// Zoom out 50%
_ObjectCallMethod(hPen, "VerticalZoom", 0.5);
```

```
// Undo the Zoom
_ObjectCallMethod(hPen, "VerticalZoom", 2.0);
END
```

## See Also

[IPen.HorizontalZoom \[Method\]](#)

# IPen.Visible [Property][Get/Set]

Get or set whether this pen will be visually shown (True) or hidden (False) to the operator.

### Defined As

- [VBA] Boolean Visible
- [Cicode] INT Visible
- [C++] VARIANT\_BOOL Visible

### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the pen is deleted, the return value will be GeneralFailure.

### Limits

- True (-1): Visible
- False (0): Hidden

### Calling Syntax

Assumes you have passed a valid pen object into the function.

## [VBA]

```
Sub Example(pen As Object)
Dim visible As Boolean
`Get the property value
visible = pen.Visible
` Set the property value
pen.Visible = False
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPen)
INT bVisible;
// Get the property value
bVisible = _ObjectGetProperty(hPen, "Visible", 0.5);
// Set the property value
_ObjectSetProperty(hPen, "Visible", 0);
END
```

## IPens Interface

### Defined As

- [VBA] Object
- [Cicode] OBJECT
- [C++] IPens

### Methods (2)

- [IPens.Create \[Method\]](#)
- [IPens.RemoveAll \[Method\]](#)

### Properties (5)

- [IPens.Count \[Property\]\[Get\]](#)
- [IPens.Item \[Property\]\[Get\]](#)
- [IPens.\\_NewEnum \[Property\]\[Get\]](#)
- [IPens.ItemByName \[Property\]\[Get\]](#)
- [IPens.Pane\[Property\]\[Get\]](#)

## IPens.\_NewEnum [Property][Get]

This allows For.. Each.. Next integration in VB.

### Calling Syntax

This example assumes there is a valid Pens collection object to be passed into the example methods. This property is not applicable to Cicode.

### [VBA]

```
Sub Example(Pens As Object)
Dim pen As Object
Dim count As Long
`Using Property
For Each pen In Pens
count = count + 1
Next pen
End Sub
```

## IPens.Count [Property][Get]

Gets the number of Pens in this collection.

### Defined As

- [VBA] Long Count
- [Cicode] INT Count
- [C++] int Count

#### Execution Result

If the property get succeeds, the return value will be Success. If the pens collection is deleted, the return value will be GeneralFailure.

#### Calling Syntax

This example assumes there is a valid Pens collection object to be passed into the example methods.

### [VBA]

```
Sub Example(Pens As Object)
Dim count As Long
`Getting Property value
count = Pens.Count
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPens)
// Getting property value
INT nCount = _ObjectGetProperty(hPens, "Count");
END
```

## IPens.Create [Method]

Creates a new pen and adds it to this collection.

#### Defined As

- [VBA] Create(penType As Integer, nameMode As Integer) as Object
- [Cicode] OBJECT Create (INT penType, INT nameMode)
- [C++] HRESULT Create(PenType penType, PenNameMode penNameMode, IPen\*\* pen)

#### Parameters

##### penType

[in] Indicates the type of pen that will be created. See PenType Enumeration for the types of pen that can be created.

##### penNameMode

[in] Indicates how the name will be obtained for this pen. The Process Analyst provides options of PenNameMode\_Comment, PenNameMode\_Tag, and PenNameMode\_Custom. Specifying PenNameMode\_Comment will mean that the Process Analyst names the pen from the Comment field of the trend/alarm tag associated with the IPen.DataPoint property. Specifying PenNameMode\_Tag will mean that the Process Analyst will name the pen as the value of the IPen.DataPoint property. Specifying PenNameMode\_Custom causes the Process Analyst to provide a default name and leave setting the name to you

via the IPen.Name property.

#### Execution Results

If the method succeeds the return value will be Success. If the pens collection is deleted, the return value will be GeneralFailure.

#### Remarks

If this method succeeds, a new Pen of the specified type is created and appended to the pens collection.

#### Calling Syntax

This example assumes there is a valid Pens collection object to be passed in to the example methods.

### [VBA]

```
Sub Example(pens As Object)
Dim pen As Object
Set pen = pens.Create(4097, 1)
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hPens)
OBJECT hPen = _ObjectCallMethod(hPens, "Create" , 4097, 1);
END
```

### See Also

[IPen Interface](#)

## IPens.Item [Property][Get]

Gets the Pen at the given index from this pen's collection.

#### Defined As

- [VBA] Item(index As Long) as Object
- [Cicode] OBJECT Item(INT index)
- [C++] Item(int index, IPen\* Item)

#### Parameters

index

[in] Indicates the index of the pen item to return from this collection. (One based)

#### Execution Result

If the property get succeeds, the return value will be Success. If the index is out of range, the return value will be InvalidArgument. If the pen's collection is deleted, the return value will be GeneralFailure.

**Calling Syntax**

This example assumes there is a valid Pens collection object to be passed into the example methods.

**[VBA]**

```
Sub Example(pens As Object)
Dim pen As Object
`Getting Property value
Set pen = pens.Item(1)
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPens)
// Getting property value
OBJECT hPen = _ObjectCallMethod(hPens, "get_Item", 1);
END
```

## IPens.ItemByName [Property][Get]

Gets the Pen of the given name from this Pens collection.

**Defined As**

- [VBA] ItemByName(name As String) as Object
- [Cicode] OBJECT ItemByName(STRING name)
- [C++] ItemByName(STRING name, IPen\* Item)

**Parameters**

name

[in] Indicates the name of the Pen item to return from this collection.

**Execution Result**

If the property get succeeds, the return value will be Success. If the pen does not exist, the return value will be InvalidArgument. If the pens collection is deleted, the return value will be GeneralFailure.

**Calling Syntax**

This example assumes there is a valid Pens collection object to be passed into the example methods.

**[VBA]**

```
Sub Example(Pens As Object)
Dim pen As Object
`Getting Property value
Set pen = Pens.ItemByName("CPU Usage")
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPens)
// Getting property value
OBJECT hPen = _ObjectCallMethod(hPens, "get_ItemByName", "CPU Usage");
END
```

## IPens.Pane[Property][Get]

Gets the Pane that this Pens collection belongs to.

**Defined As**

- [VBA] Object Pane
- [Cicode] OBJECT Pane
- [C++] HRESULT Pane(IPane\*\* Pane)

**Execution Result**

If the property get succeeds the return value will be Success. If the pens collection is deleted the return value will be GeneralFailure.

**Remarks**

Each Pens collection belongs to a Pane.

**Calling Syntax**

This example assumes there is a valid Pens collection object to be passed into the example methods.

**[VBA]**

```
Sub Example(pens As Object)
Dim pane As Object
`Getting Property value
Set pane = pens.Pane
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hPens)
// Getting property value
OBJECT hPane = _ObjectGetProperty(hPens, "Pane");
END
```

## IPens.RemoveAll [Method]

Removes every Pen from the Pens collection.

**Defined As**

- [VBA] RemoveAll()
- [Cicode] RemoveAll()
- [C++] HRESULT RemoveAll()

### Execution Result

If the property get/set succeeds the return value will be Success. If the pens collection is deleted the return value will be GeneralFailure.

### Calling Syntax

This example assumes there is a valid Pens collection object to be passed into the example methods.

## [VBA]

```
Sub Panes(pens As Object)
pens.RemoveAll()
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hPens)
_ObjectCallMethod(hPens, "RemoveAll");
END
```

## IProcessAnalyst Interface

- IProcessAnalyst.CommandSystem [Property][Get]
- IProcessAnalyst.ContextMenu [Property][Get/Set]
- IProcessAnalyst.Cursors [Property][Get]
- IProcessAnalyst.DataRequestRate [Property][Get/Set]
- IProcessAnalyst.DisplayRefreshRate [Property][Get/Set]
- IProcessAnalyst.Language [Property] [Get/Set]
- IProcessAnalyst.LastSelectedPen [Property][Get]
- IProcessAnalyst.LockedPens [Property][Get/Set]
- IProcessAnalyst.NumberofSamples[Property][Get/Set]
- IProcessAnalyst.ObjectView [Property][Get]
- IProcessAnalyst.Panes [Property][Get]
- IProcessAnalyst.PrimaryPath [Property][Get/Set]
- IProcessAnalyst.SecondaryPath [Property][Get/Set]
- IProcessAnalyst.Toolbars [Property][Get]
- IProcessAnalyst.ViewLocation [Property][Get]
- IProcessAnalyst.WritePrivilegeLevel [Property][Get]
- IProcessAnalyst.ZoomMode [Property][Get/Set]

## IProcessAnalyst.BlockUpdates [Method]

Blocks certain aspects of the Process Analyst's redrawing and data updating.

### Defined As

- [VBA] BlockUpdates()
- [Cicode] BlockUpdates()
- [C++] HRESULT BlockUpdates()

### Remarks

- This method blocks three redraw systems: redraw for the chart, the Object View, and the toolbars.
- Data updates are also blocked.
- The current data requests are cancelled.
- The Process Analyst has a built-in counter to store how many times the block and unblock have been called, so that only the final UnBlockUpdates call actually unblocks the above mentioned data updates and redraw systems.

### Execution Result

If the function succeeds, the return value will be Success. If the function does not succeed, the return value will be GeneralFailure.

### Calling Syntax

This example assumes there is a valid Process Analyst object to be passed into the example methods.

## [VBA]

```
Sub Example(ProcessAnalyst As Object)
ProcessAnalyst.BlockUpdates()
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hProcessAnalyst)
    _ObjectCallMethod(hProcessAnalyst, "BlockUpdates");
END
```

## See Also

[IProcessAnalyst.UnBlockUpdates \[Method\]](#)

# IProcessAnalyst.UnBlockUpdates [Method]

Unblocks certain aspects of the Process Analyst's redrawing and data updating.

### Defined As

- [VBA] UnblockUpdates()
- [Cicode] UnblockUpdates()
- [C++] HRESULT UnblockUpdates()

### Remarks

- This method unblocks three redraw systems: redraw for the chart, the Object View, and the toolbars.
- Data updates are also unblocked.
- The Process Analyst has a built-in counter to store how many times the block and unblock have been called, so that only the final UnBlockUpdates call actually unblocks the above mentioned data updates and redraw systems.

### Execution Result

If the function succeeds, the return value will be Success. If the function does not succeed, the return value will be GeneralFailure. If other BlockUpdates are in effect, a Success will be returned also (for those C++ users, S\_FALSE will be returned in this case).

### Calling Syntax

This example assumes there is a valid Process Analyst object to be passed into the example methods.

### [VBA]

```
Sub Example(ProcessAnalyst As Object)
ProcessAnalyst.UnblockUpdates()
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hProcessAnalyst)
    _ObjectCallMethod(hProcessAnalyst, "UnblockUpdates");
END
```

### See Also

[IProcessAnalyst.BlockUpdates \[Method\]](#)

## IProcessAnalyst.CopyToClipboard [Method]

Copies the data in the current viewable range for visible pens to the clipboard.

### Defined As

- [VBA] CopyToClipboard()
- [Cicode] CopyToClipboard()
- [C++] HRESULT CopyToClipboard()

### Remarks

The timestamp of each sample will be in local time defined by your computer. The start and end sample maybe generated for each pen to indicate the exported range of the data.

### Execution Result

If the function succeeds the return value will be Success. If the function does not succeed the return value will be GeneralFailure.

### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

### [VBA]

```
Sub Example()
myPage_AN35.CopyToClipboard
End Sub
```

### [Cicode]

```
Sub Example()
```

```
OBJECT hProcessAnalyst = ObjectByName("AN35");
_ObjectCallMethod(hProcessAnalyst, "CopyToClipboard");
End Sub
```

## See Also

[IProcessAnalyst.CopyToFile \[Method\]](#)

# IProcessAnalyst.CopyToFile [Method]

Saves the data in the current viewable range for visible pens to the specified file.

### Defined As

- [VBA] CopyToFile(filename As String)
- [Cicode] CopyToFile(STRING filename)
- [C++] HRESULT CopyToClipboard(BSTR filename)

### Parameters

filename

[in] Indicates the name and path of the file that the data will be exported to.

### Execution Result

If the function succeeds the return value will be Success. If the function does not succeed the return value will be GeneralFailure.

### Remarks

The timestamp of each sample will be in local time defined by your computer. The start and end sample maybe generated for each pen to indicate the exported range of the data.

### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

## [VBA]

```
Sub Example()
myPage_AN35.CopyToFile "test.xls"
End Sub
```

## [Cicode]

```
Sub Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
_ObjectCallMethod(hProcessAnalyst, "CopyToFile", "test.xls");
End Sub
```

## See Also

[IProcessAnalyst.CopyToClipboard \[Method\]](#)

# IProcessAnalyst.FreezeEvent [Method]

Enables or disables a specified event from triggering.

### Defined As

- [VBA] FreezeEvent(eventName As String, freeze As Boolean)
- [Cicode] FreezeEvent(STRING eventName, INT freeze)
- [C++] HRESULT FreezeEvent(BSTR columnName, VARIANT\_BOOL freeze)

### Parameters

eventName

[in] Specifies the event that you want to cease receiving notifications for.

freeze

[in] Indicates whether to enable or disable the event. True(-1) disable the event. False(0) enable the event.

### Execution Result

If the method succeeds, the return value will be Success. If the method does not succeed, the return value will be GeneralFailure. If eventName is bad or does not exist, the return value will be InvalidArgument.

### Remarks

All events exposed by the Process Analyst can be enabled or disabled. This method is particularly useful to minimize the likelihood of recursive behavior of functions that generate the same event that you are trying to handle.

### Calling Syntax

This example assumes there is a valid Process Analyst object to be passed into the example methods.

### [VBA]

```
Sub Example(analyst As Object)
analyst.FreezeEvent "HorizontalAxisChanged" True
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hAnalyst)
_ObjectCallMethod(hAnalyst, "FreezeEvent","HorizontalAxisChanged", -1);
END
```

# IProcessAnalyst.LoadFromFile [Method]

Loads a specified view into the Process Analyst.

## Defined As

- [VBA] LoadFromFile(filename As String, fileLocation As Integer)
- [Cicode] LoadFromFile(STRING filename, INT fileLocation)
- [C++] HRESULT LoadFromFile(BSTR filename, FileLocation fileLocation)

## Parameters

### filename

[in] Indicates a relative path and filename of the view to load into the Process Analyst. See Remarks, below.

### fileLocation

[in] Indicates which known location to load the file from.

## Execution Result

If the function succeeds the return value will be Success. If the filename is invalid the return value will be InvalidArgument. If the path indicated by fileLocation is invalid or offline then the return value will be PathNotFound. If any other problem occurs then the return value will be GeneralFailure.

## Remarks

This method will replace the current view with the one in the specified file.

Absolute paths are not necessary for the filename as the method has been designed to load the specified file from [Run]:\Analyst Views (FileLocation\_Local), my documents folder (FileLocation\_User) or from the primary/secondary paths (FileLocation\_Server).

When a file is loaded it will be synchronized with the other locations to verify each location has the file which is the latest. If the file you are loading is older than one which exists in another location it will be replaced.

## Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

## [VBA]

```
Sub Example()
` Load the view from the server
myPage_AN35.LoadFromFile "Test1.pav", 0
End Sub
```

## [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
_ObjectCallMethod(hProcessAnalyst, "LoadFromFile", "Test1.pav", 0);
END
```

## See Also

# IProcessAnalyst.PrintAll [Method]

Displays the Print configuration dialog.

### Defined As

- [VBA] PrintAll
- [Cicode] PrintAll()
- [C++] HRESULT PrintAll()

### Execution Result

If the function succeeds the return value will be Success. If an unexpected error occurs then return value will be GeneralFailure.

### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

## [VBA]

```
Sub Example()
myPage_AN35.PrintAll
End Sub
```

## [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
_ObjectCallMethod(hProcessAnalyst, "PrintAll");
END
```

# IProcessAnalyst.SaveToFile [Method]

Saves the current view using the specified name to the specified location.

### Defined As

- [VBA] SaveToFile(filename As String, fileLocation As Integer)
- [Cicode] SaveToFile(STRING filename, INT fileLocation)
- [C++] HRESULT SaveToFile(BSTR filename, FileLocation fileLocation)

**Parameters****filename**

[in] Indicates a relative path and filename which will be used during the saving of the view. See Remarks.

**fileLocation**

[in] Indicates which known location to save the file to.

**Execution Result**

If the function succeeds the return value will be Success. If the filename is invalid the return value will be InvalidArgument. If the path indicated by fileLocation is invalid or offline then the return value will be PathNotFound. If any other problem occurs, the return value will be GeneralFailure.

**Remarks**

On a client where the current user matches the WritePrivilegeLevel only the FileLocation\_Server and FileLocation\_User options will succeed. Saving using the FileLocation\_Server option will save to the locations indicated by PrimaryPath and SecondaryPath properties and into the Project directory.

On a client where the current user does not match the WritePrivilegeLevel only the FileLocation\_User will succeed.

**Calling Syntax**

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

**[VBA]**

```
Sub Example()
` Save the view to the server and project
myPage_AN35.SaveToFile "Analyst Views\Test1.pav", 1
End Sub
```

**[Cicode]**

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
` Save the view to the server and project
_ObjectCallMethod(hProcessAnalyst, "SaveToFile", "Analyst Views\Test1.pav", 1);
END
```

**See Also**

[IProcessAnalyst.SecondaryPath \[Property\]\[Get/Set\]](#)

[IProcessAnalyst.WritePrivilegeLevel \[Property\]\[Get\]](#)

## IProcessAnalyst.ShowProperties [Method]

Displays the Process Analyst's property configuration dialog.

**Define As**

- [VBA] ShowProperties
- [Cicode] ShowProperties()
- [C++] HRESULT ShowProperties ()

**Execution Result**

If the function succeeds the return value will be Success. If an unexpected error occurs then the return value will be GeneralFailure.

**Calling Syntax**

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

**[VBA]**

```
Sub Example()
myPage_AN35.ShowProperties
End Sub
```

**[Cicode]**

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
_ObjectCallMethod(hProcessAnalyst, "ShowProperties");
END
```

## IProcessAnalyst.SubscribeForPropertyChange [Method]

Use this method to receive notifications of when a particular property changes. Notifications will be sent via the PropertyChanged event.

**Defined As**

- [VBA] SubscribeForPropertyChange(interfaceName As String, propertyName As String)
- [Cicode] SubscribeForPropertyChange(STRING interfaceName, STRING propertyName)
- [C++] HRESULT SubscribeForPropertyChange(BSTR interfaceName, BSTR propertyName)

**Parameters**

interfaceName

[in] Specify the name of the interface that the property you want notifications for is defined on.

propertyName

[in] This is the name of the property you want to receive notifications for.

**Execution Result**

If the function succeeds, the return value will be Success. If the interfaceName or propertyName is a bad string,

the return value will be InvalidArgument. If any other problem occurs, the return value will be GeneralFailure.

#### Remarks

The following set of properties are supported:

Interface name	Property Name
IProcessAnalyst	AutoScroll
IProcessAnalyst	BackgroundColor
IProcessAnalyst	ContextMenu
IProcessAnalyst	LockedPens
IProcessAnalyst	DisplayRefreshRate
IProcessAnalyst	DataRequestRate
IProcessAnalyst	ZoomMode

#### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

#### [VBA]

```
Sub Example()
    myPage_AN35.SubscribeForPropertyChange "IProcessAnalyst", "ZoomMode"
End Sub
```

#### [Cicode]

```
Sub Example()
    OBJECT hProcessAnalyst = ObjectByName("AN35");
    _ObjectCallMethod(hProcessAnalyst, "SubscribeForPropertyChange",
    "IProcessAnalyst", "ZoomMode");
End Sub
```

#### See Also

[IProcessAnalyst.UnsubscribePropertyChange \[Method\]](#)

[PropertyChanged \[Event\]](#)

## IProcessAnalyst.SynchroniseToNow [Method]

Synchronizes pens such that the date/time reflects "Now."

#### Defined As

- [VBA] SynchroniseToNow

- [Cicode] SynchroniseToNow()
- [C++] HRESULT SynchroniseToNow()

#### Execution Result

If the function succeeds, the return value will be Success. If any other problem occurs, the return value will be GeneralFailure.

#### Remarks

The current span for each pen will be maintained. 'Now' is defined as the current time on the client machine.

#### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

### [VBA]

```
Sub Example()
    myPage_AN35.SynchroniseToNow
End Sub
```

### [Cicode]

```
Sub Example()
    OBJECT hProcessAnalyst = ObjectByName("AN35");
    _ObjectCallMethod(hProcessAnalyst, "SynchroniseToNow");
End Sub
```

## IProcessAnalyst.UnsubscribePropertyChanged [Method]

Use this method to cancel notifications of when the specified property changes. Notifications will cease to be sent via the PropertyChanged event.

#### Defined As

- [VBA] UnsubscribePropertyChanged(interfaceName As String, propertyName As String)
- [Cicode] UnsubscribePropertyChanged(STRING interfaceName, STRING propertyName)
- [C++] HRESULT UnsubscribePropertyChanged(BSTR interfaceName, BSTR propertyName)

#### Parameters

interfaceName

[in] Name of the interface that the property you want to remove notifications for is defined on.

propertyName

[in] Name of the property you want to remove notifications for.

#### Execution Result

If the function succeeds, the return value will be Success. If the interfaceName or propertyName is a bad string, the return value will be InvalidArgument. If any other problem occurs, the return value will be GeneralFailure.

#### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

#### [VBA]

```
Sub Example()
    myPage_AN35.UnsubscribePropertyChanged "IProcessAnalyst", "ZoomMode"
End Sub
```

#### [Cicode]

```
Sub Example()
    OBJECT hProcessAnalyst = ObjectByName("AN35");
    _ObjectCallMethod(hProcessAnalyst, "UnsubscribePropertyChanged",
        "IProcessAnalyst", "ZoomMode");
End Sub
```

#### See Also

[IProcessAnalyst.SubscribeForPropertyChange \[Method\]](#)

[PropertyChanged \[Event\]](#)

## IProcessAnalyst.AdminPrivilegeLevel [Property] [Get]

Retrieves the privilege level currently set for controlling administration features of the Process Analyst at Run-time.

#### Defined As

- [VBA] Integer AdminPrivilegeLevel
- [Cicode] INT AdminPrivilegeLevel
- [C++] short AdminPrivilegeLevel

#### Execution Result

If the property get succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument.

#### Remarks

By default the level is 0 (Zero), which allows access to every feature at run time. Setting this to any other level will require the operator viewing the Process Analyst to have a privilege equal to that level.

This property can only be set at design time (in the Graphics Builder property pages) and is recommended to prevent Operators from changing performance properties such as DataRequestRate and DisplayRefreshRate.

**Limits**

Privilege level defined in Plant SCADA 1 - 8. 0 = no security.

**Calling Syntax**

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

**[VBA]**

```
Sub Example()
Dim privilege As Boolean
`Getting Property value
privilege = myPage_AN35.AdminPrivilegeLevel
End Sub
```

**[Cicode]**

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
INT privilege;
// Getting current property value
privilege = _ObjectGetProperty(hProcessAnalyst,"AdminPrivilegeLevel");
END
```

## IProcessAnalyst.AutoScroll [Property][Get/Set]

Gets or Sets the automatic scrolling of pens as time passes.

**Defined As**

- [VBA] Boolean AutoScroll
- [Cicode] INT AutoScroll
- [C++] VARIANT\_BOOL AutoScroll

**Execution Result**

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Remarks**

This function does not synchronize the pens to now. The display will be updated according to the value of the DisplayRefreshRate property.

**Limits**

- True (-1): Autoscroll is On
- False (0): Autoscroll is Off

**Calling Syntax**

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

**[VBA]**

```
Sub Example()
Dim autoScroll As Boolean
`Getting Property value
autoScroll = myPage_AN35.AutoScroll
`Setting Property value
myPage_AN35.AutoScroll = True
End Sub
```

**[Cicode]**

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
INT autoScroll;
// Getting current property value
autoScroll = _ObjectGetProperty(hProcessAnalyst, "AutoScroll");
// Setting Property to true
_ObjectSetProperty(hProcessAnalyst, "AutoScroll", -1);
END
```

## **IProcessAnalyst.BackgroundColor [Property][Get/ Set]**

Gets or sets the background color for the Process Analyst.

**Defined As**

- [VBA] Long BackgroundColor
- [Cicode] INT BackgroundColor
- [C++] OLECOLOR BackgroundColor

**Execution Result**

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Remarks**

The background is the area under the panes. To calculate the integer value necessary for a color, apply the following formula:

$$(65536 * Blue) + (256 * Green) + (Red)$$

where Red, Green, and Blue are 0-255.

**Limits**

- True (-1): Context menu is enabled
- False (0): Context menu is disabled

**Calling Syntax**

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

### [VBA]

```
Sub Example()
Dim backgroundColor As Long
`Getting Property value
backgroundColor = myPage_AN35.BackgroundColor
`Setting Property value to Red
myPage_AN35.BackgroundColor = 255
End Sub
```

### [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
INT backgroundColor;
// Getting current property value
backgroundColor = _ObjectGetProperty(hProcessAnalyst, "BackgroundColor");
// Setting Property to Red
_ObjectSetProperty(hProcessAnalyst, "BackgroundColor", 255);
END
```

## IProcessAnalyst.CommandSystem [Property][Get]

Gets a reference to the Process Analyst's Command System object. With this object you can execute commands, query command information, and create your own custom commands.

#### Defined As

- [VBA] Object CommandSystem
- [Cicode] OBJECT CommandSystem
- [C++] ICommandSystem\* CommandSystem

#### Execution Result

If the property get succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument.

#### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

### [VBA]

```
Sub Example()
Dim commandSystem As Object
`Retrieve command system
Set commandSystem = myPage_AN35.CommandSystem
End Sub
```

**[Cicode]**

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
OBJECT hCommandSystem;
// Retrieve command system
hCommandSystem = _ObjectGetProperty(hProcessAnalyst, "CommandSystem");
END
```

## IProcessAnalyst.ContextMenu [Property][Get/Set]

Enables or disables the context menu which is displayed at Run-time when an operator clicks the right mouse button on the graphical display.

**Defines As**

- [VBA] Boolean ContextMenu
- [Cicode] INT ContextMenu
- [C++] VARIANT\_BOOL ContextMenu

**Execution Result**

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument.

**Calling Syntax**

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

**[VBA]**

```
Sub Example()
Dim contextMenu As Boolean
`Getting Property value
contextMenu = myPage_AN35.ContextMenu
`Disable the context menu
myPage_AN35.ContextMenu = False
End Sub
```

**[Cicode]**

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
INT contextMenu;
// Getting current property value
contextMenu = _ObjectGetProperty(hProcessAnalyst, "ContextMenu");
// Disable the context menu
_ObjectSetProperty(hProcessAnalyst, "ContextMenu", 0);
END
```

## IProcessAnalyst.Cursors [Property][Get]

Gets a reference to the Process Analyst's cursors collection. With this object you can create new, and browse existing cursors.

### Defined As

- [VBA] Object Cursors
- [Cicode] OBJECT Cursors
- [C++] ICursors\* Cursors

### Execution Result

If the property get succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument.

### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

### [VBA]

```
Sub Example()
Dim cursors As Object
`Retrieve cursors collection
Set cursors = myPage_AN35.Cursors
End Sub
```

### [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
OBJECT hCursors;
// Retrieve cursor collection
hCursors = _ObjectGetProperty(hProcessAnalyst, "Cursors");
END
```

## IProcessAnalyst.DataRequestRate [Property][Get/ Set]

Indicates how often (in milliseconds) the Process Analyst Control will request data from the Trends Server(s). Internally the Process Analyst will choose the most optimum request rate for data, but this property can be used to slow the request down further.

### Defined As

- [VBA] Integer DataRequestRate
- [Cicode] INT DataRequestRate

- [C++] short DataRequestRate

#### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument.

#### Remarks

This property is useful for controlling the load on a Trends Server. The higher the figure the less load will be put on the Trends Server(s).

#### Limits

- Minimum = 10 milliseconds
- Maximum = 60000 milliseconds (1 minute)
- Default = 1000 milliseconds (1 second)

#### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

### [VBA]

```
Sub Example()
Dim requestRate As Integer
`Retrieve request rate
requestRate = myPage_AN35.DataRequestRate
`Set request rate
myPage_AN35.DataRequestRate = 2000
End Sub
```

### [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
INT requestRate;
// Retrieve property value
requestRate = _ObjectGetProperty(hProcessAnalyst, "DataRequestRate");
// Set property value to 2 seconds
_Object SetProperty(hProcessAnalyst, "DataRequestRate", 2000);
END
```

## IProcessAnalyst.DisplayRefreshRate [Property][Get/Set]

Indicates how fast the Process Analyst Control display is updated in milliseconds. The default is an update of 1 second, which provides optimum client performance and visual feedback.

#### Defined As

- [VBA] Integer DisplayRefreshRate

- [Cicode] INT DisplayRefreshRate
- [C++] short DisplayRefreshRate

## ⚠ WARNING

### UNACCEPTABLY SLOW PROGRAM EXECUTION

- Do not specify a Display refresh rate less than 500 ms.
- Do not specify a Number of Samples greater than 500.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

### Remarks

This property is useful for controlling the performance of a client (CPU usage).

### Limits

- Minimum = 10 milliseconds (most machines will not be fast enough to keep up).
- Maximum = 60000 milliseconds (1 minute).
- Default = 1000 milliseconds (1 second).

### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

## [VBA]

```
Sub Example()
Dim requestRate As Integer
`Retrieve request rate
requestRate = myPage_AN35.DisplayRefreshRate
`Set request rate
myPage_AN35.DisplayRefreshRate = 2000
End Sub
```

## [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
INT requestRate;
// Retrieve request rate
requestRate = _ObjectGetProperty(hProcessAnalyst, "DisplayRefreshRate");
// Set request rate
_Object SetProperty(hProcessAnalyst, "DisplayRefreshRate", 2000);
END
```

# IProcessAnalyst.DisplaySize[Property][Get/Set]

Gets or sets the size of graphical elements in the control's design and runtime surfaces.

## Defined As

- [VBA] Long DisplaySize
- [Cicode] INT DisplaySize
- [C++] DisplaySize DisplaySize

## Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

## Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

## [VBA]

```
Sub Example()
Dim displaySize As Long

'Getting Property value
displaySize = myPage_AN35.DisplaySize
'Setting Property value
myPage_AN35.DisplaySize = 1
End Sub
```

## [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");

// Getting property value
INT nDisplayMode = _ObjectGetProperty(hProcessAnalyst, "DisplaySize");
// Setting property value
_Object SetProperty(hProcessAnalyst, "DisplaySize", 1);
END
```

## See Also

[DisplaySize\[Enumeration\]](#)

# IProcessAnalyst.Language [Property] [Get/Set]

This function allows dynamic changing of the user interface to the language specified.

## Defined As

- [VBA] String Language
- [Cicode] STRING Language
- [C++] BSTR Language

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

### Remarks

To change languages you need to have additional localized resource .dll files alongside the main resources.dll file. Additional language .dll files are named (and have to be named) using the format "Resources\_<languagecode>.dll". The Process Analyst expects this format or the language will not be loaded.

For example, if you have a Chinese resource dll named "Resources\_zh-CN.dll", set the Language property to "zh-CN". The .dll files are named according to the RFC 1766 standard for specifying culture names.

Specifying "." resets the language back to the default.

---

**Note:** This method is not necessary to be called if you are using Plant SCADA's multilanguage feature to make the Process Analyst switch languages. For details, see Multi-language Support.

### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

## [VBA]

```
Sub Example()
Dim language As String
`Retrieve current language
language = myPage_AN35.Language
`Set language to Japanese
myPage_AN35.Language = "ja-JP"
End Sub
```

## [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
STRING language;
// Retrieve current language
language = _ObjectGetProperty(hProcessAnalyst, "Language");
// Set language to Japanese
_Object SetProperty(hProcessAnalyst, "Language", "ja-JP");
END
```

# IProcessAnalyst.LastSelectedPen [Property][Get]

Retrieves the last selected pen on the Process Analyst.

### Defined As

- [VBA] Object LastSelectedPen

- [Cicode] OBJECT LastSelectedPen
- [C++] IPen\* LastSelectedPen

#### Execution Result

If the property get succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument.

#### Remarks

The last selected pen is also referred to as the "primary" selection. If there are no pens in the view, an invalid object will be returned.

#### Limits

- A reference to the primary selected pen.
- Invalid object when there are no pens on the display.

#### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

### [VBA]

```
Sub Example()
Dim selectedPen As Object
`Retrieve primary selection
Set selectedPen = myPage_AN35.LastSelectedPen
End Sub
```

### [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
OBJECT selectedPen;
// Retrieve primary selection
selectedPen = _ObjectGetProperty(hProcessAnalyst, "LastSelectedPen");
END
```

## IProcessAnalyst.LockedPens [Property][Get/Set]

Determines whether every the pen across every pane in the Process Analyst control are locked together.

#### Defined As

- [VBA] Boolean LockedPens
- [Cicode] INT LockedPens
- [C++] VARIANT\_BOOL LockedPens

#### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return

value will be InvalidArgument.

#### Remarks

While this property is enabled, any operation applied to the selected pen is applied to every pen. When the property is disabled, the pens will lose the lock logic, and any interaction technique will apply to the individual pen with selection focus.

If this property is disabled and then enabled, every pen assumes the same scale, timespan, and end time position as the selected pen.

#### Limits

- True (-1): Pens are locked.
- False (0): Pens are unlocked.

#### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

### [VBA]

```
Sub Example()
Dim locked As Boolean
`Get current locked status
locked = myPage_AN35.LockedPens
`Turn off locked Pens
myPage_AN35.LockedPens = False
End Sub
```

### [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
OBJECT lockedPens;
// Get current locked status
lockedPens = _ObjectGetProperty(hProcessAnalyst, "LockedPens");
// Turn off locked Pens
_ObjectSetProperty(hProcessAnalyst, "LockedPens", 0);
END
```

## IProcessAnalyst.NumberofSamples[Property][Get/ Set]

Specifies the date/time axis span of each pen in number of samples. More or less detail for each pen can be displayed by increasing or decreasing the value of this property respectively.

UNACCEPTABLY SLOW PROGRAM EXECUTION

- Do not specify a Display refresh rate less than 500 ms.
- Do not specify a Number of Samples greater than 500.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

**Note:** The value entered into the **Number of Samples** box in the Process Analyst Properties dialog box is closely tied to the display resolution. The default setting is ideal for screen resolutions from 1024x768 to 1280x1024. The association between Number of Samples and the display resolution occurs because for each sample shown on screen the Process Analyst attempts to leave a small gap to allow for sample markers. Because the Process Analyst shows samples when they occur, it requires less data than a traditional trend client. Retrieving data is expensive and the more data you retrieve the more time the request takes. *It is recommended that this parameter not exceed 500.*

#### Defined As

- [VBA] Integer NumberofSamples
- [Cicode] INT NumberofSamples
- [C++] short NumberofSamples

#### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

#### Remarks

This property is useful for controlling the performance of a client. (CPU usage).

By dividing a pen's time span by the value of this property, you can calculate the current display period of the pen. The Process Analyst will only display a maximum of one sample per display period. See Data Compaction for details.

#### Limits

- Minimum = 10
- Maximum = 5000
- Default = 300

#### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

### [VBA]

```
Sub Example()
Dim numOfSamples As Integer
`Retrieve number of samples
numOfSamples = myPage_AN35.NumberOfSamples
`Set request rate
myPage_AN35.NumberOfSamples = numOfSamples
End Sub
```

**[Cicode]**

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
INT numOfSamples;
// Retrieve number of samples
numOfSamples = _ObjectGetProperty(hProcessAnalyst, "NumberOfSamples");
// Set request rate
_ObjectSetProperty(hProcessAnalyst, "NumberOfSamples", 500);
END
```

**See Also**

[Exporting Pen Data](#)

## IProcessAnalyst.ObjectView [Property][Get]

Gets a reference to the ObjectView object. With this object you can manipulate the look of the ObjectView.

**Defined As**

- [VBA] Object ObjectView
- [Cicode] OBJECT ObjectView
- [C++] IObjectView\* ObjectView

**Execution Result**

If the property get succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument.

**Calling Syntax**

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

**[VBA]**

```
Sub Example()
Dim objectView As Object
`Retrieve the objectview
Set objectView = myPage_AN35.ObjectView
End Sub
```

**[Cicode]**

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
OBJECT objectView;
// Retrieve the objectview
objectView = _ObjectGetProperty(hProcessAnalyst, "ObjectView");
END
```

# IProcessAnalyst.Panes [Property][Get]

Gets a reference to the Panes collection. With this object you can create new, and browse existing panes.

## Defined As

- [VBA] Object Panes
- [Cicode] OBJECT Panes
- [C++] IPanes\* Panes

## Execution Result

If the property get succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument.

## Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

## [VBA]

```
Sub Example()
Dim panes As Object
`Retrieve the panes collection
Set panes = myPage_AN35.Panes
End Sub
```

## [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
OBJECT panes;
// Retrieve the panes collection
panes = _ObjectGetProperty(hProcessAnalyst, "Panes");
END
```

# IProcessAnalyst.PrimaryPath [Property][Get/Set]

Specifies the primary location for saving and loading Process Analyst views.

## Defined As

- [VBA] String PrimaryPath
- [Cicode] STRING PrimaryPath
- [C++] BSTR PrimaryPath

## Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

### Remarks

The primary and secondary path properties together provide a file redundancy option for large systems that need to store Process Analyst Views in a shared location. Whenever a load operation occurs from either of these locations, the loaded file will be synchronized with each location, such that the latest version of the file appears in both locations.

### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

## [VBA]

```
Sub Example()
Dim path As String
`Retrieve the path
path = myPage_AN35.PrimaryPath
`Set the path
myPage_AN35.PrimaryPath = "\\\computer1\PA Views"
End Sub
```

## [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
STRING path;
// Retrieve the path
path = _ObjectGetProperty(hProcessAnalyst, "PrimaryPath");
// Set the path
_Object SetProperty(hProcessAnalyst, "PrimaryPath", "\\\computer1\PA Views");
END
```

## See Also

[IProcessAnalyst.SecondaryPath \[Property\]\[Get/Set\]](#)

[IProcessAnalyst.LoadFromFile \[Method\]](#)

[IProcessAnalyst.SaveToFile \[Method\]](#)

# IProcessAnalyst.SecondaryPath [Property][Get/ Set]

Specifies the secondary location for saving and loading Process Analyst views.

### Defined As

- [VBA] String SecondaryPath
- [Cicode] STRING SecondaryPath
- [C++] BSTR SecondaryPath

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

### Remarks

The secondary and primary path properties together provide a file redundancy option for large systems that need to store Process Analyst Views in a shared location. Whenever a load operation occurs from either of these locations, the loaded file will be synchronized with each location, such that the latest version of the file appears in both locations.

### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

## [VBA]

```
Sub Example()
Dim path As String
`Retrieve the path
path = myPage_AN35.PrimaryPath
`Set the path
myPage_AN35.SecondaryPath = "\computer1\PA Views"
End Sub
```

## [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
STRING path;
// Retrieve the path
path = _ObjectGetProperty(hProcessAnalyst, "SecondaryPath");
// Set the path
_Object SetProperty(hProcessAnalyst, "SecondaryPath", "\computer1\PA Views");
END
```

## See Also

- [IProcessAnalyst.PrimaryPath \[Property\]\[Get/Set\]](#)
- [IProcessAnalyst.SaveToFile \[Method\]](#)

## IProcessAnalyst.Toolbars [Property][Get]

Gets a reference to the Toolbars collection. With this object you can browse and modify existing toolbars.

### Defined As

- [VBA] Object Toolbars
- [Cicode] OBJECT Toolbars

- [C++] IToolbars\* Toolbars

#### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

#### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

### [VBA]

```
Sub Example()
Dim toolbars As Object
`Retrieve the toolbars collection
Set toolbars = myPage_AN35.Toolbars
End Sub
```

### [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
OBJECT toolbars;
// Retrieve the toolbars collection
toolbars = _ObjectGetProperty(hProcessAnalyst, "Toolbars");
END
```

## IProcessAnalyst.ViewLocation [Property][Get]

The location of last successfully loaded or saved PAV file. e.g. If you loaded a PAV file test.pav from the project folder, this property will be "[Local]test.pav".

#### Defined As

- [VBA] STRING ViewLocation
- [Cicode] STRING ViewLocation
- [C++] BSTR ViewLocation

#### Execution Result

If the property get succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument.

#### Calling Syntax

Assumes your Process Analyst's Object Name has been named "AN35".

### [VBA]

```
Sub Example()
Dim sViewLocation As String
`Retrieve view location
```

```
Set sViewLocation = myPage_AN35.ViewLocation
End Sub
```

### [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
STRING sViewLocation;
// Retrieve view location
sViewLocation = _ObjectGetProperty(hProcessAnalyst, "ViewLocation");
END
```

## IProcessAnalyst.WritePrivilegeLevel [Property][Get]

Returns the privilege level necessary to save Process Analyst views to the Primary and Secondary paths.

#### Defined As

- [VBA] Integer WritePrivilegeLevel
- [Cicode] INT WritePrivilegeLevel
- [C++] short WritePrivilegeLevel

#### Execution Result

If the property get succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument.

#### Remarks

The privilege cannot be set via automation. It needs to be set in the property pages at design time (for example, in Graphics Builder).

#### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

### [VBA]

```
Sub Example()
Dim privilege As Integer
`Retrieve the privilege
privilege = myPage_AN35.WritePrivilegeLevel
End Sub
```

### [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
INTEGER privilege;
// Retrieve the privilege
```

```
privilege = _ObjectGetProperty(hProcessAnalyst, "WritePrivilegeLevel");
END
```

## See Also

[IProcessAnalyst.SaveToFile \[Method\]](#)  
[IProcessAnalyst.SecondaryPath \[Property\]\[Get/Set\]](#)

# IProcessAnalyst.ZoomMode [Property][Get/Set]

Enables or disables the box zooming mode for the Process Analyst.

### Defined As

- [VBA] Boolean ZoomMode
- [Cicode] INT ZoomMode
- [C++] VARIANT\_BOOL ZoomMode

### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

### Remarks

Setting this mode will verify only box zooming operations can occur; other operations such as interactive scrolling and scaling will cease.

### Limits

- True (-1): Enable zoom mode.
- False (0): Disable zoom mode.

### Calling Syntax

Assumes you have a page called "myPage" and the Process Analyst has been named "AN35".

## [VBA]

```
Sub Example()
Dim zoomMode As Boolean
`Retrieve the mode
zoomMode = myPage_AN35.ZoomMode
`Set the path
myPage_AN35.ZoomMode = True
End Sub
```

## [Cicode]

```
FUNCTION Example()
OBJECT hProcessAnalyst = ObjectByName("AN35");
```

```
INT zoomMode;
// Retrieve the zoomMode
zoomMode = _ObjectGetProperty(hProcessAnalyst, "ZoomMode");
// Set the zoomMode
_ObjectSetProperty(hProcessAnalyst, "ZoomMode", -1);
END
```

## IToolbar Interface

### Defined As

- [VBA] Object
- [Cicode] OBJECT
- [C++] IToolbar

### Methods (0)

### Properties (2)

[IToolbar.Visible \[Property\]\[Get/Set\]](#)

[IToolbar.Buttons \[Property\]\[Get\]](#)

## IToolbar.Buttons [Property][Get]

Gets this Toolbars collection of Buttons.

### Defined As

- [VBA] Object Buttons
- [Cicode] OBJECT Buttons
- [C++] IToolbarButtons\* Buttons

### Execution Result

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

### Calling Syntax

This example assumes there is a valid Toolbar object as retrieved from a Process Analyst's Toolbars collection.  
(for example, VBA: ProcessAnalyst.Toolbars.Item(1))

## [VBA]

```
Sub Example(Toolbar As Object)
Dim buttons As Object
`Getting Property value
Set buttons = Command.Buttons
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hToolbar)
// Getting property value
OBJECT hButtons = _ObjectGetProperty(hToolbar, "Buttons");
END
```

# IToolbar.Visible [Property][Get/Set]

Gets and Sets this Toolbars Visible state.

**Defined As**

- [VBA] Boolean Visible
- [Cicode] INT Visible
- [C++] VARIANT\_BOOL Visible

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Limits**

- True (-1): Visible
- False (0): Invisible

**Remarks**

Both the main and navigation toolbars can be hidden.

If a toolbar is not visible, the buttons tied to it will not appear.

---

**Note:** The navigation toolbar is automatically hidden when the chart contains no pens. Changing the value of this property while there are no pens will not have an effect until a pen is added.

**Calling Syntax**

This example assumes there is a valid Toolbar object as retrieved from a Process Analyst's Toolbars collection.  
(for example, VBA: ProcessAnalyst.Toolbars.Item(1))

**[VBA]**

```
Sub Example(Toolbar As Object)
Dim visible As Boolean
`Getting Property value
visible = Command.Visible
`Setting Property value
Command.Visible = False
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hToolbar)
// Getting property value
INT nVisible = _ObjectGetProperty(hToolbar, "Visible");
// Setting property value
_ObjectSetProperty(hToolbar, "Visible", 0);
END
```

**IToolbars Interface****Defined As**

- [VBA] Object
- [Cicode] OBJECT
- [C++] IToolbar

**Methods (0)****Properties (3)**

[IToolbars.Count \[Property\]\[Get\]](#)  
[IToolbars.Item \[Property\]\[Get\]](#)  
[IToolbars.\\_NewEnum \[Property\]\[Get\]](#)

## IToolbars.Item [Property][Get]

Gets the Toolbar at a supplied index location in this collection.

**Defined As**

- [VBA] Item(index As Long) as Object
- [Cicode] OBJECT Item(INT index)
- [C++] Item(int index, IToolbar\* Item)

**Parameters**

index

[in] Indicates the index location of the child item to return from this collection. (One based) 1 = Main toolbar; 2 = Navigation toolbar.

**Execution Result**

If the property get succeeds, the return value will be Success. If the index is out of range, the return value will be InvalidArgument.

**Calling Syntax**

This example assumes there is a valid Toolbars collection as retrieved from an ObjectView. (for example, VBA: objectView.Toolbars)

**[VBA]**

```
Sub Example(Toolbars As Object)
Dim toolbar As Object
`Getting Property value
Set toolbar = Toolbars.Item(1)
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hToolbars)
// Getting property value
OBJECT hToolbar = _ObjectCallMethod(hToolbars, "get_Item", 1);
END
```

## IToolbars.\_NewEnum [Property][Get]

This allows For.. Each.. Next integration in VB.

**Calling Syntax**

This example assumes there is a valid Toolbars collection as retrieved from an ObjectView (for example, VBA: objectView.Toolbars). This property is not applicable to Cicode.

**[VBA]**

```
Sub Example(Toolbars As Object)
Dim toolbar As Object
Dim count Object
`Using Property
For Each toolbar In Toolbars
count = count + 1
Next toolbar
End Sub
```

## IToolbars.Count [Property][Get]

Gets the number of Toolbars in this collection.

**Defined As**

- [VBA] Long Count
- [Cicode] INT Count
- [C++] int Count

**Execution Result**

If the property get succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument.

**Calling Syntax**

This example assumes there is a valid Toolbars collection as retrieved from an ObjectView. (for example, VBA: objectView.Toolbars).

**[VBA]**

```
Sub Example(Toolbars As Object)
Dim count As Long
`Getting Property value
count = Toolbars.Count
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hToolbars)
// Getting property value
INT nCount = _ObjectGetProperty(hToolbars, "Count");
END
```

**IToolBarButton Interface****Defined As**

- [VBA] Object
- [Cicode] OBJECT
- [C++] IToolbar

**Methods (0)****Properties (1)**

[IToolBarButton.CommandId \[Property\]\[Get\]](#)

## IToolBarButton.CommandId [Property][Get]

Gets the ID of the associated command for this button.

**Defined As**

- [VBA] String CommandId
- [Cicode] STRING CommandId
- [C++] BSTR CommandId

**Calling Syntax**

This example assumes there is a valid ToolbarButtons collection as retrieved from an ObjectView (for example, VBA: objectView.Toolbars.Item(1).Buttons(1).CommandID).

**[VBA]**

```
Sub Example(Button As Object)
Dim commandId As String
`Getting Property value
commandId = Buttons.CommandId
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hButton)
// Getting property value
STRING nCommandId = _ObjectGetProperty(hButton, "CommandId");
END
```

**IToolbarButtons Interface****Defined As**

- [VBA] Object
- [Cicode] OBJECT
- [C++] IToolbar

**Methods (3)**

- IToolbarButtons.Add [Method]
- IToolbarButtons.Remove [Method]
- IToolbarButtons.RemoveAll [Method]

**Properties (3)**

- IToolbarButtons.Count [Property][Get]
- IToolbarButtons.Item [Property][Get]
- IToolbarButtons.\_NewEnum [Property][Get]

## IToolbarButtons.\_NewEnum [Property][Get]

This allows For.. Each.. Next integration in VB.

**Calling Syntax**

This example assumes there is a valid ToolbarButtons collection as retrieved from an ObjectView (for example, VBA: objectView.Toolbars.Item(1).Buttons). This property is not applicable to Cicode.

**[VBA]**

```
Sub Example(Buttons As Object)
Dim button As Object
```

```
Dim count Object
`Using Property
For Each button In Buttons
count = count + 1
Next button
End Sub
```

## IToolbarButtons.Add [Method]

Adds a toolbar button linked to the command identified by the supplied Command Id to this Toolbar.

### Defined As

- [VBA] Add(CommandId as String)
- [Cicode] Add (STRING CommandId)
- [C++] HRESULT Add (BSTR CommandId)

### Parameters

CommandId

[in] The Command ID of a command to link to the new button that is being added.

### Execution Result

If this method succeeds, the return value will be Success. If the command ID is invalid, the return value will be InvalidArgument.

### Remarks

If this method succeeds, the ID supplied will be linked to the new button that is added. The Commands properties will be applied to that button. (its icon, tooltip, security) If this button is pressed, the CommandExecuted event will raise with this Command ID.

### Calling Syntax

This example assumes there is a valid ToolbarButtons collection as retrieved from an ObjectView (for example, VBA: objectView.Toolbars.Item(1).Buttons).

## [VBA]

```
Sub Example(Buttons As Object)
Buttons.Add("Citect_Command_Help")
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hButtons)
_ObjectCallMethod(hButtons, "Add", "Citect_Command_Help");
END
```

## See Also

[CommandExecuted \[Event\]](#)

## IToolbarButtons.Count [Property][Get]

Gets the number of Buttons in this collection.

### Defined As

- [VBA] Long Count
- [Cicode] INT Count
- [C++] int Count

### Calling Syntax

This example assumes there is a valid ToolbarButtons collection as retrieved from an ObjectView. (for example, VBA: objectView.Toolbars.Item(1).Buttons).

### [VBA]

```
Sub Example(Buttons As Object)
Dim count As Long
`Getting Property value
count = Buttons.Count
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hButtons)
// Getting property value
INT nCount = _ObjectGetProperty(hButtons, "Count");
END
```

## IToolbarButtons.Item [Property][Get]

Gets the button at a supplied index location in this collection.

### Defined As

- [VBA] Item(index As Long) as Object
- [Cicode] OBJECT Item(INT index)
- [C++] Item(int index, IToolBarButton\* Item)

### Parameters

index

[in] Indicates the index location of the button to return from this collection. (One based)

### Execution Results

If the property get succeeds, the return value will be success. If the index is out of range, the return value will be InvalidArgument. If the method does not succeed, the return value will be GeneralFailure.

**Calling Syntax**

This example assumes there is a valid ToolbarButtons collection as retrieved from an ObjectView (for example, VBA: objectView.Toolbars.Item(1).Buttons).

**[VBA]**

```
Sub Example(Buttons As Object)
Dim toolbar As Object
`Getting Property value
Set toolbar = Buttons.Item(1)
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hButtons)
// Getting property value
OBJECT hToolbar = _ObjectCallMethod(hButtons, "get_Item", 1);
END
```

## IToolbarButtons.Remove [Method]

Removes a button from this toolbar at the supplied index.

**Defined As**

- [VBA] Remove(Index as Integer)
- [Cicode] Remove (INT Index)
- [C++] HRESULT Remove (int Index)

**Parameters****Index**

[in] The index of the button to remove from this toolbar. (1 Based)

**Execution Results**

If the method succeeds, the return value will be Success. If the index is out of range, the return value will be InvalidRange. If the method does not succeed, the return value will be GeneralFailure.

**Calling Syntax**

This example assumes there is a valid ToolbarButtons collection as retrieved from an ObjectView. (for example, VBA: objectView.Toolbars.Item(1).Buttons).

**[VBA]**

```
Sub Example(Buttons As Object)
Buttons.Remove(1)
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hButtons)
    _ObjectCallMethod(hButtons, "Remove", 1);
END
```

## IToolbarButtons.RemoveAll [Method]

Removes every button from this Toolbar.

**Defined As**

- [VBA] RemoveAll()
- [Cicode] RemoveAll()
- [C++] HRESULT RemoveAll()

**Execution Results**

If this method succeeds, the return value will be Success. If this method does not succeed, the return value will be GeneralFailure.

**Calling Syntax**

This example assumes there is a valid ToolbarButtons collection as retrieved from an ObjectView. (for example, VBA: objectView.Toolbars.Item(1).Buttons)

**[VBA]**

```
Sub Example(Buttons As Object)
    Buttons.RemoveAll()
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hButtons)
    _ObjectCallMethod(hButtons, "RemoveAll");
END
```

**ITrendCursor Interface****Defined As**

- [VBA] Object
- [Cicode] OBJECT
- [C++] ITrendCursor

**Methods**

- [ITrendCursor.GetValue \[Method\]](#)

- ITrendCursor.Delete [Method]

#### Properties

- ITrendCursor.Color [Property][Get/Set]
- ITrendCursor.Width [Property][Get/Set]
- ITrendCursor.Position [Property][Get/Set]
- ITrendCursor.Visible [Property][Get/Set]
- ITrendCursor.Collection [Property][Get]
- ITrendCursor.Name [Property][Get/Set]
- ITrendCursor.PenLabelVisible [Property][Get/Set]
- ITrendCursor.PenLabelWidth [Property][Get/Set]
- ITrendCursor.PenLabelHeight [Property][Get/Set]
- ITrendCursor.PenLabelX [Property][Get/Set]
- ITrendCursor.PenLabelY [Property][Get/Set]
- ITrendCursor.LabelsLocked [Property][Get/Set]

## ITrendCursor.Collection [Property][Get]

Obtain a reference to the ICursors collection that contains the cursor.

#### Defined As

- [VBA] Object Collection
- [Cicode] OBJECT Collection
- [C++] HRESULT Collection(ICursors \*\*cursor)

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the cursor is deleted, the return value will be GeneralFailure.

#### Calling Syntax

This example assumes you have a valid reference to a cursor.

### [VBA]

```
Sub Example(cursor As Object)
Dim cursors As Object
`Getting Property collection
Set cursors = cursor.Collection
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hCursor)
```

```
OBJECT hCursors;
// Getting collection
hCursors = _ObjectGetProperty(hCursor, "Collection");
END
```

## ITrendCursor.Color [Property][Get/Set]

Gets or Sets the line color of the cursor.

### Defined As

- [VBA] Long Color
- [Cicode] INT Color
- [C++] OLE\_COLOR Color

### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the cursor is deleted the return value will be GeneralFailure.

### Remarks

The Cicode function PackedRGB can be used to convert an RGB color specification to the OLE\_COLOR type used by the Process Analyst.

### Calling Syntax

This example assumes you have a valid reference to a cursor.

### [VBA]

```
Sub Example(cursor As Object)
Dim trendCursorColor As Long
`Getting Property value
trendCursorColor = cursor.Color
`Setting Property value (to red)
cursor.Color = 255
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hCursor)
INT trendCursorColor;
// Getting current property value
trendCursorColor = _ObjectGetProperty(hCursor, "Color");
// Setting Property to blue
_ObjectSetProperty(hCursor, "Color", PackedRGB(0, 0, 255));
END
```

# ITrendCursor.Delete [Method]

Deletes the cursor.

## Defined As

- [VBA] Delete()
- [Cicode] Delete()
- [C++] HRESULT Delete()

## Execution Result

If the function succeeds, the return value will be Success. If the cursor is deleted, the return value will be GeneralFailure.

## Remarks

This method will remove the cursor from the Process Analyst. Any current references to the cursor will continue to be valid; however, operations on them will result in errors.

## Calling Syntax

This example assumes you have a valid reference to a cursor.

## [VBA]

```
Sub Example(cursor As Object)
cursor.Delete
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hCursor)
_ObjectCallMethod(hCursor, "Delete");
END
```

# ITrendCursor.GetValue [Method]

Gets the value at the cursor for the given pen.

## Defined As

- [VBA] GetValue(pen As Object, asLocal As Boolean, time As Date, milli As Integer, value As String)
- [Cicode] GetValue(OBJECT pen, INT asLocal, REAL time, INT milli, STRING value)
- [C++] HRESULT Create GetValue(IPen\* pen, VARIANT\_BOOL asLocal, DATE \*time, short \*milli, BSTR \*value)

## Parameters

pen

[in] The pen for which the value is necessary.

asLocal

[in] Set to True (-1) if returned time is necessary in Local form (False (0) for UTC).

time

[out] The time represented by the cursor position. This is accurate to one second and needs to be combined with milli to give millisecond accuracy.

milli

[out] Added to time (see above) to give cursor time in millisecond accuracy.

value

[out] The value of the trend for the given pen at the returned time.

### Execution Result

If the function succeeds, the return value will be Success. If one of the return variables are bad, then the return value will be InvalidArgument. If the cursor is deleted, the return value will be GeneralFailure.

### Calling Syntax

This example assumes you have a valid reference to a cursor and a pen.

## [VBA]

```
Sub Example(cursor As Object, pen As Object)
Dim asLocal As Boolean
Dim cursorTime As Date
Dim milli As Integer
Dim cursorValue As String
asLocal = 0
cursor.GetValue pen, asLocal, cursorTime, milli, cursorValue
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hCursor, OBJECT hPen)
INT asLocal = 0;
REAL time;
INT milli;
STRING value;
_ObjectCallMethod(hCursor , "GetValue", hPen, asLocal, time, milli, value);
END
```

# ITrendCursor.LabelsLocked [Property][Get/Set]

Get or Set whether the cursor label positions are locked.

### Defined As

- [VBA] Boolean LabelsLocked
- [Cicode] INT LabelsLocked
- [C++] VARIANT\_BOOL LabelsLocked

### Limits

- True (-1): Labels are locked
- False (0): Labels are unlocked

#### Remarks

If labels are locked, they will not move when the cursor position is changed.

#### Calling Syntax

This example assumes you have a valid reference to a cursor.

### [VBA]

```
Sub Example(cursor As Object)
Dim labelsLocked As Boolean
`Getting Property value
labelsLocked = cursor.LabelsLocked
`Setting Property value (False)
cursor.LabelsLocked = False
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hCursor)
INT labelsLocked;
// Getting current property value
labelsLocked = _ObjectGetProperty(hCursor, "LabelsLocked");
// Setting Property to False (0)
_ObjectSetProperty(hCursor, "LabelsLocked", 0);
END
```

## ITrendCursor.Name [Property][Get/Set]

Get or Set the Name of the cursor.

#### Defined As

- [VBA] String Name
- [Cicode] STRING Name
- [C++] BSTR Name

#### Execution Result

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the name is 0 characters or greater than 250, the return value will be InvalidArgument.

If the cursor is deleted, the return value will be GeneralFailure.

#### Remarks

When setting the name property, remember that cursor names needs to be unique. Setting the Name property will not succeed if a cursor with that name already exists.

**Calling Syntax**

This example assumes you have a valid reference to a cursor.

**[VBA]**

```
Sub Example(cursor As Object)
Dim name As String
`Getting Property value
name = cursor.Name
`Setting Property value
cursor.Name = "NewCursor"
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCursor)
STRING name;
// Getting current property value
name = _ObjectGetProperty(hCursor, "Name");
// Setting Property
_ObjectSetProperty(hCursor, "Name", "NewCursor");
END
```

## ITrendCursor.PenLabelHeight [Property][Get/Set]

Get or Set the label height of the specified pen on this cursor.

**Defined As**

- [VBA] Double PenLabelHeight(pen As Object)
- [Cicode] REAL PenLabelHeight (OBJECT pen)
- [C++] HRESULT PenLabelHeight (IPen\* pen, double labelHeight)

**Parameters**

pen

[in] The pen for which cursor label is to be referenced.

**Execution Result**

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the cursor is deleted the return value will be GeneralFailure.

**Remarks**

The value of height is represented in pixels.

**Calling Syntax**

This example assumes you have a valid reference to a cursor and a pen.

**[VBA]**

```
Sub Example(cursor As Object, pen As Object)
Dim labelHeight As Double
`Getting Property value
labelHeight = cursor.PenLabelHeight(pen)
`Setting Property value (100)
cursor.PenLabelHeight (pen) = 100
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCursor, OBJECT hPen)
REAL labelHeight;
// Getting current property value
labelHeight = _ObjectCallMethod(hCursor , "get_PenLabelHeight", hPen);
// Setting Property to 100
_ObjectCallMethod(hCursor , "put_PenLabelHeight", hPen, 100);
END
```

**See Also**

[ITrendCursor.PenLabelX \[Property\]\[Get/Set\]](#)

[ITrendCursor.PenLabelY \[Property\]\[Get/Set\]](#)

## ITrendCursor.PenLabelVisible [Property][Get/Set]

Get or Set the label visibility of the specified pen on this cursor.

**Defined As**

- [VBA] Boolean PenLabelVisible(pen As Object)
- [Cicode] INT PenLabelVisible(OBJECT pen)
- [C++] HRESULT PenLabelVisible(IPen\* pen, VARIANT\_BOOL labelVisible)

**Parameters**

pen

[in] The pen for which cursor label is to be referenced.

**Execution Result**

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the cursor is deleted, the return value will be GeneralFailure.

**Limits**

- True (-1): Label is visible.
- False (0): Label is hidden.

### Remarks

Setting the visibility of the cursor using the Visible property will override the pen label visibility. For example, if a particular label is hidden using PenLabelVisible, this label will be shown again if Visible is set to True (-1).

### Calling Syntax

This example assumes you have a valid reference to a cursor and a pen.

## [VBA]

```
Sub Example(cursor As Object, pen As Object)
Dim labelVisible As Boolean
`Getting Property value
labelVisible = cursor.PenLabelVisible(pen)
`Setting Property value (False)
cursor.PenLabelVisible(pen) = False
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hCursor, OBJECT hPen)
INT labelVisible;
// Getting current property value
labelVisible = _ObjectCallMethod(hCursor, "get_PenLabelVisible", hPen);
// Setting Property to FALSE
_ObjectCallMethod(hCursor , "put_PenLabelVisible", hPen, 0);
END
```

## See Also

# ITrendCursor.PenLabelWidth [Property][Get/Set]

Get or Set the label width of the specified pen on this cursor.

### Defined As

- [VBA] Double PenLabelWidth(pen As Object)
- [Cicode] REAL PenLabelWidth (OBJECT pen)
- [C++] HRESULT PenLabelWidth (IPen\* pen, double labelWidth)

### Parameters

pen

[in] The pen for which cursor label is to be referenced.

### Execution Result

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the cursor is deleted the return value will be GeneralFailure.

**Remarks**

The value of width is represented in pixels.

**Calling Syntax**

This example assumes you have a valid reference to a cursor and a pen.

**[VBA]**

```
Sub Example(cursor As Object, pen As Object)
Dim labelWidth As Double
`Getting Property value
labelWidth = cursor.PenLabelWidth(pen)
`Setting Property value (100)
cursor.PenLabelWidth(pen) = 100
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCursor, OBJECT hPen)
REAL labelWidth;
// Getting current property value
labelWidth = _ObjectCallMethod(hCursor , "get_PenLabelWidth", hPen);
// Setting Property to 100
_ObjectCallMethod(hCursor , "put_PenLabelWidth", hPen, 100);
END
```

## ITrendCursor.PenLabelX [Property][Get/Set]

Get or Set the label's X-Axis position of the specified pen on this cursor.

**Defined As**

- [VBA] Double PenLabelX(pen As Object)
- [Cicode] REAL PenLabelX (OBJECT pen)
- [C++] HRESULT PenLabelX (IPen\* pen, double labelX)

**Parameters**

pen

[in] The pen for which cursor label is to be referenced.

**Execution Result**

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return

value will be InvalidArgument. If the cursor is deleted the return value will be GeneralFailure.

#### Remarks

The label position is represented in pixels.

#### Calling Syntax

This example assumes you have a valid reference to a cursor and a pen.

### [VBA]

```
Sub Example(cursor As Object, pen As Object)
Dim labelX As Double
`Getting Property value
labelX = cursor.PenLabelX(pen)
`Setting Property value (100)
cursor.PenLabelX(pen) = 100
End Sub
```

### [Cicode]

```
FUNCTION Example(OBJECT hCursor, OBJECT hPen)
REAL labelX;
// Getting current property value
labelX = _ObjectCallMethod(hCursor , "get_PenLabelX", hPen);
// Setting Property to 100
_ObjectCallMethod(hCursor , "put_PenLabelX", hPen, 100);
END
```

[ITrendCursor.PenLabelY \[Property\]\[Get/Set\]](#)

## ITrendCursor.PenLabelY [Property][Get/Set]

Get or Set the label's Y-Axis position of the specified pen on this cursor.

#### Defined As

- [VBA] Double PenLabelY(pen As Object)
- [Cicode] REAL PenLabelY (OBJECT pen)
- [C++] HRESULT PenLabelY (IPen\* pIPen, double labelY)

#### Remarks

The label position is represented in pixels

#### Calling Syntax

This example assumes you have a valid reference to a cursor and a pen.

**[VBA]**

```
Sub Example(cursor As Object, pen As Object)
Dim labelY As Double
`Getting Property value
labelY = cursor.PenLabelY(pen)
`Setting Property value (100)
cursor.PenLabelY(pen) = 100
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCursor, OBJECT hPen)
REAL labelY;
// Getting current property value
labelY = _ObjectCallMethod(hCursor , "get_PenLabelY", hPen);
// Setting Property to 100
_ObjectCallMethod(hCursor , "put_PenLabelY", hPen, 100);
END
```

## ITrendCursor.Position [Property][Get/Set]

Get or Set the cursor's physical position in the Process Analyst.

**Defined As**

- [VBA] Long Position
- [Cicode] INT Position
- [C++] int Position

**Execution Result**

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the cursor is deleted, the return value will be GeneralFailure.

**Remarks**

The cursor position is measured as the number of pixels from the left of the Process Analyst graph.

**Calling Syntax**

This example assumes you have a valid reference to a cursor.

**[VBA]**

```
Sub Example(cursor As Object)
Dim position As Integer
`Getting Property value
position = cursor.Position
`Setting Property value
cursor.Position = 300
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCursor)
INT position;
// Getting current property value
position = _ObjectGetProperty(hCursor, "Position");
// Setting Property to (300)
_ObjectSetProperty(hCursor, "Position", 300);
END
```

## ITrendCursor.Visible [Property][Get/Set]

Get or Set whether the cursor is visible.

**Defined As**

- [VBA] Boolean Visible
- [Cicode] INT Visible
- [C++] VARIANT\_BOOL Visible

**Execution Result**

If the property get/set succeeds, the return value will be Success. If the return variable is bad, the return value will be InvalidArgument. If the cursor is deleted, the return value will be GeneralFailure.

**Remarks**

This property controls the visibility of the cursor. The visibility is also applied to labels associated with the cursor.

**Calling Syntax**

This example assumes you have a valid reference to a cursor.

**[VBA]**

```
Sub Example(cursor As Object)
Dim visibility As Boolean
`Getting Property value
visibility = cursor.Visible
`Setting Property value (False)
cursor.Visible = False
End Sub
```

**[Cicode]**

```
FUNCTION Example(OBJECT hCursor)
INT visibility;
// Getting current property value
visibility = _ObjectGetProperty(hCursor, "Visible");
// Setting Property to False (0)
_ObjectSetProperty(hCursor, "Visible", 0);
END
```

**See Also**

[ITrendCursor.PenLabelVisible \[Property\]\[Get/Set\]](#)

## ITrendCursor.Width [Property][Get/Set]

Gets or Sets the line width of the cursor.

**Defined As**

- [VBA] Long Width
- [Cicode] INT Width
- [C++] int Width

**Execution Result**

If the property get/set succeeds the return value will be Success. If the return variable is bad then the return value will be InvalidArgument. If the cursor is deleted the return value will be GeneralFailure.

**Limits**

- Minimum (0)
- Maximum (8)

**Calling Syntax**

This example assumes you have a valid reference to a cursor.

**[VBA]**

```
Sub Example(cursor As Object)
Dim lineWidth As Long
`Getting Property value
lineWidth = cursor.Width
`Setting Property value
cursor.Width = 5
End Sub
```

## [Cicode]

```
FUNCTION Example(OBJECT hCursor)
INT lineWidth;
// Getting current property value
lineWidth = _ObjectGetProperty(hCursor, "Width");
// Setting Property to 5
_ObjectSetProperty(hCursor, "Width", 5);
END
```

## Automation Examples

One way of understanding how to use the Process Analyst's automation model is to see some example code. The following examples cover some concepts of extensibility offered by the Process Analyst:

- [Handling an Event](#)
- [Enumerating Collections](#)
- [Implementing a Custom Command](#)
- [Implementing a Custom Column.](#)

The samples assume you are using the Example project and have pasted a new Process Analyst onto the test page provided by the project.

You will also need to configure the Process Analyst object's Name and Event class by doing the following:

1. In the Example project open the "test" page in Graphics Builder
2. Click the **Process Analyst** icon in the toolbox to insert the control.
3. Resize the control to fit the test page.
4. Double-click the **Process Analyst**.
5. Click the **Access/Identification** tab.
6. Change the **Object Name** to **CPA**.
7. Change the **Event class** to **CPA\_E**.
8. Click **Apply** and **OK**.

### Handling an Event

The Process Analyst contains many events that are triggered when certain actions occur. See Events.

To handle an event you need to provide a handler for the event by prepending your Process Analyst's event class name with the event name you want to handle and an underscore.

The example below shows how to define a handler for the "MouseClick" event with an event class defined as "CPA\_E".

## [VBA]

```
Sub CPA_E_MouseClick(pen As Object, button As Integer)
End Sub
```

**[Cicode]**

```
FUNCTION CPA_E_MouseClick(OBJECT hPA, OBJECT hPen, INT button)
END
```

The following example uses the MouseClick event to cancel the box zoom operation when the right mouse button is clicked.

**Note:** When referring to an ActiveX object in VBA, you need to prepend it with the page name and an underscore. In the example below, the page name is called "test". The object name is "CPA" and the event class name is "CPA\_E".

**[VBA]**

```
Sub CPA_MouseClick(pen As Object, button As Integer)
Dim bZoomMode As Boolean

If (button = 1) Then
bZoomMode = test_CPA.ZoomMode

If (bZoomMode = True) Then
test_CPA.ZoomMode = False
End If
End If
End Sub
```

**[Cicode]**

```
FUNCTION CPA_E_MouseClick(OBJECT hPA, OBJECT hPen, INT button)
INT bZoomMode = 0;
IF (button = 1) THEN
bZoomMode = _ObjectGetProperty(hPA, "ZoomMode")
IF (bZoomMode = -1) THEN
_ObjectSetProperty(hPA, "ZoomMode", 0)
ENDIF
ENDIF
ENDIF
```

**Enumerating Collections**

The Process Analyst contains many "collections" such as Panes, Pens, Cursors, Commands, and so on. This example shows you how to enumerate through the buttons on the navigation toolbar.

**[VBA]**

```
Sub EnumerateToolbarButtons()
Dim navBar As Object
Dim iButton As Integer
Dim button As Object
Dim nButtons As Integer

` The Navigation toolbar is the 2nd toolbar in the collection
```

```
Set navBar = test_CPA.Toolbars.Item(2)
If IsNull(navBar) = False Then
nButtons = navBar.Buttons.Count
For iButton = 1 To nButtons
Set button = navBar.Buttons(iButton)
Next iButton
End If
End Sub
```

## [Cicode]

```
FUNCTION EnumerateToolbarButtons()
OBJECT hPA = ObjectByName("CPA");
OBJECT hToolbars = _ObjectGetProperty(hPA, "Toolbars");
// The Navigation toolbar is the 2nd toolbar in the collection
OBJECT hNavBar = _ObjectCallMethod(hToolbars, "get_Item", 2);
OBJECT hButtons;
OBJECT hButton;
INT nButtons;
INT iButton;

IF (ObjectIsValid(hNavBar)) THEN
hButtons = _ObjectGetProperty(hNavBar, "Buttons");
nButtons = _ObjectGetProperty(hButtons, "Count");

FOR iButton = 1 TO nButtons DO
hButton = _ObjectCallMethod(hButtons, "get_Item", iButton);
END
END
END
```

**Note:** Many collections have an `ItemById` property that allows you to get the item you want without having to enumerate through the collection to find the item you want.

## Implementing a Custom Command

Custom commands are easy to implement and involve creating a new command, adding it to a toolbar, and responding to the `CommandExecuted` event.

### To add a new command and add it to the toolbar as a button:

- Display the properties for your Process Analyst in the Graphics Builder
- See Adding New Commands.
- Use the following settings:
  - ID = "SelectedPen"
  - Tooltip = "Show the name of the selected pen"
  - Button style = <Push>
  - Enabled = <Checked>

Once you've done this, you need to write an event handler for the `CommandExecuted` event. This event will be called when the command is executed, whether by Cicode or by clicking on the respective toolbar button. The

CommandExecuted event when triggered has a commandId parameter identifying the command executed by the operator.

This example implements a command that displays a message box showing the name of the primary selected pen.

## [VBA]

```
Sub CPA_E_CommandExecuted(commandId As String)
Select Case commandId
Case "SelectedPen"
Call OnSelectedPen()
End Select
End Sub

Sub OnSelectedPen()
Dim pen As Object
Dim sName As String
Dim sMessage As String

Set pen = test_CPA.LastSelectedPen

If IsNull(pen) = False Then
sName = pen.Name
End If
sMessage = "The name of the selected pen is:" + Chr(13) + sName
MsgBox sMessage, 48, "Citect"
End Sub
```

## [Cicode]

```
FUNCTION CPA_E_CommandExecuted(OBJECT hPA, STRING commandId)
SELECT CASE commandId
CASE "SelectedPen"
OnSelectedPen(hPA);
END SELECT
END

FUNCTION OnSelectedPen(OBJECT hPA)
OBJECT hPen;
STRING sName;
STRING sMessage;
IF ObjectIsValid(hPA) THEN
hPen = _ObjectGetProperty(hPA, "LastSelectedPen");

IF ObjectIsValid(hPen) THEN
sName = _ObjectGetProperty(hPen, "Name");
END
sMessage = "The name of the selected pen is:^n" + sName;
Message("Citect", sMessage, 48);
END
END
```

## See Also

[CommandExecuted \[Event\]](#)

### Enabling and Disabling a Command

You can also respond to the UpdateCommand event to control the enable/disable state of the command's toolbar button. The example below disables the button if there are no pens.

### [VBA]

```
Sub CPA_E_UpdateCommand(commandId As String)
Select Case commandId
Case "SelectedPen"
Call OnUpdatedSelectedPen()
End Select
End Sub

Sub OnUpdatedSelectedPen()
Dim pen As Object
Dim command As Object
Dim sName As String

On Error Goto errHandler

Set command = test_CPA.CommandSystem.ItemById("SelectedPen")
Set pen = test_CPA.LastSelectedPen

sName = pen.Name
command.Enabled = True
Exit Sub

errHandler:
command.Enabled = False
End Sub
```

### [Cicode]

```
FUNCTION CPA_E_UpdateCommand(OBJECT hPA, STRING commandId)
SELECT CASE commandId
CASE "PanelLock"
OnUpdatePanelLock(hPA);
CASE "SelectedPen"
OnUpdateSelectedPen(hPA);
END SELECT
END

FUNCTION OnUpdateSelectedPen(OBJECT hPA)
OBJECT hPen = _ObjectGetProperty(hPA, "LastSelectedPen");
OBJECT hCommandSystem = _ObjectGetProperty(hPA, "CommandSystem");
OBJECT hCommand = _ObjectCallMethod(hCommandSystem, "get_ItemById", "SelectedPen");
INT iError = 0;
```

```
ErrSet(1);
_ObjectGetProperty(hPen, "Name");
iError = IsError();

IF (iError <> 0) THEN
_ObjectSetProperty(hCommand, "Enabled", 0);
ELSE
_ObjectSetProperty(hCommand, "Enabled", -1);
END
ErrSet(0);
END
```

[UpdateCommand \[Event\]](#)

### Implementing a Custom Column

Custom columns are added to the Object View allowing you to display your own information associated with a pen.

The sample below implements a column that calculates the "Display Period" for each pen on the Process Analyst. The sample consists of three functions: an update function and two event handlers to verify the column is updated when new pens are added and when the time span is changed.

#### The Update Function

The update function is complex since it needs to match an Object View pen item with a real pen object; however, this isn't too difficult because the Object View tree always reflects how many panes and pens are being displayed.

The code achieves this by iterating through each pane and pen object in the Process Analyst while simultaneously keeping a running index count of which pane/pen item it matches up to in the Object View tree.

By using these indexes the code knows which row to update. A row update is achieved using the `PutField` method.

---

**Note:** Implementing your own column is CPU-intensive. Try to keep the amount of code necessary to calculate a row value as efficient as possible and be aware how often the code will be executed. Note also that, for efficiency, the `BlockUpdates` and `UnblockUpdates` functions are used to limit the number of updates made to the Object View.

#### Event Handlers

Once you have a function that implements your custom column, you need to know when to update that column. The most common method of doing this is to implement event handlers for particular Process Analyst events. The example below uses the `PenCreated` event and the `HorizontalAxisChanged` event. These events will verify that the column values will be updated when pens are added to the display and when the time span changes.

## [VBA]

```
Sub UpdateMyColumn()
Dim iPaneItem As Integer
Dim iPane As Integer
Dim nPanes As Integer
Dim nSamples As Integer

Dim penItem As Object
Dim paneItem As Object

nPanes = test_CPA.NumberOfSamples
iPaneItem = 0
nPanes = test_CPA.Panes.Count
For iPane = 1 To nPanes
Dim pane As Object

Set pane = test_CPA.Panes.Item(iPane)
If IsNull(pane) = False Then
Dim pen As Object
Dim iPen As Integer
Dim iPenItem As Integer
Dim nPens As Integer

iPenItem = iPaneItem + 1

Set paneItem = test_CPA.ObjectView.Items.Item(iPenItem)

test_CPA.BlockUpdates
iPenItem = 0
nPens = pane.Pens.Count
For iPen = 1 To nPens
Set pen = pane.pens.Item(iPen)

If IsNull(pen) = False Then
Dim dDiff As Double
Dim sText As string

Dim dtStart As Date
Dim dtEnd As Date
Dim dtStartMs As Integer
Dim dtEndMs As Integer

iPenItem = iPenItem + 1

pen.GetHorizontalAxisTimeSpan dtStart, dtStartMs, dtEnd, dtEndMs, False

dDiff = ((CDbl(dtEnd) - CDbl(dtStart)) / nSamples) * 86400
If (dDiff >= 0.001) Then
sText = CStr(Format(dDiff, "#0.000")) + " seconds"
Else
sText = "0.001 seconds"
End If
Set penItem = paneItem.Items.Item(iPenItem)

If IsNull(penItem) = False Then
```

```
penItem.Putfield "DisplayPeriod", sText
End If
End If
Next
test_CPA.UnblockUpdates
End If
Next
End Sub

Sub CPA_E_HorizontalAxisChanged(hPen As Object)
UpdateMyColumn
End Sub

Sub CPA_E_PenCreated(hPen As Object)
UpdateMyColumn
End Sub
```

### [Cicode]

```
FUNCTION UpdateMyColumn()
OBJECT hPA = ObjectByName("CPA");
OBJECT hPanes = _ObjectGetProperty(hPA, "Panes");
OBJECT hPane;

## Schedules

You can use schedules to automate the operation of equipment in a Plant SCADA system. Schedules are configured in Plant SCADA using **Scheduler**, a tool that uses a simple calendar-based interface to execute state

changes for specific pieces of equipment at runtime.

## ⚠ WARNING

### UNINTENDED EQUIPMENT OPERATION

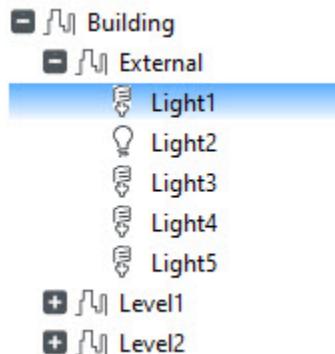

Do not use the Scheduler in situations where equipment requires a guaranteed sequence of successful actions. The Scheduler engine will attempt to run the actions in the correct order, but if entry actions take too long or a failure in communications occurs when an entry action is run, the engine does not guarantee that the equipment will receive every command.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

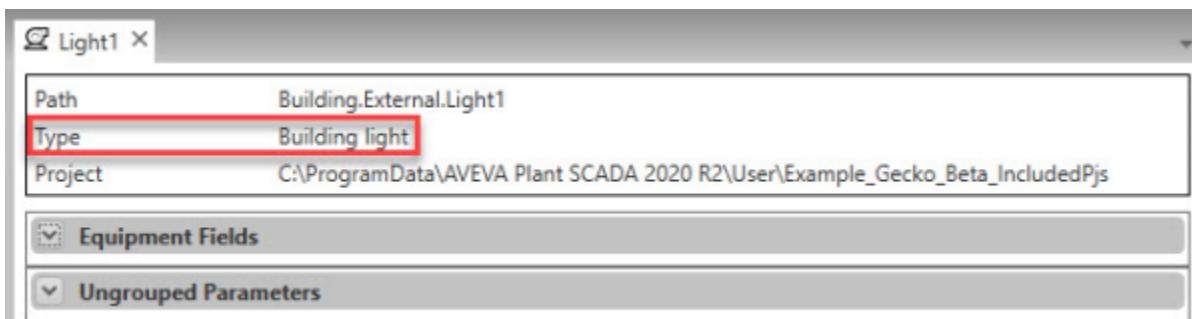

In Plant SCADA, a schedule specifies how a piece of equipment will operate at a particular time. This depends on the following:

- The piece of equipment needs to be defined within the system's equipment hierarchy (see [Equipment](#))
- The piece of equipment needs to include a defined set of "states" that can be used to manage its operation (see [Equipment States](#)).

For example, the equipment hierarchy in the Plant SCADA Example project includes a branch that represents a building.

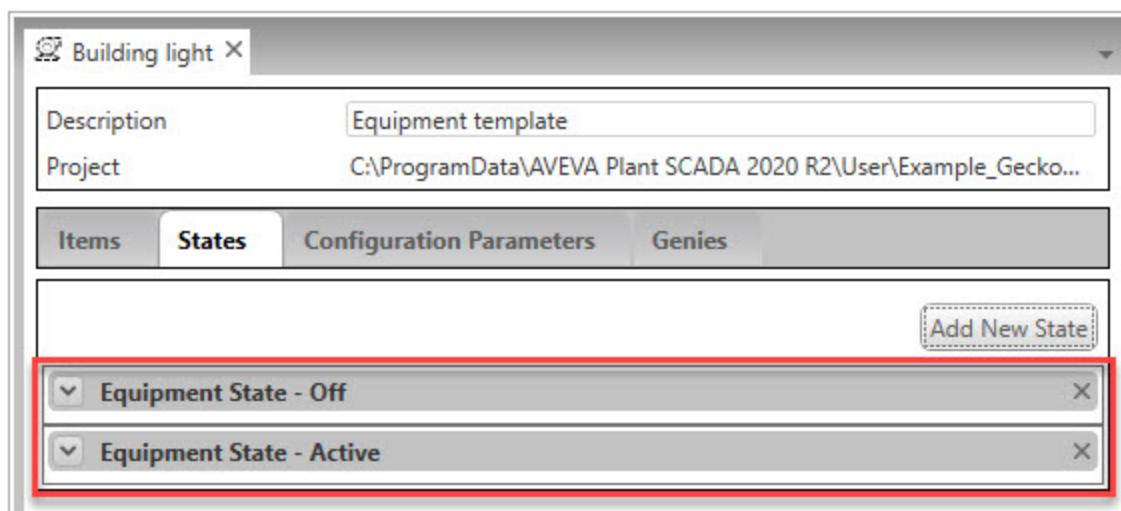

The piece of equipment selected above (Light1) represents an external light. When you view Light1 in Equipment Editor, you can see that it is an instance of an equipment type called "Building Light".

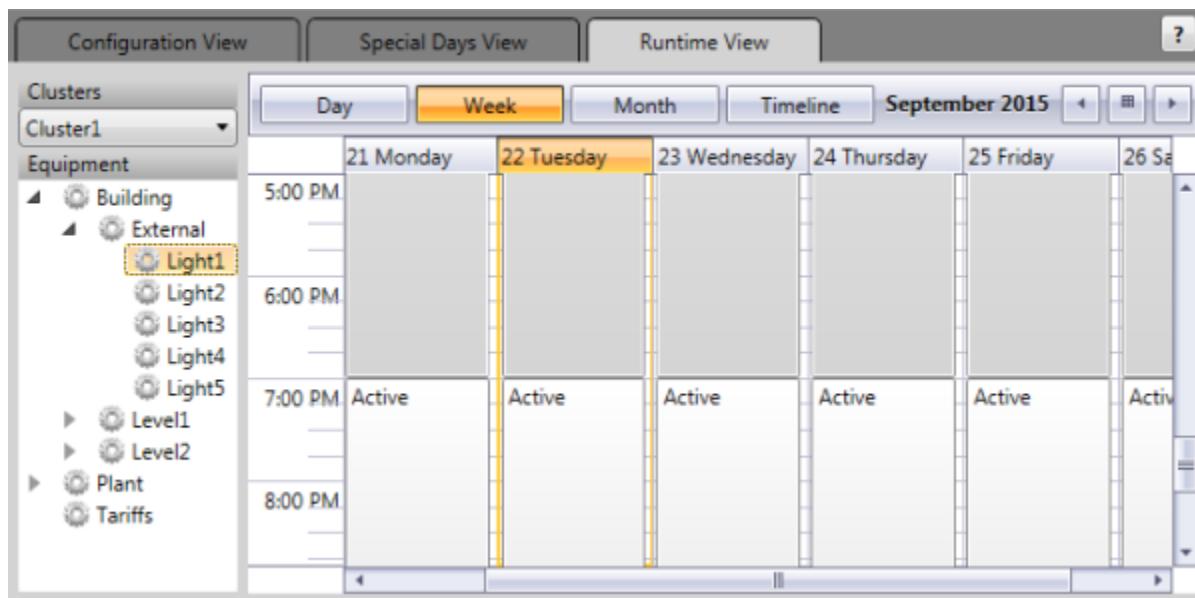

When you view the Building Light equipment type, you can see that it has two **States** configured:

- Off
- Active.

This allows a schedule to be applied to Light1 that uses the **Active** state to turn the external light on at 7pm every night, and the **Off** state to switch the light off again at 7am every morning.

Schedules are configured in Plant SCADA using [Scheduler](#), a tool that displays the equipment hierarchy for a project alongside a calendar. When a piece of equipment or branch is selected in the equipment hierarchy, the current schedule for it is displayed on the calendar.

A change of state is configured for a selected piece of equipment by adding a "schedule entry" to the calendar. A schedule entry specifies a **Start Time** and **End Time** for a particular **State**. You can also use a schedule entry to create a recurring schedule using patterns based on a day, week, month or year.

Scheduler also allows you to perform the following:

- Configure a schedule for all equipment within a particular branch in the equipment hierarchy (see [Schedule Inheritance](#))
- Set up "special days" that require a unique set of circumstances, such as public holidays or maintenance days (see [Special Days](#))
- Take manual control of a piece of equipment (see [Override Mode](#)).

- See [Prepare Your System for Scheduling](#) for information on how to prepare Plant SCADA to support schedules at runtime.
- See [Operate Scheduler at Runtime](#) for information about how to use Scheduler in the runtime environment.

**Note:** Scheduler supports the integration of schedules that are configured locally on a BACnet device. This means you can view and modify schedule-object and calendar-object properties on a BACnet device at runtime. For more information, see [Integrate BACnet Schedules into Scheduler](#).

## See Also

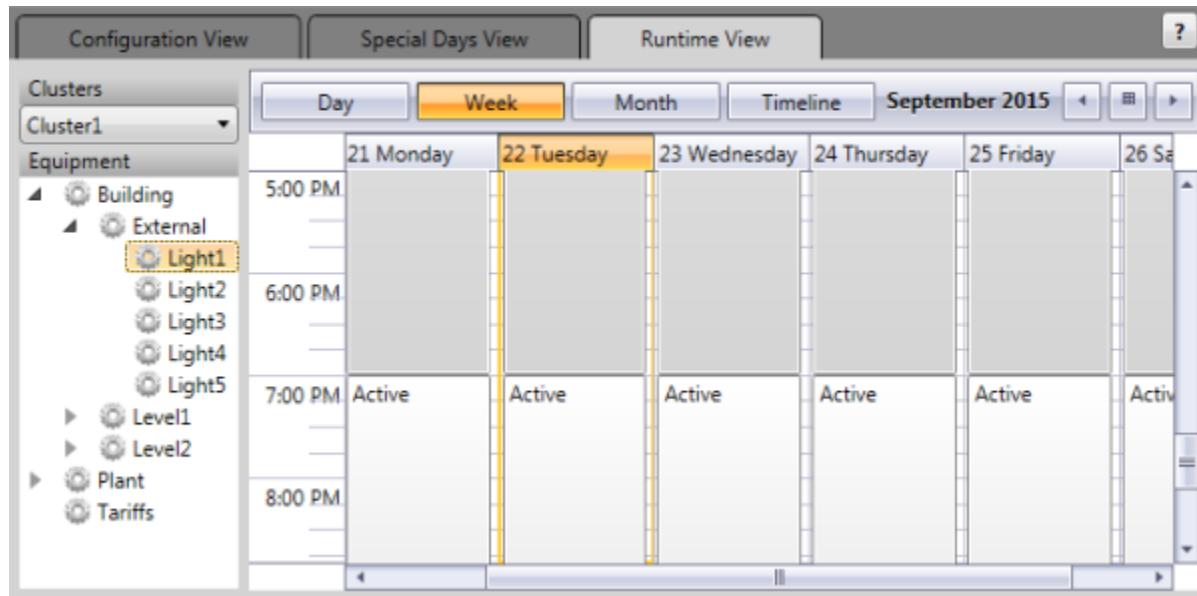

[Monitor Schedules](#)

## Scheduler

Scheduler is a runtime tool that allows you to view and manage schedule entries for a selected piece of equipment. You can also use it to specify when [Special Days](#) occur.

The Scheduler interface is made up two key components:

- [Equipment Tree](#) — displays the system's equipment hierarchy
- [Calendar](#) — displays the schedule entries for the equipment that is currently selected in the equipment tree.

You can use Scheduler to perform the following tasks:

- [Add a Schedule Entry](#)
- [Add a Recurring Schedule Entry](#)
- [Edit a Schedule Entry](#)
- [Enable Override Mode](#)
- [Manually Set a State Change](#)
- [Configure Special Days](#).

**Note:** Scheduler operates as a core component of the Plant SCADA reports server. This enables support for online changes. Any configuration changes to equipment or equipment states can be implemented during runtime via a report server restart using Runtime Manager or Cicode functions.

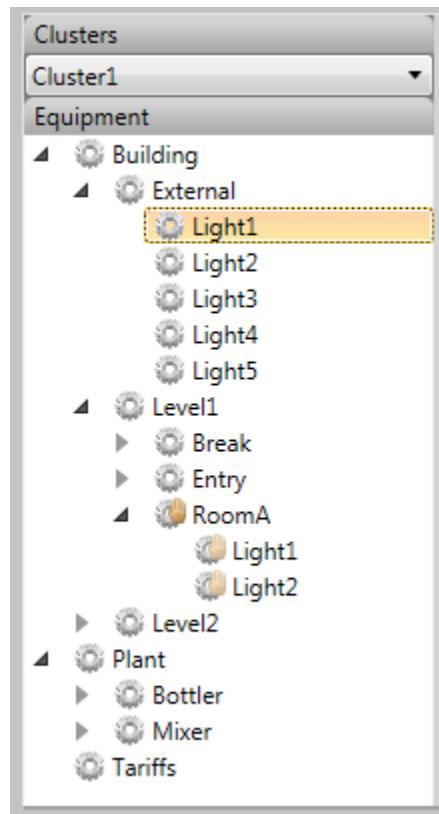

## See Also

[Manage Daylight Saving Transitions](#)

[View and Edit BACnet Schedules at Runtime](#)

## Equipment Tree

The equipment tree appears to the left of the Scheduler interface. It displays the equipment hierarchy for a selected cluster.

For instructions on how to prepare the equipment hierarchy that displays in the equipment tree, see the topic [Configure Equipment for Scheduling](#) in the Plant SCADA documentation.

When you select an item in the equipment tree, the schedule entries that are configured for the item appear in the calendar to the right.

The equipment tree uses a set of icons to indicate the status of the items included in the equipment hierarchy. For example, the icon for "Building.Level1.RoomA" in the equipment tree shown above indicates that RoomA is currently in override mode.

The current status of an item will determine the right-click menu options that are available for it. The following table describes the meaning of the icons that are used in the equipment tree, and the context menus that are supported in each case.

Icon	Equipment Mode	Context Menu
	This icon indicates that the equipment is in automatic mode. The current state is either the equipment's default state, or is set by any active schedules.	Override
	This icon indicates a piece of virtual equipment. Virtual equipment has no states defined, however it can have sub-directories.	No context menu
	This icon indicates the equipment is in <b>Override Mode</b> . The state is defined by the <b>Set to State</b> menu item.	Remove Override Set to State
	This icon indicates the equipment has inherited override mode from a parent directory. Its state is defined by the <b>Set to State</b> setting for the parent item. You can apply an override to counteract an inherited override setting.	Override

## See Also

[Calendar](#)

## Calendar

[Scheduler](#) includes a calendar that can be used to display a time-based representation of a schedule. When you make a selection in the [Equipment Tree](#), the associated schedule entries are presented on the calendar.

You can also use the calendar to determine when [Special Days](#) will occur.

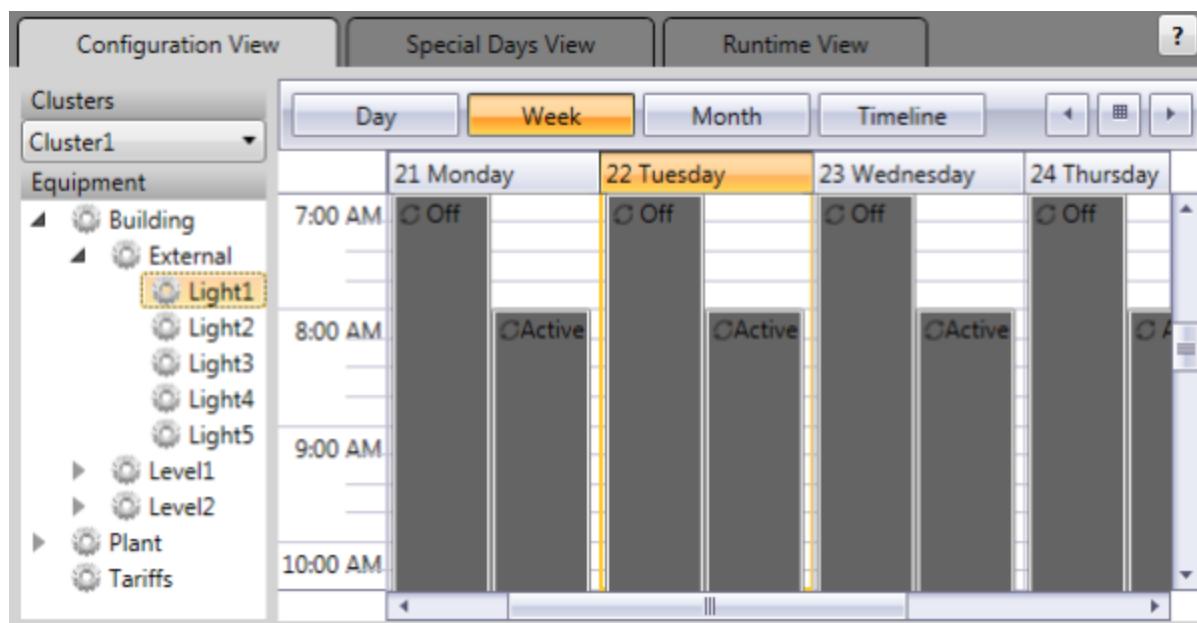

The calendar supports three different views:

- Configuration View
- Runtime View
- Special Days View.

Each view is accessible via the tabs that run across the top of the calendar.

- **Configuration View**

The Configuration View is used to add, modify or delete schedule entries for a selected piece of equipment.

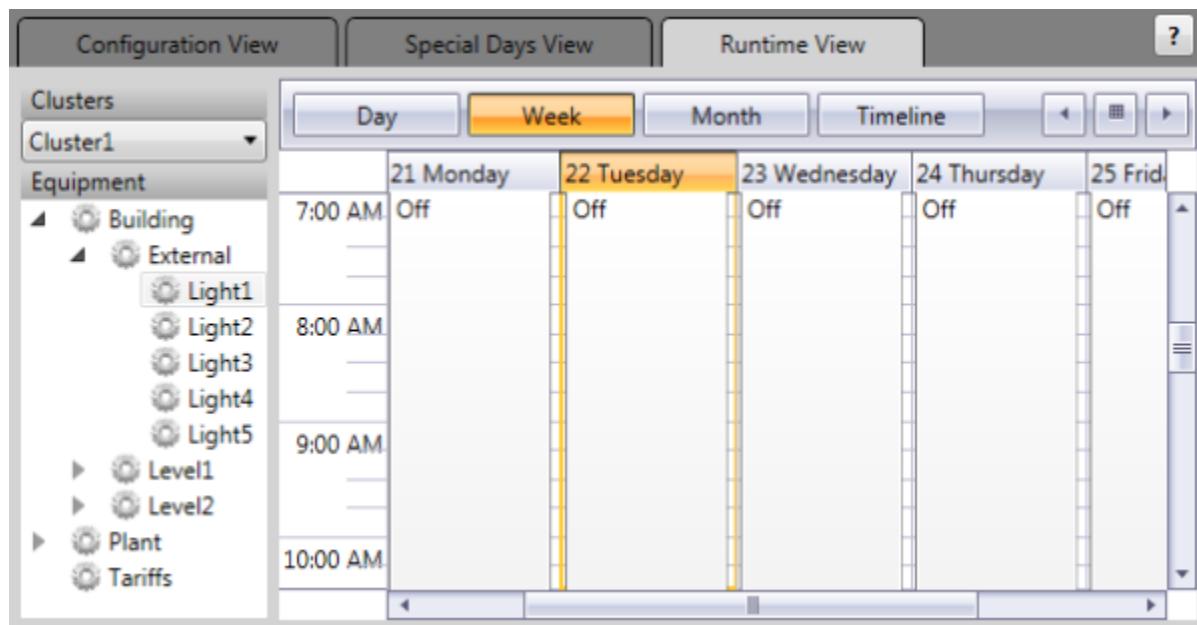

In this view, each schedule entry for a selected piece of equipment is shown as a block that spans the period between the **Start Time** and **End Time** specified for the associated equipment state. You can double-click on a block to view the properties for the schedule entry.

You can adjust the calendar to show a **Day**, **Week**, **Month**, or **Timeline**.

In some cases, a particular piece of equipment may have conflicting schedule entries. In the example above, "Light1" has two recurring schedule entries configured every day at 8:00 AM. When this situation occurs, precedence is given to the equipment state with the highest priority setting. For more information see [Schedule Priorities](#).

- **Runtime View**

The Runtime View is a read-only view that displays the activity that will occur for a piece of equipment (with any conflicts resolved).

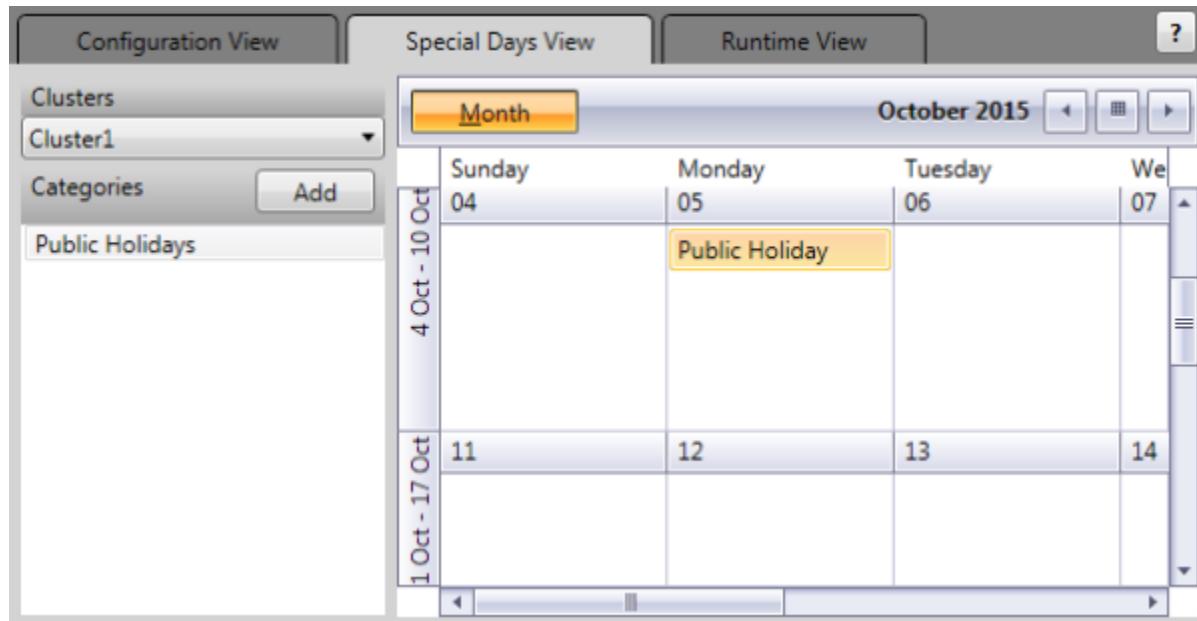

As with the Configuration View, the schedule is displayed as a series of blocks that indicate when each

equipment state will start and finish. You can double-click on a block to view the properties for the schedule entry, but you will be unable to make any changes.

You can adjust the calendar to show a **Day**, **Week**, **Month**, or **Timeline**.

- **Special Days View**

The Special Days View is used to view and configure [Special Days](#).

In this view, the calendar displays a month at a time. The equipment tree is replaced by a list of special day **Categories**. When you select a category, the associated special days are displayed on the calendar. Each is identified by a label that displays its **Name**.

## See Also

[Operate Scheduler at Runtime](#)

## Special Days

Special days are used to identify those days where regular scheduling does not apply to the equipment in a plant. For example, if your plant does not operate on certain public holidays, you could identify these days as special days in the Scheduler calendar.

Once you have set up special days, you can use them in the following ways:

- You can configure recurring schedule entries that exclude special days
- You can configure recurring schedule entries that only apply on special days.

Each special day needs to belong to a category. This allows you to manipulate the behavior of recurring schedules by including or excluding particular categories.

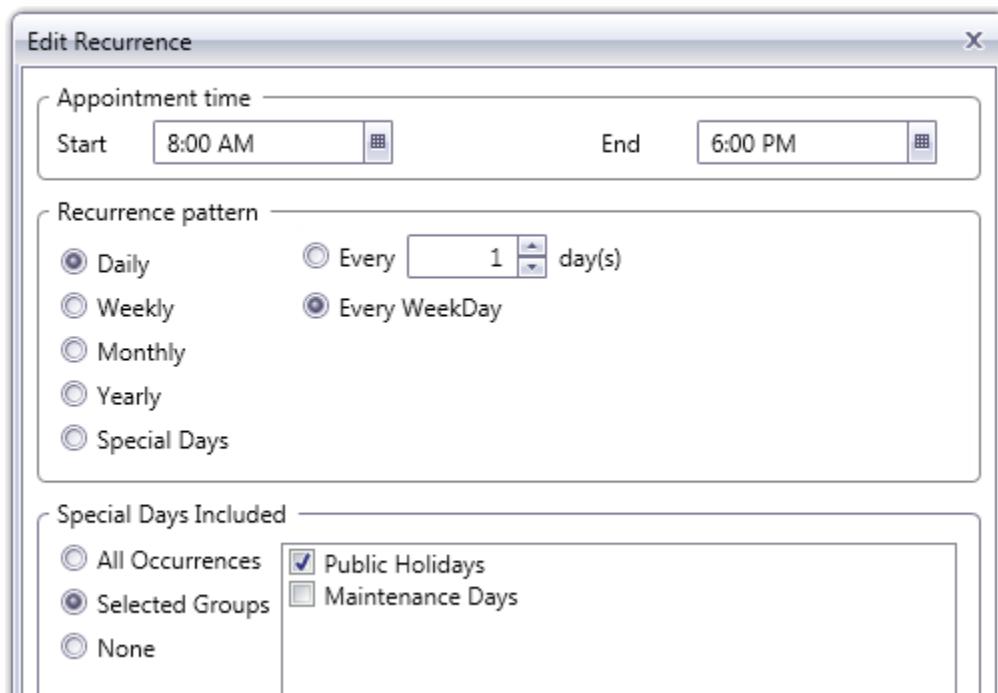

**Note:** If you are using Scheduler to display schedules imported from a BACnet device, Special Days will operate differently as they are used to display exception schedules. For more information, see [Integrate BACnet Schedules into Scheduler](#).

## Example

A production facility ceases operation on the last Friday of every month for maintenance. To manage this process, a special day category called "Maintenance Days" is created in the Scheduler, and the last Friday of every month is included.

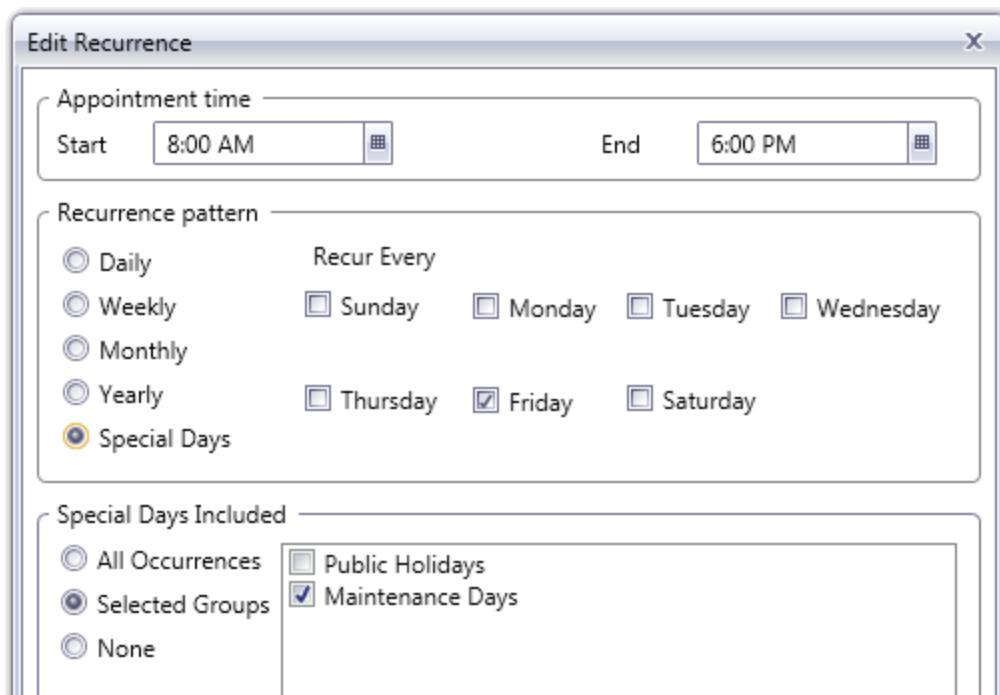

Schedules for both normal operation and maintenance days can then be configured in the following ways:

- Any recurring schedules that apply to normal operation will exclude the maintenance days. To achieve this, the following settings are used:

Observe that the "Maintenance Days" category is **not** selected in the **Special Days Included** section of the dialog.

- Any recurring schedules that are meant to run on maintenance days are configured to include the special days. To achieve this, the following settings are used:

In this case, the **Recurrence Pattern** is based on **Special Days**, and the "Maintenance Days" category is selected in the **Special Days Included** section of the dialog.

---

**Note:** In Plant SCADA 7.40, a different tool was used to configure special days. If you run a version 7.40 project that includes Scheduler, it will still display the old special days calendar control to the right of the Scheduler interface. This control will still work, however it is recommended that you use the new Special Days View to configure special days.

---

## See Also

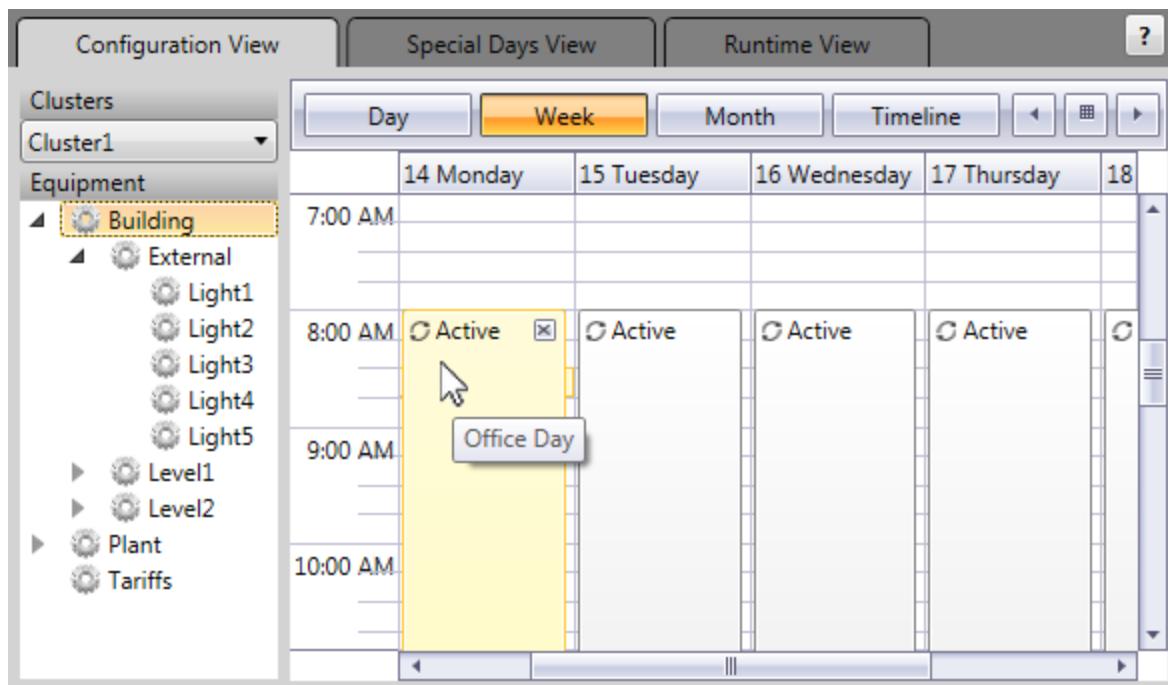

[Configure Special Days](#)

[Add a Recurring Schedule Entry](#)

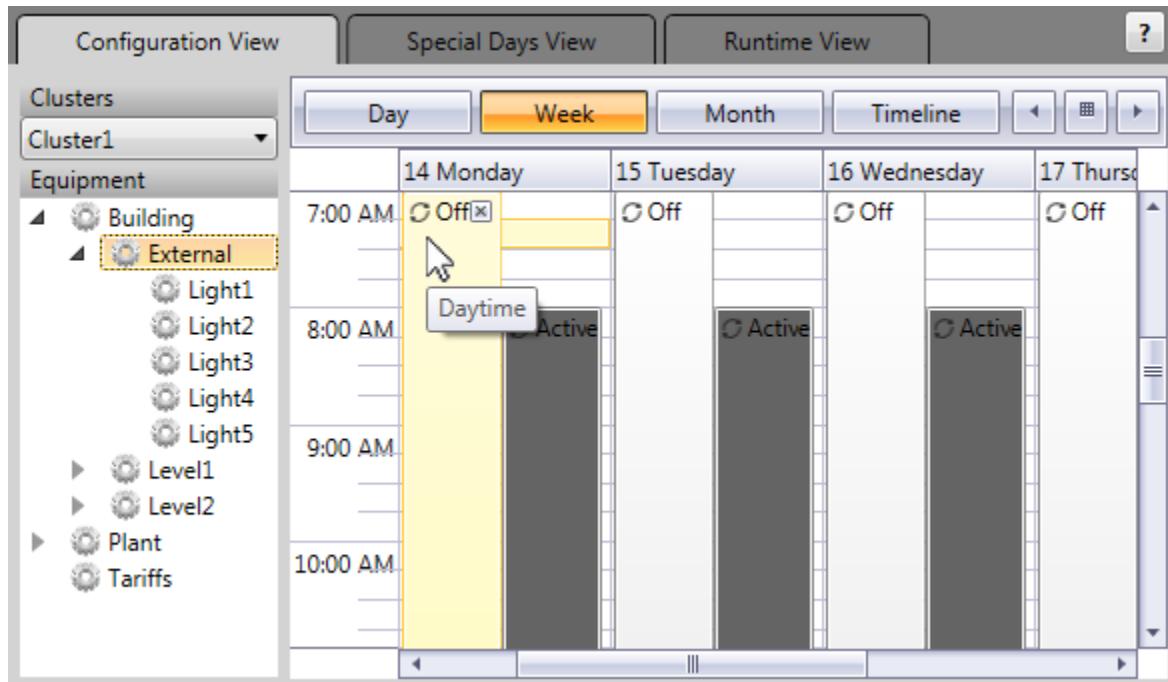

## Schedule Inheritance

If a schedule is applied to a location within an equipment hierarchy that has levels beneath it, the schedule is automatically inherited by the equipment within the lower levels.

For example, the equipment hierarchy in the Plant SCADA Example project includes a top level entry named "Building". A recurring schedule entry named "Office Day" is configured at this level. It specifies an active state commencing at 8:00 AM every weekday.

If you move down one level in the equipment hierarchy to "External", you will see that the "Office Day" schedule still applies (an inherited schedule is highlighted using dark gray). The inherited schedule entries display alongside a recurring schedule configured at the External level named "Daytime".

This means that all of the lights within the "External" branch of the equipment hierarchy will inherit both the "Daytime" and "Office Day" schedules. This creates a conflict at 8:00 AM every weekday, as the two inherited schedules have conflicting equipment states defined.

To determine how this type of conflict is resolved, see [Schedule Priorities](#).

---

**Note:** To view inherited schedules in the Scheduler calendar (including any conflicts), select the **Configuration View** tab (see [Calendar](#)).

## See Also

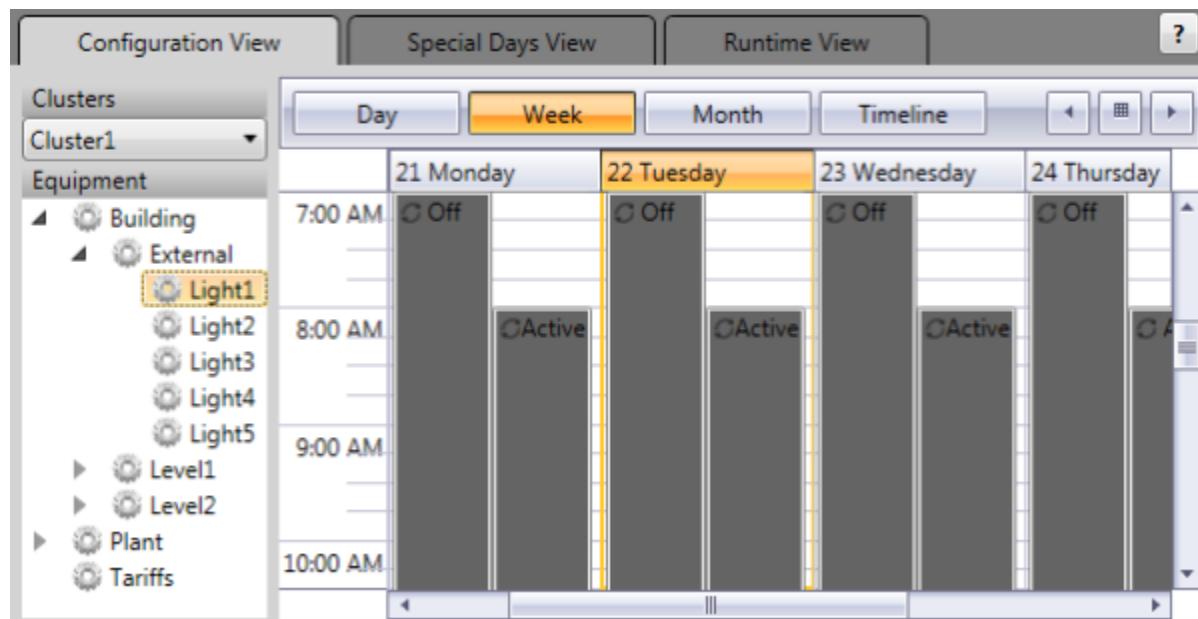

[Add a Schedule Entry](#)

[Add a Recurring Schedule Entry](#)

## Schedule Priorities

It is possible for a piece of equipment to have schedule entries that specify conflicting equipment states at the same time. This can be caused by [Schedule Inheritance](#), or by recurring schedules that overlap.

If two schedule entries appear alongside each other in the calendar's configuration view (see example below), it means that a scheduling conflict has occurred.

The situation is resolved according to the following priorities:

- If priorities are applied to the equipment states specified in the conflicting schedule entries, the schedule with the highest priority will take precedence (regardless of recurrence).
- If two (or more) schedule entries have the same priority level applied to their associated equipment state, the entry with the latest start time will take precedence.

If priorities are not specified for the conflicting equipment states:

- Inherited schedule entries will have the lowest priority.
- For schedule entries on the same branch, a recurring schedule entry will have a lower priority than a schedule entry set to run just once.
- For equipment with two or more schedule entries with the same start time, the schedule entry that was accessed last takes precedence.

**Note:** You can view the outcome of any schedule conflicts by displaying the Scheduler calendar's **Runtime View** (see [Calendar](#)). The Runtime View displays the activity that is scheduled for a piece of equipment with all conflicts resolved.

## Override Mode

Override mode allows you to take control of equipment scheduling and manually execute state changes. You can set equipment to override mode via the Scheduler [Equipment Tree](#).

When a piece of equipment is set to override mode, its associated schedule entries will not be executed. The following also occurs:

- Override mode is automatically propagated down the equipment hierarchy, which means it is inherited by the equipment on lower levels.
- Equipment state changes are also propagated down the equipment hierarchy to equipment that has inherited override mode.

If required, you can counteract a state specified by an inherited override by implementing another override at the level where you would like a different state to be set.

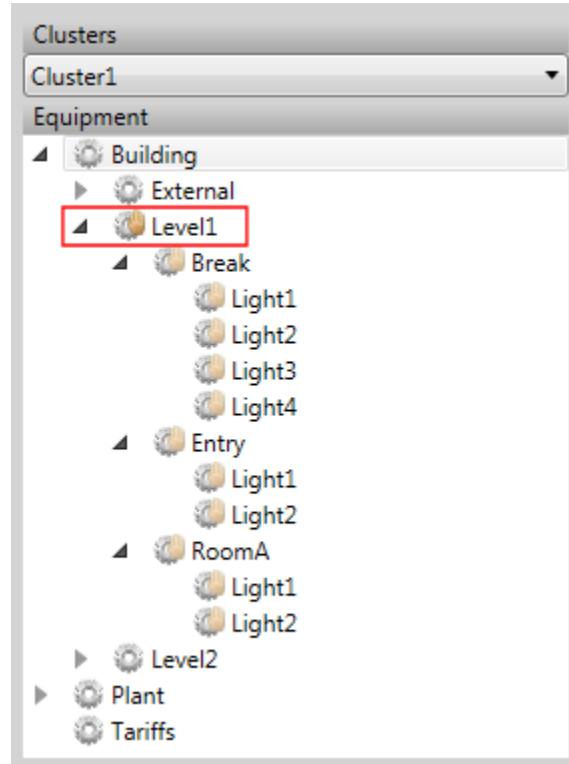

---

**Note:** If you hold the mouse over a piece of equipment in the Scheduler's equipment tree, its current state will display as a tool tip.

---

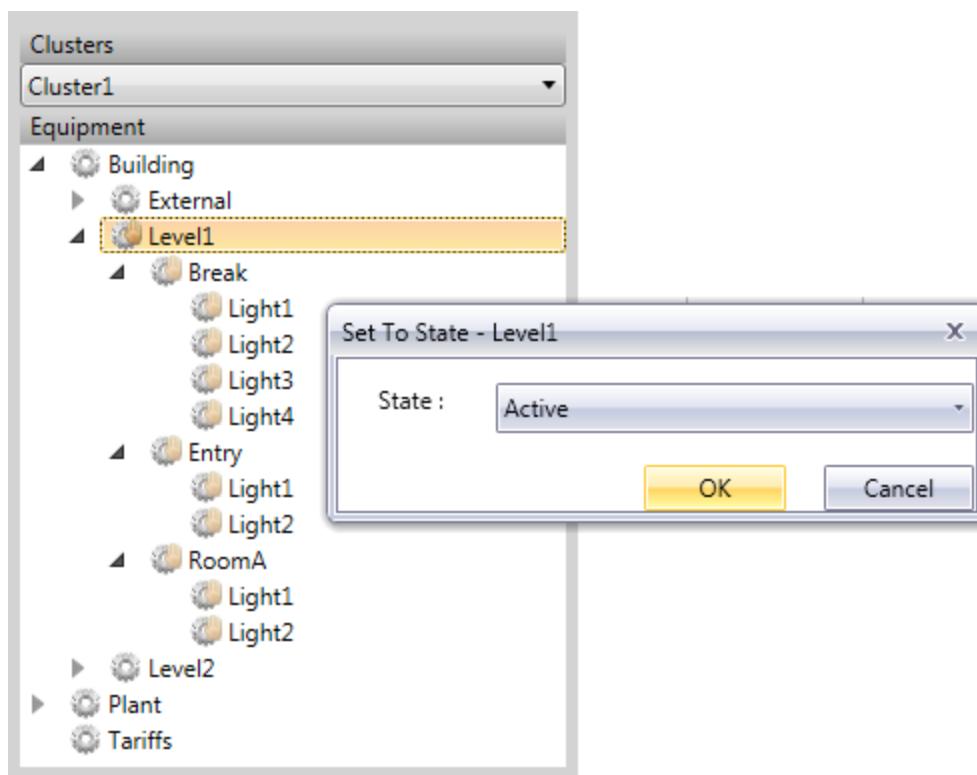

## Example

In the example below, the location "Building.Level1" is set to override mode. This is indicated by the small hand icon next to its location in the equipment hierarchy.

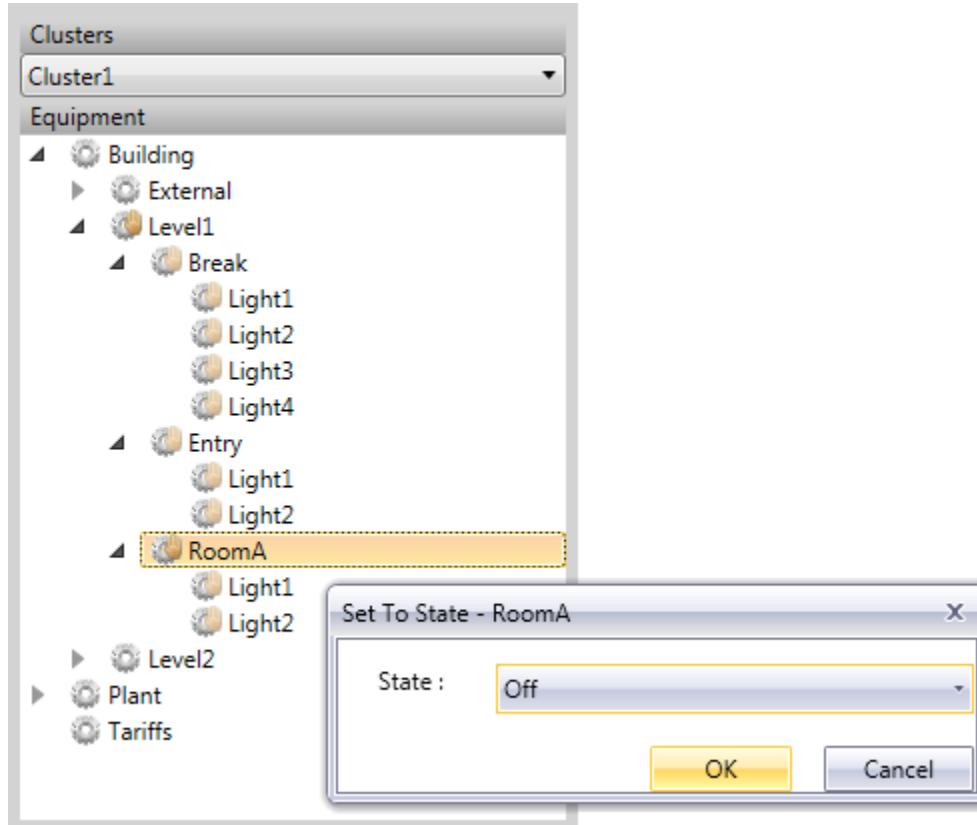

The override setting has propagated down the equipment hierarchy. This is indicated by the transparent icon located next to the equipment that branches off from Level1.

In the example below, the equipment state for Level1 is set to "Active" in the Scheduler equipment tree, which means every light on Level1 would turn on.

In the example below, a secondary override has been applied to "Building.Level1.RoomA" to counteract the Active state inherited override from Level1. This means the lights in RoomA can now be controlled independently and turned off.

## See Also

## Prepare Your System for Scheduling

This section of the help describes the configuration changes that may be required in a Plant SCADA project to enable operation of Scheduler during runtime.

- [Configure Equipment for Scheduling](#)
- [Configure a Demand and Response Solution](#)
- [Add the Scheduler ActiveX Object to a Page](#)
- [Use ActiveX Properties to Control Scheduler's Current Selection](#)
- [Back Up Schedules](#)
- [Manage Security and Permissions](#)
- [Configure Scheduler Redundancy.](#)

---

**Note:** Scheduler supports the integration of schedules that are configured locally on a BACnet device. This means you can view and modify schedule-object and calendar-object properties on a BACnet device at runtime. For more information, see [Integrate BACnet Schedules into Scheduler](#).

---

## Configure Equipment for Scheduling

To use schedules in a Plant SCADA system, your project needs to include an [Equipment Hierarchy](#) (that incorporates the equipment you would like to automate) and [Equipment States](#) that control the operation of your equipment.

There are two ways you can configure equipment and equipment states in a Plant SCADA system:

- **Equipment Editor** — If you are starting a new project (or adding a new area or process to an existing project), you can use Equipment Editor to generate tags (see [Equipment Editor](#)).
- **Plant SCADA Studio** — If you have a project with existing tags, you can use Plant SCADA Studio to associate equipment with your tags (see [Define an Equipment Association for a Tag](#)).

In both cases, you need to consider the following equipment state properties when creating a schedule for a piece of equipment:

- **Entry Action** — defines the activity that occurs when an equipment state is initiated. It is configured using a Cicode expression, for example, you could use an expression that writes a value to a variable tag.

---

**Note:** Entry actions are not supported for equipment states that are associated with a BACnet device (see [Integrate BACnet Schedules into Scheduler](#)).

---

You can use the INI parameter [Scheduling]AlwaysExecuteEntryAction to specify that the entry actions for all equipment resource states are executed, regardless of whether or not their internal states are the same. By default, this parameter is set to false (0), which means only changes that have been made to the selected equipment will take effect.

- **Delay** — allows you to postpone an entry action for a specified period of time. A delay can be used to turn on equipment sequentially, thereby avoiding a power spike.
- **Repeat Action** — defines a repeat action that occurs when the entry action has completed. The repeat action will reoccur according to the specified **Period**, though it will not occur until the previous repeat action is complete.

If you are using Equipment Editor to configure equipment, these properties are defined when you add an equipment state to an equipment type (see [Add a State to an Equipment Type](#)).

If you are manually defining equipment for an existing set of tags, you can define these properties in the Equipment State Properties (see [Define Equipment States in Plant SCADA Studio](#)).

## See Also

[Configure a Demand and Response Solution](#)

## Configure a Demand and Response Solution

Demand and response (DR) refers to the mechanisms used for the management of electricity consumption in response to supply conditions. The Open ADR is an example of a standard that can be used to help automate demand response in commercial buildings. To provide demand and response, a system requires pre-defined levels that are used to adjust the expected consumption of energy.

You can use Plant SCADA to implement a demand and response solution.

In Scheduler, states can be defined multiple times to support a set of DR modes. This means the state that is scheduled to occur is determined by the DR mode for the equipment. In the example below "line2.lights" has multiple 'On' states to support multiple DR modes. This allows the room to be scheduled for 'On', with the amount of energy consumed adjusted according to the assigned DR mode.

Equipment	Equipment State	DR Mode	Entry Action	Description
Factory.Floor.Line2.Lights	On	0	TagI2_lights=1	When scheduled light will turn on at 100% energy output
	On	1	TagI2_lights=80	Energy saving 20%
	On	2	TagI2_lights=60	Energy savings is 40%
	On	3	TagI2_lights=40	Energy savings is 60%
	On	4	TagI2_lights=20	Energy Savings is 80%
	Off	0	TagI2_lights=0	

The default DR mode value is '0'. When the DR mode field is empty, the default value is used. The Scheduler engine selects the state with the nearest lower DR mode value in the case where an exact match to the current specified DR mode is not found.

Set the DR mode on equipment using the **EquipSetProperty** Cicode function, for example:

```
EquipSetProperty (Equipment, "DRMODE", "1", cluster)
```

## Add the Scheduler ActiveX Object to a Page

Scheduler is an ActiveX control that you can add to a Plant SCADA graphics page as an object. You can then use Scheduler when the page displays at runtime.

---

**Note:** If you are planning to add the Scheduler to a Situational Awareness Project, refer to the topic Use a Scheduler Control in a Situational Awareness Project.

---

### To add the Scheduler ActiveX control to a graphics page:

1. In Graphics Builder, open the page to which you would like to add the Scheduler ActiveX object.
2. On the **Edit** menu, select **Insert ActiveX Control**. The Insert ActiveX Control dialog box appears.
3. Double-click on the **SE Energy Scheduler Control** in the **ActiveX Controls** list.

The **Scheduler Control** properties dialog will display.

Or:

- On the **Drawing Toolbox**, select the **Scheduler** icon.

The **Scheduler Control** properties dialog will open.

Or:

- On the **Objects** menu, select **Scheduler**.

The **Scheduler Control** properties dialog will open.

For information on how to configure the properties for the control, see the following topics:

- ActiveX Object Properties - Appearance (Tag Association)
- Defining Common Object Properties.

Once you have placed the Scheduler control, you can position and re-size it. It is recommended that you size the control so the whole calendar will display in the runtime window.

## See Also

[Scheduler](#)

## Use ActiveX Properties to Control Scheduler's Current Selection

You can use the Scheduler ActiveX Control properties to customize the Scheduler Page in Runtime as per the requirement. Using these properties, you can:

- Select a cluster
- Select an equipment

- Select one of the Scheduler tabs
- Select a special day category
- Show only the **Runtime View** tab
- Show or hide the **Special Days View** tab
- Highlight special days
- Show or hide the **Add** button in the **Categories** panel on the **Special Days View** tab.

You can use the ActiveX properties in the following ways:

- Binding one of the Scheduler's ActiveX properties to a tag.
- Using the ActiveX properties as part of a page event command.

#### **Binding one of Scheduler's ActiveX properties to a tag:**

This functionality allows you to control the Scheduler's current selection by changing the associated tag value. For example, you can configure a button on a graphics page that displays the schedule for a particular piece of equipment.

To bind the scheduler's ActiveX properties to a tag perform the following steps:

1. In Graphics Builder, open the page that hosts the Scheduler ActiveX control (see [Open a Graphics Page](#)).
2. Select the Scheduler ActiveX control, then right-click on it and select Properties.
3. The SE Energy Scheduler Control Properties dialog box appears. Select the Appearance tab, and then the Tag Association tab on the right side.
4. Select one of the following options available in the Properties panel:
  - SelectedCluster
  - SelectedEquipment
  - SelectedSpecialDayCategory
  - SelectedTab
  - IsRuntimeViewOnly
  - IsSpecialDaysHidden
  - HighlightSpecialDays
  - IsAddSpecialDaysButtonVisible
5. In the panel labeled Associate property <property name> with tag..., enter the tag that you need to associate with the selected property.  
Refer to [ActiveX Object Properties - Appearance \(Tag Association\)](#) and associate a tag, or type a tag name.
6. Click OK.

Any value change to the associated variable tag reflects in the ActiveX object property, if the value meets the following requirements:

- SelectedCluster — The value is a string that specifies a valid cluster name (case sensitive).
- SelectedEquipment — The value is a string that represents a valid equipment path with periods (.) used to specify hierarchy levels (case sensitive).
- SelectedSpecialDayCategory — The value is a string that specifies a valid category name.

- SelectedTab — The value is an integer between 0 and 2:
  - 0 — Shows the **Configuration View** tab.
  - 1 — Shows **Special Days View** tab.
  - 2 — Shows the **Runtime View** tab.
- IsRuntimeViewOnly — The value is a boolean:
  - 0 (default) — Shows three tabs (**Configuration View**, **Special Days View** and **Runtime View**).
  - 1 — Hides the **Configuration View** and the **Special Days View** tab.
- IsSpecialDaysHidden — The value is a boolean:
  - 0 (default) — Shows the **Special Days View** tab.
  - 1 — Hides the **Special Days View** tab.
- HighlightSpecialDays — The value is a boolean:
  - 0 — Does not highlight special days.
  - 1 (default) — Highlights the special days in orange.
- IsAddSpecialDaysButtonVisible — The value is a boolean:
  - 0 — Hides the **Add** button in the **Categories** panel on the **Special Days View** tab.
  - 1 (default) — Shows the **Add** button in the **Categories** panel on the **Special Days View** tab.

### Using Scheduler's ActiveX properties as part of a page event command:

This functionality uses Cicode to specify the Scheduler selection when a page event occurs, typically the **On page shown** event.

To use Scheduler's ActiveX properties as part of a page event command perform the following steps:

1. In the Graphics Builder, open the page that hosts the Scheduler ActiveX control (see Open a Graphics Page).
2. Go to the **File** menu and select **Properties** to display the page properties.
3. Select the **Events** tab.
4. In the **Events** panel, select the event you need to associate with an ActiveX property. This is likely to be the **On page shown** event, as the other page events may produce illogical outcomes.
5. In the **<Event> command** panel, enter the required Cicode.

For example, the following Cicode (applied to the On page shown event) uses the function `_Object SetProperty` to display the schedule for "Building.External.Light1" in the Example project.

```
_Object SetProperty(ObjectByName("AN4"), "SelectedCluster", "Cluster1")
_Object SetProperty(ObjectByName("AN4"), "SelectedEquipment", "Building.External.Light1")
```

6. Click **OK**.

### See Also

[Tag Association](#)

## Back Up Schedules

### To back up the schedule entries created using Scheduler:

- Make a copy of the "[ClusterName].[ReportServerName].scheduling" XML file located in the Plant SCADA 'Data' directory on the local machine.

The file name be similar to the following:

Cluster1.ReportServer1.scheduling.xml

To restore the schedule entries in Scheduler, copy the xml file back into the Data directory.

---

**Note:** When you paste a backup of the schedules XML file into the Data directory, it will overwrite the schedule entries that are currently configured in Scheduler.

---

## Manage Security and Permissions

Scheduler integrates into the Plant SCADA security model by allowing access to certain features based on areas and user permissions.

When adding equipment to Scheduler, you can define the area to which the equipment belongs. This helps to add security around the use of equipment, as the Scheduler interface will only list equipment that is available to the current user. They will only be able to create, modify, delete and browse schedules for equipment that belongs to the area or areas that they can access. If the user attempts to access equipment in other through Cicode, an error code is returned.

When a new user logs on, the Scheduler interface will refresh and list the equipment which is available to that user, based on the areas the user has permission to access.

For more information regarding security refer to [Security Roles](#).

## Configure Scheduler Redundancy

Scheduler operates as a core component of the Plant SCADA reports server. This means you can use report server redundancy to help maintain the operation of schedules during periods of system instability.

Redundancy support for Scheduler is provided as follows:

- When a connection is established, Scheduler's files are synchronized (merged) between the peer report servers.
- Only the active server will execute the schedules. If both servers are running, the active server will be the one that started first.
- If a network outage occurs, the primary will become active after communication is restored.
- When both servers are online, changes to the Scheduler file are replicated across both servers.
- If one of the report servers becomes inoperative, the schedules will run on the remaining reports server. When the inoperative report server returns online, the client will remain with the current reports server.

For more information, see [Reports Server Redundancy](#).

---

**Note:** At startup, Scheduler may begin executing actions before other server processes in the system are available. This may result in the action not completing successfully. If this occurs, use the Citect.ini parameter

---

---

[Scheduling]StartDelay to delay the startup of the Scheduler engine. This allows time for the other server processes of the system to come online before any scheduled actions are initiated.

---

## Integrate BACnet Schedules into Scheduler

A BACnet device can be configured to incorporate its own schedule as a set of schedule-object and calendar-object properties. If you install the BACNET driver, Plant SCADA can read and write to these object properties at runtime. This allows you to integrate BACnet schedules into [Scheduler](#).

This functionality is enabled via the following process:

- A BACnet I/O device is configured in Plant SCADA and connected via the BACNET driver.
  - Variable tags and equipment definitions that represent the device's schedule and calendar objects are configured on the Plant SCADA I/O server. You can achieve this using the [Import Variable Tags](#) tool.
  - The Plant SCADA reports server subscribes to the tags on the I/O server and generates schedule entries in Scheduler.
  - Any changes to the schedule entries are written back to the BACnet device via the I/O server.
- 

**Note:**

1. The present value for a BACnet schedule is evaluated in the BACnet device, not by the Plant SCADA system. This means Plant SCADA entry actions are not supported for equipment states that are associated with a BACnet schedule.
  2. If a BACnet schedule object has exception schedules configured, they are presented in Scheduler using Special Days.
  3. If the date range specified for an exception schedule or calendar object is excessively long, it can affect system performance. For this reason, only the first six months of a date range will display in Scheduler.
  4. If the date range specified for an exception schedule or calendar object has a start date that is beyond three years in the future, it will not display in Scheduler.
  5. Wildcards (for example, "\*") are not supported by the Scheduler.
  6. Exception schedule or calendar objects that use a WeekNDay (WD) configuration will not display in Scheduler.
- 

### To integrate BACnet schedules into Scheduler:

1. Install the latest version of the BACNET driver.  
The latest version of the BACNET driver is available from the Plant SCADA Driver Web.
2. Add the BACnet device to your project as an I/O device (see [Using the Device Communications Wizard](#)).
3. Create the variable tags and equipment required to support the BACnet calendar and schedule object types.

You can automatically generate the required tags and equipment using the **Import Variable Tags** tool (see [Import Variable Tags from an External Data Source](#)). If you use this approach, you need to observe the following:

- The source **Database Type** specified on the Import Variable Tag dialog needs to be set to "BACnet".
- The BACnet Device Configuration dialog is used to configure the tag import. This dialog is accessible via the **Browse** button next to the **External Database** field. Information on how to use this dialog is accessible via the **Help** button.
- Select the **Import BACnet Schedule Instances as Equipment** option to create the equipment required to support the schedule entries in Scheduler.

4. Specify a data type for each BACnet schedule object so that they match the data type configured for the corresponding schedule entry on the BACnet device.

This can be done via Equipment Editor by modifying each Schedule Instance in the Equipment View. The parameter "DataType" can be set to the following values: "Int", "Dig", "Dbl", "Enum", "UInt", "Real". For more information, see [Specify a Data Type for a BACnet Schedule](#).

---

**Note:**

- Scheduler integration will not operate correctly if a data type configuration is not correctly matched with the device.
  - If you do not specify a data type for each BACnet schedule object, a "Bad IO device variable" error notification will be generated when you attempt to compile your project.
- 

5. Run an equipment update to generate the required tags (see [Update Equipment in Plant SCADA Studio](#)).

Alternatively, you can manually create instances of the required equipment using the BACnet equipment type templates provided in Plant SCADA's Include project.

The BACNET schedule entries will appear in Scheduler when you run your project (see [View and Edit BACnet Schedules at Runtime](#)).

## Specify a Data Type for a BACnet Schedule

Schedule entries can be configured locally on a BACnet device using any of the following data types:

- Integer
- Digital
- Double
- Enumerate
- Unsigned integer
- Real.

Plant SCADA accommodates these different data types with a corresponding set of tag addresses (stored as a 'string' data type):

- WeeklyScheduleExInt
- WeeklyScheduleExDig
- WeeklyScheduleExDbl
- WeeklyScheduleExEnum
- WeeklyScheduleExUInt
- WeeklyScheduleExReal.

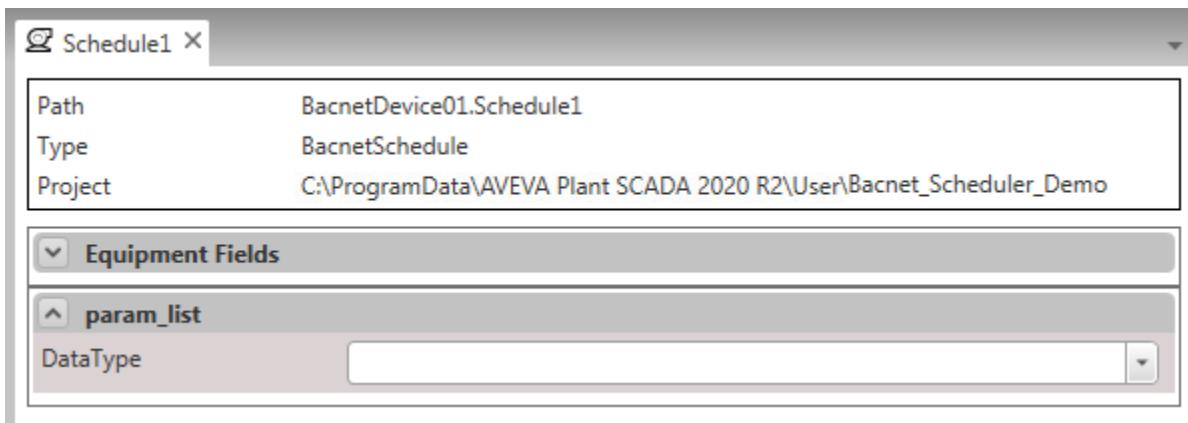

If you use the Tag Import tool to generate tags for BACnet scheduling, Plant SCADA is unable to detect the data type that has been used to configure the schedules on a device. This means you need to indicate the data type that should be used when the associated tag addresses are generated.

To simplify this task, the equipment instances generated by the Tag Import process to support BACnet schedule objects include a custom parameter called "DataType". Once you have set this parameter to the correct data type in the required equipment instances, you just need to run an equipment update to apply the correct

addresses to your tags.

#### To specify a data type for a BACnet schedule:

1. Open Equipment Editor and select the **Equipment** tab.
2. In the **Equipment** list to the right, locate the required BACnet device.  
BACnet devices are labeled using the **Parent Equipment** name specified during the tag import process.
3. In the equipment instances that branch off the required device, locate the BACnet Schedule instances.  
By default, equipment instances for BACnet schedule objects are named using "Schedule\_<n>", where *n* is the **Schedule ID** used to identify the associated schedule object in the BACnet device.
4. Open an equipment instance that requires updating (see [Open an Equipment Instance](#)).
5. Expand the **param\_list** fields to display the **DataType** parameter.

6. Select the required data type from the drop-down list to the right of the field. The options are:
  - **Dig** (digital)
  - **Dbl** (double)
  - **Int** (integer)
  - **Enum** (enumerate)
  - **UInt** (unsigned integer)
  - **Real** (real).

**Note:**

- Scheduler integration will not operate correctly if a data type configuration is not correctly matched with the device.
- If you do not specify a data type for each BACnet schedule object, a "Bad IO device variable" error notification will be generated when you attempt to compile your project.

7. Save your changes to the equipment instance.
8. Run an equipment update (see [Update Equipment](#)).

The variable tags associated with the equipment instance will now be configured to use the appropriate tag address.

#### See Also

[Integrate BACnet Schedules into Scheduler](#)

## Operate Scheduler at Runtime

You can use [Scheduler](#) to perform the following tasks at runtime:

- Add a Schedule Entry
- Add a Recurring Schedule Entry
- Edit a Schedule Entry
- Enable Override Mode
- Manually Set a State Change
- Configure Special Days
- View and Edit BACnet Schedules at Runtime.

**Note:** Special circumstances apply to schedule entries that occur during a daylight savings transition. For more information, see [Manage Daylight Saving Transitions](#).

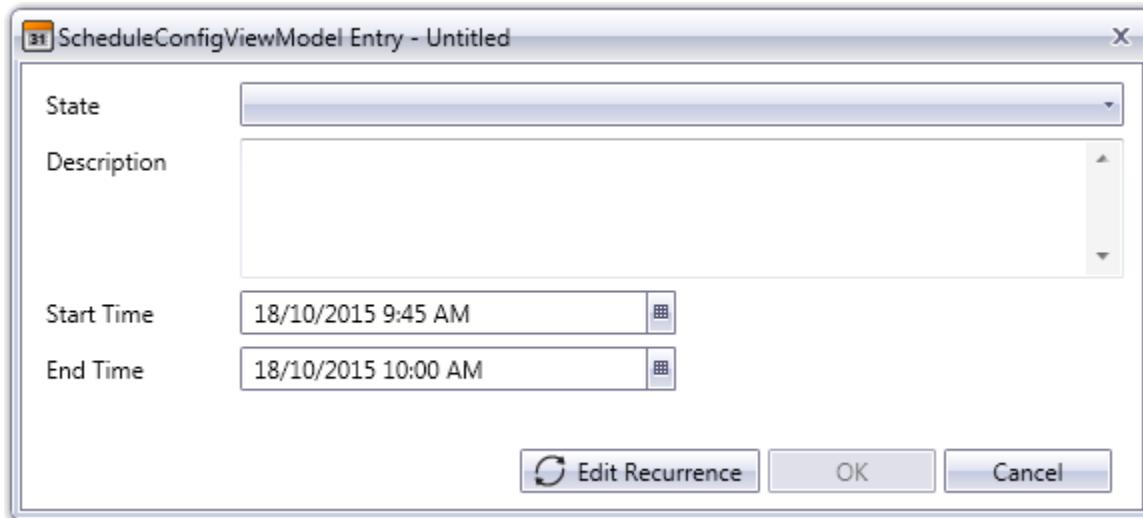

### Add a Schedule Entry

Schedule entries are used to specify a change of state for a selected piece of equipment. A schedule entry specifies a **Start Time** and **End Time** for a particular **State**.

**Note:** You can also create recurring schedule entries that follow patterns based on a day, week, month or year. See [Add a Recurring Schedule Entry](#).

#### To add a new schedule entry:

1. Open the Scheduler in the runtime environment and select the **Configuration View** tab.
2. In the [Equipment Tree](#), select the piece of equipment (or equipment hierarchy location) that requires a schedule entry.
3. In the [Calendar](#), double-click on the location that represents the date and time at which the schedule entry should occur. The Schedule Entry dialog will display.

**Note:** If you would like to add a schedule entry at a time where one already exists, you will need to select a time just outside the range of the existing entry and manually adjust the **Start Time** and **End Time**

---

accordingly. Be aware that this will create a schedule conflict (see [Schedule Priorities](#)).

4. In the **State** field, select the equipment state you would like the schedule entry to execute. The drop-down menu includes the states that are configured for the selected equipment.
5. Add a **Description** of the schedule entry (if required).
6. Use the **Start Time** and **End Time** fields to specify when the state change should commence and its duration. The button to the right of each field displays a date and time selection tool.
7. Click **OK**.

---

**Note:** Special circumstances apply to schedule entries that occur during a daylight savings transition. For example, the transition period is read-only which means schedule entries cannot be added. For more information, see [Manage Daylight Saving Transitions](#).

---

## See Also

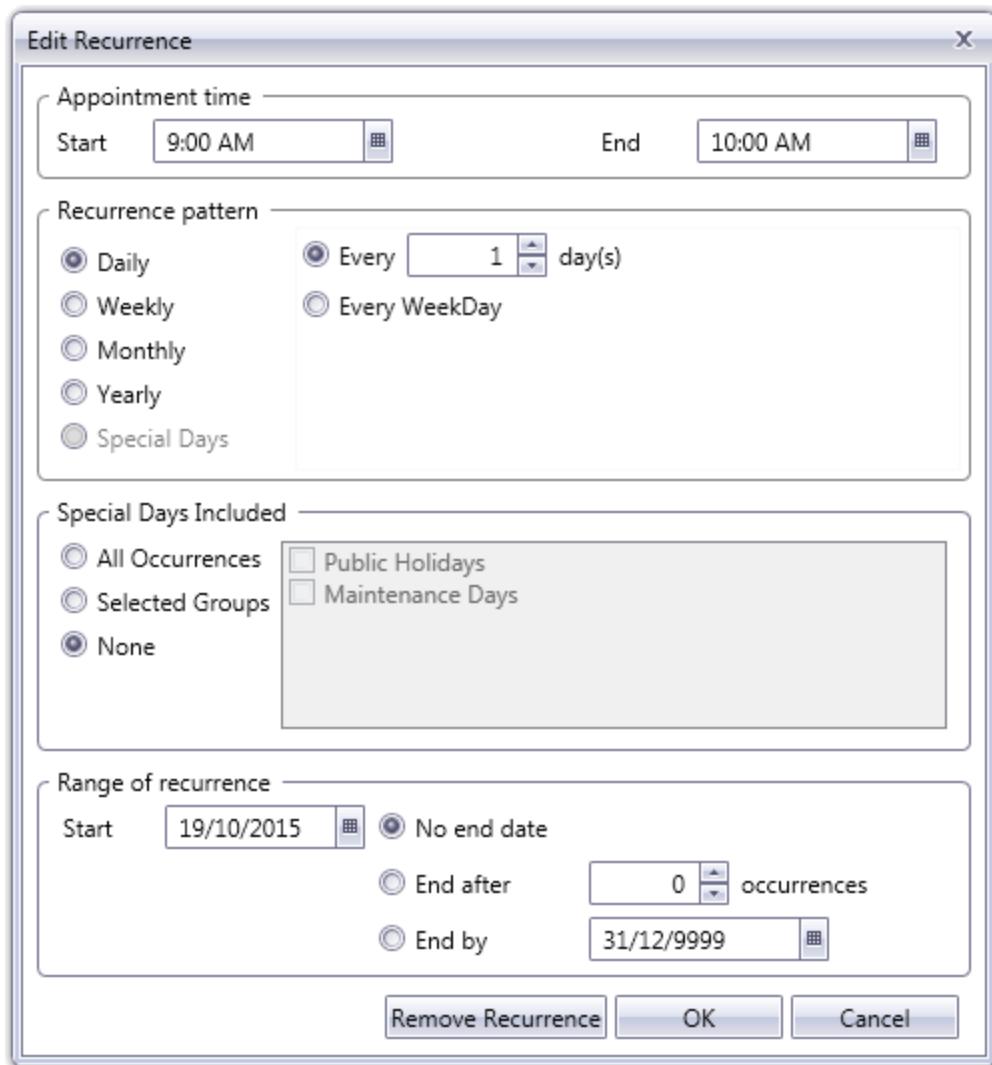

[Add a Recurring Schedule Entry](#)

## Add a Recurring Schedule Entry

A recurring schedule entry allows you to specify ongoing state changes for a piece of equipment based on a day, week, month or year.

### To add a recurring schedule entry:

1. Create a schedule entry following the steps described in [Add a Schedule Entry](#).
2. If required, double-click on the required schedule entry in the Scheduler calendar to open the Schedule Entry dialog.
3. Confirm that the period of time specified by the **Start Time** and **End Time** fields is not longer than 24 hours, as this is the maximum period of time supported by a recurring schedule entry.
4. Click on the **Edit Recurrence** button. The Edit Recurrence dialog will display.

5. In the **Recurrence pattern** section, select one of the following:

- **Daily** — Specifies how regularly the schedule will occur based on the **Every** field value. For example, "2" would mean the state change occurs every second day. Alternatively, you can specify that the state change will occur **Every Week Day** (Monday to Friday).
- **Weekly** — Specifies how regularly the schedule will occur based on the **Every** field value. For example, "2" would mean the state change occurs every fortnight. You can also use the check boxes to indicate that a state change should only happen on certain days of the week.
- **Monthly** — Specifies that the state change occurs on the same day across a monthly cycle (for example, "Day 1 of every 3 month(s)"), or on a particular day within a specific week (for example, "The Last Friday of every 1 month(s)").
- **Yearly** — Specifies that the state change occurs on the same date every year (for example, "Every January 1"), or on a particular day within a specific month (for example, "The First Tuesday of November")
- **Special Days** — Use this option if you want the state change to only occur on **Special Days** that fall on the selected week days. To enable the Special Days radio button, the **Special Days Included** section needs to be set to something other than **None**.

6. In the **Special Days Included** section, specify on which special days the state change will occur:

- **All Occurrences** — indicates the schedule entry will occur on every special day (regardless of the category).
  - **Selected Categories** — indicates the schedule entry will occur on the special days within the selected categories. You can select more than one category.
  - **None** — indicates the state change will not occur on any special days.
7. In the **Range of recurrence** section, specify the recurring schedule's **Start** date and an end date (if required). You can specify an end date using one of the following options:
- **No end date** — indicates that the state change will occur indefinitely
  - **End After** — specifies a selected number of occurrences (for example "9" indicates the state change will occur nine times).
  - **End by** — specifies a particular end date.
8. Click **OK** to close the **Edit Recurrence** dialog.
9. Click **OK** to save the schedule entry.

---

**Note:** To remove a recurrent pattern from a schedule entry, open the Edit Recurrence dialog and click on the **Remove Recurrence** button.

---

## See Also

[Configure Special Days](#)

## Edit a Schedule Entry

You can edit a schedule entry in the following ways:

- Update the schedule entry properties
- Move a schedule entry to a different time
- Delete a schedule entry.

---

**Note:** You are not able to edit an inherited schedule entry (see [Schedule Inheritance](#)). To edit a schedule entry, you need to determine the branch in the equipment tree on which it was created and make you required changes at that level.

---

### To update the properties for a schedule entry:

1. Open Scheduler in the runtime environment.
2. Display the **Configuration View** tab.
3. In the equipment tree, select the equipment you would like to update.
4. In the Scheduler calendar, double-click on the schedule entry you would like to change. The Schedule Entry dialog will appear.
5. Make the required changes to the schedule entry. Use the **Edit Recurrence** button if you would like to add or edit a [Add a Recurring Schedule Entry](#).
6. Click **OK** to save your changes.

**To move a schedule entry:**

1. Open Scheduler and display the Configuration View tab.
2. In the equipment tree, select the equipment you would like to update.
3. In the Scheduler calendar, locate the schedule entry you would like to move.
4. Click on the schedule entry and drag it to the required location on the calendar. The **Start Time** and **End Time** properties will update according to the entry's new location.

You can move a schedule entry to a location where one already exists, however this will create a schedule conflict (see [Schedule Priorities](#)).

---

**Note:** The drag-and-drop feature described here is not supported for recurring schedule entries.

---

**To delete a schedule entry:**

1. Open Scheduler and display the **Configuration View** tab.
2. In the equipment tree, select the equipment you would like to update.
3. In the Scheduler calendar, locate the schedule entry you would like to remove.
4. Hold the mouse over the schedule entry to display a small close icon. Click on this icon to delete the schedule entry.  
Or:  
Select the schedule entry and press the **Delete** key.
5. Click **OK** on the Delete Item dialog to confirm your selection.

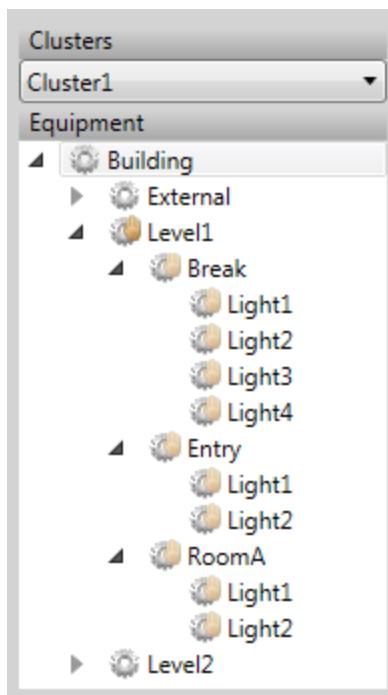

## Enable Override Mode

[Override Mode](#) allows you to take control of equipment scheduling and manually execute state changes.

**To enable override mode:**

1. Open [Scheduler](#) in the runtime environment.
2. In the equipment tree, locate the equipment you would like to set to override mode.
3. Right-click and select **Override**.

A small hand will appear on the icon next to the selected item indicating it is now in override mode. In the example below, "Level1" is in override mode.

**Note:** Override mode is automatically propagated down the equipment hierarchy, which means it is inherited by the equipment on lower levels (see [Override Mode](#)).

When override mode is enabled for equipment, you can manually set equipment state changes (see [Manually Set a State Change](#)).

#### To disable override mode:

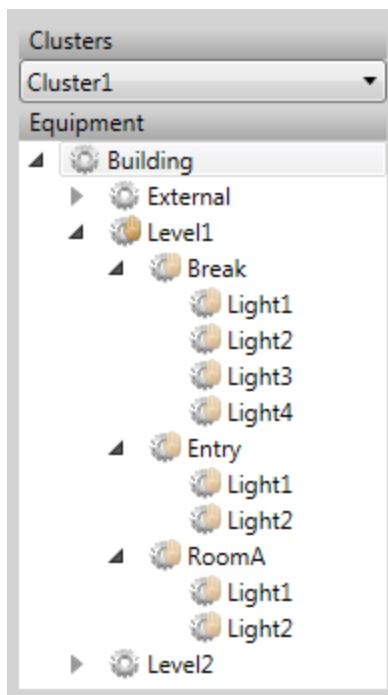

- In the equipment tree, right-click on the equipment and select **Remove Override**.

### Manually Set a State Change

When [Override Mode](#) is enabled for a piece of equipment, you can manually apply state changes to the equipment (and the equipment levels beneath it).

#### To manually set state changes to equipment in override mode:

1. Open [Scheduler](#) in the runtime environment.
  2. In the equipment tree, locate the equipment to which you would like to manually apply a state change.
- If the equipment is in override mode a small hand will appear on the icon to the left. In the example below, "Level1" is in override mode.

If this is not the case, follow the procedure described in [Enable Override Mode](#) to place the equipment into override mode.

3. Right click on the branch and select **Set to State**. The Set To State dialog will appear.
4. In the **State** field, select the equipment state you would like to implement. The drop-down menu to the right of the field includes a list of the equipment states that are configured for the selected piece of equipment.
5. Click **OK**.

**Note:** Equipment state changes are propagated down the equipment hierarchy to the equipment that has inherited override mode. If required, you can counteract a state specified by an inherited override by implementing another override at the level where you would like a different state to be set.

## Configure Special Days

[Special Days](#) are used to identify those days where regular scheduling does not apply to the equipment in a plant.

Each special day belongs to a category. To configure a special day, you should do the following:

### Creating a special day category

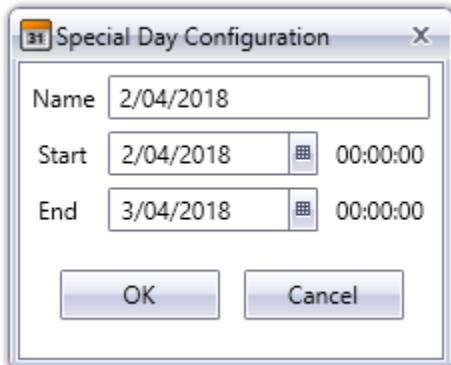

1. Open [Scheduler](#) in the runtime environment.
2. Click the **Special Days View** tab.
3. In the **Categories** panel, click the **Add** button.
4. The **Add Category** dialog box appears. Enter a unique name for the category and click **OK**. The new entry appears in the list of categories.

If the **Add** button is not available, go to the Scheduler page in Graphics Builder and set the "IsAddSpecialDaysButtonVisible" property value to "1." Refer to [Use ActiveX Properties to Control](#)

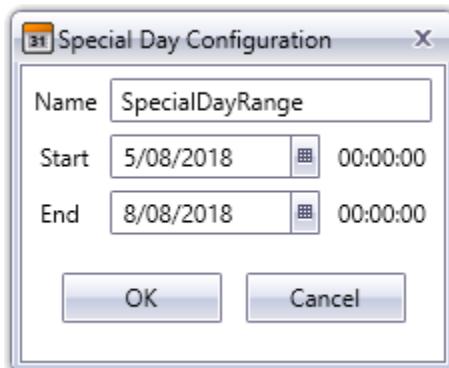

[Scheduler's Current Selection](#) for more details.

## Adding special days to the Scheduler calendar

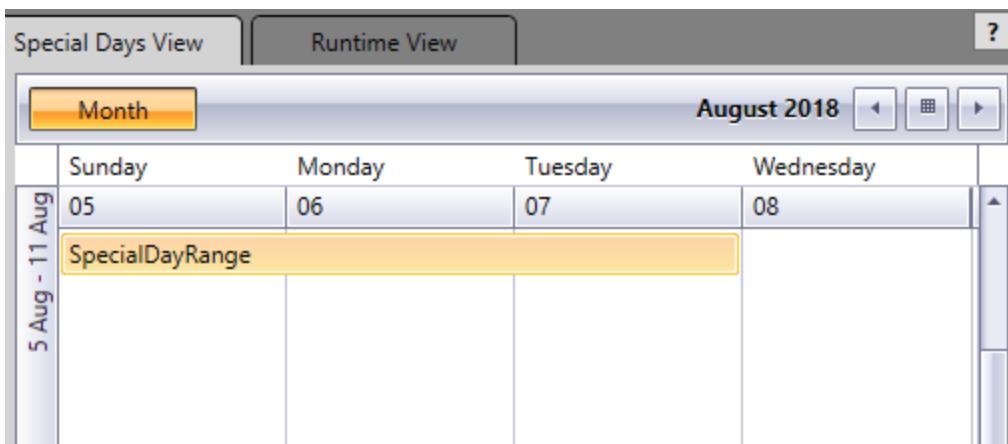

1. Open [Scheduler](#) in runtime environment and click the **Special Days View** tab.
2. In the **Categories** panel, select the category to which you need to add special days. (If required, follow the procedure described above to create a new category).
3. In the Scheduler calendar, navigate to the month with the day (or range of days) that you need to specify as a special day.
4. Double-click on a day that you want to specify as a special day.

5. The **Special Day Configuration** dialog box appears. Enter a name, start date and end date. A timestamp of "00:00:00" (the start of a day) applies to the **Start** and **End** fields. The configuration does not include the end date in the special days range, because the associated timestamp occurs as the day begins. For example, if you specify the dates from 5/08/2018 to 8/08/2018:

The span of the special days range highlights from 5/08/2018 to 7/08/2018.

6. Click **OK**.

If the special days are adjacent to each other and share the same name, then it will be grouped together in a single block.

[Add a Recurring Schedule Entry](#)

## Manage Daylight Saving Transitions

In some time zones, the time is put forward or back one hour in response to the start and end of daylight saving time (DST).

In the [Scheduler](#) calendar, the period when a DST transition takes place is grayed out. You are unable to add a schedule entry that starts or ends in the transition period. When a schedule entry includes the transition period, the schedule will run according to the rules below:

### For the start of daylight saving:

For single and recurring schedule entries that include the transition to DST, the entries will run an hour less due to time shifting forward one hour. For example, if the schedule entry is from 1:30 to 3:30 A.M., and the time is set to switch at 2:00 A.M. (forward to 3:00 A.M.), the schedule will run from 1:30 to 2:00 A.M., and then from 3:00 A.M. to 3:30 A.M..

For recurring schedule entries set to end during the transition to DST, the entry will run from start time up to 1:59 A.M. (before the transition time). For example, if the schedule entry is set from 1:30 A.M. to 2:30 A.M., and the time is set to switch at 2:00 A.M. (forward to 3:00 A.M.), the schedule will run from 1:30 A.M. to 1:59 A.M., and on switching to DST will skip to 3:00 A.M. thus passing the end time of 2:30 A.M..

For recurring schedule entries set to start during the transition to DST, the entry will run from 3:00 A.M. to the end time. For example if the schedule entry is set from 2:30 A.M. to 4:00 A.M., the schedule will skip to 3:00 A.M. and run from 3:00 A.M. to 4:00 A.M..

## For the end of daylight saving:

For single schedule entries that include the transition back to normal time from DST, the entries will run for an additional hour due to the time shifting back one hour. For example, if the schedule entry is from 1:30 to 3:30 A.M., and the time is set to switch at 3:00 A.M. (back to 2:00 A.M.), the schedule will run from 1:30 to 3:00 A.M., and then from 2:00 A.M. to 3:30 A.M..

For single schedule entries that are set to end during the transition back from DST, the entry will run for an additional period from end time to 3:00 A.M. (2:00 A.M.). For example, if the schedule entry is set from 1:30 to 2:30, the schedule will run from 1:30 A.M. to 3:00 A.M. (2:00 A.M.), then from 2:00 A.M. to 2:30 A.M. for a total of 2 hours.

For recurring schedule entries that are set to end during the transition back from DST, the entry will run before the switch back from DST. For example, if the schedule entry is set from 1:30 A.M. to 2:30 A.M., the schedule will run from 1:30 A.M. to 2:30 A.M. for one hour only.

For single and recurring schedule entries that are set to start during the transition back from DST, the entry will run after the switch from DST. For example, if the schedule entry is set from 2:30 to 3:30, the schedule will run from 2:30 A.M. to 3:30 A.M. for 1 hour only.

---

**Note:** To see resolved schedule entries and how the Scheduler is set to behave during the transition to and from DST, display the Runtime View in the [Calendar](#).

---

## View and Edit BACnet Schedules at Runtime

Scheduler is able to display BACnet schedules that have been configured on a BACnet device and imported into Plant SCADA. This means you can read and write to schedule and calendar objects on a BACnet device at runtime using the Scheduler interface.

---

**Note:** Runtime View is not supported for BACnet schedule objects. It is recommended that you use the Configuration View when displaying BACnet schedules in Scheduler.

---

Schedules that were configured on a BACnet device will demonstrate the following when displayed in Scheduler:

- In the equipment tree, each schedule object associated with a BACnet device will appear as a branch.
- When a schedule object is selected in the equipment tree, the schedule entries that display will reflect the schedule configured on the BACnet device.
- Instead of specifying an equipment state change, BACnet schedule entries specify a value that can be interpreted by the BACnet device.

Exception schedules that were configured on a BACnet device will demonstrate the following when viewed in Scheduler:

- Exception schedules will appear on the Configuration View on a highlighted special day.
- Each exception schedule on the BACnet device is represented by a category in the Special Days View. The date or date range of the exception schedule will be shown as special days.
- Each calendar object will be available as a single category in the Special Days View.
- The **Type** field on the schedule entry properties will indicate if a schedule entry is a "weekly" or "exception" schedule.

---

**Note:**

- If the date range specified for an exception schedule or calendar object is excessively long, it can affect

---

system performance. For this reason, only the first six months of a date range will display in Scheduler.

- If the date range specified for an exception schedule or calendar object has a start date that is beyond three years in the future, it will not display in Scheduler.
- 

### You can make the following changes to BACnet schedule entries:

1. Edit the **Start Time** and **End Time** within the boundaries of a day (from midnight to midnight).  
A schedule entry will still end at midnight even if the specified **End Time** is later.
2. Edit the **Value**.
3. Delete a schedule entry.

### See Also

[Edit a Schedule Entry](#)

## Monitor Schedules

You can monitor the execution of schedule entries using the following trace messages:

- [Kernel Trace Messages](#)
- [Tracelog Trace Messages](#)

### Kernel Trace Messages

Scheduler outputs status information to the Kernel regarding the Runtime Transition Manager and the Redundancy engine.

### WARNING

#### UNINTENDED EQUIPMENT OPERATION

- Do not use the kernel for normal Plant SCADA operation. The kernel is only for diagnostics and debugging purposes.
- Configure your security so that only approved personnel can view or use the kernel.
- Do not view or use the kernel unless you are an expert user of Plant SCADA and Cicode, or are under the direct guidance of Technical Support for this product.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

## Runtime Transition Manager

These messages are prefixed with "Runtime Transition Manager:"

- **Start delayed** - Start operation was requested but delayed due to the start delay period not being elapsed.

The message indicates that the start will occur later and specifies in how many milliseconds. A timestamp is supplied indicating the local time that the start was called.

- **Started** - Runtime Transitions Manager has been started, and a local timestamp supplied indicating when.
- **Delayed Start Canceled** - Prior start call which was queued due to startdelay has been dequeued and not started.
- **Stopped** - Runtime Transition Manager has halted its operation, a local timestamp indicating when.

## Redundancy Engine

These messages are prefixed with "Scheduler Redundancy:"

- **Synchronization stopped due to connect failed** - Synchronization has been aborted due to a lack of connection between the local and peer.
- **Synchronization stopped due to disconnect** - Synchronization has been aborted due to a connection disconnection between the local and peer.
- **Synchronization initiated from (peer or local)** – Synchronization has been started. Peer or local will be specified in this method, and indicates which server is initiating the synchronization start.
- **Synchronization Complete** - This indicates that a synchronization has successfully completed.

## Tracelog Trace Messages

The Scheduler outputs diagnostics information to the platform trace log.

For more information regarding log files and the rules belonging to platform logging systems refer to the section **Monitoring and Debugging Runtime** in the Plant SCADA main help.

The tracelog.Report.<Report server name>.dat file contains report server related trace information and is similar to the syslog.dat file.

Refer to the [Debug Parameters](#) help for information pertaining to logging. If you require additional information refer to the help for the [Computer Setup Editor](#).

---

**Note:** By default the logging levels are set to every category, but only Critical and Error level traces will be logged. As the traces from the Scheduler are currently Informational only, change this level to include information. (If that is the only change made, then informational traces from every component will be directed to the tracelog) With manipulation of the debug ini parameters, you can fine tune a fairly granular trace set.

Example for Scheduler critical, error, information ONLY:

```
[Debug]SeverityFilter= Critical,Error,Information  
CategoryFilterMode=0  
CategoryFilter=Scheduler
```

---

## Runtime Transition Manager

These messages are prefixed with "Runtime Transition Manager:"

- **Start delayed** - Start operation was requested but delayed due to the start delay period not having elapsed. The message indicates that the start will occur later and specifies in how many milliseconds. A timestamp is supplied indicating the local time that the start was called.
- **Started** - Runtime transitions manager has been started, and a local timestamp supplied indicating when.

- **Delayed Start Cancelled** - Prior start call which was queued due to startdelay has been dequeued and not started.
- **Stopped** - Runtime transition manager has halted its operation and a local timestamp indicating when.

## Equipment

These messages are prefixed with "Equipment"

- **Mode changed** - Gives an equipment name, the previous mode (Automatic or Manual) and the new mode, along with the standard timestamp information of when the transition occurred.
- **Demand Response Mode changed** - Gives an equipment name, the previous demand response mode (numeric) and the new mode, along with the standard timestamp information when the transition occurred.
- **Manual state changed** - Gives an equipment name, the previous state (string) and the new state, along with the standard timestamp information when the transition occurred. This message is only triggered on manual override state changes.
- **State changed** - Gives an equipment name, the previous state (string) and the new state, along with the standard timestamp information when the transition occurred. This message will be triggered for both automatic equipment state changes and manual ones.

---

**Note:** Currently traces for equipment property changes are logged on the server that they occurred on. No updates done via synchronization are logged.

# Graphics

This section of the documentation describes the tools and templates that are available to help you create graphical content for a Plant SCADA project.

## See Also

- [Graphics Builder](#)
- [AVEVA Industrial Graphics](#)
- [Situational Awareness Projects](#)

## Graphics Builder

Graphics Builder is the tool you use to create and configure graphics pages. You can add content to a page that makes it reflect the area or processes it will be used to monitor.

### To open Graphics Builder:

- On the Activity Bar, select **Graphics Builder** from the menu.
- Or:
- Click the Graphics Builder icon.

A graphics page is typically based on a template that conforms to the style applied to every page included in a project (see [Page Templates](#)). For example, if your current project is based on the SxW starter project, you would create a new graphics page from the "Normal" template based on the SxW style. The page that opens in Graphics Builder will include navigational tools and functionality that are common to every page in the project (for example, the alarm banner, navigation panel and equipment hierarchy).

A page template also allows you to build graphics pages that are an appropriate [Screen Resolution](#) for your client computers.

To create content for a graphics page, you use graphics objects that allow you to create a meaningful representation of the system that is being monitored. These objects can be configured to display system data and respond to tag value changes. A wide range of graphics objects are supported in Graphics Builder, from simple shapes to complex [Symbols](#), [Genies](#) and [Composite Genies](#).

When you add an object to a page, it is automatically allocated an animation point number (AN). This provides a way to reference animations at runtime (see [Animation Points](#)).

You can also add commands and controls to a graphics page, providing a way for an operator to interact with a system at runtime (see [Interact with Graphics Pages at Runtime](#)).

## See Also

## Graphics Builder Settings

The following topics explain how to configure and use the tools and features supported by Graphics Builder.

- [Set Graphics Builder Options](#)
- [Display the Drawing Toolbox](#)
- [Use a Grid to Align Objects](#)
- [Use Guidelines to Align Objects](#)
- [Display the Zoom Dialog Box](#)
- [Use a Cross Hair Cursor](#)
- [Customize Graphics Builder.](#)

## See Also

- [Configure Graphics Pages](#)

## Set Graphics Builder Options

You can define general options for the drawing environment.

### To define general options for Graphics Builder:

1. Open Graphics Builder.
2. Choose **Tools | Options**. The Options dialog box appears.
3. Select the required options (a description of the options is given below).
4. Click **OK**.

## Graphics Builder - General Options

Option	Description
<b>Display Properties on New</b>	Enables the automatic display of the relevant properties dialog when you add an object to the page.
<b>Display Properties on Copy</b>	Enables the automatic display of the relevant

Option	Description
	properties dialog when you copy an existing object on the page.
<b>Save Template Warning</b>	Enables the display of an alert message when you modify and then save an existing template. When you modify an existing template, any graphics pages that are associated with the template are not updated until you perform an <a href="#">Update Equipment in Plant SCADA Studio</a> to update each page based on the template.
<b>Modify AN Field</b>	Allows you to modify the number of the animation point (AN) of any object. You cannot change an AN to the same number as an existing AN on the graphics page.
<b>Disable Genie Forms</b>	Disables the display of Genie forms when a new Genie is added to the page or an existing Genie is edited. With Genie forms disabled, a form for each native object in the Genie displays.
<b>Display Group Button</b>	Enables the display of a group button on a Genie dialog. The group button displays a form for each native object in the Genie.
<b>Compile Enquiry Message</b>	Enables the "Do you want to compile?" message window when the project has been modified and <b>Run</b> is selected. Normally the project is compiled automatically (if the project has been modified) when <b>Run</b> is selected.
<b>Fast Runtime Display</b>	Enables the fast display of graphics pages in the runtime system.
<b>List System Pages</b>	<p>Specifies that system pages will be included in:</p> <ul style="list-style-type: none"> <li>• The list of pages in the Graphics Builder Open and Save dialog boxes.</li> <li>• The Page Properties Previous and Next menus, used for defining a browse sequence for your pages.</li> </ul> <p>System pages are prefixed with an exclamation mark (!).</p>
<b>Show version 3.xx/4.xx tools</b>	Enables the old (version 3 and version 4) toolbox. This toolbox contains old tools (such as Slider and Bar Graph), which are no longer necessary, as they can be configured using the Object properties.

Option	Description
<b>Transparent Paste</b>	<p>Allows you to specify a color that becomes transparent when a bitmap is pasted on a graphics page. This applies to bitmaps that are pasted from the clipboard, or imported from another application.</p> <p><b>Note:</b> Transparent data bits are not natively supported by other applications. If pasting a bitmap into an external application, transparent bits will appear as the transparent paste color.</p>

## See Also

[Graphics Builder Settings](#)

## Customize Graphics Builder

You can customize the Graphics Builder workspace and adjust the cursor speed.

Procedure	Description
To hide the status bar:	Choose <b>View   Show Status Bar</b> . Choose the command again to redisplay the status bar.
To hide the toolbar:	Choose <b>View   Show Tool Bar</b> . Choose the command again to redisplay the tool bar.
To change the speed of the cursor when using the mouse:	Choose <b>View   Mouse Slow Speed</b> .
To change the speed of the cursor when using the cursor keys:	<p>Choose <b>View   Cursor Keys Slow Speed</b>.</p> <p><b>Hint:</b> Move the cursor on screen by using the left, right, up, and down cursor keys.</p>

## See Also

[Graphics Builder Settings](#)

## Display the Drawing Toolbox

Plant SCADA's Drawing Toolbox allows you to add graphics objects to a page, symbol or template in Graphics Builder (see [Graphics Object Types](#)).

**To display the drawing toolbox:**

1. Open Graphics Builder.
2. On the **View** menu, select **Show Tools**.

Or:

Press the **F3** key.

**To hide the drawing toolbox:**

- On the **View** menu, deselect **Show Tools**.

Or:

Press the **F3** key.

Or:

Click on the button to the left of the toolbox title bar.

You can also minimize the drawing toolbox without closing it. To do this, select the button to the right of the toolbox title bar.

---

**Note:** The Drawing Toolbox may include a button that lets you insert a Pelco™ Viewer Camera Control. This button will only appear if you have previously installed this control on the local computer. The Pelco ActiveX control has been deprecated and is no longer part of the Plant SCADA installation. If you have upgraded your computer from a previous version with this control installed, it will continue to function. However, it is recommended that you communicate with Pelco cameras using a different method.

---

**See Also**

[Graphics Objects](#)

## Use a Grid to Align Objects

You can use a grid to align and place objects with precision. When the grid is active, any objects or groups of objects that you create, move, or re-size snap to the nearest grid intersection. Options for the grid can be set up in the Grid Setup dialog.

### To open the Grid Setup Dialog:

1. Open Graphics Builder.
2. From the **View** menu, select **Grid Setup**.
3. Set the required options (see the table below).
4. Click **OK**.

Field	Description
<b>Pitch</b>	The horizontal and vertical spacing of the grid points (in pixels). The smallest grid size you can specify is 3 x 3 pixels.
<b>Origin</b>	Specifies the grid origin (base point).
<b>Display Grid</b>	Displays the grid on screen.
<b>Snap to Grid (F8)</b>	Activates the grid. When the grid is active, any object or group of objects that you create, move, or re-size snaps to the nearest grid intersection.

## Use Guidelines to Align Objects

You can use horizontal and vertical guidelines as a straight-edge to align and place objects. When an edge or the center of an object gets close to a guideline, that edge or center automatically snaps to the guideline. Options for guidelines can be set up in the Guidelines Setup dialog. This dialog box lets you define 32 horizontal and 32 vertical guidelines. Guidelines act as a straight-edge, allowing you to align and place objects precisely. When an edge or center of an object gets close to a guide, that edge or center automatically snaps to the guide.

### To open the Guidelines Setup dialog:

1. Open Graphics Builder.
2. From the **View** menu, select **Guidelines Setup**.
3. The dialog provides the following options.

Field	Description
<b>Direction</b>	The direction of the guideline (horizontal or vertical).
<b>Display Guidelines</b>	Displays the guidelines on screen.
<b>Snap to Guidelines (F7)</b>	Activates the guidelines. When the guidelines are

Field	Description
	active, any object or group of objects that you create, move, or re-size snaps to the nearest guideline.

**To run a guideline horizontally across a page:**

1. Select **Horizontal**.
2. Enter a position (distance from the top of your page) for the guideline, and click **Set**.

**To run a guideline vertically down a page:**

1. Select **Vertical**.
2. Enter a position (distance from the left edge of your page) for the guideline, and click **Set**.

**To display the guidelines:**

1. From the **View** menu, select **Guidelines Setup**.
2. On the **Guideline Setup** dialog box, select the **Display Guidelines** check box.

**To snap objects to the nearest guideline:**

- On the **Guidelines Setup** dialog box, select the **Snap to Guidelines** check box.  
Or:  
Press the **F7** key.

**To move a guideline:**

1. Move the cursor over the guideline.
2. Click and hold the left mouse button.
3. Move the guideline to a new location.
4. Release the mouse button.

**To create a new guideline with the mouse:**

1. Move the cursor over the guideline.
2. Press and hold the **Ctrl** key.
3. Click and hold the left mouse button.
4. Move the guideline to a new position.
5. Release the mouse button and **Ctrl** key.

**To delete a guideline with the mouse:**

- Drag the guideline to the edge of the page.

## Display the Zoom Dialog Box

Use the Zoom dialog box to display an enlarged view of your drawing. The Zoom dialog box magnifies the area around your cursor, enabling you to position or draw objects precisely.

You can alter the magnification level by selecting **Zoom In** or **Zoom Out** on dialog's control menu (accessible to the left of the dialog's title bar).

### To display the Zoom dialog box:

1. Open Graphics Builder.
2. On the **View** menu, select **Show Zoom**.  
Or:  
Press the **F10** key.

### To hide the Zoom dialog box:

1. On the **View** menu, deselect **Show Zoom**.  
Or:  
Press the **F10** key.  
Or:  
Double click on the dialog's control menu.

## See Also

[Customize Graphics Builder](#)

## Use a Cross Hair Cursor

You can change the cursor into cross hairs that extend the full width and length of the drawing area. When you move away from the drawing area, the normal pointer reappears, allowing you to select commands and tools.

### To display a cross hair cursor:

1. Open Graphics Builder.
2. From the **View** menu, select **Cross Hair Cursor**.

[Customize Graphics Builder](#)

## Colors

Plant SCADA supports True Color (16.7 million colors) for static and animated objects, including page backgrounds, imported images, symbols, metafiles and bitmaps.

Wherever a particular page or object property has a color value, a current color button will appear.

To choose a different color to the one currently displayed on the button, click on the small black arrow to the right. This launches the [Color Picker](#).

The following tools are also provided to help manage the colors used on your graphics pages:

- [Edit Favorite Colors Dialog Box](#)
- [Swap Color Dialog Box](#)
- [Adjust Colors Dialog Box](#)

## Color Picker

The first 11 rows of the Color Picker show a set of standard colors, including transparent (marked with a black cross). The remaining rows display any user defined colors, referred to as **Color Favorites**. This includes flashing colors, represented by a two color block, divided diagonally.

To select one of the colors displayed on the color picker, click on it. If the necessary color does not appear, you have the option to create a custom color, or match an existing color from one of your graphics pages.

### To match an existing color on a graphics page:

1. Verify that the color you would like to match is present on the page currently displayed in Graphics Builder.
2. From the Color Picker, choose the Color Selector tool (looks like an eyedropper).
3. Use the Color Selector to click on the color you would like to match.
4. The color you have chosen will now appear in the Color Value Display button.

### To create a customized color:

1. From the Color Picker, click the **Edit** button. The [Edit Favorite Colors Dialog Box](#) is displayed. Use the to create the color you would like to use.
2. **Name** the color if necessary.
3. Use the **Add** button to include the color with the Color Favorites displayed on the Color Picker.
4. Click **OK**. The color you have just created will now be selected.

## See Also

[Edit Favorite Colors Dialog Box](#)

[Swap Color Dialog Box](#)

[Adjust Colors Dialog Box](#)

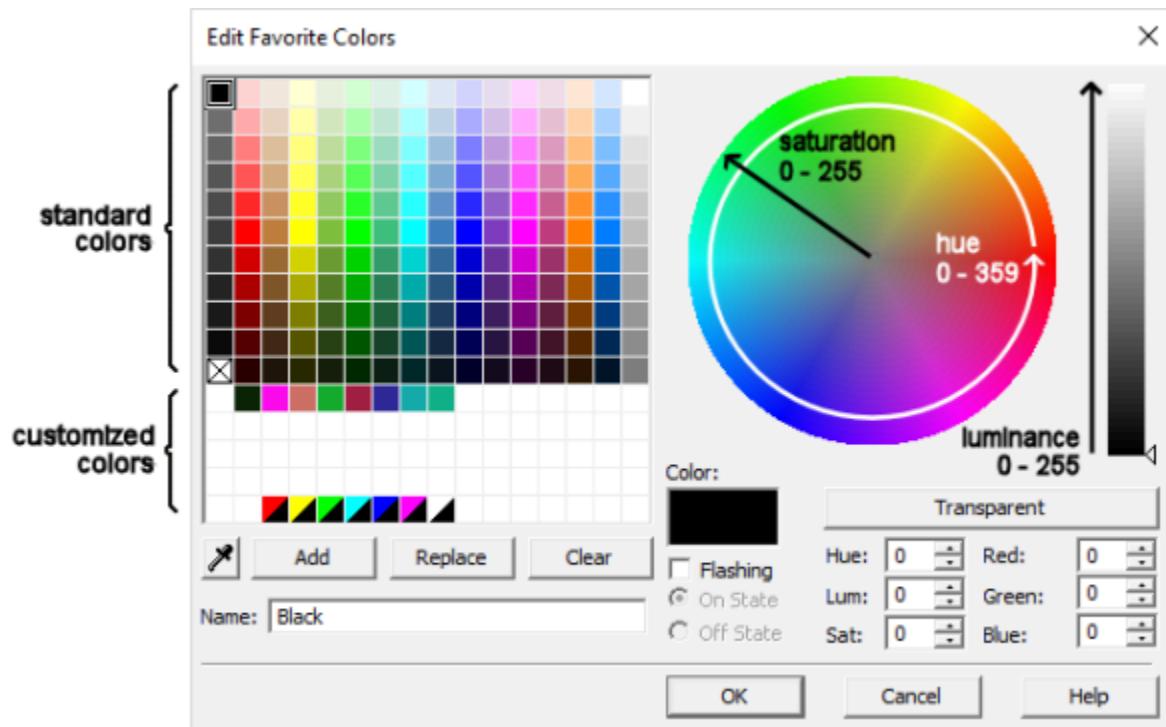

## Edit Favorite Colors Dialog Box

From the Color Picker, click the **Edit** button. The Edit Favorite Color dialog appears.

With the Edit Favorite Colors dialog box, you can:

- Make a visual selection of a color you would like to use by clicking on the color wheel.

- Decide the brightness level for a color by clicking on the brightness bar.
- Create a color by entering hue, saturation and luminance values.
- Create a color by entering red, green and blue color values.
- Modify the colors available on the Color Picker by adding, replacing and removing colors on the color grid.
- Name a color, allowing it to be identified on the color grid via a tool tip.

## Edit Favorite Colors Dialog Fields

Field	Description
<b>Colors Grid</b>	Displays a selection of predefined colors. The first 11 rows show a set of standard colors, including transparent (marked with a black cross). The remaining rows display the user-defined colors currently added as favorites. This includes flashing colors, represented by a two color block, divided diagonally. The colors that appear in this grid represent those that are available from the Color Picker.
<b>Add</b>	Adds the color currently displayed in the <b>Color</b> panel to the user-defined favorites in the color grid. If there are no places available on the grid, you will have to use the <b>Replace</b> or <b>Clear</b> button instead.
<b>Replace</b>	This button allows to you alter a color on the color

Field	Description
	grid. Select the color you would like to change, adjust its color value, and then hit the <b>Replace</b> button. The selected color will be updated to reflect the changes that were made.
<b>Clear</b>	Removes the selected color, leaving an "unused" position on the color grid.
<b>Name</b>	<p>Allows you to associate a name with a predefined color. The name can be viewed as a tool tip in the Color Picker, making it easy to distinguish a specific color among similar shades.</p> <p>You can associate a name with a newly created color by typing in a name before clicking the <b>Add</b> button. You can also apply a name to an existing color by selecting the color, keying in a name and clicking the <b>Replace</b> button.</p> <p><b>Note:</b> The predefined color labels are already defined as color names.</p>
<b>Color</b>	<p>The <b>Color</b> panel displays the color created by the current settings applied to the Edit Favorite Color dialog.</p> <p>The values displayed on the Edit Favorite Color dialog automatically adjust to correctly represent the color currently displayed in this panel. The values in each field are not independent.</p>
<b>Color wheel</b>	The color wheel allows you to visually select a color. It represents the full spectrum of colors in a cyclic layout, with color saturation increasing towards the outside edge. Simply click on the wheel to select a color.
<b>Brightness bar</b>	Allows you to visually select the brightness you would like applied to a color. Click on the bar in the appropriate location to apply a brightness level. The bar represents luminance, as the colors move away from pure black as they progress up the bar to pure white.
<b>Hue</b>	Specifies the hue value for the color currently displayed in the <b>Color</b> panel. Hue primarily distinguishes one color from another. The value can be between 0 (zero) and 359, representing degrees around the color wheel. For example, zero is a pure red to the right, 180 is pure cyan on the left.

Field	Description
<b>Sat</b>	Specifies the saturation level for the color currently displayed in the <b>Color</b> panel. Saturation level increases the further the selected color moves away from gray scale to a pure primary color. The value can be between 0 (zero) and 255.
<b>Lum</b>	<p>Specifies the luminance of the color currently displayed in the <b>Color</b> panel. Luminance represents the brightness of a color, the value increasing the further the color moves away from black towards pure white. The value can be between 0 (zero) and 255.</p> <p><b>Note:</b> When you create a color by using HLS values, you may find that the HLS values you specified for a color have changed when you reopen the dialog box. This happens because RGB values are less precise than HLS values, sometimes resulting in several HLS values being assigned the same RGB value. As a result, when the HLS values are generated from the RGB values, some values may change.</p>
<b>Red</b>	Indicates the amount of red used to create the color currently displayed in the <b>Color</b> panel. The value can be between 0 (zero) and 255. Adjust this setting if you want to create a color using RGB values.
<b>Green</b>	Indicates the amount of green used to create the color currently displayed in the <b>Color</b> panel. The value can be between 0 (zero) and 255. Adjust this setting if you want to create a color using RGB values.
<b>Blue</b>	Indicates the amount of blue used to create the color currently displayed in the <b>Color</b> panel. The value can be between 0 (zero) and 255. Adjust this setting if you want to create a color using RGB values.
<b>Transparent</b>	Click this button to select transparent. Wherever transparent is used as a color, the background color, or color behind the transparent object, will be displayed.
<b>Flashing</b>	Check this box if you want to create a flashing color. A flashing color appears as a diagonally divided panel in the color grid. To create a flashing color, you will have to select an <b>On State</b> and <b>Off State</b> color.

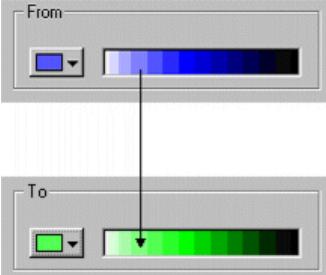

## Swap Color Dialog Box

You use the Swap Color dialog box to swap the colors of an object (or group of objects, or a bitmap) to new

colors. From the **Tools** menu in Graphics Builder, select **Swap Colors**. The Swap Colors dialog appears.

**Note:** You may find that you get unexpected results when swapping colors in your bitmaps if they contain areas that have either very high or very low luminance values (that is, white or black areas). This is due to the fact that these areas contain almost no color, only luminance. For example, areas that represent specular highlights (the shine on a brightly illuminated steel conveyor belt, for example) will remain colorless no matter how the color for the rest of the bitmap is adjusted. Consequently, before working with the Swap Color dialog box and other color tools, familiarize yourself with the concepts of hue, luminance, and saturation in order to avoid unexpected results with the images on your graphics pages.

## Swap Colors Dialog Fields

Field	Description
<b>From</b>	<p>The current color of the object. If you click the <b>Swap Range</b> check box, it presents a range of colors in varying degrees of brightness ranging from white to black. Any colors in this range that exist in the object are replaced by the corresponding colors from the <b>To</b> range.</p>  <p>If a color in the <b>From</b> range exists in the object, it will be replaced by the <b>To</b> color in the same relative position in the range.</p>
<b>To</b>	<p>The color to which the original object color will be changed. If you click the <b>Swap Range</b> check box, it presents a range of colors in varying degrees of brightness from white to black. This allows you to swap a whole range of colors at once.</p>
<b>From any color</b>	<p>Specifies to change every color in the object to the new color.</p>
<b>Swap range</b>	<p>Specifies to swap a range of colors. The <b>From</b> and <b>To</b> boxes indicate the starting colors in the ranges.</p> <p><b>Note:</b> You cannot invert colors with <b>Swap Range</b> selected. This means, for example, that you could not swap dark red for light green and light red for dark green in one go.</p>

## Adjust Colors Dialog Box

The Adjust Colors dialog box allows refined color re-mapping with Graphics Builder objects. From the **Tools** menu in Graphics Builder, select **Adjust Colors**. The Adjust Colors dialog appears.

## Adjust Colors Dialog Fields

Field	Description
<b>Hue Degrees</b>	<p>The Hue area allows the user to set the color hue range to map to and from. The bars displayed span values of 0 (zero) to 359 degrees, representing the cyclic nature of hue color values. A numeric value for each slider can be keyed in to the field to the right.</p> <ul style="list-style-type: none"><li>• The slider above the <b>From Hue Range</b> bar selects the start of the color range that will be mapped.</li><li>• The slider below the <b>From Hue Range</b> bar selects the end of the color range to be mapped.</li><li>• The slider above the <b>To Hue Range</b> bar selects the start point for the color range you'll be mapping to. Because the value range is cyclic, the selected area can wrap around to the left side of the bar.</li></ul> <p>The range of colors that is excluded by your selection is grayed out, allowing for a visual assessment of the selected range.</p>
<b>Lightness (%)</b>	The lightness slider allows you to boost the lightness of colors across a range of (negative) - 100% to 100%. If the slider is increased above zero, colors will tend towards white. If the slider is set below zero, colors will move towards black. A numeric value for the slider can be entered into the field to the right.
<b>Selected Hues Only</b>	Applies the lightness setting to only those colors that will be remapped. Leaving the box unchecked allows the lightness to be adjusted for every color.
<b>Saturation (%)</b>	The saturation slider allows you to boost the saturation of color across a range of (negative) -100% to 100%. If the slider is increased above 0, colors will tend towards primary colors. If the slider is set below zero, colors will move towards grayscale. A numeric value for the slider can be entered into the field to the right.
<b>Selected Hues Only</b>	Applies the saturation setting to only those colors that

Field	Description
	will be remapped. Leaving the box unchecked allows saturation to be adjusted for every color.

## Page Templates

Page templates are used in Plant SCADA to produce a consistent look and feel across all of the pages included in a project.

---

**Note:** If a project is based on a Situational Awareness Starter Project, it will not use page templates in the way described here. Situational Awareness projects use a workspace architecture that is based on a master page. For more information, see [Create a Master Page for a Customized Workspace](#).

---

The templates that are included with a Plant SCADA installation are grouped according to "styles". These styles include:

- **situational\_awareness** — see note above.
- **sxw\_style\_1** — a feature-rich template set designed for use with systems that conform to Schneider Electric's StruxureWare specification.
- **tab\_style\_1** — a feature-rich template set that includes a layout with a tabbed ribbon menu.
- **standard** — a legacy style with basic functionality, simple page navigation and alarm icons.
- **bottom** — a variation of the legacy standard style with the toolbars at the bottom of the screen.
- **top** — a variation of the legacy standard style with the toolbars at the top of the screen.

Each style has templates for the pages you are likely to use in a typical runtime project.

---

**Note:** If you need to generate multiple graphics pages that share a common look and feel and behavior, you can also create your own page template from any existing template (see [Create a Template](#)). Use your own template to apply changes in a single location and update all of your pages automatically (see [Link a Page to a Template](#)).

---

## Page Templates Common to All Styles

Template Name	Page Description
<b>alarm</b>	The Active Alarms page.
<b>blank</b>	A blank page.
<b>disabled</b>	The Disabled Alarms page.
<b>doublepa</b>	A page containing two instances of the Process Analyst.  Some older styles will contain a variation named "doubletrend" that displays two trends (without using Process Analyst).
<b>file</b>	Used to display a file.

Template Name	Page Description
	Versions of this template may exist that specifically support an RTF or HTML file (for example, "file_html" or "file_rtf").
<b>hardware</b>	The Hardware Alarms page.
<b>meanmeanchart</b>	A page that displays control charts for the mean of SPC tags.
<b>normal</b>	A page to which you can add content that reflects an area or process to be monitored.
<b>poppa</b>	A popup page that contains an instance of the Process Analyst.  Some legacy styles will contain a variation named "poptrend" that displays a trend (without using Process Analyst).
<b>singlepa</b>	A page containing a single instance of the Process Analyst.  Some legacy styles will contain a variation named "singletrend" that displays a single trend (without using Process Analyst).
<b>soe</b>	The Sequence Of Events page.
<b>standardchart</b>	A page with charts that display the standard deviation and mean for SPC tags.
<b>summary</b>	The Alarm Summary page.

## Example

A project that is created using the SxW starter project will automatically include a set of pages based on the style "sxw\_style\_1". This style supports visual components that are included on all pages, such as a menu panel, an equipment hierarchy and an alarm banner. The templates used to generate these pages are stored in the system project named "SxW\_Style\_Include".

To add a graphics page to this project, use the sxw\_style\_1 "normal" template. The page that is created will already include the visual components that are common to the other pages in the project. You can then add your own content to the page.

---

**Note:** To browse the page templates associated with the active project, use the **Libraries** view in the **Visualization** activity (see [Browse Libraries in Plant SCADA Studio](#)).

---

## See Also

[Screen Resolution](#)

## Screen Resolution

The page templates that are delivered with Plant SCADA are grouped according to "styles" (see [Page Templates](#)). Within each style, the templates are available in a variety of resolutions to support a range of possible screen sizes on a client computer.

### Screen Resolutions Supported by Each Template Style.

Style	Available Resolutions
<b>bottom</b>	VGA (640x480, 4:3) SVGA (800x600, 4:3) XGA (1024x768, 4:3)
<b>standard</b>	VGA (640x480, 4:3) SVGA (800x600, 4:3) XGA (1024x768, 4:3) SXGA (1280x1024; 5:4)
<b>sxw_style_1</b>	HD768 (1366x768, 16:9) HD1080 (1920x1080, 16:9)
<b>tab_style_1</b>	SXGA (1280x1024; 5:4) HD768 (1366x768, 16:9) HD1080 (1920x1080, 16:9) WUXGA (1920x1200, 16:10)
<b>top</b>	VGA (640x480, 4:3) SVGA (800x600, 4:3) XGA (1024x768, 4:3)

When you create a graphics page, you should consider the screen resolution of the client computer that will display the page at runtime. While you are able to adjust the size of the runtime window (see [Sizing the Runtime Window](#)), choosing a template in the correct resolution will make a page the appropriate size for full screen operation. It will also avoid the need for scroll bars (due to a page being too large).

If required, you may also need to consider the impact of running your project on multiple monitors (see [MultiMonitors Parameters](#)).

---

**Note:** The legacy standard templates styles (**standard**, **bottom** and **top**) come in "no title bar" variations. These are provided to support projects that will run in fullscreen mode with no title bar (where the citect.ini parameter [\[Animator\]FullScreen](#) is set to 1). The **sxw\_style\_1** and **tab\_style\_1** templates are designed to always include a title bar. If you use these templates, you can restrict usage of the standard title bar buttons with Cicode (see [Secure the Window Title Bar](#)).

If you need to adjust the screen resolution for a page (for example, if you are creating a popup page or your own template set from a blank template), you can change the screen resolution for a page at any time by adjusting the **Resolution** property (see [Edit the Properties for a Page](#)).

## Sizing the Runtime Window

By default, when the Plant SCADA runtime window initially opens, its size is determined by the dimensions of the project's startup page. You are able to re-size the runtime window by dragging its frame, and you can use the standard title bar buttons (Maximize, Minimize/Restore and Close).

However, there are a number of ways you can manipulate this behavior. For example, you can:

- operate in fullscreen mode
- open as a maximized window
- disable dynamic sizing
- lock the aspect ratio of the runtime window.

To implement these customizations, you use the following `citect.ini` parameters:

- [\[Animator\]FullScreen](#)
- [\[Animator\]MaximizedWindow](#)
- [\[Page\]DynamicSizing](#)
- [\[Page\]MaintainAspectRatio](#)
- [\[Page\]StartupMode](#)

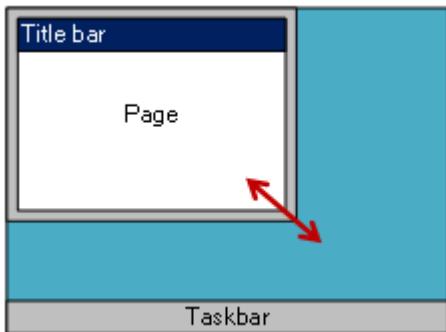

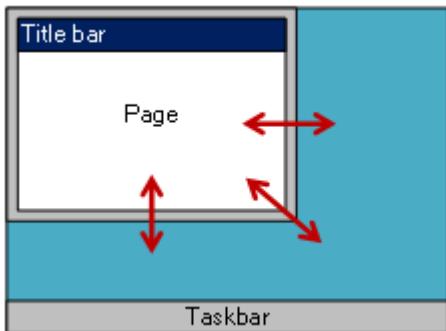

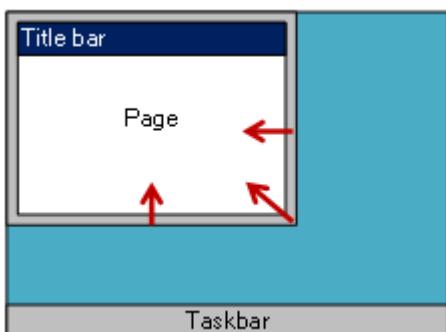

---

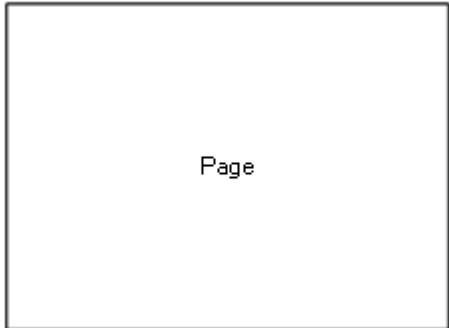

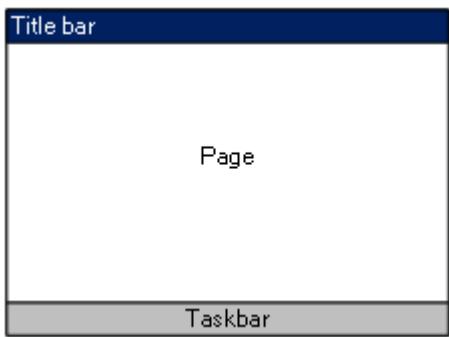

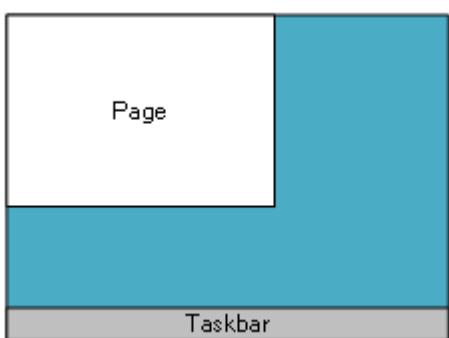

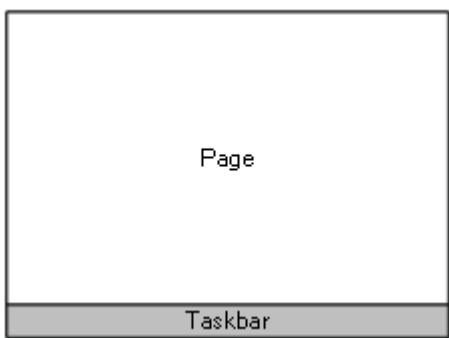

**Note:** Certain runtime window customizations may determine which template you need to use to create your project pages. For example, if your project uses the "standard" style and `[Animator]FullScreen` is set to 2 (no title bar), you will need to use the "no title bar" variation of a page template (see [Page Templates](#)).

---

## Examples

The following examples demonstrate the outcome of using different combinations of the `citect.ini` parameters listed above.

Example	Parameter Settings
	<p>The default behavior. Resizing the window maintains the aspect ratio.</p> <p>[Animator]FullScreen = 0  [Animator]MaximizedWindow = 0  [Page]DynamicSizing = 1  [Page]MaintainAspectRatio = 1</p>
	<p>The default behavior, with aspect ratio control turned off.</p> <p>[Animator]FullScreen = 0  [Animator]MaximizedWindow = 0  [Page]DynamicSizing = 1  [Page]MaintainAspectRatio = 0</p>
	<p>Dynamic sizing is turned off, which means you are not able to increase the window size and content is not scaled. Scroll bars are enabled if the window size is decreased and no longer large enough to show the entire page.</p> <p>[Animator]FullScreen = 0  [Animator]MaximizedWindow = 0  [Page]DynamicSizing = 0</p>
	<p>Fullscreen mode, with a title bar.</p> <p>[Animator]FullScreen = 2  [Page]DynamicSizing=1  [Page]MaintainAspectRatio = 0</p> <p><b>Note:</b> If dynamic sizing is turned off, the page content cannot be scaled and fullscreen mode does not work.</p>

Example	Parameter Settings
 <p>Page</p>	<p>Fullscreen mode, without a title bar.</p> <p>[Animator]FullScreen = <b>1</b>  [Page]DynamicSizing=1  [Page]MaintainAspectRatio = 0</p>
 <p>Title bar</p> <p>Page</p> <p>Taskbar</p>	<p>The window is maximized on startup. If you select the restore button on the title bar, you can adjust the size of the window.</p> <p>[Animator]FullScreen = 0  [Animator]MaximizedWindow = <b>1</b>  [Page]DynamicSizing = 1  [Page]MaintainAspectRatio = 0</p> <p><b>Note:</b> If [Page]MaintainAspectRatio is set to 1, the maximized window will maintain the aspect ratio of displayed page, not the monitor. This means the page may not cover the entire desktop.</p>
 <p>Page</p> <p>Taskbar</p>	<p>Startup mode is set to 16, which means the window is displayed with thin borders, no caption, and no maximize/minimize or system menu icons. The window cannot be re-sized.</p> <p>[Animator]FullScreen = 0  [Animator]MaximizedWindow = 0  [Page]StartupMode = <b>16</b></p>
 <p>Page</p> <p>Taskbar</p>	<p>Startup mode is set to 16, which means the window is displayed with thin borders, no caption, and no maximize/minimize or system menu icons. With dynamic sizing enabled, the window can be maximized.</p> <p>[Animator]FullScreen = 0  [Animator]MaximizedWindow = <b>1</b>  [Page]DynamicSizing = <b>1</b>  [Page]MaintainAspectRatio = 0  [Page]StartupMode = <b>16</b></p> <p><b>Note:</b> If [Page]MaintainAspectRatio is set to 1, the</p>

Example	Parameter Settings
	maximized window will maintain the aspect ratio of displayed page, not the monitor. This means the page may not cover the entire desktop.

## Configure Graphics Pages

This section of the help explains how to create and manage graphics pages. It includes the following topics:

- [Create a Graphics Page](#)
- [Open or Save a Graphics Page](#)
- [Locate a Graphics Page](#)
- [Edit the Properties for a Page](#)
- [Edit the Default Page Settings](#)
- [Use a Browse Sequence](#)
- [Configure a Startup Page and Splash Screen](#)
- [Secure the Window Title Bar](#)
- [Display Tags on a Page](#)
- [Create a Template](#)

## Create a Graphics Page

### To create a new page:

1. Open Graphics Builder.
2. On the **File** menu, select **New**.

Or:

Select the **New** button.

The New Dialog box is displayed. This dialog box is used to create a page, template, symbol, Genie, or Super Genie by selecting a button.

3. On the New dialog box, click **Page**. The Use Template dialog box is displayed.
4. Complete the fields in the Use Template dialog box (see below for a description).
5. Click **OK**.

If you create a new page using the Graphics Builder, you need to edit the page record to define a browse

sequence.

**Note:** You can initiate the process to create a page directly from the **Pages** view in Plant SCADA Studio's **Visualization** activity. See [Browse Pages in Plant SCADA Studio](#).

## Use Template (New Page/Template) Dialog Box

This dialog box lets you create a new page or template based on an existing template.

Element	Description
<b>Template</b>	A table of templates on which you can base the new page or template. Use the scroll bar to locate the thumbnail image of the template, then choose the template and click <b>OK</b> (or double-click the thumbnail image). <b>Note:</b> To edit the template, select it and click <b>Edit</b> .
<b>Style</b>	The style of the page. Plant SCADA templates are grouped into several styles and are available in various page resolutions (see <a href="#">Page Templates</a> ). When you create a new project, you can choose the style that best suits your requirements.
<b>Linked</b>	To maintain the link with the original template, select this check box. A page or template that is linked with its original template is automatically updated if the template is changed. <b>Note:</b> You can remove the link to the template at any time with the <b>Cut Link</b> command from the <b>Edit</b> menu, but you cannot re-link a page or template with its original template after this has occurred.
<b>Designed for showing title Bar</b>	Determines whether to display the Windows title bar (at the top of each graphics page). The title bar contains the title of the window, maximize, minimize and close buttons (at the right hand end of the title bar), and the control menu button (at the left hand end of the title bar). To display a page in fullscreen (without a title bar), the size of the page needs to be the same size as the display (or larger). If the page is smaller than the display, the title bar still displays, even if fullscreen mode is enabled. Standard templates styles are available for both page sizes. <b>Note:</b> The <b>swx_style_1</b> and <b>tab_style_1</b> templates are designed to always include a title bar. If you use these templates, you can restrict usage of the standard title bar buttons with Cicode (see <a href="#">Secure the Window Title Bar</a> ).

Element	Description
<b>Resolution</b>	<p>The screen resolution of the page or template (see <a href="#">Screen Resolution</a>):</p> <p><b>Default</b> - width x height of the screen on the computer currently in use</p> <p><b>VGA</b> - 640 x 480</p> <p><b>SVGA</b> - 800 x 600</p> <p><b>XGA</b> - 1024 x 768</p> <p><b>SXGA</b> - 1280 x 1024</p> <p><b>User</b> - User-defined width x height</p>

## Open or Save a Graphics Page

You can open and/or save a graphics page using the Open/Save As Dialog Box.

---

**Note:** This dialog box lets you open or save a page, template, symbol, Genie, or Super Genie. To select the type of entity, click the appropriate tab.

---

### To open an existing page:

1. Click **Open**, or choose **File | Open**. The Open/Save As dialog box is displayed. (See below for a description of the fields in this dialog box).
2. Choose **Type: Page**.
3. Select the **Project** where the page is stored.
4. Select the **Page**.
5. Click **OK**.

---

**Note:** To delete a page from the project, select the page name and click **Delete**.

---

### To save the current page:

1. Click **Save**, or choose **File | Save**.
2. Select the **Project** in which to store the page.
3. Click **OK**.

### To save the current page with a new name:

1. Choose **File | Save As**.
2. Select the project in which the page is stored.
3. Enter a name for the page in **Page** (64 characters maximum).
4. Click **OK**.

### To save all current pages that are open:

- Choose **File | Save All**.

**To delete a page:**

- Select the page and click **Delete**.

**Open/Save As Dialog Box**

Element	Description
<b>Page / Symbol / Template / Genie</b>	<p>The name of the graphics page, template, symbol, Genie, or Super Genie.</p> <p>If you are opening a page, template, symbol, Genie, or Super Genie, select its name from the large window.</p> <p>If you are saving a page, template, symbol, Genie, or Super Genie, type a name into the smaller input box (or select a name from the large window if you want to overwrite an existing page, template, symbol, Genie, or Super Genie).</p> <p><b>Note:</b> If you are using distributed servers, the name needs to be unique to the cluster (for example you cannot have the same page name in more than one cluster).</p>
<b>Library</b>	(For symbols, Genies, and Super Genies only.) The library in which to save the symbol, Genie, or Super Genie. To create a new library, click <b>New</b> .
<b>Style</b>	(For templates only.) The style of the template. To create a new style, click <b>New</b> .
<b>Preview Enable</b>	Displays a thumbnail image of the page, template, symbol, Genie, or Super Genie.
<b>Title bar</b>	(For templates only.) Specifies whether to include a space for the title bar. If you use a title bar, you will have slightly less display space on screen.
<b>Resolution</b>	<p>(For templates only.) The screen resolution of the template:</p> <p><b>Default</b> - width x height of the screen on the computer currently in use</p> <p><b>VGA</b> - 640 x 480</p> <p><b>SVGA</b> - 800 x 600</p> <p><b>XGA</b> - 1024 x 768</p> <p><b>SXGA</b> - 1280 x 1024</p> <p><b>User</b> - User-defined width x height</p>

## Page Properties - General

Graphics pages have the following general properties:

Field	Description
<b>Window title</b>	<p>The title to be displayed on the page at runtime. A window title can have a maximum size of 64 characters.</p> <p>The title can be plain text, Super Genie syntax or both (for example, "Pump ?AREA? status").</p>
<b>Description</b>	<p>Enter a description of the page, and its various functions and so on up to a maximum of 250 characters. The description is designed for comments only and does not affect how your system performs, nor does the description appear during runtime.</p>
<b>Previous page</b>	<p>The page that will precede the current page in the runtime browse sequence (maximum 64 characters). Choose an existing page from the menu or type in a page name.</p> <p>This property is optional. If not specified, the Page Previous command is inoperative while this page is displayed.</p>
<b>Next page</b>	<p>The page that will follow the current page in the runtime browse sequence (maximum 64 characters). Choose an existing page from the menu or type in a page name.</p> <p>This property is optional. If not specified, the Page Next command is inoperative while this page is displayed.</p>
<b>[Security] All areas</b>	<p>Select the check box if you want the page to belong to every area (the page can be seen by any operator with view access to at least one area).</p>
<b>[Security] Area</b>	<p>Enter the area to which this page belongs. Only users with access to this area can view this page. Click the menu to select an area, or type in an area number directly. If an area is not specified, the page is accessible to every user.</p>
<b>[Page scan time] Default</b>	<p>The Page scan time defines how often this graphics page is updated at runtime. The Page scan time also determines the rate of execution of the While page shown events (i.e. the command(s) which are executed while the page is displayed at runtime).</p>

Field	Description
	<p>Select this check box to use the default page scan time (as set using the <a href="#">[Page]ScanTime</a> parameter); otherwise, leave it blank, and enter (or select) another value in the field below. For example, if you enter a page scan time of 200 milliseconds, there will be an attempt to update the page every 200 milliseconds, and any While page shown events are executed every 200 milliseconds.</p> <p><b>Note:</b> You can set the default page scan time using the Setup Wizard.</p>
<b>[Logging] Log device</b>	<p>This is the device to which messages are logged for the page's keyboard commands. Click the menu to the right of the field to select a device, or type a device name.</p> <p><b>Note:</b> You need to include the <i>MsgLog</i> field in the format of the log device for the message to be sent.</p>
<b>[Cluster context] Inherit from caller</b>	<p>Select this check box to make the current page inherit the default cluster context from the page or Cicode task that opened this page (for example using the <i>PageDisplay</i> or <i>WinNewAt</i> Cicode functions). If this is checked you cannot select a specific default cluster. See <i>Cluster Context</i> in the topic <a href="#">Clusters</a> for more information.</p>
<b>[Cluster context] Cluster</b>	<p>Specifies a default cluster context for this page.</p>

Click **Apply**, and then click **OK**. To define further properties for the page, select the relevant tabs.

[Edit the Properties for a Page](#)

### Page Properties - Appearance

You define the appearance of your graphics pages by using the controls on the **Appearance** tab.

Graphics pages have the following appearance properties:

Field	Description
<b>[Template] Style</b>	<p>The style (appearance) of the graphics page in the runtime system. You can set a default style (to be applied to new pages) using the page defaults of existing pages and templates using the Page Properties. For a description of the available styles,</p>

Field	Description
	see the topic <a href="#">Page Templates</a> .
<b>[Template] Resolution</b>	<p>The default screen resolution of the pages:</p> <ul style="list-style-type: none"> <li>• VGA — 640 x 480 pixels (4:3)</li> <li>• SVGA — 800 x 600 pixels (4:3)</li> <li>• XGA — 1024 x 768 pixels (4:3)</li> <li>• SXGA — 1280 x 1024 pixels (5:4)</li> <li>• HD768 — 1366 x 768 pixels (16:9)</li> <li>• HD1080 — 1920 x 1080 pixels (16:9)</li> <li>• WUXGA — 1920 x 1200 pixels (16:10)</li> <li>• UHD4K — 3840 x 2160 pixels (16:9)</li> <li>• User Defined.</li> </ul>
<b>[Template] Name</b>	<p>The name of the template on which the page is based. Choose a template name from the menu.</p> <p><b>Note:</b> If you are looking for a template that you created yourself, check that you entered the correct <b>Style</b> and <b>Resolution</b> above.</p>
<b>[Template] Show title bar</b>	<p>Determines whether the Windows title bar displays (at the top of the page). The title bar contains the title of the window, maximize, minimize and close buttons (at the right hand end of the title bar), and the control menu button (at the left hand end of the title bar).</p> <p>To display a page in full screen (without a title bar), the size of the page needs to be the same size as the display (or larger). If the page is smaller than the display, the title bar still displays, even if full screen mode is enabled. Standard templates styles are available for both page sizes.</p>
<b>[View area] Width</b>	<p>The width (in pixels) of the area that the operator can view at runtime. Click the up and down arrows to increase and decrease the width, or type in another value directly.</p>
<b>[View area] Height</b>	<p>The height (in pixels) of the area that the operator can view at runtime. Click the up and down arrows to increase and decrease the height, or type in another value directly.</p>
<b>Page color</b>	<p>The color that will display in the background of the graphics page.</p>

Field	Description
Ignore Quality	<p>This field allows you to override the global [Page]IgnoreValueQuality parameter setting in the Citect.ini file for a particular page.</p> <p>The options are:</p> <ul style="list-style-type: none"><li>• Default Indication - use the current setting for the [Page]IgnorevalueQuality parameter setting in the Citect.ini file.</li><li>• #COM Indication - change the setting to the equivalent of 0 for the [Page]IgnorevalueQuality parameter setting in the Citect.ini file.</li><li>• No Indication - change the setting to the equivalent of 1 for the [Page]IgnorevalueQuality parameter setting in the Citect.ini file.</li><li>• Background Indication - change the setting to the equivalent of 2 for the [Page]IgnorevalueQuality parameter setting in the Citect.ini file.</li></ul>

The preview field to the right of this dialog displays a picture of the selected template. Click **Apply**, then click **OK**. To define further properties for the page, click the relevant tabs.

[Edit the Properties for a Page](#)

### Page Properties - Keyboard Commands

The Keyboard Commands property lets you define keyboard commands for the page. A keyboard command is a particular key sequence which executes a command when it is typed in by the operator at runtime.

You can also define a message which will log every time the key sequence is entered.

If an operator does not satisfy the Access requirements specified under **Security** (see below), they will not be able to enter keyboard commands for this page at runtime.

Keyboard commands have the following properties:

Field	Description
<b>Key sequence</b>	<p>Enter the key sequences that the operator can enter to execute a command (32 characters or less). You can enter as many key sequences as you like. To add a key sequence, click <b>Add</b>, and type in the sequence or select one from the menu. To edit an existing sequence, click the relevant line, and click <b>Edit</b>. You can also remove key sequences by clicking <b>Delete</b>. See <a href="#">Define Key Sequences for Commands</a>.</p>
<b>Key sequence command</b>	<p>The commands (set of instructions) to be executed immediately when the selected key sequence is entered. The key sequence command can have a maximum length of 254 characters.</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options: <b>Insert Tag</b>, and <b>Insert Function</b>.</p>
<b>[Security] Same area as page</b>	<p>Select this check box to assign the keyboard command to the same area as the page (see <a href="#">Page Properties - General</a>). Only users with access to this area (and any necessary privileges) can issue this command or log the message. If you want to assign this keyboard command to another area, leave this check box clear and enter another area below.</p>
<b>[Security] Command area</b>	<p>Enter the area to which this keyboard command belongs up to a maximum of 16 characters. Only users with access to this area (and any necessary privileges) can issue this command or log the message. For example, if you enter Area 1 here, operators need to have access to Area 1 to issue this command.</p> <p>Click an area from the menu or type in an area number.</p>
<b>[Security] No privilege restrictions</b>	<p>Tick this box to disable privilege restrictions; otherwise, leave it blank, and enter another privilege below.</p> <p>The result of not assigning a privilege restriction differ according to whether you have used areas in your security setup:</p> <ul style="list-style-type: none"> <li>• <b>No Areas:</b> Every operator has full control of the page.</li> <li>• <b>Areas:</b> An operator will only need view access to the area assigned to this page to have full control</li> </ul>

Field	Description
	over the page.
<b>[Security] Privilege level</b>	<p>Enter the privilege level that a user needs to possess to issue this command or log the message. For example, if you enter Privilege Level 1 here, operators need to possess Privilege Level 1 to issue this command. You can also combine this restriction with area restrictions (see above). For example, if you assign the keyboard command to Area 5, with Privilege Level 2, the user needs to be set up with Privilege 2 for Area 5.</p> <p>Choose a privilege from the menu or type in an area number.</p>
<b>[Logging] Log Message</b>	<p>A text message sent to the <i>MsgLog</i> field of the Log Device when the selected action is performed by the operator at runtime (32 characters maximum). The message can be plain text, Super Genie syntax, or a combination of the two.</p> <p>If you want to include field data as part of a logged message, you need to insert the field name as part of the device format when you configure the device. For instance, in the <b>Format</b> field of the <b>Devices</b> form, you could enter {MsgLog,20} {FullName,15}. This would accommodate the logging of messages such as <b>P2 started by John Smith</b>.</p> <p>The log device to which the message is sent is specified through the General page properties.</p>

Click **Apply**, and then click **OK**. Click **Clear Property** to clear property details, and disable the property. To define further properties for the page, click the relevant tabs.

## See Also

[Edit the Properties for a Page](#)

### Page Properties - Events

You use the **Events** tab to assign commands to your graphics pages. These commands can be executed when the page is opened, closed, or whenever the page is open. You can also define different messages to log at the same time.

Page events have the following properties:

Field	Description
<b>Event</b>	<p>There are three events to which commands can be attached. You can select more than one type of event. Unique commands can be attached to each (i.e., you can perform one task when the page is opened, and another when it is closed).</p>
<b>[Event] On page entry</b>	<p>Select this option if you want a command to be executed when the page is initializing. For example, you could execute a command to extract recipe data from a database into a Cicode variable, to be displayed on the page.</p> <p>The following functions should not be called: Login() or UserLogin().</p> <p><b>Note:</b> Use the "On Page Shown" event if your command uses ActiveX controls. The "On page entry" event may not properly initialize ActiveX controls. The resulting value from a tag write that is performed using the "On page entry" event may not be displayed and accessed correctly if the tag is used directly within the page. The "On page shown" event can be used for initializing tags that are to be accessed on the page.</p>
<b>[Event] On page exit</b>	<p>Select this option if you want a command to be executed when the operator exits the page. For example, this command could be used to close a database that was opened at page entry.</p> <p>The following functions should not be called: PageGoto(), PageNext(), PagePrev(), PageDisplay(), or PageLast().</p> <p><b>Note:</b> If you shut down the system, "On page exit" functions for the currently open pages will not execute. If a particular page exit code needs to run, call the code before calling the Shutdown() function.</p>
<b>[Event] While page is shown</b>	<p>Select this option if you want a command to execute continually for the entire time that the page is open. For example, the <b>While page is shown</b> command could be used to perform background calculations for this page.</p>

Field	Description
<b>[Event] On page shown</b>	<p>Select this option if you want a command to execute when a page is first displayed and objects on it (including ActiveX controls) have been initialized. If you want to reference ActiveX controls in your command then use this event instead of "On page entry".</p> <p><b>Note:</b></p> <ol style="list-style-type: none"> <li>1. Use the "On Page Shown" event if your command uses ActiveX controls. The "On page entry" event may occur before the ActiveX controls have been initialized.</li> <li>2. Use the "On Page Shown" event if your command requires access to the latest variable tag value. The "On page entry" event may occur before the tag has been resolved.</li> </ol> <p>See <a href="#">PageInfo</a> Cicode function, type 25.</p>
<b>[Event] On activate</b>	<p>Select this option if you want the command to execute when the window is activated at runtime. The automation interface allows you to set or get commands for this event using <a href="#">PageEventPutEx</a> and <a href="#">PageEventGetEx</a>.</p>
<b>[Event] On deactivate</b>	<p>Select this option if you want the command to execute when the window is deactivated. This command will close the window. The automation interface allows you to set or get commands for this event using <a href="#">PageEventPutEx</a> and <a href="#">PageEventGetEx</a>.</p>
<b>Command</b>	<p>The commands (set of instructions) to be executed immediately when the selected Event occurs.</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options; <b>Insert Tag</b>, and <b>Insert Function</b>.</p>

Click **Apply**, and then click **OK**. Click **Clear Property** to clear property details, and disable the property. To define further properties for the page, click the relevant tabs.

[Edit the Properties for a Page](#)

### Page Properties - Environment

You use the **Environment** tab to define environment information for your graphics pages. You can add, remove, or edit page environment variables for a graphics page, template, or Super Genie.

For example, you can design your loop pages to expand when clicked (a **Tune >>** button) to show tuning parameters. You can use the environment variable to define the size of the expanded window. The **DspGetEnv()** function would be used as part of the Cicode for the button that expands the window. This means that the Cicode used to expand the window can be generic; you can use the same Cicode each time.

Environment variables are propagated from Super Genie templates to Super Genie pages automatically.

### Variables

The environment variables to be added to the page. When the page is opened during runtime, these variables are created. Their values can then be read using the **DspGetEnv()** function. When the page is closed, the environment variable memory is freed (discarded). For the example above, you would add one variable to define the width of the page, and another to define the height.

**Note:** When using Cicode, be aware that page variables are case sensitive.

To add an environment variable, click **Add**. To edit an existing environment variable, select it, and click **Edit**. (If you click **Add** or **Edit**, a small dialog appears, containing two fields, one for the property and one for its value.) To remove an environment variable, select it, and click **Remove**.

[Edit the Properties for a Page](#)

### Page Properties - Associations

The Page Property association Name Tab is used to define default Associations. The name you use when defining a Super Genie association is entered in the Name Field.

Use this tab to reference or edit existing associations. In using this tab you can add those associations that are currently in use in a Super Genie association and define the appropriate default value and value on error fields. You can also add a description.

Double-click in the row to make it editable, or Click **Add**.

Field	Description
Name	<p><b>Note:</b> On upgrading from an earlier version of Plant SCADA existing numbered substitutions are taken from defined Super Genie pages and automatically listed in the drop down box.</p> <p>For new associations enter the name of the association directly in the field [Name] provided: or select the name of the association from the drop-down box. Only those association names that are 'in-use' as part of a Super Genie association are listed. For example, if the association in the expression field of a button was '?Speed?' then the association name is Speed.</p> <p>Name Associations:</p> <ul style="list-style-type: none"><li>• To start with an alphanumeric or "_" character</li></ul>

Field	Description
	<ul style="list-style-type: none"> <li>• To contain only those characters that are allowed in variable tag names (excluding the period character '.'), and not contain any white space.</li> <li>• Be no more than 253 characters in length</li> </ul>
<b>Default (optional)</b>	Enter the default value to be used if the page association has not been performed using one of the Association Cicode functions at runtime. The default value needs to be either a literal string constant enclosed in single quotes (e.g. <'a literal value'> or <'1.23'>) or a valid full or partial tag name, equipment.item reference.
<b>Value on Error (optional):</b>	Enter the text to be used if no default value is defined and the association is not performed, or if the defined association did not resolve to a valid tag name. Since the value on error cannot be a variable tag, it is not necessary to enclose the text in quotation marks.  If the association on the page is specified in a typed format, the value will be converted to the specified type. If the value cannot be converted a hardware alarm will be raised. For example, if the association is specified as ?INT AlmDesc? and the value on error is set to <LowLevel>, the animation will display zero (0) and a hardware alarm will be raised. Typeless substitutions such as ?AlmDesc? will display the value on error as specified.
<b>Description (optional):</b>	Enter a description of the page association. The description is useful when maintaining associations.
<b>In Use:</b>	This column can not be edited and simply indicates if the association is in use on the current page in a Super Genie.

When finished click **Add**, the association is then added to the table.

To edit an association select an item and click **Edit** or double-click on the row to make it editable. You can not edit the name of an existing association that is in use. However you can select a new name in an existing row, and when this name is <ENTERED>, a new row of information will be displayed and the existing row of data will disappear.

To delete an association select the row in the table and click **Delete**. You can delete associations in use or not in use. If you delete the object from the page, the status of the association used in the Super Genie substitution will be updated to not in-use.

Click **Ok** or **Apply** to save the association table or click **Cancel** to discard any changes you may have made.

## Edit the Default Page Settings

You can edit the default properties that all new graphics pages will use.

**To set the properties to be used for new graphics pages:**

1. Choose **File | Defaults**.
2. Complete the **Page Defaults** dialog box (see below for a description of the fields), then click **OK**.

## Page Defaults Dialog Box

Field	Description
<b>Template Resolution</b>	<p>Default screen resolution of the standard graphics pages (for example, alarms pages and standard trend pages):</p> <p><b>Default</b> - width x height of the screen on the computer currently in use</p> <p><b>VGA</b> - 640 x 480</p> <p><b>SVGA</b> - 800 x 600</p> <p><b>XGA</b> - 1024 x 768</p> <p><b>SXGA</b> - 1280 x 1024</p> <p><b>User</b> - User-defined width x height</p>
<b>Template Style</b>	The style (appearance) of the graphics pages in the runtime system. The style you select is the default style for new pages you add to the project. You can change the style of existing pages and templates using the Page Properties. For a description of the available styles, see the topic <a href="#">Page Templates</a> .
<b>[Template] Show title bar</b>	Determines whether the Windows title bar displays at the top of each graphics page. The title bar contains the title of the window, maximize, minimize and close buttons (at the right hand end of the title bar), and the control menu button (at the left hand end of the title bar).  To display a page in full screen (without a title bar),

Field	Description
	the size of the page needs to be the same size as the display (or larger). If the page is smaller than the display, the title bar still displays, even if full screen mode is enabled. Standard templates styles are available for both page sizes  You can override this default for your own pages at the time you create them, or later.
Background color	The color that will display in the background of new graphics pages.
Preview	This dialog also displays a preview of your page with the defaults applied.

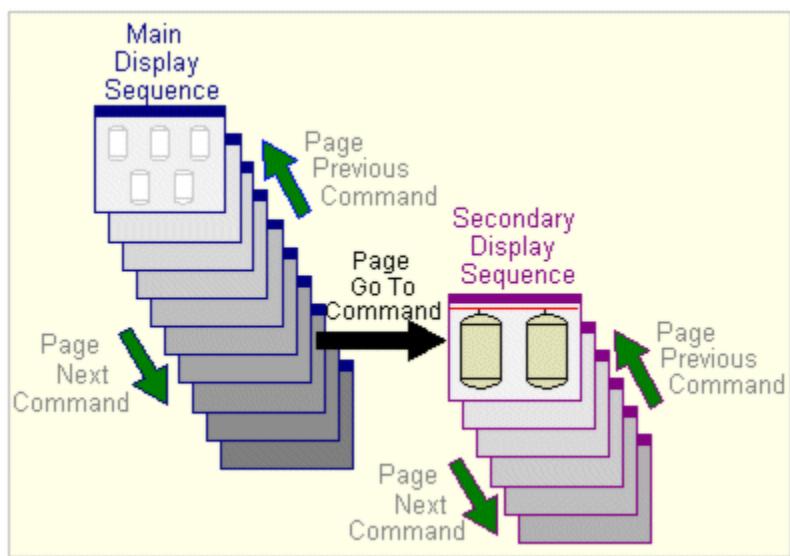

## Use a Browse Sequence

You can link related pages together with a browse sequence. A browse sequence creates a linear navigation sequence for the pages in your system.

When you define a graphics page, you can specify where in the browse sequence the page displays. Within a browse sequence, an operator can display a preceding or following page by choosing **Page Previous** and **Page Next** commands (or a similar set of buttons defined on each page using the PageNext and PagePrev Cicode functions).

When you save a page for the first time it is automatically added to the browse sequence.

You can also use multiple browse sequences by defining a Page GoTo command that displays a page in another (secondary) sequence. The Page Next and Page Previous commands then display the next and previous pages in the secondary sequence, as in the following diagram:

A display sequence is optional. You can define several Page GoTo commands that display specific pages in an hierarchical structure.

## See Also

[Configure a Startup Page and Splash Screen](#)

# Configure a Startup Page and Splash Screen

Every system needs to have a startup page, and some may use a splash screen.

- **Splash screen**

A splash screen is the very first window that is displayed when Plant SCADA starts. It is defined by the parameter [\[Page\]Splash](#).

The splash window has a thin border, is non-movable and is often set to "always on top". It can be used to display project information while the system is initializing, such as a company logo, software version, project version, and so on. By default, it is only displayed for a brief period of time and then automatically dismissed.

- **Startup page**

The startup page is the page that is displayed when Plant SCADA runtime has initialized and become operational. It is defined by the parameter [\[Page\]Startup](#).

The startup page can be displayed before or after the splash window is dismissed. The timing is controlled by the following set of parameters:

- [\[Page\]SplashTimeout](#) - determines how long the splash window will be displayed.
- [\[Page\]StartupDelay](#) - determines how long the startup page will wait before it is displayed.

If the StartupDelay is set to less than the SplashTimeout, the startup page will be displayed while the splash screen is still shown. On the other hand, setting the StartupDelay to be greater than the SplashTimeout will display the startup page after the splash screen is dismissed.

The Example project makes use of the splash screen parameters to specify a page that is displayed as splash screen, and Cicode functions to display product and project information on the splash screen.

The following parameters are used to set up the splash screen in the Example project:

```
[Page]
Splash = !Splash
SplashWinName = Splash
SplashTimeout = 5000
Startup = Menu
StartupWinName = Main
StartupDelay = 5100
HomePage = Menu
```

## See Also

[Secure the Window Title Bar](#)

## Secure the Window Title Bar

You can now specify confirmation actions for standard title bar buttons (minimize, maximize, restore, and close) to override the standard behavior for graphic page windows by writing a Cicode function that defines the alternative action, and specifying that Cicode function using the appropriate [OnEvent](#) function event code. The Cicode function needs to return a value.

If your Cicode function returns a zero value, then the Windows message will be passed on to the default message handler so that the window will continue to execute the default behavior.

If your Cicode function returns non-zero, then the Windows message will not be passed on to the default message handler.

In addition, when you call Cicode function [Shutdown](#), you can decide whether to bypass the confirmation function or not.

## See Also

[Event Functions](#)

[Window Functions](#)

## Display Tags on a Page

You can apply visual cues to a tag displayed on a graphics page, providing greater emphasis to the data presented. For example, you could highlight a bad quality tag value by presenting it in a different color or style.

This type of activity is enabled using the [\[Page\]IgnoreValueQuality](#) parameter, which can be used to display a graphical representation of data quality.

[\[Page\]IgnoreValueQuality](#) can be used in tandem with a number of [\[Page\]](#) parameters to provide different visual outcomes based on the state of a tag. For example, you could change the text background color for a tag according to its current state using the following parameters:

- [\[Page\]BadTextBackgroundColor](#)
- [\[Page\]ErrorTextBackgroundColor](#)
- [\[Page\]UncertainTextBackgroundColor](#)
- [\[Page\]OverrideTextBackgroundColor](#)
- [\[Page\]ControlInhibitTextBackgroundColor](#)

You can also use the parameter [\[Page\]EnableQualityToolTip](#) to enable tool tips that present quality and timestamp data when the cursor is held over a tag.

The Tag Extension Parameters page in the Plant SCADA Example Project provides an interactive example of how these parameters can be implemented.

## See Also

[Tag Extensions](#)

## Create a Template

If you need to generate multiple graphics pages that share a common set of objects, you can create your own page template (from any existing template). You can then use this template to create the required pages with the shared objects, and add individual objects to each.

If you want to delete or change the location of a common object, or to add a new common object, you will not have to change each page; instead, you can change the template. Pages based on that template are automatically updated.

**Note:** When you create a template, save it in the project directory. It is then backed up when you back up the project. Don't modify the supplied standard templates. When you edit a template, you need to use one of the [Update Pages](#) commands (from the **Tools** menu) to update each page based on the template. The properties of the template are not updated automatically.

### Create a Template:

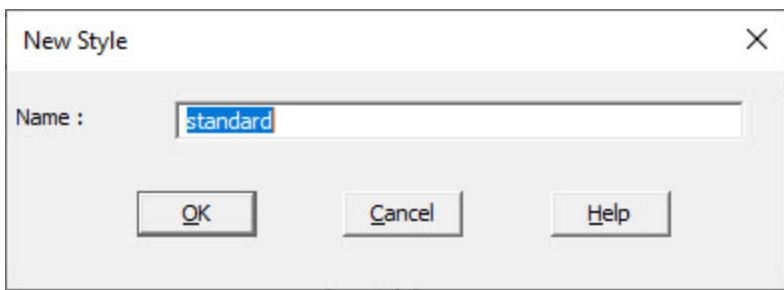

1. Open Graphics Builder.
2. On the **File** menu, select **New**.  
Or:  
Select the **New** button.  

3. On the New dialog box, click **Template**.
4. On the Use Template dialog box, choose a **Template** upon which to base your template (see [Page Templates](#)).
5. Choose a **Style** for the template.
6. If required, select or clear the **Linked** check box (see [Link a Page to a Template](#)).
7. If required, select or clear the **Designed for showing title bar** check box.
8. Choose the **Resolution** for the template (see [Screen Resolution](#)).
9. Click **OK**.

### Save the Current Template:

1. On the **File** menu, select **Save**.  
Or:  
Select the **Save** button.
2. On the Save As dialog box, select the **Project** in which to store the template, and its **Resolution**.
3. Click **OK**.

**Note:** To create a new style for the template, click **New**. You create a new template style using the New Style dialog box. Enter a name for your new style in the **Name** field.

## Link a Page to a Template

When using a template to create a new page, a link can be kept to the template. A page (or template) that is linked with its original template is automatically updated if the template is changed.

When a page is linked to a template, the objects that form the template cannot be accessed from the page by the usual double-click. To display the properties of these objects, hold the **Control** (CTRL) key down and double-click the object you want to view properties for. Alternatively, choose **Tools | Goto Object**, select the group, and click **OK**. However, most of these properties are read-only.

---

**Note:** You can remove the link to the template at any time using **Edit | Cut Link**, but you cannot re-link a page or template with its original template after this has occurred.

---

[Create a Template](#)

## The Bitmap Editor

A bitmap image is a drawing object represented as an array of pixels (or dots), rather than as individual entities. A bitmap is treated as a single object that you can move, copy, and reshape. Because you can edit individual pixels in a bitmap, you can use bitmaps for vignettes and image blending. In a runtime system, bitmaps are displayed differently to other objects. Bitmaps are mapped directly to the screen (that is, each pixel in the image corresponds to a pixel on the screen). Objects are stored as a series of instructions, and are drawn on the screen in the same order as they were drawn on the graphics page.

You can create bitmaps with the Bitmap Editor, or import bitmaps from any other Windows-based bitmap editor. You can use bitmap images on your graphics pages, and as animated symbols. The background color in the Bitmap Editor is always transparent, indicated as a white pixel with a black dot at the center. To draw with the background (transparent) color, click (and hold) the right mouse button.

Flashing colors are represented by a diagonally split pixel, indicating the on-state and off-state colors used.

### To open the Bitmap Editor:

1. Select **Tools | Bitmap Editor**.

### Bitmap Editor Toolbar Buttons

Button	Description
	Exits the Bitmap Editor and saves editing changes.
	Exits the Bitmap Editor and discards changes.
	Zooms in on the image.
	Zooms out on the image.
	Selects a color from the image to set as the current color (keyboard shortcut is <b>Shift+P</b> ). You can also select the current color from the color swatch.
	Displays the <b>Bitmap Size</b> dialog box where you can view the image's current dimensions and edit the image's edge.

**To re-size a bitmap:**

1. In Graphics Builder, click the bitmap.
2. Choose **Tools | Bitmap Editor**, or press **F9**.
3. Click **Resize**. The Bitmap Size dialog box appears.
4. Select a mode. Click **Grow** to enlarge the image, or **Shrink** to reduce it.
5. For each side of the bitmap, specify how many pixels you want to add or remove, then click **OK**.

**To set a color from a bitmap as the current color:**

1. In Graphics Builder, click a bitmap.
2. Choose **Tools | Bitmap Editor**, or press **F9**.
3. Click **Eye Dropper**, and then click a color in the image. The selected color becomes the current color, and is used when you click elsewhere on the image.

**To convert an object (or objects) to a bitmap:**

1. Select the object(s).
2. Choose **Tools | Convert to Bitmap**.

---

**Note:** The Convert to Bitmap operation is only supported in 8-bit (256) color mode.

---

**To paste a bitmap (from another application):**

1. Create the image in an external application.
2. Use the external application's copy command to copy the image to your computer's clipboard.
3. Switch to the graphics builder.

4. Choose **Edit | Paste**.

You can edit pasted bitmaps by selecting the object and then choosing **Edit | Properties**.

**To import a graphic:**

1. Choose **File | Import**. The Import dialog box appears.
2. Select the file you want to import by using the Import dialog box.
3. Click **OK** (or click the file that you want to import and drag it onto a page in Graphics Builder).

You can edit imported bitmaps by selecting the object and then choosing **Edit | Properties**.

**To import a flashing graphic:**

1. Choose **File | Import as Flashing**. The Primary Import dialog box appears.
2. Select the first file you want to use for your flashing image.
3. Click **OK**. The Flashing Import dialog box appears.
4. Select the second file you want to use for your flashing image.

## Update Pages

If you have modified a template, library object, symbol, Genie or Super Genie, you can update all instances where the template, library object, symbol, Genie or Super Genie is in use in your project.

---

**Note:** Before updating your pages it is recommended you back up your project. If your project contains a page using an ActiveX control , and you update pages for that project on a machine that does not have the ActiveX control installed, the page may become corrupted after the update is completed.

---

To update pages in Graphics Builder, go to the **Tools** menu and select **Update Pages in Active and Included Projects**.

## See Also

[Pack Libraries](#)

## Pack Libraries

When you delete library objects (symbols, Genies, Super Genies and page templates), they are marked for deletion and can not be used. However, they will remain in the associated database file. Packing a library deletes all items marked for deletion from the various database files and re-indexes these files.

It is recommended to run the pack operation at regular intervals.

To pack libraries in the Graphics Builder go to the **Tools** menu. You can choose to:

- **Pack Libraries in Active Pages** - this option only deletes items from the active project.
- **Pack Libraries in Active and Include Projects** - this option deletes items from the selected project and its include projects.

# Graphics Objects

Graphics objects are the components you add to a graphics page to create a meaningful representation of the process that the page will monitor. Objects are added to a page via Graphics Builder's drawing toolbox (see [Display the Drawing Toolbox](#)). Each button on the drawing toolbox allows you to add a particular graphic object type to the page that is currently displayed (see [Graphics Object Types](#)). Objects can be moved, reshaped, or copied after they have been added to a page.

Objects are defined by a set of properties that control how the object behaves at runtime. These properties can be used to assign keyboard commands and access rights to an object, and can be configured in such a way that the object will dynamically change at runtime when an expression returns a certain value or a variable tag changes state.

Each object has:

- Properties that relate to the particular object type
- Properties that are common to all objects.

Common object properties can be used to manipulate the following aspects of an object:

- 3D effects
- Visibility
- Movement
- Scaling
- Fill
- Input commands
- Slider control
- Access
- Metadata.

For example, you can associate a tool tip with any object. This is achieved via the object's [General Access to Objects](#) properties. For more information, see [Edit Common Object Properties](#).

---

**Note:** Some objects may not support every common property set. For example, buttons will not support slider behavior.

---

The Object Properties dialog box appears when an object is initially drawn. You can also access it at any time by double-clicking an object.

---

**Note:** Object properties will override any conflicting Cicode display functions.

[Object Groups](#)

## Graphics Object Types

You can add the following graphics object types to a graphics page using the [Display the Drawing Toolbox](#).

Drawing Tool Icon	Description
	<b>Free Hand Line</b> — a hand-drawn line (see <a href="#">Add a Free Hand Line</a> ).
	<b>Straight Line</b> — a straight line (see <a href="#">Add a Straight Line</a> ).
	<b>Rectangle</b> — a square or rectangle (see <a href="#">Add a Rectangle</a> ).
	<b>Ellipse</b> — a circle or ellipse (see <a href="#">Add an Ellipse</a> ).
	<b>Polygon</b> — a multi-sided shape (see <a href="#">Add a Polygon</a> ).
	<b>Pipe</b> — a multi-segment line that feature shading to create a tubular appearance (see <a href="#">Add a Pipe</a> ).
	<b>Text</b> — displays text within a specified area (see <a href="#">Add Text</a> ).
	<b>Number</b> — displays numerical values within a specified area (see <a href="#">Add Numbers</a> ).
	<b>Button</b> — a simple control switch with 'on' and 'off' states (see <a href="#">Add a Button</a> ).
	<b>Symbol Set</b> — a collection of symbols that can be used to create an animation (see <a href="#">Add a Symbol Set</a> ).
	<b>Trend</b> — displays up to eight trends within a specified area (see <a href="#">Add a Trend</a> ).
	<b>Cicode</b> — adds a Cicode object (see <a href="#">Add a Cicode Object</a> ).
	<b>Web Content</b> — adds an object on a graphics page that allows you to view web-based content at runtime

Drawing Tool Icon	Description
	(see <a href="#">Add a Web Content Object</a> ).
	<b>Pasted Symbol</b> — inserts a <a href="#">Symbols</a> on a page. Pasted symbols have different appearance properties to those of normal objects as you can only specify a visibility property (see <a href="#">Paste a Symbol</a> ).
	<b>Pasted Genie</b> — inserts a <a href="#">Genies</a> onto the graphics page (see <a href="#">Paste a Genie</a> ).
	<b>Composite Genie</b> — inserts a <a href="#">Composite Genies</a> onto the graphics page (see <a href="#">Insert a Composite Genie</a> ).
	<b>Process Analyst</b> — displays an instance of Process Analyst within a specified area (see <a href="#">Process Analyst</a> ).
	<b>Database Exchange Control</b> — allows you to connect to a data source (see <a href="#">Add a Database Exchange Control</a> ).
	<b>Scheduler</b> — inserts the <a href="#">Scheduler</a> control onto a graphics page (see <a href="#">Add the Scheduler ActiveX Object to a Page</a> ).
	<b>ActiveX</b> — an ActiveX object (see <a href="#">Add an ActiveX Object</a> ).

[Graphics Objects](#)

[Object Groups](#)

## Object Groups

You can group multiple objects together to create an object group. An object group can even include a mix of objects and other object groups.

An object group has a set of properties (similar to an individual object) which determine the runtime behavior of the group as a whole (for example, when an expression returns a certain value or a variable tag changes state). The properties of the individual objects in the group remain unchanged.

To edit or view the properties of a group, double-click it. If there are several groups on your page, you can use the **Go to Object** tool (accessible via the **Tools** menu). This allows you to see which groups and objects are on your page, making it easier for you to select the object you want to edit. It also allows you to display the properties of the objects (or groups) that make up the group (see [Locate an Object](#)).

You can also edit the properties of an object in the group by holding down the **Control** (CTRL) key and double-clicking the object.

[Group Objects](#)

## Configure Graphics Objects

Graphics objects are added to a page via Graphics Builder's drawing tool (see [Display the Drawing Toolbox](#)).

You can use this tool to perform the following tasks in Graphics Builder:

- [Add a Free Hand Line](#)
- [Add a Straight Line](#)
- [Add a Rectangle](#)
- [Add an Ellipse](#)
- [Add a Polygon](#)
- [Add a Cicode Object](#)
- [Paste a Symbol](#)
- [Paste a Genie](#)
- [Add a Web Content Object](#)
- [Add an ActiveX Object](#)
- [Add a Database Exchange Control](#)

Each object type also has a set of properties that are common to all objects. For more information, see [Edit Common Object Properties](#).

[Graphics Object Types](#)

## Add a Free Hand Line

The Free Hand Line tool allows you to draw lines. Lines can be moved, re-sized, reshaped, brought to the front and so on, and their properties edited just like other types of object.

**To draw a free hand line:**

1. Click the Free Hand tool.  

2. Move the cursor to where you want the line to start.
3. Click and drag the cursor to draw the line.

When you release the mouse button, the object properties dialog for the line is displayed.

## Freehand Line Properties - Appearance (General)

Free Hand Line drawings have the following general appearance properties.

Property	Description
[Line] Width	The width of the line (in pixels). You can change the width by clicking the up and down arrows to the right of the field, or by entering another value in this field. If you make the line more than 1 pixel wide, it needs to be solid.
[Line] Style	The style of the line. You can choose one of the following line styles: <ul style="list-style-type: none"> <li> - Solid</li> <li> - Dash</li> <li> - Dot</li> <li> - Dash Dot</li> <li> - Dash Dot Dot</li> </ul> To change the style, choose a style from the menu to the right of this field.
[Line] Color	The color of the line.
[Fill] Filled	The Filled check box determines whether the object will be filled with a color. If you check this box, an invisible line is drawn from one end of your line to the other. Everything between the invisible line and your line will be filled.  - unfilled  - filled
[Fill] Color	The color with which the object will be filled. The color that you select as your fill color here is static. To specify a fill color that changes with runtime conditions, click the <b>Fill</b> tab. If you have enabled the Fill (Color) properties, be aware that the color you select here will override the OFF color for Fill Color (On/Off), the ABC color for Fill Color (Multi-state), Array Color 0 for Fill Color (Array), and the At minimum color for Fill Color (Gradient).

For help on the remaining properties tabs, see [Edit Common Object Properties](#).

### Add a Straight Line

The Straight Line tool allows you to draw straight lines. Straight lines can be moved, re-sized, reshaped, brought to the front and so on, and their properties edited just like any other type of object.

#### To draw a straight line:

1. Click the **Straight Line** tool.

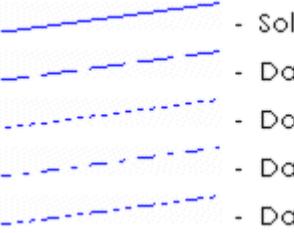

2. Move the cursor to where you want to start the line.
3. Click and drag to draw the line. (If you hold the **Ctrl** key while drawing the line it is constrained to the vertical or horizontal).

When you release the mouse button, the object properties dialog for the line is displayed.

### Straight Line Properties - Appearance (General)

Straight Lines have the following general appearance properties.

Property	Description
[Line] Width	The width of the line (in pixels). You can change the width by clicking the up and down arrows to the right of the field, or by entering another value in this field. If you make the line more than 1 pixel wide, it needs to be solid.
[Line] Style	The width of the line (in pixels). You can change the width by clicking the up and down arrows to the right of the field, or by entering another value in this field. If you make the line more than 1 pixel wide, it needs to be solid.  The style of the line. You can choose from the following line styles:   <ul style="list-style-type: none"><li>- Solid</li><li>- Dash</li><li>- Dot</li><li>- Dash Dot</li><li>- Dash Dot Dot</li></ul> <p>To change the style, choose a style from the menu to</p>

Property	Description
	the right of this field.
[Line] Color	The color of the line.

For help on the remaining properties tabs, see [Edit Common Object Properties](#).

[Graphics Object Types](#)

### Add a Rectangle

Use the Rectangle tool to draw rectangles and squares. Rectangles and squares can be moved, re-sized, reshaped, brought to the front and so on, and their properties edited just like other types of object.

#### To draw a rectangle:

1. Click the **Rectangle** tool.

2. Move the cursor to where you want the rectangle to start.
3. Click and drag the mouse to the opposite corner of the rectangle and release the mouse button. If you hold the **Shift** key before you start drawing the rectangle, it is drawn from its center outwards.

When you release the mouse button, the object properties dialog for the rectangle is displayed.

#### To draw a square:

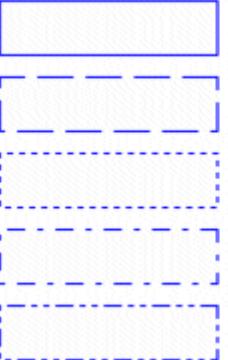

1. Click the **Rectangle** tool.
2. Click (and hold) the **Ctrl** key.
3. Move the cursor to where you want the square to start and click (and hold) the mouse button.
4. Drag the cursor to the opposite corner of the square and release the mouse button. If you hold the **Shift** key (and the **Ctrl** key) before you start drawing the square, it is drawn from its center outwards.

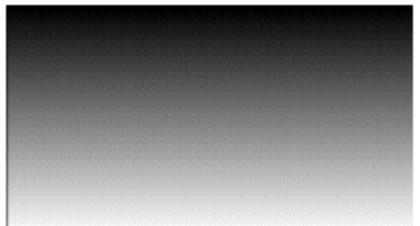

When you release the mouse button, the object properties dialog for the square is displayed.

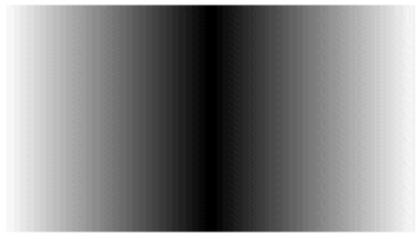

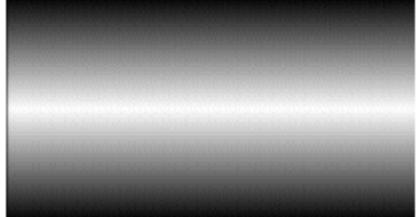

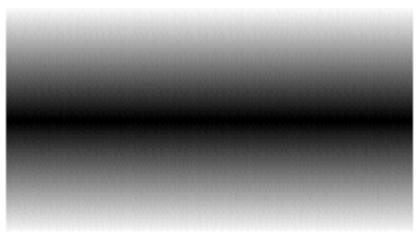

## Rectangle Properties - Appearance (General)

Rectangles have the following general appearance properties.

Property	Description
[Line] Width	The width of the line (in pixels). You can change the width by clicking the up and down arrows to the right of the field, or by entering another value in this field. If you make the line more than 1 pixel wide, it needs

Property	Description
	to be solid.
<b>[Line] Style</b>	<p>The outline style of the rectangle. You can choose one of the following line styles:</p>  <ul style="list-style-type: none"> <li>- Solid</li> <li>- Dash</li> <li>- Dot</li> <li>- Dash Dot</li> <li>- Dash Dot Dot</li> </ul> <p>To change the style, choose a style from the menu to the right of this field.</p>
<b>[Line] Color</b>	The outline color of the rectangle.
<b>[Fill] Filled</b>	The Filled check box determines whether the object will be filled with a color.
<b>[Fill] Color</b>	<p>The color with which the rectangle will be filled. The color that you select as your fill color here is static.</p> <p>To specify a fill color that changes with runtime conditions, click the <b>Fill</b> tab.</p> <p>If you have enabled the Fill (Color) properties, be aware that the color you select here will override the OFF color for Fill Color (On/Off), the ABC color for Fill Color (Multi-state), Array Color 0 for Fill Color (Array), and the At minimum color for Fill Color (Gradient).</p>
<b>[Object type] Extra line</b>	Adds an extra line (1 pixel width) of lowlight color to the rectangle, if the rectangle is defined as Raised or Lowered (click the 3D Effects tab).
<b>[Gradient] Color</b>	<p>Controls the color of the gradient fill between the fill color and the gradient color. This option is available only when the <b>Filled</b> and <b>Gradient Fill</b> check boxes are selected. The gradient is updated at runtime to reflect the gradient between the two colors selected.</p> <p>Gradient fills support flashing colors.</p> <p>Gradients will not rotate with an object; for example, if an object contains a left-to-right gradient fill and is rotated 90 degrees (either at runtime or in Graphics</p>

Property	Description
	Builder), the gradient is still left to right.
<b>[Gradient] Direction</b>	<p>The direction to be used for the gradient color. Use the table below as a guide to choose the gradient color direction you want.</p> 
	<p>Left to Right</p> 
	<p>Right to Left</p> 
	<p>Top to Bottom</p> 
	<p>Bottom to Top</p>

Property	Description
	
	
	
	
<b>[Object type] Border</b>	Adds an extra line (1 pixel width) of black to the perimeter of the rectangle.
<b>[Object type] Corner Radius</b>	Controls the radius of the corners of the rectangle. Enter a value between 0 and 32. The higher the value, the more rounded the corners of the rectangle.  When the radius is greater than 0, the <b>Extra line</b> and <b>Border</b> options are not available.

For help on the remaining properties tabs, see [Edit Common Object Properties](#).

### Add an Ellipse

You use the Ellipse tool to draw ellipses, circles, arcs, and pie-slices. Ellipse objects can be moved, re-sized, reshaped, brought to the front and so on, and their properties edited just like other types of object.

#### To draw an ellipse:

1. Click the **Ellipse** tool.

2. Move the cursor to a corner of the bounding rectangle (marquee) and click (and hold) the mouse button.
3. Drag the cursor to the opposite corner of the bounding rectangle and release the mouse button. If you hold the **Shift** key before you start drawing the ellipse, it is drawn from its center outwards.

When you release the mouse button, the object properties dialog for the ellipse is displayed.

#### To draw a circle:

1. Click the **Ellipse** tool.
2. Click (and hold) the **Ctrl** key.
3. Move the cursor to a corner of the bounding rectangle (marquee) and click (and hold) the mouse button.
4. Drag the cursor to the opposite corner of the bounding rectangle and release the mouse button. If you hold the **Shift** key and the **Ctrl** key before you start drawing the circle, it is drawn from its center outwards.

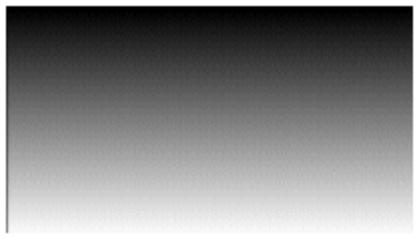

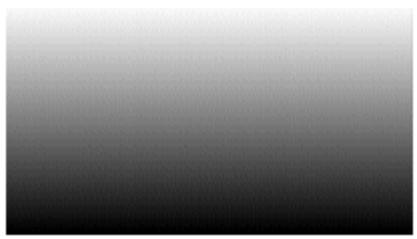

When you release the mouse button, the object properties dialog for the circle is displayed.

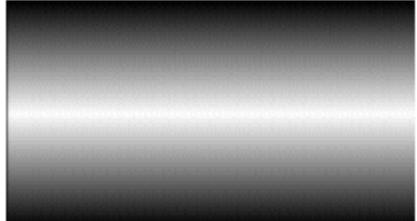

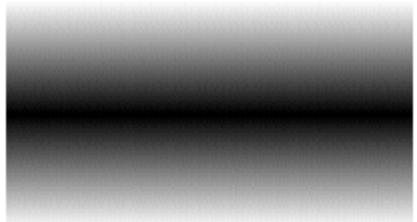

### Ellipse Properties - Appearance (General)

Ellipses have the following general appearance properties:

Property	Description
[Line] Width	The width of the outline of the ellipse (in pixels). You can change the width by clicking the up and down arrows to the right of the field, or by entering another value in this field. If you make the line more than 1 pixel wide, the line style will be solid.
[Line] Style	The outline style of the ellipse. You can choose one of the following line styles:

Property	Description
	 <p>- Solid  - Dash  - Dot  - Dash Dot  - Dash Dot Dot</p> <p>To change the style, choose a style from the menu to the right of this box.</p>
[Line] Color	The outline color of the ellipse.
[Fill] Filled	The Filled check box determines whether the ellipse will be filled with a color.
[Fill] Color	<p>The color with which the ellipse will be filled. The color that you select as your fill color here is static.</p> <p>To specify a fill color that changes with runtime conditions, click the Fill tab. If you have enabled the Fill (Color) properties, be aware that the color you select here will override the OFF color for Fill Color (On/Off), the ABC color for Fill Color (Multi-state), Array Color 0 for Fill Color (Array), and the At minimum color for Fill Color (Gradient).</p>
[Gradient] Color	<p>Controls the color of the gradient fill between the fill color and the gradient color. This option is available only when the <b>Filled</b> and <b>Gradient Fill</b> check boxes are selected. The gradient is updated at runtime to reflect the gradient between the two colors selected.</p> <p>Gradient fills support flashing colors.</p> <p>Gradients will not rotate with an object; for example, if an object contains a left-to-right gradient fill and is rotated 90 degrees (either at runtime or in Graphics Builder), the gradient is still left to right.</p>
[Gradient] Direction	The direction to be used for the gradient color. Use the table below as a guide to choose the gradient color direction you want.

Property	Description
	 A horizontal gradient bar transitioning from black on the left to white on the right.
	<p>Left to Right</p>  A horizontal gradient bar transitioning from white on the left to black on the right.
	<p>Right to Left</p>  A horizontal gradient bar transitioning from white at the top to black at the bottom.
	<p>Top to Bottom</p>  A horizontal gradient bar transitioning from black at the top to white at the bottom.
	<p>Bottom to Top</p>  A horizontal gradient bar transitioning from black on the left and right to white in the center.
	<p>Horizontal Gradient to Middle</p>

Property	Description
	 Horizontal Gradient from Middle   Vertical Gradient to Middle   Vertical Gradient from Middle
<b>[Object type] Ellipse</b>	<p>Select this radio button if you want to the object to be a full ellipse.</p>  For a full ellipse, you are not required to specify Start and End angles.
<b>[Object type] Pie-slice</b>	<p>Select this radio button if you want to remove a section from your ellipse (i.e., you want it to resemble a pie-slice).</p> <p>If you select this option, you can specify a Start angle, and an End angle:</p>
<b>Start angle</b>	<p>The angle (measured clockwise from 0 degrees) of the section to be removed from the ellipse. For example, if you enter a start angle of 50 degrees, your pie-slice would look something like this:</p>

Property	Description
	
<b>End angle</b>	<p>The angle (measuring clockwise from 0 degrees) of the section of the ellipse which is to remain. For example, if you enter an end angle of 150 degrees, your pie-slice would look something like this:</p>  <p>Start and End angles can be combined for various effects. For example, a Start angle of 270 degrees, and an End angle of 150 degrees would produce the following pie-slice:</p> 
<b>[Object type] Arc</b>	<p>Select this radio button if you want to draw an arc. If you select this option, you can specify a Start angle, and an End angle:</p>
<b>Start angle</b>	<p>The angle (measured clockwise from 0 degrees) defining the segment to be removed from the ellipse, leaving an arc. For example, if you enter a start angle of 50 degrees, your arc would look something like this:</p> 
<b>End angle</b>	<p>The angle (measuring clockwise from 0 degrees) defining the segment of the ellipse which is to remain. For example, if you enter an end angle of 150 degrees, your pie-slice would look something like this:</p>  <p>Start and End angles can be combined for various effects. For example, a Start angle of 270 degrees, and an End angle of 150 degrees would produce the following arc:</p> 

For help with the other properties, see [Edit Common Object Properties](#).

### Add a Polygon

Use the Polygon tool to draw polygons and polylines. Polygons can be moved, re-sized, reshaped, brought to the front and so on, and their properties edited just like other types of object.

---

**Note:** You can manipulate the shape of a polygon at runtime by associating an expression with the polygon vertices. See [Animate a Polygon at Runtime](#) for a description of a polygon's Vertices properties.

---

#### To draw a polygon:

1. Click the **Polygon** tool.

2. Move the cursor to where you want the polygon to start and click and hold the mouse button.
3. At the end of the first line segment, release the mouse button.
4. Move the cursor to each point on the polygon in turn, and click the mouse button (clicking and dragging is not necessary after the first segment).
5. To draw horizontally or vertically only, hold the **Ctrl** key down when you are drawing the polygon.
6. To complete the polygon, double-click the mouse button.

When you complete the polygon, the object properties dialog is displayed.

#### To draw a polyline:

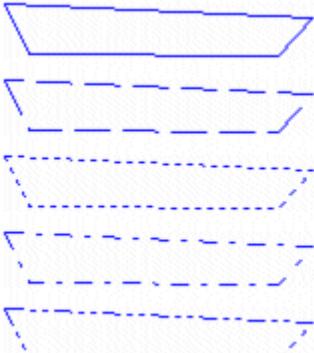

1. Click the **Polygon** tool.
2. Move the cursor to where you want the polyline to start and click and hold the mouse button.
3. At the end of the first line segment, release the mouse button.
4. Move the cursor to each point on the polyline in turn and click the mouse button (clicking and dragging is not necessary after the first segment).
5. To draw horizontally or vertically only, hold the **Ctrl** key down when you are drawing the polyline.
6. To complete the polyline, double-click the mouse button.

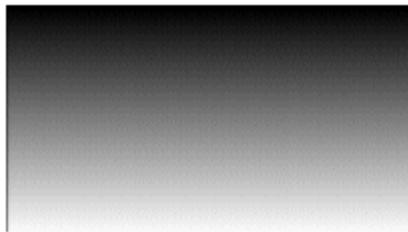

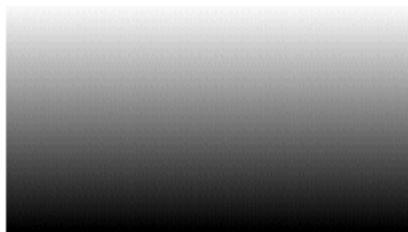

When you release the mouse button, the object properties dialog for the circle is displayed.

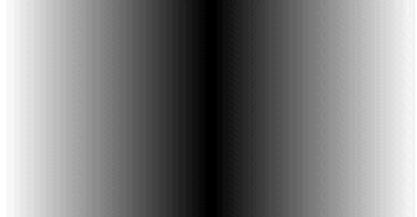

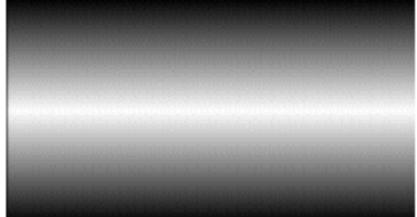

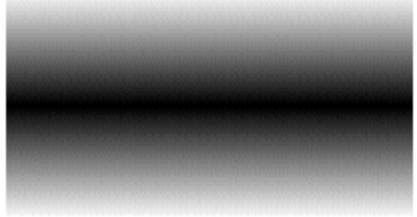

Initially, the object will actually be a polygon. To change it to a polyline, in the object's properties dialog define it as **[Object type] Open**.

### Polygon Properties - Appearance (General)

Polygons have the following general appearance properties:

Property	Description
[Line] Width	<p>The width of the outline of the polygon (in pixels). You can change the width by clicking the up and down arrows to the right of the field, or by entering another value in this field.</p> <p>If you make the line more than 1 pixel wide, the line style will be solid.</p>
[Line] Style	<p>The outline style of the polygon. You can choose one of the following line styles:</p>  <ul style="list-style-type: none"> <li>- Solid</li> <li>- Dash</li> <li>- Dot</li> <li>- Dash Dot</li> <li>- Dash Dot Dot</li> </ul> <p>To change the style, choose a style from the menu to the right of this box.</p>
[Line] Color	The outline color of the polygon.
[Fill] Filled	The Filled check box determines whether the polygon will be filled with a color.
[Fill] Color	<p>The color with which the polygon will be filled. The color that you select as your fill color here is static. To specify a fill color that changes with runtime conditions, click the Fill tab. If you have enabled the Fill (Color) properties, be aware that the color you select here will override the OFF color for Fill Color (On/Off), the ABC color for Fill Color (Multi-state), Array Color 0 for Fill Color (Array), and the At minimum color for Fill Color (Gradient).</p>
[Gradient] Color	<p>Controls the color of the gradient fill between the fill color and the gradient color. This option is available only when the <b>Filled</b> and <b>Gradient Fill</b> check boxes are selected. The gradient is updated at runtime to reflect the gradient between the two colors selected. Gradient fills support flashing colors.</p> <p>Gradients will not rotate with an object; for example, if an object contains a left-to-right gradient fill and is</p>

Property	Description
	rotated 90 degrees (either at runtime or in Graphics Builder), the gradient is still left to right.
<b>[Gradient] Direction</b>	<p>The direction to be used for the gradient color. Use the examples below as a guide to choose the gradient color direction you want.</p> 
	<p>Left to Right</p> 
	<p>Right to Left</p> 
	<p>Top to Bottom</p>  <p>Bottom to Top</p> 

Property	Description
	
	Horizontal Gradient to Middle
	
	Horizontal Gradient from Middle
	
	Vertical Gradient to Middle
	
	Vertical Gradient from Middle
<b>[Object type] Open</b>	Defines the object as a polyline (the first point and the last point are not joined)..
<b>[Object type] Closed</b>	Defines the object as a polygon (the first point and the last point are joined).

For a description of a polygon's Vertices properties, see [Animate a Polygon at Runtime](#).

For help with the other properties, see [Edit Common Object Properties](#).

[Graphics Object Types](#)

### Animate a Polygon at Runtime

Plant SCADA allows you to associate a tag or Cicode expression with the vertices of a polygon. This means the shape of a polygon can be manipulated at runtime in response to values generated by a production system.

This is achieved by applying offset values to a vertex (in relation to its location) that define a path along which the vertex can move at runtime.

- **From Offset X** and **From Offset Y** define the starting point for the vertex path.
- **To Offset X** and **To Offset Y** define the end point for the vertex path.

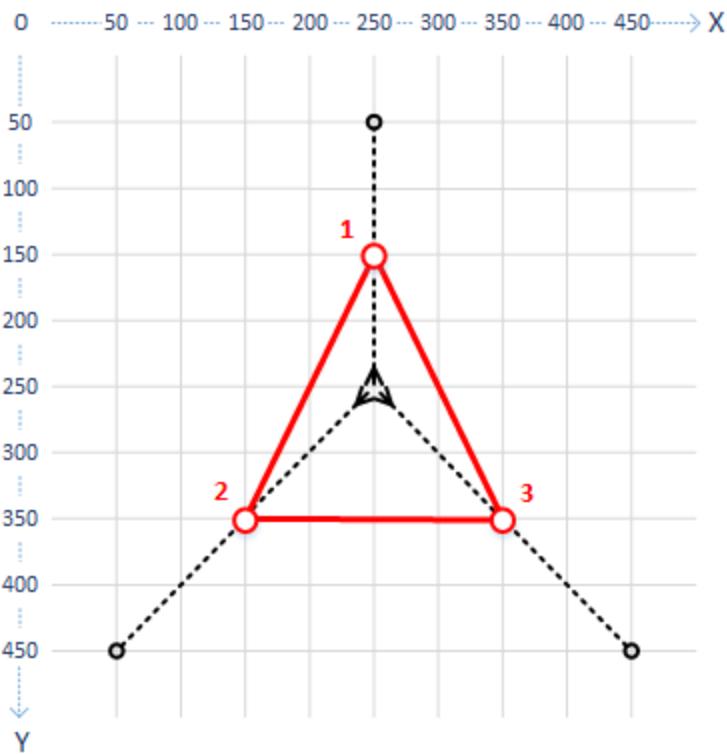

As the return value for the expression changes, the vertex will move along the path defined for it, altering the shape of the polygon.

## Example

A triangle is placed on a graphics page with the following settings configured for its three vertices.

Vertex	Location		From Offset		To Offset		Specified Range	
	X	Y	X	Y	X	Y	Min	Max
1	250	150	0	+100	0	-100	0	100
2	150	350	+100	-100	-100	+100	0	100
3	350	350	-100	-100	+100	+100	0	100

The following diagram shows the triangle with the path defined for each vertex by its offset values. In each case, the defined path starts at the center of the triangle and extends outwards.

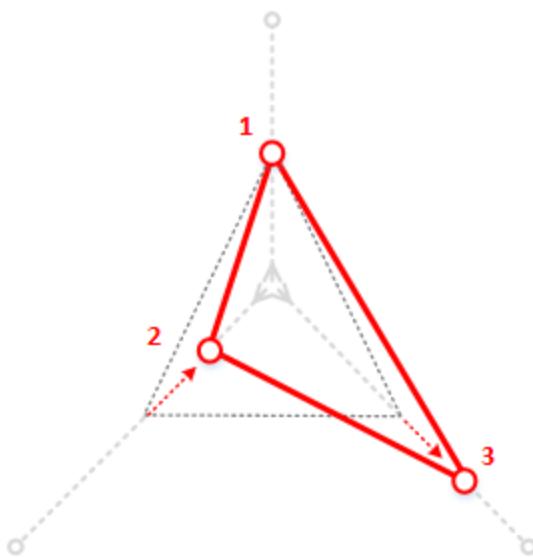

To manipulate the shape of the triangle at runtime, the following expressions could be added to the vertices.

Vertex	Expression
1	Tag1
2	Tag2
3	Tag3

Assuming the following list represents the current tag values, the triangle would appear as displayed below.

- Tag1 = 50
- Tag2 = 25
- Tag3 = 75

You can also apply a range to a vertex that specifies the start point and end point values for its path. By default, this range is set to 0—100.

If you need to accommodate a different range of return values for an expression, select the **Specify Range** option when configuring the vertex properties.

## Vertices Properties

Polygon vertices have the following properties:

Property	Description
[Vertices] Vertex	A number automatically applied to each vertex in a polygon, based on the order in which they were drawn. To set the properties for a particular vertex, select it within this list.
[Vertices] X	The location of a vertex along the horizontal axis of the page (in pixels). Zero (0) represents the left edge of the page.
[Vertices] Y	The location of a vertex along the vertical axis of the page (in pixels). Zero (0) represents the top edge of the page.
Expression for Vertex: <n>	The tag value or Cicode expression used to determine the location of the selected vertex at runtime. As the return value for the expression changes, the vertex will move along the path defined by its offset values (see below). To insert a tag or a function, click the Wizard button to

Property	Description
	the right of this field. This button displays two options: Insert Tag and Insert Function.
<b>Specify Range</b>	<p>Select this option if you would like to specify the start and end values for the vertex path.</p> <p>This option will be required if the return values from an expression span a different range to the default setting of 0—100.</p>
<b>[Specify Range] Minimum</b>	<p>Enter the minimum return value that you would like to use for the vertex range. When this value is returned, the vertex will shift to the location specified by the <b>From Offset</b> values.</p> <p>You can only enter a value here if you have selected the <b>Specify</b> range box.</p>
<b>[Specify Range] Maximum</b>	<p>Enter the maximum return value that you would like to use for the vertex range. When this value is returned, the vertex will shift to the location specified by the <b>To Offset</b> values.</p> <p>You can only enter a value here if you have selected the <b>Specify</b> range box.</p>
<b>[From Offset] X</b>	<p>The distance (in pixels) along a horizontal axis that the vertex will shift when the expression returns the minimum value in the specified range. You can shift the vertex to the left by entering a negative offset value.</p> <p>You can change the offset value by pressing the up and down arrows to the right of the field, or by directly entering a value.</p>
<b>[From Offset] Y</b>	<p>The distance (in pixels) along a vertical axis that the vertex will shift when the expression returns the minimum value in the specified range. You can shift the vertex towards the top of the page by entering a negative offset value.</p> <p>You can change the offset value by pressing the up and down arrows to the right of the field, or by directly entering a value.</p>
<b>[To Offset] X</b>	<p>The distance (in pixels) along a horizontal axis that the vertex will shift when the expression returns the maximum value in the specified range. You can shift the vertex to the left by entering a negative offset value.</p>

Property	Description
	You can change the offset value by pressing the up and down arrows to the right of the field, or by directly entering a value.
[To Offset] Y	The distance (in pixels) along a vertical axis that the vertex will shift when the expression returns the maximum value in the specified range. You can shift the vertex towards the top of the page by entering a negative offset value.  You can change the offset value by pressing the up and down arrows to the right of the field, or by directly entering a value.

## Add a Pipe

Use the Pipe tool to draw pipes with automatic three-dimensional shading. Pipes can be moved, re-sized, reshaped, brought to the front and so on, and their properties edited just like other types of object.

### To draw a pipe:

1. Click the **Pipe** tool.

2. Move the cursor to where you want the pipe to start, and click and hold the mouse button.
3. At the end of the first line segment, release the mouse button.
4. Move the cursor to each point on the path in turn and click the mouse button (clicking and dragging is not necessary after the first segment).
5. To complete the pipe, double-click the mouse button.

When you complete the pipe, the object properties dialog is displayed.

To draw horizontally or vertically only, hold the **Ctrl** key down when drawing the pipe.

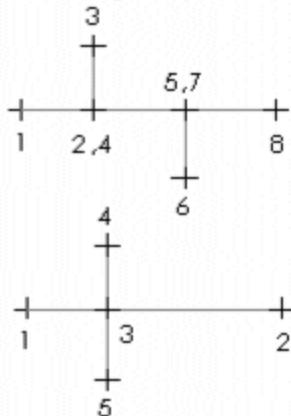

## Drawing Complex Pipe Arrangements

Use the Pipe tool to draw complex pipe arrangements (including 'T' pieces and junctions). The illustration below shows some pipes, and the sequence of mouse clicks needed to draw each of them:

To draw this pipe ...

... follow this mouse clicking sequence

**Hint:** Use the grid to assist in accurate positioning for each click.

## Pipe Properties - Appearance (General)

Pipes have the following general appearance properties.

Property	Description
[Line] Width	The width of the pipe (in pixels). You can change the width by clicking the up and down arrows to the right of the field, or by entering another value in this field. Every pipe needs to be at least 1 pixel wide.
[Line] Highlight Color	The color of the pipe where it is "in the light"; that is, the brightest color on the pipe.
[Line] Lowlight Color	The color of the pipe where it is "in shadow"; that is, the dullest color on the pipe.

For help on the remaining properties tabs, see [Edit Common Object Properties](#).

## See Also

[Graphics Object Types](#)

## Add Text

Use the Text tool to type text on the page. Text can be moved, re-sized, reshaped, brought to the front and so on, and their properties edited just like other types of object.

### To add text:

1. Click the **Text** tool.

2. Type your text on the keyboard. (Press **Enter** to start a new line.)
3. Move the cursor to where you want to position the text and click the left mouse button.

When you click the mouse button to place the text, the object properties dialog is displayed.

**Note:** You can adjust the appearance properties for a text object by selecting **Font** from Graphics Builder's **Text** menu.

## Text Properties - Appearance (General)

Text has the following general appearance properties

Property	Description
<b>Font</b>	The font used to display the text. Use the scroll bar to the right to view available fonts, or type the font name, or part of it, directly into this field.
<b>Style</b>	Select whether you would like the text to be Regular, <b>Bold</b> , <b>Bold Italic</b> , or <i>Italic</i> .
<b>Size</b>	Define the size of the text (point size). Available sizes might vary according to the selected printer and the selected font.
<b>[Alignment] Left</b>	Select this radio button to align the text to the left of the text box.
<b>[Alignment] Right</b>	Select this radio button to align the text to the right of the text box.
<b>[Alignment] Center</b>	Select this radio button to align the text in the center of the text box.
<b>[Effect] Strikeout</b>	Select this box to make the text will appear with a line through it.
<b>[Effect] Underline</b>	Select this box to underline the text.
<b>Text</b>	This field contains the text that will display on the page. You can enter any keyboard character(s). You can edit the text here, or directly from the graphics page. It is useful to edit text at this field, as you can apply text changes at the same time as you apply other font and color changes.  This text changes automatically depending on the Display Value properties that you define.

Property	Description
<b>Foreground</b>	The color of the text.
<b>Script</b>	<p>The script for the text.</p> <p><b>Note:</b> If the selected script is not supported by the selected font, a warning icon will appear next to the drop-down. The icon will display a tool tip that explains, the combination is unsupported and a different font will be used at runtime.</p>

**Note:** There are several radio buttons in Display Value (On/Off, Multi-state and so on). When selected, these radio buttons change the appearance of the right hand side of the dialog.

## Text Properties - Appearance (Display Value)

Text has the following display value appearance properties. Selecting one of the following five options changes the appearance of the right hand side of the dialog.

Property	Description
<b>[Type] On / Off</b>	<p>Changes the text which displays when a particular condition is met, and another when it is not. For example, you could display an alarm message when a particular variable tag is in alarm, and a normal message when it is not.</p> <p>See <a href="#">Text Properties - Appearance Display Value (On/Off)</a>.</p>
<b>[Type] Multi-state</b>	<p>This option is useful when you have several possible conditions, occurring together in different combinations, at different times. Select this option to display different text for each combination.</p> <p>For example, three digital variable tags (A,B, and C) can each be ON or OFF at any time. You can display a different message for each ON/OFF combination. In other words, you could display a different message for each of the following ON/OFF combinations ABC, ABC, ABC, ABC, ABC, ABC, ABC.</p> <p>.</p>
<b>[Type] Array</b>	<p>Allows you to enter an expression which returns an integer. For each integer (from 0-255), you can display different text. For example, you could display a different message for each state of an analog tag.</p> <p>See <a href="#">Text Properties - Appearance Display Value (Array)</a>.</p>

Property	Description
[Type] Numeric	Displays the value of a tag or expression in numeric format (you can specify the format). See <a href="#">Text Properties - Appearance Display Value (Numeric)</a> .
[Type] String	Displays the value of an expression as a string. See <a href="#">Text Properties - Appearance Display Value (String)</a>

## See Also

[Graphics Object Types](#)

### Text Properties - Appearance Display Value (On/Off)

Text has the following On/Off Display Value properties:

Property	Description
<b>ON text when</b>	The text entered in the <b>ON text</b> field (below) appears when the condition entered here is true. The text can be a maximum of 128 characters long. To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options; <b>Insert Tag</b> , and <b>Insert Function</b> .
<b>OFF text</b>	The text that will display whenever the condition entered above is false. You can use any keyboard character(s) to a maximum length of 256 characters. For example, you could display the message <b>Conveyor 110 Normal</b> when <b>CV110_ERROR.On</b> is false (i.e., there is no alarm at conveyor 110).
<b>ON text</b>	The text that will display whenever the condition entered above is true. You can enter any keyboard character(s) to a maximum length of 256 characters. For example, you could display the message <b>Conveyor 110 Alarm</b> when <b>CV110_ERROR.On</b> is true (i.e. there is no alarm at conveyor 110).

Click **Clear Property** to clear property details and disable the property.

## See Also

[Text Properties - Appearance Display Value \(Array\)](#)

[Text Properties - Appearance Display Value \(Numeric\)](#)

[Text Properties - Appearance Display Value \(String\)](#)

### Text Properties - Appearance Display Value (Multi-state)

Text has the following multi-state display value properties:

#### Conditions

The conditions you enter here will occur together in different ways, at different times. You can use each different combination to determine the text that will display.

The default number of conditions is 3, but you can add more (to a maximum of 5 conditions, providing 32 combinations), using the **Add** button. You can also delete conditions using the **Delete** button, but you need to enter a condition in this field. To enter a condition, click the relevant line (A, B, C, etc.), and click **Edit**. To insert a tag or function, click the **Wizard** button. This button displays two options: Insert Tag and Insert Function.

**Note:** You can also insert Equipment.item references into expression fields using the **insert tag** option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.

#### State text

The text that is to display for each combination of the above conditions. You can enter any keyboard character(s).

For example:

To display different messages about the status of a valve, you could fill out the **Conditions** and **State text** fields as follows:

Conditions		State text	
A	Open Feedback	ABC	Valve Inoperable
B	Close Feedback	ABC	Valve Inoperable
C	Open Output	ABC	Valve Closed
		ABC	Valve Inoperable
		ABC	Valve Inoperable
		ABC	Valve Open
		ABC	Valve Inoperable
		ABC	Valve Inoperable

In this example, **Open\_Feedback** and **Close\_Feedback** are variable tags representing digital inputs on the valve; **Open\_Output** is a variable tag representing an output on the valve. So, ABC means **Open\_Feedback** is on, and **Close\_Feedback** and **Open\_Output** are both off. For this combination, the text "Valve Inoperable" will display, because the valve is open when it is meant to be closed. The same type of logic applies to the rest of the states.

Click **Clear Property** to clear property details and disable the property.

### See Also

[Text Properties - Appearance Display Value \(On/Off\)](#)

[Text Properties - Appearance Display Value \(Array\)](#)

[Text Properties - Appearance Display Value \(Numeric\)](#)

[Text Properties - Appearance Display Value \(String\)](#)

## Text Properties - Appearance Display Value (Array)

Text has the following Array Display Value properties:

### Array expression

Enter the expression which is to return one or more integers. For each returned integer, a different piece of text is displayed.

If the return value is:

- Less than 0 (zero), it will be set to 0 (zero), and a runtime hardware alarm will be triggered.
- Greater than 255, it will be set to 255, and a runtime hardware alarm will be triggered.
- A real (non-integer) number, it will be rounded off to the nearest integer.

To insert a tag or a function, click the **Wizard** button to the right of this field. This button displays two options: Insert Tag and Insert Function.

**Note:** You can also insert Equipment.item references into expression fields using the **insert tag** option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.

### Array text

The text that is to display for each integer returned by the Array expression entered above. You can enter any keyboard character(s).

For example, to display different messages about the status of a motor, you could fill out the **Array expression** and **Array text** fields as follows:

Array expression	Array text	
MOTOR_STATUS	0	Running
	1	Starting
	2	Stopping
	3	Stopped - Normal
	4	Stopped - Error
	5	Isolated

In this example, MOTOR\_STATUS is an analog variable tag representing the status of a motor. When the motor changes state, an integer is returned (0 = Running, 1 = Starting etc.) and the appropriate text displays.

Click **Clear Property** to clear property details and disable the property.

## See Also

[Text Properties - Appearance Display Value \(On/Off\)](#)

[Text Properties - Appearance Display Value \(Multi-state\)](#)

[Text Properties - Appearance Display Value \(Numeric\)](#)

## [Text Properties - Appearance Display Value \(String\)](#)

### **Text Properties - Appearance Display Value (Numeric)**

Text has the following Numeric Display Value properties.

#### **Numeric expression**

The value of the expression entered here will be displayed on the graphics page. It will be formatted according to the format selected.

To insert a tag or a function, click the **Wizard** button to the right of this field. This button displays two options: Insert tag and Insert Function.

---

**Note:** You can also insert Equipment.item references into expression fields using the **insert tag** option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.

#### **Format**

The value returned for the expression entered above displayed according to the format you enter here. For example, the analog variable tag **MOTOR\_STATUS** returns integers 0-5. If you enter this tag as the Numeric expression above, and enter **#.##** as your format, the display will alternate between **0.00**, **1.00**, **2.00**, **3.00**, **4.00**, and **5.00**. You can select a format from the drop-down list, or type in your own. If the numeric expression is a single variable, its format is overwritten by the format you enter here.

---

**Note:** To display the Variable Tag's unit as defined in the Eng unit ( System Model | Variables) field select **#!** from the drop down list.

Click **Clear Property** to clear property details and disable the property.

[Text Properties - Appearance Display Value \(Array\)](#)

[Text Properties - Appearance Display Value \(String\)](#)

### **Text Properties - Appearance Display Value (String)**

Text has the following String Display Value properties.

#### **String Expression**

The value of the expression entered here will be displayed as a string on the graphics page.

To insert a tag or a function, click the **Wizard** button to the right of this field. This button displays two options: Insert tag and Insert Function.

---

**Note:** You can also insert Equipment.item references into expression fields using the **insert tag** option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.

---

Click **Clear Property** to clear property details, and disable the property. To define further properties for the object, click the relevant tabs.

For help on the remaining properties tabs, see [Edit Common Object Properties](#).

## Add a Button

Use the **Button** tool to draw buttons on graphics page. You can then assign security rights and attach commands to it.

Buttons can be moved, re-sized, reshaped, brought to the front, and so on, and their properties edited just like other types of object.

### To draw a button:

1. Click the **Button** tool.

2. Move the mouse to where you want the button to start and press (and hold) the mouse button.
3. Drag the mouse to where you want the button to finish and release the mouse button.

When you release the mouse button, the object properties dialog is displayed.

## Button Properties - Appearance (General)

Buttons have the following General Appearance properties.

Property	Description
<b>[Type] Text</b>	<p>Select this option to display text on the button. If you select this option, the <b>Text</b> and <b>Font</b> fields will display to the right of the dialog.</p> <p>If either the <b>Text</b> or <b>Symbol</b> type option is selected, you can use XP style buttons. To configure a button to use the Windows XP style, select the <b>XP Style</b> check box. During runtime an XP style button has a blue border when it has keyboard focus, and an orange border when the mouse is on the button. When you place a button on a page, the <b>XP Style</b> check box is selected by default.</p> <p>Pressing '^n' or 'Enter' wraps the text onto the next line. For example, Start^nMotor would display as:</p> 
<b>Font</b>	<p>The font used to display the text. Use the scroll bar to the right to view available fonts, or type part of a font name directly into this field.</p> <p><b>Note:</b> The Background Color property is no longer supported for button fonts. Any imported buttons from a previous version will have the Background Color set to the default color.</p>
<b>Style</b>	<p>Select whether you would like the text to be Regular, Bold, Bold Italic, or Italic.</p>
<b>Size</b>	<p>Define the size of the text (point size). Available sizes might vary according to the selected printer and the selected font.</p>
<b>Custom Fill Color</b>	<p>Select this check box to enable the Fill Color Up and Fill Color down boxes.</p>
<b>Fill Color Up</b>	<p>The button color when in the Up state.</p>
<b>Fill Color Down</b>	<p>The button color when in the Down state.</p> <p><b>Note:</b> Fill Color Up and Down options available for Text and Symbol Types only.</p>
<b>[Alignment] Left</b>	<p>Select this radio button to left-align multi-line text. The aligned text will remain in the center of the button. This has no effect on single lines of text.</p>
<b>[Alignment] Right</b>	<p>Select this radio button to right-align multi-line text. The aligned text will remain in the center of the</p>

Property	Description
	button. This has no effect on single lines of text.
[Alignment] Center	Select this radio button to center-align multi-line text. The aligned text will remain in the center of the button. This has no effect on single lines of text.
[Effect] Strikeout	Select this box to make the text appear with a line through it.
[Effect] Underline	Select this box to underline the text.
Text	<p>This field contains the text that will display on the page. You can enter any keyboard character(s). You can edit the text here, or directly from the graphics page. It is useful to edit text at this field, as you can apply text changes at the same time as you apply other font and color changes.</p> <p>This text changes automatically depending on the Display Value properties that you define.</p>
Foreground	The color of the text.
Script	<p>The script for the text.</p> <p><b>Note:</b> If the selected script is not supported by the selected font, a warning icon will appear next to the drop-down. The icon will display a tool tip that explains, the combination is unsupported and a different font will be used at runtime.</p>
[Type] Symbol	<p>Select this option to display a symbol on the button. If you select this option, the <b>Set</b> button will display to the right of the dialog.</p> <p>Click <b>Set</b> to choose the symbol which is to display on the button. A picture of the selected symbol will also display.</p>
[Type] Target	When this option is selected, the button will not have any text or symbols on it, and it will have a transparent face.
Mode	<p>There are three different modes of transparent buttons:</p> <ul style="list-style-type: none"> <li>• <b>BORDER_3D:</b> The button is drawn with only the 3-D border (transparent face).</li> <li>• <b>BORDER:</b> The button is drawn with only a thin line</li> </ul>

Property	Description
	<p>border.</p> <ul style="list-style-type: none"><li>• <b>TARGET:</b> The button is totally transparent. This constitutes a screen target.</li></ul>

For help on the remaining properties tabs, see [Edit Common Object Properties](#).

## Add Numbers

Use the Number tool to represent a tag or expression as a number. When you place a number on your page, simply enter the relevant variable tag or expression. Numbers can be moved, re-sized, brought to the front, and so on, and their properties edited just like other types of object.

(The same functionality is also available through the Text tool.)

**To add a number to your graphics page:**

1. Click the **Number** tool.

2. Move the cursor to where you want the number to display and click the mouse button. The Text Properties dialog box appears where you enter the relevant variable tag or expression.

## See Also

[Add Text](#)

[Graphics Object Types](#)

## Add a Symbol Set

The Symbol Set tool allows you to represent changing runtime conditions with changing symbols. By clicking on this tool, then clicking on the graphics page, you can define the symbols which are to display for each condition.

After a symbol set has been added to the page, it can be moved, re-sized, re-shaped, brought to the front etc., and its properties can be edited, just like any other type of object.

**To add a Symbol Set:**

1. Click the **Symbol** tool.

2. Move the mouse pointer to the desired position on the page, and click with the left mouse button.
3. When you click the mouse button, the object properties dialog is displayed.
4. Fill out the relevant properties for the symbol set (see below for a description), and click **OK**.

**Note:** There are several radio buttons in Symbol Sets Appearance (described below). When selected, these radio buttons change the appearance of the right hand side of the dialog.

## Symbol Set Properties

Property	Description
<b>[Type] On / Off</b>	<p>Select this radio button to display one symbol when a particular expression is TRUE, and another when it is FALSE. For example, you could display a red symbol when a particular variable tag is in alarm, and a green symbol when it is not.</p> <p>See <a href="#">Symbol Set Properties - Appearance General (On/Off)</a>.</p>
<b>[Type] Multi-state</b>	<p>This option is useful when you have several possible conditions, occurring together in different combinations, at different times. Select this option to display different symbols for each combination.</p> <p>For example, three digital variable tags (A,B, and C) can each be ON or OFF at any time. You can display a different symbol for each ON/OFF combination. In other words, you could display a different symbol for each of the following ON/OFF combinations ABC, ABC, ABC, ABC, ABC, ABC, ABC.</p> <p>See <a href="#">Symbol Set Properties - Appearance General (Multi-state)</a>.</p>
<b>[Type] Array</b>	<p>The Array option allows you to enter an expression which returns an integer. For each unique integer (from 0 to 255), you can display a unique symbol. For example, you could display a different symbol for each threshold of an analog alarm.</p> <p>See <a href="#">Symbol Set Properties - Appearance General (Array)</a>.</p>
<b>[Type] Animated</b>	<p>Select this radio button to display an actual animation (several different symbols in sequence).</p> <p>When selected, the radio buttons on the dialog box change the appearance of the right hand side of the dialog. These radio buttons are only documented once below.</p> <p>See <a href="#">Symbol Set Properties - Appearance General</a></p>

Property	Description
	(Animated).

- [Configure Graphics Objects](#)

## Add a Trend

The Trend tool allows you to add a trend to the graphics page with the mouse (click and drag).

After a trend object is drawn, it can be moved, re-sized, re-shaped, brought to the front etc., and its properties

can be edited, just like any other type of object.

### To add a trend to a page:

1. Click the **Trend** tool

or choose **Objects | Trend**.

2. Move the mouse to where you want the trend to start and click (and hold) the mouse button.
3. Drag the mouse to the opposite corner of the trend and release the mouse button.

The **Trend Properties** dialog appears. Assign the Trend Tags to the pens, choosing appropriate colors.

## Trend Properties

Trends have the following general appearance properties:

Property	Description
<b>Cluster Name</b>	<p>The name of the cluster that runs the trends being graphed. Each trend graph can only communicate with one cluster, so you cannot mix trends from multiple clusters on a single trend graph.</p> <p><b>Note:</b> To mix trends from different clusters on a single trend graph you will need to use Process Analyst.</p> <p>If there is only one cluster, or, the client is connected to only one cluster, this property can be left blank and the value of the single connected cluster is inferred.</p> <p>If the client is connected to more than one cluster, then this field needs to be specified.</p>
<b>Pens</b>	<p>The pens (including color) to be displayed on the graph (31 characters maximum). You can use up to eight pens.</p> <p>Double-clicking a selected pen or clicking <b>Edit</b> allows you to change the trend tag and pen color. To insert a trend tag, click <b>Wizard</b> to display the <a href="#">Insert Trend Dialog Box</a>.</p> <p>If more than one trend tag is displayed in a trend window and each has a different sample period, the trend with the smallest sample period is used as the general display period.</p> <p><b>Note:</b> If the trend object is part of a group, part of a pasted Genie or symbol, or part of the page's template, you can still access its properties: hold down the <b>Control</b> (CTRL) key and double-click the object.</p> <p>Alternatively, choose <b>Goto Object</b> from the Tools</p>

Property	Description
	<p>menu, click the object, then click <b>OK</b>. Be aware, however, that if it is part of a pasted Genie or symbol, or part of the template, you cannot edit existing pens, only new ones.</p> <p>If you are configuring an SPC control chart, you need to add a suffix to the trend tag to indicate the type of SPC. There are SPC templates that are easily configured through Genies. Use the Genies rather than defining these trend tags for yourself. The following table lists available SPC types:</p> <p>SPC Definition - SPC Type</p> <p>&lt;tag name&gt;.X - Mean of raw data in a subgroup (X - bar)</p> <p>&lt;tag name&gt;.XCL - Center line of X - bar</p> <p>&lt;tag name&gt;.XUCL - Upper control limit of X - bar</p> <p>&lt;tag name&gt;.XLCL - Lower control limit of X - bar</p> <p>&lt;tag name&gt;.R - Range of raw data in a subgroup (R - bar)</p> <p>&lt;tag name&gt;.RCL - Center line of R - bar</p> <p>&lt;tag name&gt;.RUCL - Upper control limit of R - bar</p> <p>&lt;tag name&gt;.RLCL - Lower control limit of R - bar</p> <p>&lt;tag name&gt;.S - Standard deviation of raw data in a subgroup (S - bar)</p> <p>&lt;tag name&gt;.SCL - Center line of S - bar</p> <p>&lt;tag name&gt;.SUCL - Upper control limit of S - bar</p> <p>&lt;tag name&gt;.SLCL - Lower control limit of S - bar</p> <p>Where &lt;tag name&gt; is any trend tag, for example:</p> <p>Pen 1 - PIC117_PV.XCL</p> <p>Pen 2 - PIC117_PV.XUCL</p> <p>Pen 3 - PIC117_PV.XLCL</p> <p>Pen 4 - PIC117_PV.X</p> <p>If you are using the PageTrend() function to display this trend page, leave these fields blank.</p>
<b>Display Trend Types as Periodic</b>	<p>When selected, enables trend pens (both periodic and event) to be displayed as periodic. Event and periodic trend data can then be displayed on the same graph. If this box is not selected, event and periodic pens have different styles and needs to be displayed on separate graphs.</p> <p><b>Note:</b> This option is set by default in the predefined</p>

Property	Description
	templates designed for use with periodic trends. It will only need to be enabled for customized templates.
<b>[Samples] Number of samples</b> (5 Chars.)	<p>The number of samples (1-32767) you can display in your trend window without scrolling (i.e., the width of your trend object). The default depends on the number of pixels per sample and your display resolution. The width of a trend object is equal to <b>Pixels per sample x Number of samples</b>.</p> <p><b>Note:</b> For a meaningful trend graph, make <b>Pixels per sample x Number of samples</b> less than the width of the display. For example, an XGA screen has a width of 1024 pixels. If you use 10 pixels per sample, 102 samples can be displayed on the screen without scrolling.</p>
<b>[Samples] Pixels per sample</b> (2 Chars.)	The display width of each sample. The width of a trend object is equal to <b>Pixels per sample x Number of samples</b> . The default is 1 pixel.

Click **Clear Property** to clear property details, and disable the property. To define other properties for the object, click the relevant tabs.

For help on the remaining properties tabs, see [Edit Common Object Properties](#).

[Configure Graphics Objects](#)

## Add a Cicode Object

The Cicode Object tool allows you to add a Cicode Object to the graphics page with the mouse (click and drag).

A Cicode Object can be any command (such as a function and so on). When the graphics page is displayed at runtime, the command is run continually. Cicode objects can also be assigned a key sequence, allowing you to

enter keyboard commands when it is selected at runtime.

After a Cicode object is added, it can be moved and so on and its properties edited, just like other types of object.

### To add a Cicode Object to a page:

1. Click the **Cicode Object** tool,

or choose **Objects | Cicode Object**.

2. Move the mouse to where you want to add the object, and click the left mouse button.
3. Define the relevant properties for the object, and click **OK**.

### Cicode Object Properties - Cicode (General)

Cicode Objects have the following General properties:

Property	Description
<b>Command</b> (254 Chars.)	<p>A Cicode command that is continually executed. You can use any Cicode command, built-in Cicode function or user-written function. The command is executed continually (while the page is displayed), for example:</p> <p>Command :</p> <pre>DspSymAnm(25, "Pumps.Slurry1", "Pumps.Slurry2", "Pumps.Slurry3");</pre> <p>The command in this example uses the built-in function DspSymAnm(). The function displays three symbols ("Pumps.Slurry1", "Pumps.Slurry2", "Pumps.Slurry3") continually (at AN 25).</p> <p>You can also write generic functions by using the Cicode function DspGetAnCur() to get the AN number, for example:</p> <p>Command:</p> <pre>DspSymAnm(DspGetAnCur(), "Pumps.Slurry1", "Pumps.Slurry2", "Pumps.Slurry3");</pre> <p>The command in this example displays three symbols ("Pumps.Slurry1", "Pumps.Slurry2", "Pumps.Slurry3") continually (at the current AN).</p> <p>If you are using an actual animation, each symbol is displayed at a frequency that is set using the Setup Wizard (also determined by the <a href="#">[Page]AnmDelay</a> parameter). To add just an animation point to the page, add a Cicode Object, without a command.</p>

Click **Clear Property** to clear property details, and disable the property. To define other properties for the object, click the relevant tabs.

For help on the remaining properties tabs, see [Edit Common Object Properties](#).

## See Also

[Configure Graphics Objects](#)

### Paste a Symbol

The Paste Symbol tool allows you to insert a [Symbol](#) from a library onto the graphics page.

After a symbol is pasted using this tool, it can be moved, re-sized, reshaped, brought to the front and so on, and its properties edited just like any other type of object.

You can paste a symbol from the library on to a page in the following ways:

- As an **unlinked** symbol; the pasted symbol is not updated with changes to the symbol in the library.
- As a **linked** symbol; the symbol on the page is updated when the symbol in the library is changed (to alter the properties of a symbol in the library, open the library and edit it in the library). If you edit the symbol from the page and then change the source symbol in the library, the pasted symbol changes. For example, if you double the size of a pasted symbol, then double the size of the symbol in the library, the pasted symbol doubles again. You can remove the link to the library by using the **Edit | Cut Link** command.

#### To paste a symbol from the library to a page:

1. Click the **Paste Symbol** tool or choose **Edit | Paste Symbol**.
2. To paste a linked symbol, select the **Linked** check box. To paste an unlinked symbol, deselect the **Linked** check box.

#### To break the link:

1. Select the symbol.
2. Choose **Edit | Cut Link**.

To display the properties of the objects in the symbol (after pasting), hold the **Control** (CTRL) key down and double-click the specific object. Alternatively, choose **Tools | Goto Object**, click the object, then click **OK**.

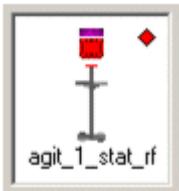

### Paste Symbol as Flashing

If you have selected **Paste Symbol as Flashing**, two dialog boxes appear in sequence, allowing you to choose two images that you want to implement as a flashing symbol. The **Primary Select Symbol** dialog allows you to select the initial image used, the **Flashing Select Symbol** dialog the second image. If the bitmaps are different in size, the flashing symbol is scaled to the size of the primary image. If one of the symbols is itself a flashing symbol, only the primary state will be displayed.

## Paste Symbol Dialog Box

This dialog box lets you paste a symbol from a library to the graphics page (or template).

## Paste Symbol Dialog Box Properties

Property	Description
<b>Symbol</b>	A table of symbols in the project. To add a symbol to a graphics page, use the scroll bar to locate the thumbnail image of the symbol, then select it and click <b>OK</b> (or double-click the thumbnail image). To edit the object in the library, select it and click <b>Edit</b> . To create a new symbol, click <b>New</b> . <b>Note:</b> If the symbol has a small diamond-shaped badge next to it, it indicates it is a flashing symbol (see example below.) 
<b>Library</b>	The library where the symbol is stored.
<b>Linked</b>	To paste a symbol that maintains the link with its library, check this box. A symbol that is linked will be automatically updated if the symbol in the library is changed. You can remove the link at any time with the <b>Cut Link</b> command from the Edit menu, but you cannot re-link a symbol with the library after this has occurred.

[Configure Graphics Objects](#)

## Add a Genie

The Paste Genie tool allows you to insert a Genie onto the graphics page.

See [Paste a Genie](#).

After a Genie is pasted using this tool, it can be re-sized, rotated, moved, copied, duplicated, pasted, brought to the front, and so on.

To display the properties of the objects in the Genie (after pasting), hold the Control (CTRL) key down and double-click the specific object.

## See Also

[Configure a Genie](#)

## Insert a Composite Genie

A Composite Genie can be inserted into any graphics page, template or Super Genie. It cannot be inserted into a Genie or symbol.

---

**Note:** The appearance of Composite Genies can be affected by different DPI settings. It is recommended that when running Graphics Builder, the **Scale and Layout** setting should be set to "100%" in the Windows™ **Display** settings. After changing the Scale and Layout setting for a computer, you should restart it.

---

### To insert a Composite Genie:

1. Open Graphics Builder.
2. Click the **Paste Composite Genie** button in the Objects toolbox.

The Open dialog box is displayed.

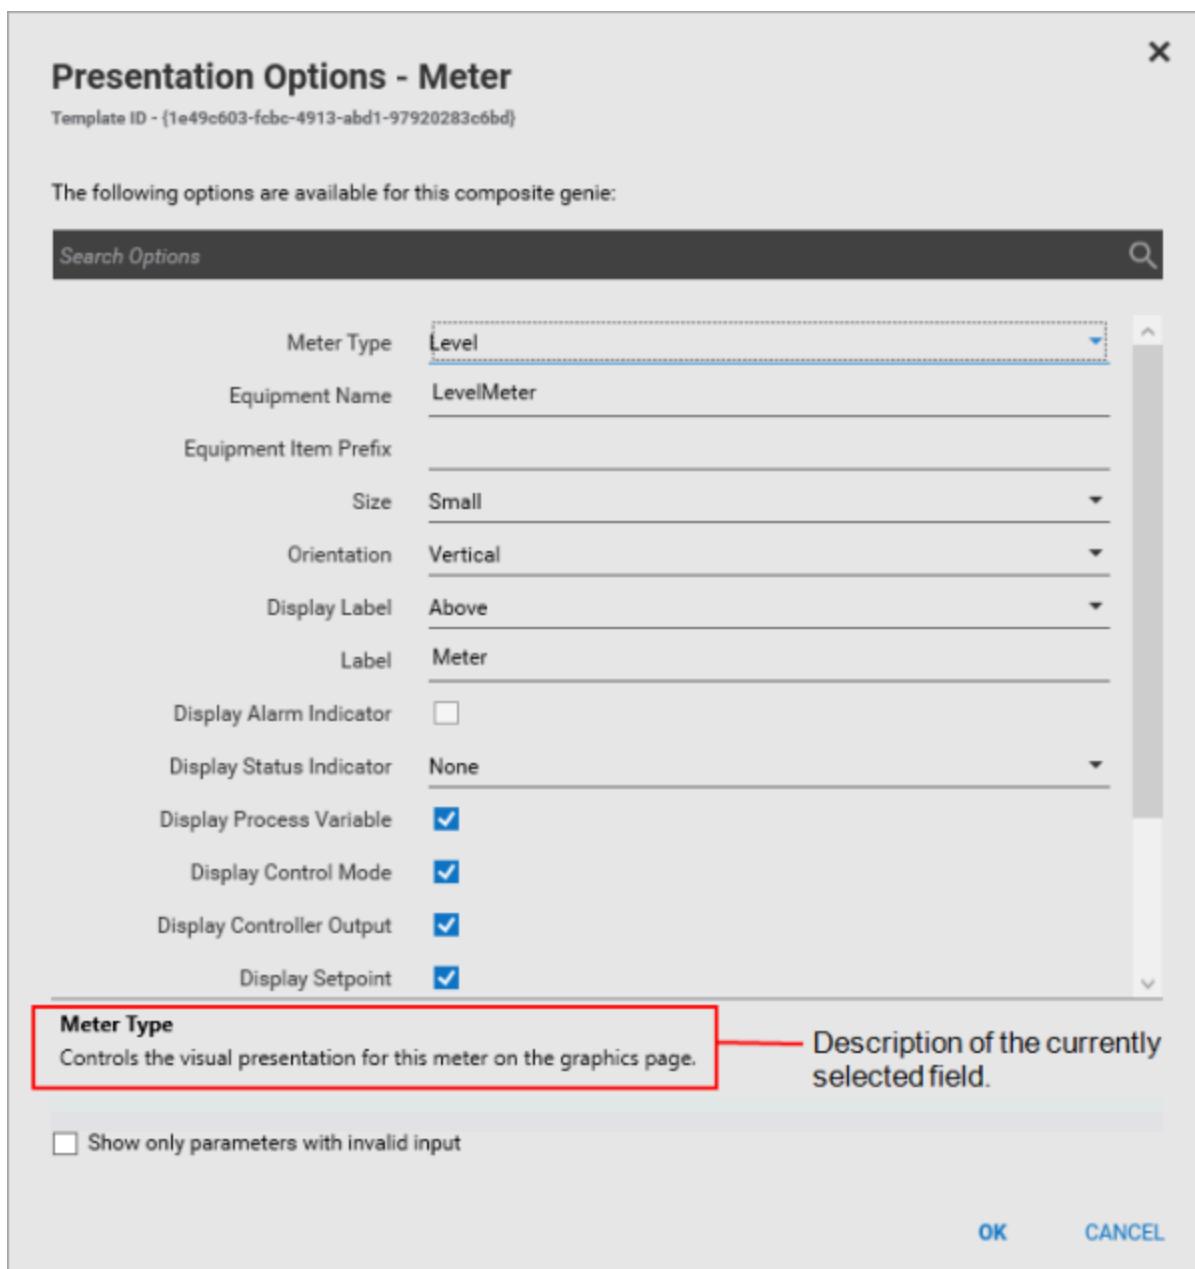

3. Select the XML template for the Composite Genie from the list of templates.

---

**Note:** The template file that you select needs to be located in the Composite Genies folder in the current project folder (or one of its included projects).

---

4. Click **OK**. The Presentation Options dialog box is displayed.

- Type or select the values for the parameters displayed.

**Note:** Depending upon the options you choose, some items may be hidden or displayed. For example, on the Meter Composite Genies, when you select the **Display Control Output** check box, the **Display Trend** and **Trend Type** options are displayed.

- Use the **Search** box to search for parameters in the dialog box. Type the parameter name or part of the parameter name to locate a parameter.

**Note:** Clear the Search box before clicking **OK** on the Presentation Options dialog box.

- Use the **Show only parameters with invalid input** option to display options for which incorrect or no values have been selected or specified.
- Click **OK** to insert the Composite Genie, or **Cancel** to close the Presentation Options dialog box without inserting the Composite Genie.

---

**Note:** You cannot rotate or mirror a Composite Genie that has been inserted on a page.

---

[Delete a Composite Genie](#)

## Add a Web Content Object

The Web Content tool allows you to add a browser window to a graphics page that displays web-based content at runtime.

Each instance of a Web Content object has a **URL** property that allows you to specify the content that is displayed. For more information about the supported functionality, see [Web Content](#).

After a browser window has been drawn on a page, it can be moved, re-sized, re-shaped, and so on. Its properties can be edited just like any other type of object.

---

**Note:** Web Content objects always appear on top other objects at runtime.

---

### To add a web content object to a page:

1. Click the **Web Content** tool in the Graphics Builder Toolbox.

Or:

From the **Objects** menu, select **Web Content**.

2. Move the mouse to where you want the browser to be located, then click (and hold) the mouse button.
  3. Drag the mouse to the opposite corner of the browser and release the mouse button.
- The **Web Content Properties** dialog appears.
4. Enter the **URL** you would like to display in the **Appearance (General)** properties (see below).

### **WARNING**

#### **LOSS OF CONTROL**

- Do not use the Plant SCADA Web Content control to display an untrusted or potentially unsafe web site, as this may leave your runtime system vulnerable to malicious activity.
- Do not enter a URL in the Web Content control that will allow users to navigate to an untrusted or potentially unsafe web site (for example, a search engine).

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

---

**Note:** Before you implement the Web Content control as part of your runtime system, you should carefully consider the security implications of the content that will be accessible. If using an internet-based website or

---

---

application, you will be externally exposing your SCADA system and network.

You can also adjust the following [Edit Common Object Properties](#):

- **Appearance (Visibility)** — see [Visibility](#).
  - **Movement (Horizontal)** — see [Object Properties - Movement \(Horizontal\)](#).
  - **Movement (Vertical)** — see [Object Properties - Movement \(Vertical\)](#).
  - **Scaling (Horizontal)** — see [Object Properties - Scaling \(Horizontal\)](#).
  - **Scaling (Vertical)** — see [Object Properties - Scaling \(Vertical\)](#).
  - **Access (General)** — see [General Access to Objects](#).
- The **Tooltip** and **Log Device** fields are disabled for Web Content objects.
- **Metadata (General)** — see [Metadata](#).

## Web Content Object Properties

A Web Content object will have the following General Appearance properties:

Property	Description
<b>URL</b>	Enter the URL for the web content you would like the object to display at runtime (maximum 2048 characters). You need to use the full URL, including the protocol and subdomain. For example: <code>https://www.aveva.com/</code> You also need to enter a static URL as expressions are not supported. If this property is set using the Cicode function <a href="#">DspWebContentSetURL</a> , then a 255 character limit will apply.
<b>Enable 'Print' in context menu</b>	Select this option if you like to enable printing from the browser's context menu.

## See Also

[Configure Graphics Objects](#)

## Add an ActiveX Object

You can incorporate ActiveX objects into your project. This means you can use components that have been developed independently of Plant SCADA.

The ActiveX tool can be used to insert ActiveX objects in graphics pages. After you have selected and positioned an ActiveX object, it can be moved, re-sized, re-shaped, brought to the front etc., and its properties can be edited, just like any other object.

## ActiveX Object Properties

The two properties tabs common to ActiveX objects are the **Tag Association** and **Visibility** tabs which appear vertically on the **Appearance** tab. The content and number of other tabs depends on the individual design of each ActiveX object. This is determined by the amount of flexibility and support its creator has included.

For details on configuring these additional tabs, refer to the documentation provided with the ActiveX object.

**Note:** The Insert an ActiveX Control windows may include the Pelco™ Viewer Camera Control. This ActiveX control has been deprecated and is no longer part of the Plant SCADA installation. If you have upgraded your computer from a previous version with this control installed, it will continue to function. However, it is recommended that you communicate with Pelco cameras using a different method.

## See Also

[Tag Association](#)

[Managing Associated Data Sources](#)

[Object Identification](#)

### Tag Association

You can create an association between a property of an ActiveX object and a variable tag.

**To create an association between a property of an ActiveX object and a variable tag:**

1. Double-click the ActiveX object. The Properties dialog box appears.
2. Click the **Tag Association** tab.
3. Select a property from the **Properties** list.
4. Click the **Wizard | Insert Tag** button.
5. Select a tag from the list and click **OK**.

### ActiveX Object Properties - Appearance (Tag Association)

ActiveX objects have the following appearance properties:

Property	Description
<b>Properties</b>	The "properties" of an ActiveX object relate to the elements that define the object's functionality and appearance. The available properties for a selected ActiveX object are listed here, as defined by the object's creator.  The check box to the left of each item on the list indicates whether or not a tag has been associated with the Property. If the box is checked, it means an association has already been defined for the property. If you want to clear this tag association, simply uncheck the box, or clear the tag from the "Associate

Property	Description
	property with tag . . ." field.
<b>Associate property with tag</b>	<p>You can create an association between an ActiveX object property and a variable tag so that changing values in one are reflected in the other. To create an association, you need to first choose a property from the property list. The label <b>Associate property with tag</b> will change to display the property name.</p> <p>Select the variable tag you would like to associate with a property by clicking on the Wizard button and choosing from the list of available tags. Alternatively, the tag name can be typed in to the <b>Associate property with tag</b> field.</p> <p><b>Note:</b> You can only use variable tag names in this field. Functions, expressions and constants are not supported when defining ActiveX property tag associations.</p> <p>You can only associate a property with a variable tag if the tag type is compatible with the property. To display a list of compatible tag types, select the property, and click <b>List Property Types</b>. A list of compatible data types will display, or a message will inform you that there are no compatible types.</p> <p>If there are no types compatible with the property, the <b>Associate Property with tag</b> and <b>Update association on</b> fields will be disabled.</p> <p>If you specify a tag which might be inappropriate for the selected ActiveX property, the <b>Type Evaluation dialog</b> will display an alert. This might happen if:</p> <ul style="list-style-type: none"> <li>• The types compatible with the property are different from the tag type.</li> <li>• The tag type is smaller than the types compatible with the property, meaning that data could be truncated or lost.</li> </ul>
<b>Bindable</b>	<p>If an object property is "bindable", it means it can automatically send notification of value changes to Plant SCADA, and acknowledge any value changes from an associated tag. This means both the property and an associated tag will automatically update whenever the value for either changes.</p> <p>If a property is not bindable, the property/tag association can only be synchronized according to the</p>

Property	Description
	<p>event selected in the <b>Update association on Event</b> field.</p> <p>Be aware that if an object property is bindable, the <b>Update association on Event</b> field will be automatically set to &lt;Property change notification&gt; by default. You can change this setting if you want the tag association to be updated by a more specific event.</p> <p>For properties that are not bindable, you can mimic the behavior of &lt;property change notification&gt; by selecting <b>After update</b> for the <b>Update association on Event</b> field.</p>
<b>Property status</b>	<p>This indicates the read/write status of the selected property. With ActiveX objects, some properties are read-only, whereas others accept value changes. If a property is marked "read only", it indicates that its value is fixed and can only be read by Plant SCADA. If its status is read/write, can modify the property during runtime via a tag association.</p>
<b>Update association on Event:</b>	<p>This defines when you want a value update to occur for the selected property and its associated tag. Use the menu to the right of the <b>Event</b> field to view events that can be used to trigger a tag association update.</p> <p>The available events that can be used with a particular property are predefined by an object's creator. They typically include user interaction events (for example, mouse clicks), time events (such as a new day or new month), or value changes (such as "after update").</p> <p><b>Note:</b> If you are associating multiple ActiveX object properties with the same variable tag, then only one property should be configured with an update event. The Runtime will create only one event association per variable tag in that ActiveX object.</p>
<b>Property documentation</b>	<p>Most ActiveX objects have documentation describing the object's controls and functionality. Some have a separate Help file included, others, simple text prompts to explain each property. This depends on what an object's creator has included.</p> <p>The Property documentation field displays Help information for a selected property, or give instructions to obtain the Help necessary for a selected property. Usually the following message will appear:</p>

Property	Description
	"Click the '?' button to the right to display the Help topic for this property" The <b>Help</b> button displays the ActiveX object Help file (if included), usually with the topic displayed that relates to the selected property. It will also provide information about settings provided on additional tabs the ActiveX object might call up on the properties dialog.

Click the **Clear Property** button to clear the tag associations for each of the ActiveX object properties. To clear a tag association for a particular object property, clear the check box to the left of the property.

If you accidentally click **Clear Property**, you can restore your tag associations by clicking **Cancel** and reopening the ActiveX properties dialog.

## See Also

[Configure Graphics Objects](#)

### Managing Associated Data Sources

If an ActiveX object has an association with a data source (for example, it stores data to a DBF file), you need to consider the impact of running a project that contains it on a different machine.

If the path to the data source is hardcoded to a location on the local machine, the data source will not be found if the project is moved or run remotely. For example, the Database Exchange ActiveX control connects to a recipe.DBF file in the project path. If you restore a project that uses it on a different computer with a different installation path, you will need to recreate the data source to retrieve any recipes.

### **WARNING**

#### UNINTENDED EQUIPMENT OPERATION

- Whenever possible, avoid programming the literal paths to data sources in your project.
- When a project or a data source is relocated to a different computer, examine the program and program objects and correct any literal paths before placing the project back into service.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

One way to avoid having to recreate data sources is to locate any associated data sources in a central location on a network. For example, if the data source is located on a SQL server, it will be accessible from every machine on the common network.

#### To insert an ActiveX Control:

1. Click the **ActiveX** tool,

or choose **Edit | Insert ActiveX Control**.

2. Select an ActiveX Control and click **Insert**.

## See Also

[Tag Association](#)

[Object Identification](#)

### Object Identification

You can identify your ActiveX object.

#### To identify your ActiveX object:

1. From Graphics Builder, double-click the ActiveX object. The Properties dialog appears.
2. Click the **Access** tab.
3. Click the **Identification** tab.
4. Assign your ActiveX object a name in the **Object Name** field.
5. Assign your ActiveX object an **Event Class**.
6. Click **OK**.

### Object Properties - Access (Identification)

Objects have the following Access Identification properties:

Property	Description
<b>[Identification] Object Name</b>	This field allows you to assign a name to your ActiveX object (254 characters maximum). It identifies the object when using the <a href="#">ObjectByName()</a> , <a href="#">AnByName()</a> , and <a href="#">CreateControlObject()</a> Cicode functions.  The name can be any combination of alpha or numeric characters.
<b>[Identification] Event Class</b>	Allocate a name for the event class of your ActiveX object (16 characters). You can then use this name to create a Cicode function to trap an event.  Don't change the default value if you want to access the ActiveX object using VBA. If you do, VBA can't access the object. If the Event Class is changed, you can reset it to the default value by clicking <b>Clear Property</b> .
<b>[Persistence] Persist ActiveX data between page</b>	Select this check box to allow changes made to the

Property	Description
<b>transitions</b>	control to be persisted between pages. For example, you can select this check box if you want an ActiveX edit control to keep the current text in the control, so that next time the page is entered, the same text is displayed.

**Note:**

- An ActiveX control may or may not implement data persistence in the manner you expect. Some controls will not persist certain data, and therefore you will not be able to save and restore that data.
- Even when an ActiveX control implements data persistence in an expected manner, be advised that data is only persisted for the current session. If Plant SCADA runtime is shut down and restarted the updated data is not available.

## See Also

[Add an ActiveX Object](#)

### Add a Database Exchange Control

The Database Exchange ActiveX control lets you connect to a data source (for example a database), and extract, display, and edit recipe values.

To use the Database Exchange control, you need to insert it on a graphics page. At runtime, values are displayed in a table. Each column of data can be associated with a Plant SCADA variable tag, enabling recipe values to be written to tags. Data can also be sorted, filtered, printed, edited, and written back to the data source.

Plant SCADA supports connection from the Database Exchange control to all Windows-supported databases, including DBF, MDB, SQL Server, and OLEDB data sources.

You can access more information about the Database Exchange control by pasting it on to a graphics page and clicking the **Help** button on the associated Object Properties dialog.

### Import Graphics

The Graphics Builder has several file format filters to allow you to import graphics from other applications, such as drafting programs, illustration programs, presentation packages, scanners, etc. After a graphic is imported, you can use the Graphics Builder to edit the image.

Graphics files can be dragged from a third-party application (such as Windows Explorer), and dropped onto a page in the Graphics Builder.

You use the Import dialog box to import a graphic produced with a different application.

If you have selected **Import as Flashing**, two Import dialog boxes appear in sequence, allowing you to choose two images that you want to implement as a flashing symbol. The **Import Primary** dialog allows you to select the initial image used; the **Import Flashing** dialog allows you to choose the second images used.

### Import Graphics Dialog

Field	Description
Look in	The drive and directory where the graphic is stored.
File Name	The name of the graphics file.
Files of Type	<p>The type of graphics file. The following file formats are supported:</p> <ul style="list-style-type: none"> <li>• Windows bitmaps (*.BMP, *.DIB, *.RLE)</li> <li>• PCX format bitmaps (*.PCX)</li> <li>• Text files (*.TXT)</li> <li>• AutoCAD DXF Files (*.DXF) 2D only (the binary format is also supported)</li> <li>• Windows metafiles (*.WMF)</li> <li>• Fax Image (*.FAX)</li> <li>• Ventura Image (*.IMG)</li> <li>• JPEG (*.JPG, *.JIF, *.JFF, *.JGE)</li> <li>• Photo CD (*.PCD)</li> <li>• Portable Network Graphic (*.PNG). (PNG files with alpha channels are not supported)</li> <li>• Targa (*.TGA)</li> <li>• Tagged Image Format (*.TIF)</li> <li>• WordPerfect (*.WPG)</li> <li>• Encapsulated Postscript (*.EPS)</li> </ul> <p><b>Note:</b> For EPS graphics, only the TIFF or WMF preview in the EPS file header is imported (if available).</p>

## Edit Common Object Properties

This section describes properties that are common to several object types. Some are also common to object groups.

- [Appearance](#)
- [3D Effects](#)
- [Visibility](#)
- [Movement](#)
- [Scaling](#)
- [Fill](#)
- [Fill Color](#)
- [Fill Level](#)

- [Object Touch Commands](#)
- [Object Keyboard Commands](#)
- [Sliders](#)
- [Access](#)
- [Metadata](#)
- [Alarm Indicator.](#)

## Appearance

Click the **Appearance** tab to define the appearance of the object, such as line style, and shadowing. You can also specify when the object will be hidden from the operator (for example when DIGITAL\_TAG is OFF).

The check mark to the left of the Appearance tab tells you when an appearance property has been configured. The check marks in the tabs down the right of the dialog indicate which property is configured.

## See Also

- [3D Effects](#)
- [Visibility](#)
- [Edit Common Object Properties](#)

## 3D Effects

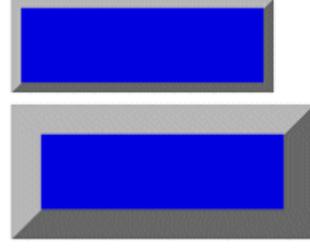

You can apply 3D effects to objects to make them more realistic.

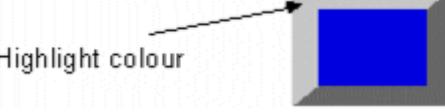

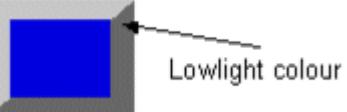

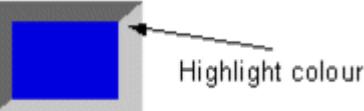

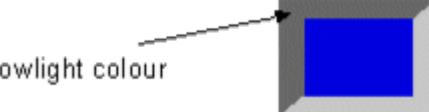

### To apply 3D effects to an object:

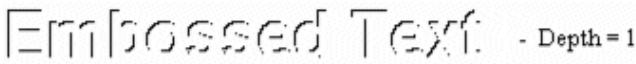

1. Draw the object/group (or paste a symbol). The properties tab dialog will automatically display, unless you have turned off the Display properties on new option in the Graphics Builder. (For a group, the properties dialog will not display automatically; you need to double-click the group).
2. Click the **Appearance** tab.
3. Click the **3D Effects** tab (to the right of the dialog).
4. The dialog will then display several options to enable you to manipulate your object. To activate any of these options click the option (or the radio bullet to the left of the option).
5. By selecting certain options additional fields will display to enable you to further manipulate your object. Enter further details as necessary, using the Help button for detailed information about each field.
6. Click **OK**.

### Object Properties - Appearance (3D Effects)

Objects have the following 3D Effects properties.

Property	Description
[Effects] None	Select this option to display the object without any special effects (such as shadowing, embossing and so on).
[Effects] Shadowed	Select this option to display the object with a shadow; for example: 
Depth	The distance (in pixels) that the shadow extends below and to the right of the object. This option alters the apparent distance between the object and its shadow, for example:  <ul style="list-style-type: none"><li>- Depth = 5</li><li>- Depth = 15</li></ul>
Shadow color	The color of the shadow. The shadow color will not change dynamically with runtime conditions.
[Effects] Raised	Select this option to display the object as a raised three dimensional solid, for example: 
Depth	The distance (in pixels) that the sides of the object extend out from the raised surface. This option alters the apparent distance from the raised surface down to your graphics page, for example:  <ul style="list-style-type: none"><li>- Depth = 5</li><li>- Depth = 15</li></ul>
Highlight color	The color of the directly illuminated "edges" of the object.

Property	Description
	 <p>Highlight colour</p>
<b>Lowlight color</b>	<p>The color of the "edges" of the object that are in shadow.</p>  <p>Lowlight colour</p>
<b>[Effects] Lowered</b>	<p>Select this option to display the object as if it is actually lower than your graphics page, for example:</p> 
<b>Depth</b>	<p>The distance (in pixels) that the sides of the object extend out from the lowered surface. This option alters the apparent distance from the lowered surface up to your graphics page, for example:</p>  <p>- Depth=5</p>  <p>- Depth=15</p>
<b>Highlight color</b>	<p>The color of the directly illuminated "edges" of the object.</p>  <p>Highlight colour</p>
<b>Lowlight color</b>	<p>The color of the "edges" of the object that are in shadow.</p>  <p>Lowlight colour</p>
<b>[Effects] Embossed</b>	<p>Select this option to display the object as if it has been embossed on your graphics page, for example:</p>

Property	Description
	<b>Embossed Text</b>
<b>Depth</b>	The distance (in pixels) that the embossed surface is lowered. This option alters the apparent distance from the embossed surface up to your graphics page, for example:  
<b>Highlight color</b>	The color of the right and lower edges of the object. 
<b>Lowlight color</b>	The color of the left and upper edges of the object. 

Click **Apply** or **OK** to save your changes, or **Cancel** to exit. To define further properties for the object, click the relevant tabs.

[Edit Common Object Properties](#)

## Visibility

You can determine whether an object is visible or not.

### To hide/unhide an object:

1. Double click the object you would like to hide.
2. Select the **Appearance** tab.
3. Select the **Visibility** tab (to the right of the dialog).
4. Click the **Wizard** button to the right of the **Hidden when** field.
5. Select either **Insert Tag** or **Insert Function** depending on which you would like to relate to your object.
6. Enter an expression in the **Hidden when** field. When this expression is true your object will be hidden.
7. Click **OK**.

## Object Properties - Appearance (Visibility)

Objects and groups have the following visibility properties:

Property	Description
<b>Hidden when</b>	<p>The object/group will be hidden whenever the expression entered in this field is TRUE. Enter an expression of 254 characters or less. For example, if you want the object/group to be hidden for every operator except the superintendent, you could enter the following:</p> <p>NOT GetPriv( _Super, _SectionA ) where _Super and _SectionA are labels.</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options: Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p> <p><b>Note:</b> If a group is hidden, every object (and other groups) in the group will also be hidden regardless of their individual properties. If the group is visible, its objects will behave according to their individual properties.</p>

Click **Clear Property** to clear property details and disable the property.

[Edit Common Object Properties](#)

## Movement

You can move an object vertically or horizontally, or to rotate it, depending on the return of an expression or the state of a tag.

### To configure an object or group that moves:

1. Draw the object/group (or paste a symbol). The properties tab dialog automatically display, unless you have turned off the **Display properties on new** option in the Graphics Builder. (For a group, the properties dialog will not display automatically; you need to double-click the group.)
2. Click the **Movement** tab.
3. Click the **Horizontal**, **Vertical** or **Rotational** tab (to the right of the dialog).

4. Enter a Movement **expression** (the expression that will move the object/group at runtime).
5. Enter further details as necessary, using the **Help** button for detailed information about each field.
6. Click **OK**.

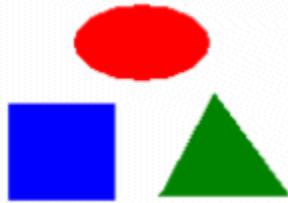

## Group and Object Movement - Examples

A group and its objects can be configured with any combination of movement (horizontal, vertical, and rotational). The following examples illustrate how some of these combinations work.

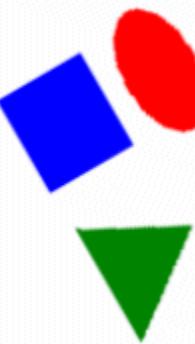

### Example 1: Rotating the group and moving the object left to right

If your group is configured to rotate from 0 degrees to 60 degrees, and one of its objects is configured to move left and right, the object will do both. It will move left and right as per its own properties, and, at the same time, it will rotate as part of the group. Remember, however, that 'left' and 'right' are relative to the original orientation of the group, not the page. As the group rotates, 'horizontal' also rotates. When the group has rotated 15 degrees, 'left' is actually 285 degrees; (not 270 degrees), and 'right' is actually 105 degrees (not 90 degrees). When the group has rotated 50 degrees, 'left' is 320 degrees, and 'right' is 140 degrees, and so on.

#### Original state of group

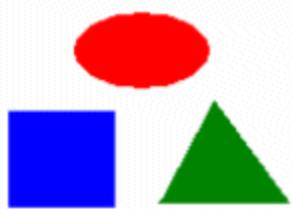

#### Group rotated right, and ellipse moved left

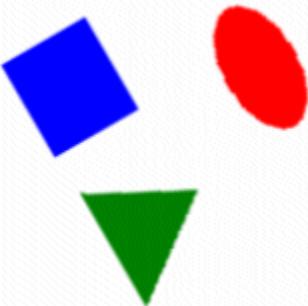

### Example 2: Rotating the group and moving the object up and down

If your group is configured to rotate from 0 degrees to 60 degrees, and one of its objects is configured to move up and down, the object will do both. It will move up and down as per its own properties, and, at the same time, it will rotate as part of the group. Remember, however, that 'up' and 'down' are relative to the original orientation of the group, not the page. As the group rotates, 'vertical' also rotates. When the group has rotated 15 degrees, 'up' is actually 15 degrees (not 0 degrees), and 'down' is actually 195 degrees (not 180 degrees). When the group has rotated 50 degrees, 'up' is 50 degrees, and 'down' is 230 degrees, and so on.

#### Original state of group

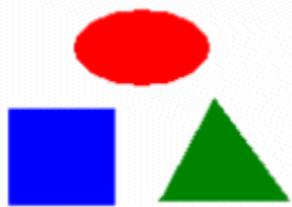

Group rotated right, and ellipse moved up

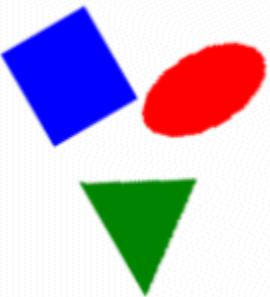

### Example 3: Rotating the group clockwise and rotating the object anticlockwise

If your group is configured to rotate from 0 degrees-60 degrees, and one of its objects is configured to rotate from 90 degrees-0 degrees, the object will do both. It will rotate as per its own properties, and, at the same time, it will rotate as part of the group. Remember, however, that the object's rotation is relative to the group, not the page. If the group rotates 60 degrees to the right, and the object rotates 90 degrees to the left, the object has only rotated 30 degrees to the left relative to the page.

Original state of group

Group rotated clockwise, and ellipse rotated anticlockwise

**Note:** By moving the ellipse as shown in the above examples, you are actually changing the overall size of the

group. You need to remember this as it might affect object fill levels.

### Object Properties - Movement (Horizontal)

Objects and groups can be moved from side to side during runtime, changing dynamically whenever the value of a particular expression changes. By default, as the value of the expression increases, the object/group will move (in increments) to the right. As the value of the expression decreases, the object/group will move (in increments) to the left.

This property could, for example, be used to display the position of a coal stacker moving along a stockpile.

**Note:** Horizontal movement cannot be used if the horizontal slider is enabled. A group and its objects can be configured with any movement combination (i.e., a group can move vertically while one of its objects rotates, and so on).

## Horizontal Movement Properties

Objects and groups have the following horizontal movement properties:

Property	Description
<b>Movement expression</b>	<p>The value of the expression entered in this field (253 characters maximum) will determine the horizontal movement of the object/group. By default, when the expression returns its minimum value, the object/group will shift hard to the left. When the expression returns its maximum, the object/group will shift hard to the right. For intermediate values, the object/group will move to the appropriate position between the minimum and maximum offset.</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options: Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>[Movement expression] Specify range</b>	<p>Select this box to manually specify <b>Minimum</b> and <b>Maximum</b> values for the movement expression, rather than using the default values. For an expression containing an analog variable tag, the defaults are the Engineering Zero and Full Scale values from the last variable tag in the expression. If the analog variable tag does not have Engineering Zero and Full Scale values, the defaults are 0 (zero) and 32000. For expressions without tags, the defaults are 0 (zero) and 100.</p>
<b>[Movement expression] Minimum</b>	<p>Enter the minimum value for the expression. When this value is returned by the expression, the object/group will shift to the left, by the <b>At minimum</b> offset. You can only enter a value here if you have selected the <b>Specify</b> range box.</p>
<b>[Movement expression] Maximum</b>	<p>Enter the maximum value for the expression. When this value is returned by the expression, the object/group will shift to the right, by the <b>At maximum</b> offset. You can only enter a value here if you have selected the <b>Specify</b> range box.</p>
<b>[Offset] At minimum</b>	<p>The distance (number of pixels from the original object/group center) that the object/group will shift to the left when the <b>Movement expression</b> returns its minimum value.</p>

Property	Description
	You can change the offset value by pressing the up and down arrows to the right of the field, or by entering another value in this field.
<b>[Offset] At maximum</b>	<p>The distance (number of pixels from the original object/group center) that the object/group will shift to the right when the <b>Movement expression</b> returns its maximum value.</p> <p>You can change the offset value by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p> <p><b>Note:</b> You can shift the object/group right at minimum and left at maximum, by entering negative distances in the Offset fields, or by swapping the expression limits (in the <b>Minimum</b> and <b>Maximum</b> fields).</p>

Click **Clear Property** to clear property details, and disable the property.

[Object Properties - Movement \(Vertical\)](#)

[Object Properties - Movement \(Rotational\)](#)

### Object Properties - Movement (Vertical)

Objects and groups can be moved up and down during runtime, changing dynamically whenever the value of a particular expression changes. By default, as the value of the expression increases, the object/group will move up (in increments). As the value of the expression decreases, the object/group will move down (in increments).

This property could be used to display the movement of an elevator.

---

**Note:** Vertical Movement cannot be used if the Vertical Slider is enabled. A group and its objects can be configured with any movement combination (i.e. a group can move vertically while one of its objects rotates, and so on).

---

## Vertical Movement Properties

Objects and groups have the following vertical movement properties:

Property	Description
<b>Movement expression</b>	The value of the expression entered in this field (253 characters maximum) will determine the vertical movement of the object/group. By default, when the expression returns its minimum value, the object/group will shift down to its lowest position. When the expression returns its maximum, the object/group will

Property	Description
	<p>shift up to its highest position. For intermediate values, the object/group will move to the appropriate position between the minimum and maximum offset.</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options: Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>[Movement expression] Specify range</b>	<p>Select this box to manually specify <b>Minimum</b> and <b>Maximum</b> values for the movement expression, rather than using the default values. For an expression containing an analog variable tag, the defaults are the Engineering Zero and Full Scale values from the last variable tag in the expression. If the analog variable tag does not have Engineering Zero and Full Scale values, the defaults are 0 (zero) and 32000. For expressions without tags, the defaults are 0 (zero) and 100.</p>
<b>[Movement expression] Minimum</b>	<p>Enter the minimum value for the expression. When this value is returned by the expression, the object/group will shift down, by the <b>At minimum</b> offset. You can only enter a value here if you have selected the <b>Specify range</b> box.</p>
<b>[Movement expression] Maximum</b>	<p>Enter the maximum value for the expression. When this value is returned by the expression, the object/group will shift up, by the <b>At maximum</b> offset. You can only enter a value here if you have selected the <b>Specify range</b> box.</p>
<b>[Offset] At maximum</b>	<p>The distance (number of pixels from the original object/group center) that the object/group will shift up when the <b>Movement expression</b> returns its maximum value.</p> <p>You can change the offset value by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p>
<b>[Offset] At minimum</b>	<p>The distance (number of pixels from the original object/group center) that the object/group will shift down when the <b>Movement expression</b> returns its</p>

Property	Description
	<p>minimum value.</p> <p>You can change the offset value by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p> <p><b>Note:</b> You can shift the object/group up at minimum and down at maximum, by entering negative distances in the Offset fields, or by swapping the expression limits (in the <b>Minimum</b> and <b>Maximum</b> fields).</p>

## See Also

[Object Properties - Movement \(Horizontal\)](#)

[Object Properties - Movement \(Rotational\)](#)

### Object Properties - Movement (Rotational)

Objects and groups can be dynamically rotated during runtime, whenever the value of a particular expression changes. By default, as the value of the expression increases, the object/group will rotate clockwise (in increments). As the value of the expression decreases, the object/group will rotate anti-clockwise (in increments).

This property could be used to display an aerial view of the movement of a circular stacker in a coal mining operation.

---

**Note:** Rotational Movement cannot be used if the Rotational Slider is enabled. A group and its objects can be configured with any movement combination (i.e. a group can move vertically while one of its objects rotates, and so on).

## Rotational Movement Properties

Objects and groups have the following rotational movement properties:

Property	Description
<b>Angle expression</b> (253 Chars.)	<p>The value of the expression entered in this field will determine the rotation of the object/group. During runtime, when the expression returns its minimum value, the object/group will rotate to its anti-clockwise limit. When the expression returns its maximum, the object/group will rotate to its clockwise limit. For intermediate values, the object/group will rotate to the appropriate position between the minimum and maximum limits.</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options: Insert Tag and Insert Function.</p>

Property	Description
	<p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>[Angle expression] Specify range</b>	<p>Select this box to manually specify <b>Minimum</b> and <b>Maximum</b> values for the angle expression, rather than using the default values. For an expression containing an analog variable tag, the defaults are the Engineering Zero and Full Scale values from the last variable tag in the expression. If the analog variable tag does not have Engineering Zero and Full Scale values, the defaults are 0 (zero) and 32000. For expressions without tags, the defaults are 0 (zero) and 100.</p>
<b>[Angle expression] Minimum</b>	<p>Enter the minimum value for the expression. When this value is returned by the expression, the object/group will rotate anti-clockwise, by the minimum offset. You can only enter a value here if you have selected the <b>Specify</b> range box.</p>
<b>[Angle expression] Maximum</b>	<p>Enter the maximum value for the expression. When this value is returned by the expression, the object/group will rotate clockwise, by the maximum offset. You can only enter a value here if you have selected the <b>Specify</b> range box.</p>
<b>[Angle] At minimum</b>	<p>The anti-clockwise angle (in degrees relative to 0 degrees) that the object/group will rotate when the <b>Angle expression</b> returns its minimum value. You can change the angle by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p>
<b>[Angle] At maximum</b>	<p>The clockwise angle (in degrees relative to 0 degrees) that the object/group will rotate when the <b>Angle expression</b> returns its minimum value. You can change the angle value by pressing the up and down arrows to the right of the field, or by entering another value in this field. <b>Note:</b> You can rotate the object/group clockwise at minimum and anti-clockwise at maximum, by entering negative angles in the Angle fields, or by swapping the expression limits (in the <b>Minimum</b> and <b>Maximum</b></p>

Property	Description
	fields).
<b>[Center axis offset] Express</b>	Click this radio button for the quick and easy way of selecting the point about which the object/group will rotate. The express option gives you the choice of 9 points (Top Left, Bottom Right and so on), which are displayed in the picture field to the right of the dialog. To select one, just click it with your mouse.
<b>[Center axis offset] Custom</b>	<p>Click this radio button to define your own center axis. When you select this radio button, two fields will display to the right, allowing you to plot the position of your center axis. Specify the distance to the right in the first field, and the distance down in the second. The Center axis is plotted based on these two values.</p> <p>For example, if you enter 8 as the horizontal offset, and 13 as the vertical offset, the Center axis will be 8 pixels to the right, and 13 pixels below the center of the object/group.</p> <p>Enter negative values in the offset distance fields to move the Center axis left instead of right, and up instead of down.</p>

## Scaling

You can scale objects both vertically or horizontally, depending on the return of an expression or the state of a tag.

### To configure an object or group that changes size:

1. Draw the object (or paste a symbol). The object properties tab dialog will automatically display, unless you have turned off the **Display properties on new** option in the Graphics Builder.
2. Click the **Scaling** tab.
3. Click the **Horizontal** or **Vertical** tab (to the right of the dialog).
4. Enter a **Scaling expression** (the expression that will change the size of the object at runtime).
5. Enter further object property details as necessary, using the **Help** button for detailed information about each field.
6. Click **OK**.

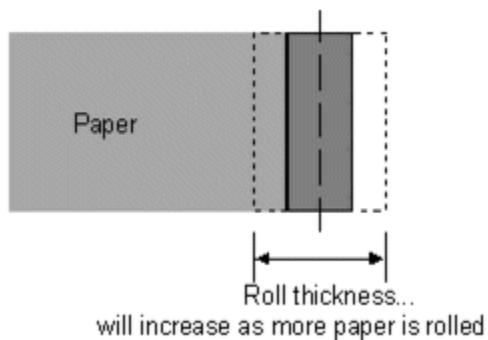

## See Also

- [Object Properties - Scaling \(Horizontal\)](#)
- [Object Properties - Scaling \(Vertical\)](#)
- [Edit Common Object Properties](#)

### Object Properties - Scaling (Horizontal)

The width of an object can be dynamically changed during runtime whenever the value of a particular expression changes. As the value of the expression increases and decreases, the width of the object increases or decreases accordingly as a percentage of the original width; that is, when it was added to the graphics page.

For example, an aerial view of a paper roll (in a paper mill), could display changing roll thickness:

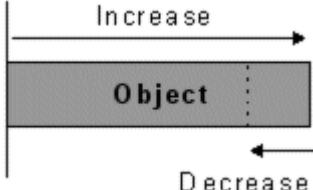

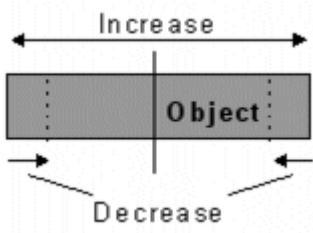

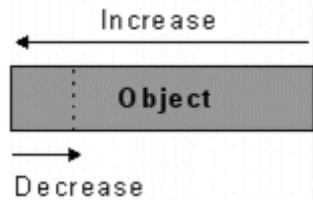

### Horizontal Scaling Properties

Objects have the following horizontal scaling properties:

Property	Description
<b>Scaling expression</b>	<p>The value of the expression entered in this field (253 characters maximum) will determine the horizontal scaling (width) of the object. By default, when the expression returns its minimum value, the object will display at its minimum width (as defined in the Scaling fields below). When the expression returns its maximum value, the object will display at its maximum width (as defined in the Scaling fields below).</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options: Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with</p>

Property	Description
	available tags.
<b>[Scaling expression] Specify range</b>	Select this box to manually specify <b>Minimum</b> and <b>Maximum</b> values for the scaling expression, rather than using the default values. For an expression containing an analog variable tag, the defaults are the Engineering Zero and Full Scale values from the last variable tag in the expression. If the analog variable tag does not have Engineering Zero and Full Scale values, the defaults are 0 (zero) and 32000. For expressions without tags, the defaults are 0 (zero) and 100.
<b>[Scaling expression] Minimum</b>	Enter the minimum value for the expression. When this value is returned by the expression, the width of the object will be reduced to its minimum. You can only enter a value here if you have selected the <b>Specify range</b> box.
<b>[Scaling expression] Maximum</b>	Enter the maximum value for the expression. When this value is returned by the expression, the width of the object will be increased to its maximum. You can only enter a value here if you have selected the <b>Specify range</b> box.
<b>[Scaling] At minimum</b>	<p>The minimum width of the object (as a percentage of its original width). The object will be reduced to this width when the <b>Scaling expression</b> returns its minimum value.</p> <p>You can change the percentage by pressing the up and down arrows to the right of the field, or by entering another value in this field. Percentages of greater than 100% can be entered.</p>
<b>[Scaling] At maximum</b>	<p>The maximum width of the object (as a percentage of its original width). The object will grow to this width when the <b>Scaling expression</b> returns its maximum value.</p> <p>You can change the percentage by pressing the up and down arrows to the right of the field, or by entering another value in this field. Percentages of greater than 100% can be entered.</p> <p><b>Note:</b> You can increase the width at minimum, and decrease it at maximum, by swapping the percentages in the Scaling fields (i.e. put the high percentage in the <b>At minimum</b> field, and the low in the <b>At maximum</b>), or by swapping the expression limits (in the <b>Minimum</b></p>

Property	Description
	and <b>Maximum</b> fields).
<b>[Center axis offset] Express</b>	<p>Click this radio button for the quick and easy way of selecting one of three of the object's vertical axes (left, center, and right). These axes appear in the picture field to the right of the dialog.</p> <p>If you choose <b>Left</b>, width changes occur to the right of the object. (i.e., the left edge remains anchored):</p>  <p>If you choose <b>Center</b>, width changes occur equally to both sides. (i.e., the vertical center axis remains anchored):</p>  <p>If you choose <b>Right</b>, width changes occur to the left of the object. (i.e., the right edge remains anchored):</p> 
<b>[Center axis offset] Custom</b>	<p>Click this radio button to define your own center axis. A field appears to the right of the dialog allowing you to specify how far from the object center (in pixels) you would like to place the axis. Although this option gives you the option to place the center axis anywhere on the object, once placed, the scaling process works in exactly the same manner as for the Express option (illustrated above).</p> <p>For example, if you enter 20, the Center axis will be 20 pixels to the right of the object center.</p> <p>Enter a negative value to move the center axis left</p>

Property	Description
	instead of right.

**Note:** If a group and its objects are configured to change size during runtime, the group scaling effects will be combined with the object scaling effects. For example, if a group is configured to double in size at runtime, and one of its objects is configured to halve in size, the object will appear to remain the same size (it halves, then doubles). Remember, however, that the object's position might change as the group gets bigger.

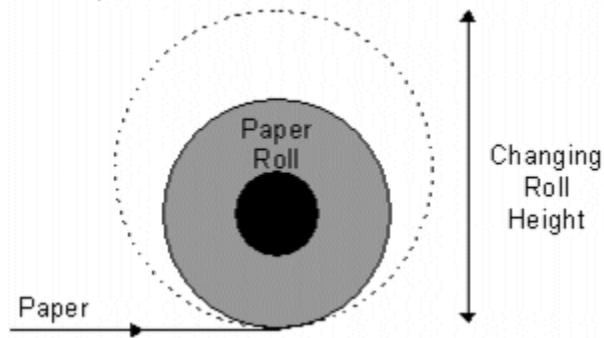

## See Also

[Object Properties - Scaling \(Vertical\)](#)

### Object Properties - Scaling (Vertical)

You can change the height of an object during runtime. As the value of the expression increases or decreases, the height of the object increases or decreases accordingly as a percentage of the original height; that is, when the object was added to the graphics page.

For example, an elevation of a paper roll (in a paper mill), could display changing roll height (and width):

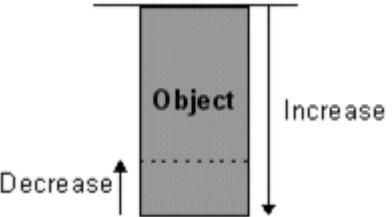

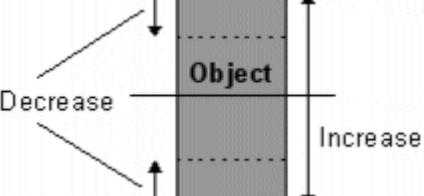

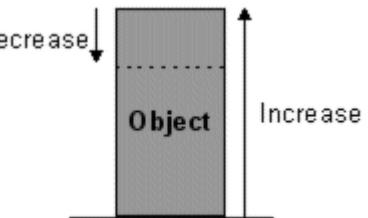

## Vertical Scaling Properties

Objects have the following vertical scaling properties:

Property	Description
<b>Scaling expression</b>	<p>The value of the expression entered in this field (253 characters maximum) will determine the vertical scaling (height) of the object. By default, when the expression returns its minimum value, the object will display at its minimum height (as defined in the Scaling fields below). When the expression returns its maximum value, the object will display at its maximum height (as defined in the Scaling fields below).</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options:</p>

Property	Description
	<p>Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>[Scaling expression] Specify range</b>	<p>Select this box to manually specify <b>Minimum</b> and <b>Maximum</b> values for the scaling expression, rather than using the default values. For an expression containing an analog variable tag, the defaults are the Engineering Zero and Full Scale values from the last variable tag in the expression. If the analog variable tag does not have Engineering Zero and Full Scale values, the defaults are 0 (zero) and 32000. For expressions without tags, the defaults are 0 (zero) and 100.</p>
<b>[Scaling expression] Minimum</b>	<p>Enter the minimum value for the expression. When this value is returned by the expression, the height of the object will be reduced to its minimum. You can only enter a value here if you have selected the <b>Specify range</b> box.</p>
<b>[Scaling expression] Maximum</b>	<p>Enter the maximum value for the expression. When this value is returned by the expression, the height of the object will be increased to its maximum. You can only enter a value here if you have selected the <b>Specify range</b> box.</p>
<b>[Scaling] At minimum</b>	<p>The minimum height of the object (as a percentage of its original height). The object will be reduced to this height when the <b>Scaling expression</b> returns its minimum value. You can change the percentage by pressing the up and down arrows to the right of the field, or by entering another value in this field. Percentages of greater than 100% can be entered.</p>
<b>[Scaling] At maximum</b>	<p>The maximum height of the object (as a percentage of its original height). The object will grow to this height when the <b>Scaling expression</b> returns its maximum value.</p> <p>You can change the percentage by pressing the up and down arrows to the right of the field, or by entering another value in this field. Percentages of greater than 100% can be entered.</p>

Property	Description
	<p><b>Note:</b> You can increase the height at minimum, and decrease it at maximum, by swapping the percentages in the Scaling fields (i.e. put the high percentage in the <b>At minimum</b> field, and the low in the <b>At maximum</b>), or by swapping the expression limits (in the <b>Minimum</b> and <b>Maximum</b> fields).</p>
<p><b>[Center axis offset] Express</b></p>	<p>Click this radio button to select one of three of the object's horizontal axes (top, middle, and bottom). These axes appear in the picture field to the right of the dialog. Click an axis to select it.</p> <p>If you choose the top, height changes will occur from the top of the object down. (i.e. the top edge will remain anchored):</p>  <p>If you choose the middle, height changes will occur equally above and below the axis. (i.e. the horizontal center axis will remain anchored):</p>  <p>If you choose the bottom, width changes will occur to the top edge of the object. (i.e. the bottom edge will remain anchored):</p> 
<p><b>[Center axis offset] Custom</b></p>	<p>Click this radio button to define your own center axis. A field will display to the right of the dialog, allowing you to specify how far from the object center (in pixels) you would like to place the axis. Although this</p>

Property	Description
	<p>option gives you the freedom to place the center axis anywhere on the object, once placed, the scaling process works in exactly the same manner as for the Express option (illustrated above).</p> <p>For example, if you enter 20, the Center axis will be 20 pixels below the object center.</p> <p>Enter a negative value to move the Center axis up instead of down.</p>

**Note:**

1. If a group and its objects are configured to change size during runtime, the group scaling effects will be combined with the object scaling effects. For example, if a group is configured to double in size at runtime, and one of its object is configured to halve in size, the object will appear to remain the same size (it halves, then doubles). Remember, however, that the object's position might change as the group gets bigger.
2. When the radio buttons in Object Properties - Fill Color (On/Off, Multi-state and so on) are selected, they change the appearance of the right-hand side of the dialog.

**See Also**

[Object Properties - Scaling \(Horizontal\)](#)

**Fill**

Click the **Fill** tab to specify the color which is to fill the object, and the level to which the object will be filled. The fill properties can change dynamically, depending on the return of an expression, or the state of a tag etc. (for instance, you could use this tab to visually reflect tank levels).

The check mark to the left of the Fill tab tells you when a Fill property has been configured. The check marks in the tabs down the right of the dialog indicate which property is configured.

**Fill Color**

You can control the fill color to use for your objects.

**To configure an object or group with changing fill color:**

1. Draw the object/group (or paste a symbol). The properties tab dialog will automatically display, unless you have turned off the **Display properties on new** option in the Graphics Builder. (For a group, the properties dialog will not display automatically; you need to double-click the group.)

2. Click the **Fill** tab.
3. Click the **Color** tab (to the right of the dialog).
4. Select the type of color change (On/Off, Multi-state and so on).
5. Enter the expression/conditions that will change the object's fill color at runtime.
6. Enter additional object property details as necessary.
7. Click **OK**.

# Object Properties - Fill Color (On/Off)

Objects and groups have the following Fill Color (On/Off) properties:

Property	Description
[Type] On / Off	Select this radio button to fill the object/group with one color when a particular expression is TRUE, and another when it is FALSE. For example, you could fill an object/group with red when a particular variable tag is in alarm, and green when it is not.
[Type] Multi-state	This option is useful when you have several possible conditions, occurring together in different combinations, at different times. Select this option to fill the object/group with a different color for each combination.  For example, three digital variable tags (A,B, and C) can each be ON or OFF at any time. You can fill the object/group with a different color for each ON/OFF combination. In other words, you could use a different fill color for each of the following ON/OFF combinations ABC, ABC, ABC, ABC, ABC, ABC, ABC, ABC.
[Type] Array	The Array option allows you to enter an expression which returns an integer. For each unique integer (from 0 to 255), you can fill the object/group with a

Property	Description
	different color. For example, you could use a different fill color for each threshold of an analog alarm.
<b>[Type] Threshold</b>	Select this radio button to dynamically change the fill color when an expression reaches a specific value (threshold). For example, you might decide that the fill color will change to red when the speed of a motor is greater than or equal to 4500 rpm, and to white when less than or equal to 100 rpm, but remains gray for every speed in between.
<b>[Type] Gradient</b>	Select this radio button to dynamically graduate the fill color, displaying a different color for each unique value returned by a particular expression. This option allows you to select two colors, to be used as the color limits. The color for each value returned is automatically selected from within the range defined by these limits. The result is a fade from one color to another.
<b>ON color when</b>	<p>The color selected as the <b>ON color</b> (below) will be used as the fill color whenever the condition entered here (254 characters maximum) is TRUE. The color selected as the <b>OFF color</b> (below) will be used as the fill color whenever this condition is FALSE. For example, you could fill an object/group with blue when <b>MIX_RUNNING</b> is TRUE, and white when it is FALSE.</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options: Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>OFF color</b>	<p>The fill color whenever the condition entered above is FALSE. For example, you could fill the object/group with white when <b>MIX_RUNNING</b> is FALSE.</p> <p><b>Note:</b> The color that you select here will change any Fill color specified through Appearance (General) properties tab.</p>
<b>ON color</b>	The fill color whenever the condition entered above is TRUE. For example, you could fill the object/group

Property	Description
	<p>with blue when <b>MIX_RUNNING</b> is TRUE.</p> <p><b>Note:</b> Group fill color is only applied if a fill color is not defined for the individual objects in the group.</p>

# Object Properties - Fill Color (Multi-state)

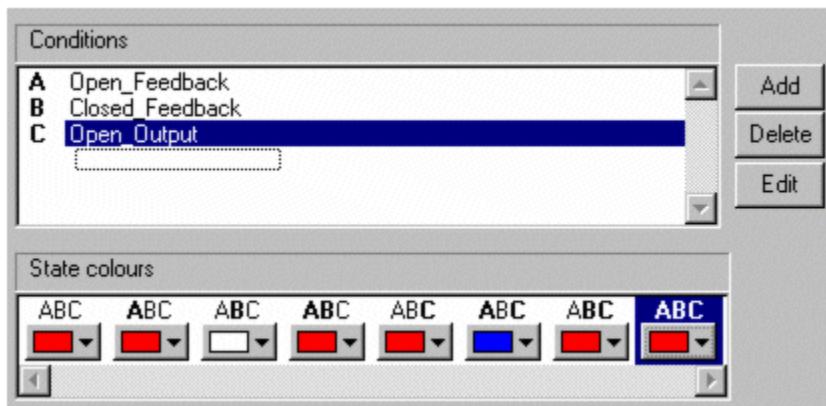

Objects and groups have the following Fill Color (Multi-state) properties:

Property	Description
<b>[Type] On / Off</b>	<p>Select this radio button to fill the object/group with one color when a particular expression is TRUE, and another when it is FALSE. For example, you could fill an object/group with red when a particular variable tag is in alarm, and green when it is not.</p>
<b>[Type] Multi-state</b>	<p>This option is useful when you have several possible conditions, occurring together in different combinations, at different times. Select this option to fill the object/group with a different color for each combination.</p> <p>For example, three digital variable tags (A,B, and C) can each be ON or OFF at any time. You can fill the object/group with a different color for each ON/OFF combination. In other words, you could use a different fill color for each of the following ON/OFF combinations ABC, ABC, ABC, ABC, ABC, ABC, ABC, ABC.</p>
<b>[Type] Array</b>	<p>The Array option allows you to enter an expression which returns an integer. For each unique integer (from 0 to 255), you can fill the object/group with a different color. For example, you could use a different fill color for each threshold of an analog alarm.</p>

Property	Description
[Type] Threshold	Select this radio button to dynamically change the fill color when an expression reaches a specific value (threshold). For example, you might decide that the fill color will change to red when the speed of a motor is greater than or equal to 4500 rpm, and to white when less than or equal to 100 rpm, but remains gray for every speed in between.
[Type] Gradient	Select this radio button to dynamically graduate the fill color, displaying a different color for each unique value returned by a particular expression. This option allows you to select two colors, to be used as the color limits. The color for each value returned is automatically selected from within the range defined by these limits. The result is a fade from one color to another.
Conditions	<p>The conditions you enter here (using a maximum of 128 characters per condition) will occur together in different ways, at different times. You can use each unique combination to force a different fill color for the object/group.</p> <p>To enter a condition, click the relevant line (A, B, C, and so on), click <b>Edit</b>, and type in the condition. You can add more conditions (to a maximum of 5, providing 32 combinations), using the <b>Add</b> button. To insert a tag or function, click the <b>Wizard</b> button. This button displays two options: Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p> <p>You can also remove conditions by clicking <b>Delete</b>, but you need to provide at least one condition in this field. Conditions left blank (instead of deleted) are evaluated as false at runtime.</p>
State colors	<p>The fill colors that will be used for each combination of the above conditions.</p> <p><b>Note:</b> The color that you select as <b>ABC</b> (all conditions false) will change any Fill color specified through Appearance (General) properties tab.</p>

## Example

To fill the object/group with a different color each time the status of a valve changes, you could fill out the **Conditions** and **State symbols** fields as follows:

In this example, **Open\_Feedback**, and **Closed\_Feedback** are variable tags representing digital inputs on the valve, and **Open\_Output** is a variable tag representing an output on the valve. So, **ABC** means **Open\_Feedback** is ON, and **Closed\_Feedback** and **Open\_Output** are both OFF. For this combination, the red is used as the fill color to indicate that the valve is not responding to commands, because it is open when it is meant to be closed. The same type of logic applies to the rest of the states.

**Note:** Group fill color is only applied if a fill color is not defined for the individual objects in the group.

The result is a fade from one color to another.</p>
<b>Array expression (128 Chars.)</b>	<p>Enter the expression which is to return an integer. For each value returned, a different color will fill the object/group.</p> <p>If the return value is:</p> <ul style="list-style-type: none"> <li>• Less than 0 (zero), it will be set to 0 (zero), and a runtime hardware alarm will be triggered.</li> <li>• Greater than 255, it will be set to 255, and a runtime hardware alarm will be triggered.</li> <li>• A real (non-integer) number, it will be truncated (for example 8.1 and 8.7 would both be truncated to 8).</li> </ul> <p>To insert a tag or a function, click the <b>Wizard</b> button to</p>

Property	Description
	<p>the right of this field. This button displays two options: Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>Array colors</b>	<p>The fill colors that will be used for each integer returned by the Array expression entered above (color 0 will be used when the expression returns integer 0, color 1 will be used when integer 1 is returned and so on).</p> <p><b>Note:</b> The color that you select for color 0 (zero) will change any Fill color specified through Appearance - General tab.</p>

## Example

To display different symbols illustrating the various states of a motor, you could fill out the **Array expression** and **Array symbol** fields as follows:

In this example, **MOTOR\_STATUS** is an analog variable tag representing the status of a motor. Each time the motor changes state, an integer is returned (0 = Running, 1 = Starting and so on), and the appropriate color fills the object/group. Color 5 onwards have no bearing on the fill color, because the tag only returns 5 unique integers (0-4).

---

**Note:** Group fill color is only applied if no fill color is defined for the individual objects in the group.

# Object Properties - Fill Color (Threshold)

## Object Properties - Fill Color (Threshold)

Objects and groups have the following fill color (threshold) properties.

Property	Description
[Type] On / Off	Select this radio button to fill the object/group with one color when a particular expression is TRUE, and another when it is FALSE. For example, you could fill an object/group with red when a particular variable tag is in alarm, and green when it is not.
[Type] Multi-state	This option is useful when you have several possible conditions, occurring together in different combinations, at different times. Select this option to fill the object/group with a different color for each combination.  For example, three digital variable tags (A,B, and C) can each be ON or OFF at any time. You can fill the object/group with a different color for each ON/OFF combination. In other words, you could use a different fill color for each of the following ON/OFF combinations ABC, ABC, ABC, ABC, ABC, ABC, ABC, ABC.
[Type] Array	The Array option allows you to enter an expression which returns an integer. For each unique integer (from 0 to 255), you can fill the object/group with a different color. For example, you could use a different fill color for each threshold of an analog alarm.
[Type] Threshold	Select this radio button to dynamically change the fill color when an expression reaches a specific value (threshold). For example, you might decide that the fill color will change to red when the speed of a motor is greater than or equal to 4500 rpm, and to white when less than or equal to 100 rpm, but remains gray for every speed in between.
[Type] Gradient	Select this radio button to dynamically graduate the fill color, displaying a different color for each unique value returned by a particular expression. This option allows you to select two colors, to be used as the color limits. The color for each value returned is

Property	Description
	automatically selected from within the range defined by these limits. The result is a fade from one color to another.
<b>Color expression</b>	<p>The value of the expression entered in this field (128 characters maximum) determines the fill color of the object/group. i.e. When the value of this expression reaches a threshold value (as defined below), fill color will change.</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options: Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>[Color expression] Specify range</b>	<p>Select this box to manually specify <b>Minimum</b> and <b>Maximum</b> values for the Color expression, rather than using the default values. (Threshold values are percentages of the range between <b>Minimum</b> and <b>Maximum</b>.) For an expression containing an analog variable tag, the defaults are the Engineering Zero and Full Scale values from the last variable tag in the expression. If the analog variable tag does not have Engineering Zero and Full Scale values, the defaults are 0 (zero) and 32000. For expressions without tags, the defaults are 0 (zero) and 100.</p>
<b>[Color expression] Minimum</b>	<p>Enter the minimum value for the expression. In terms of thresholds, the Minimum is <b>0%</b>. You can only enter a value here if you have selected the <b>Specify</b> range box.</p>
<b>[Color expression] Maximum</b>	<p>Enter the maximum value for the expression. In terms of thresholds, the Maximum is <b>100%</b>. You can only enter a value here if you have selected the <b>Specify</b> range box.</p>
<b>Thresholds (%)</b>	<p>The thresholds and their associated colors. A threshold is entered as a percentage of the expression range (the range of values that can be returned by the expression).</p>

## Example

If the expression's minimum is 0 and its Maximum 200, the default thresholds would have the effects described in the table below.

Threshold	Associated Color	Meaning
< 5%	Bright Blue	When the expression returns <b>less than 10</b> , the color fill will be <b>Bright Blue</b> .
< 15%	Blue	When the expression returns <b>less than 30</b> , the color fill will be <b>Blue</b> .
> 85%	Red	When the expression returns <b>greater than 170</b> , the color fill will be <b>Red</b> .
> 95%	Bright Red	When the expression returns <b>greater than 190</b> , the color fill will be <b>Bright Red</b> .

You can add up to 100 threshold color combinations. To add a combination, click **Add** and enter the relevant details. To edit an existing combination, click the relevant line. You can also remove combinations by clicking **Delete**.

Any values not included in a range (for example between 15% and 85% in the example above) produce a static fill color as specified through **Appearance - General** tab.

---

**Note:** Group fill color is only applied if no fill color is defined for the individual objects in the group.

---

## Object Properties - Fill Color (Gradient)

Objects and groups have the following Fill Color (Gradient) properties:

Property	Description
[Type] On / Off	Select this radio button to fill the object/group with one color when a particular expression is TRUE, and

Property	Description
	another when it is FALSE. For example, you could fill an object/group with red when a particular variable tag is in alarm, and green when it is not.
<b>[Type] Multi-state</b>	<p>This option is useful when you have several possible conditions, occurring together in different combinations, at different times. Select this option to fill the object/group with a different color for each combination.</p> <p>For example, three digital variable tags (A,B, and C) can each be ON or OFF at any time. You can fill the object/group with a different color for each ON/OFF combination. In other words, you could use a different fill color for each of the following ON/OFF combinations ABC, <b>A</b>BC, ABC, ABC, <b>A</b>BC, ABC, <b>A</b>BC, <b>A</b>BC.</p>
<b>[Type] Array</b>	The Array option allows you to enter an expression which returns an integer. For each unique integer (from 0 to 255), you can fill the object/group with a different color. For example, you could use a different fill color for each threshold of an analog alarm.
<b>[Type] Threshold</b>	Select this radio button to dynamically change the fill color when an expression reaches a specific value (threshold). For example, you might decide that the fill color will change to red when the speed of a motor is greater than or equal to 4500 rpm, and to white when less than or equal to 100 rpm, but remains gray for every speed in between.
<b>[Type] Gradient</b>	Select this radio button to dynamically graduate the fill color, displaying a different color for each unique value returned by a particular expression. This option allows you to select two colors, to be used as the color limits. The color for each value returned is automatically selected from within the range defined by these limits. The result is a fade from one color to another.
<b>Color expression</b>	The value of the expression entered in this field (128 characters maximum) will determine the fill color of the object/group. By default, when the expression returns its minimum value, the fill color will be the <b>At minimum</b> color (as defined below). When the expression returns its maximum value, the fill color will be the <b>At maximum</b> color (as defined below).

Property	Description
	<p>When the expression returns a value half-way between its minimum and maximum, a color will be selected from the half-way point of the range defined by the <b>At minimum</b> and <b>At maximum</b> colors.</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options: Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>[Color expression] Specify range</b>	<p>Select this box to manually specify <b>Minimum</b> and <b>Maximum</b> values for the Color expression, rather than using the default values. For an expression containing an analog variable tag, the defaults are the Engineering Zero and Full Scale values from the last variable tag in the expression. If the analog variable tag does not have Engineering Zero and Full Scale values, the defaults are 0 (zero) and 32000. For expressions without tags, the defaults are 0 (zero) and 100.</p>
<b>[Color expression] Minimum</b>	<p>Enter the minimum value for the expression. When this value is returned by the expression, the fill color of the object/group will be the <b>At minimum</b> color. You can only enter a value here if you have selected the <b>Specify range</b> box.</p>
<b>[Color expression] Maximum</b>	<p>Enter the maximum value for the expression. When this value is returned by the expression, the fill color of the object/group will be the <b>At maximum</b> color. You can only enter a value here if you have selected the <b>Specify range</b> box.</p>
<b>At minimum</b>	<p>The fill color of the object/group when the <b>Color expression</b> returns its minimum value.</p> <p><b>Note:</b> The color that you select here will change any Fill color specified through <b>Appearance - General</b> tab.</p>
<b>At maximum</b>	<p>The fill color of the object/group when the <b>Color expression</b> returns its maximum value.</p> <p><b>Note:</b> Group fill color is only applied if a fill color is not defined for the individual objects in the group.</p>

- [Object Properties - Fill Color \(Threshold\)](#)

### Fill Level

The fill level of an object/group can be changed during runtime, increasing or decreasing dynamically whenever the value of a particular expression changes. As the value of the expression increases and decreases, the fill level will increase and decrease accordingly (as a percentage of the full capacity of the object/group). If the object/group resizes at runtime, the fill level will adjust automatically in order to maintain the correct percentage.

The color that is used is set through either General Appearance, or Color Fill.

This property could be used to display temperature variations. You could even combine the Fill Color and Fill Level properties to produce a thermometer with mercury that rises and changes color with rising temperature.

#### To configure an object or group with changing fill level:

1. Draw the object/group (or paste a symbol). The properties tab dialog will automatically display, unless you have turned off the **Display properties on new** option in the Graphics Builder. (For a group, the properties dialog will not display automatically; you need to double-click the group.)
2. Click the **Fill** tab.
3. Click the **Level** tab (to the right of the dialog).
4. Enter a **Level expression** (the expression that will change the fill level of the object/group at runtime).
5. Enter additional properties as necessary.
6. Click **OK**.

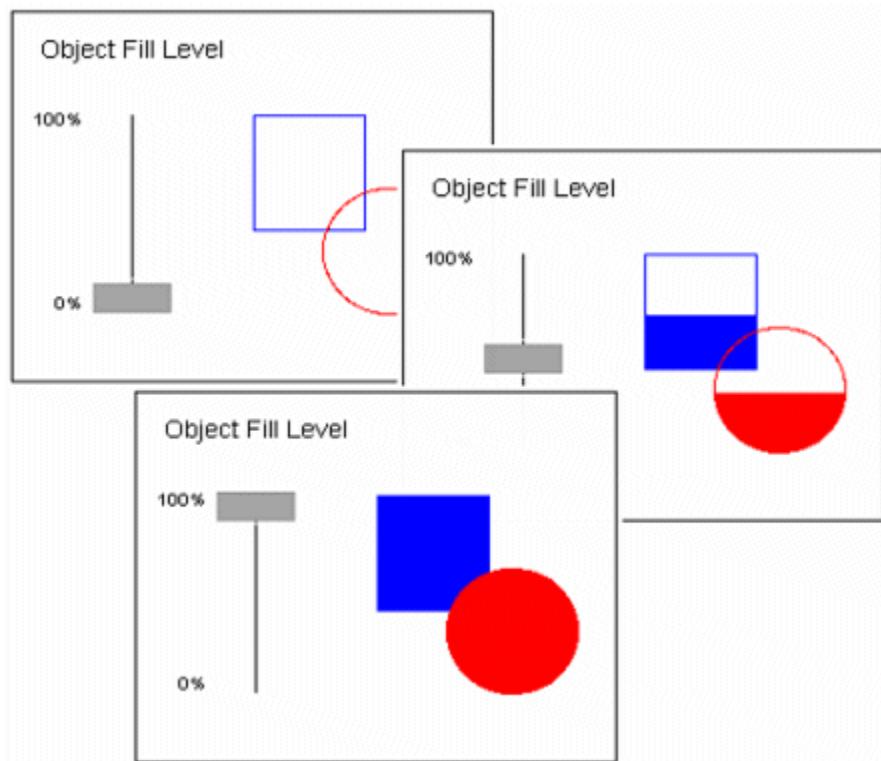

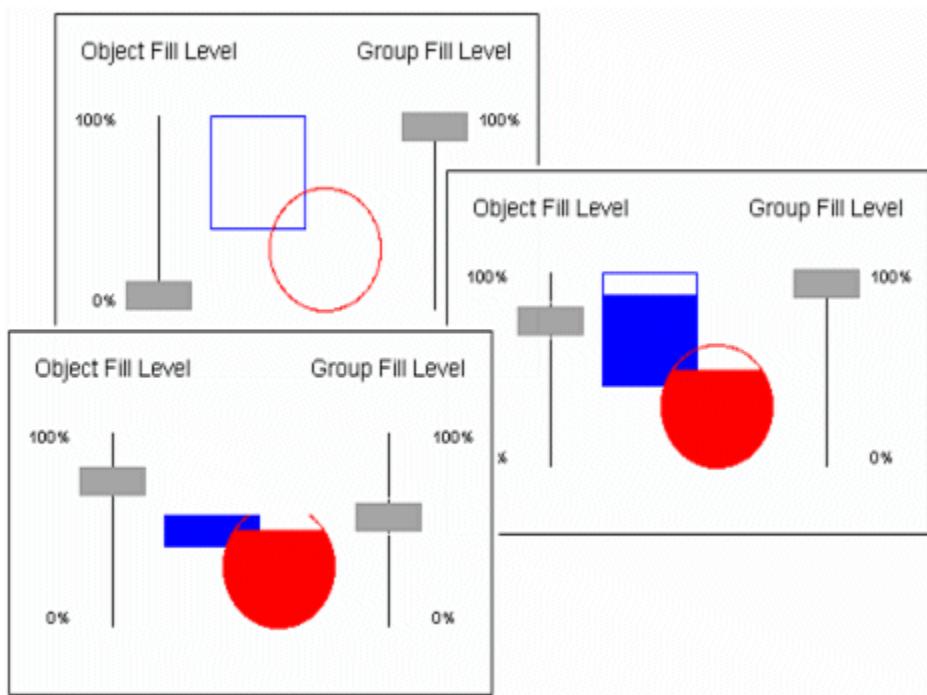

### Fill Level Properties

Objects and groups have the following Fill Level properties:

Property	Description
<b>Level expression</b>	The value of the expression entered in this field (253 characters maximum) will determine the fill level of the object/group. By default, when the expression returns its minimum value, the object/group will be filled to the <b>At minimum</b> level. When the expression returns its maximum value, the object/group will be filled to the <b>At maximum</b> level. When the expression returns a value half-way between its minimum and maximum, the object/group will be filled to half-way between the <b>At minimum</b> and <b>At maximum</b> levels.  To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options:

Property	Description
	<p>Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>[Level expression]</b> Specify range	<p>Select this box to manually specify <b>Minimum</b> and <b>Maximum</b> values for the Level expression, rather than using the default values. For an expression containing an analog variable tag, the defaults are the Engineering Zero and Full Scale values from the last variable tag in the expression. If the analog variable tag does not have Engineering Zero and Full Scale values, the defaults are 0 (zero) and 32000. For expressions without tags, the defaults are 0 (zero) and 100.</p>
<b>[Level expression]</b> Minimum	<p>Enter the minimum value for the expression. When this value is returned by the expression, the object/group will fill to the <b>At minimum</b> level. You can only enter a value here if you have selected the <b>Specify range</b> box.</p>
<b>[Level expression]</b> Maximum	<p>Enter the maximum value for the expression. When this value is returned by the expression, the object/group will fill to the <b>At maximum</b> level. You can only enter a value here if you have selected the <b>Specify range</b> box.</p>
<b>At minimum</b>	<p>The level to which the object/group will be filled when the <b>Level expression</b> returns its minimum value. For example, if you enter 30, the object/group will be 30% full when the expression returns its minimum value. You can change the percentage by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p>
<b>At maximum</b>	<p>The level to which the object/group will be filled when the <b>Level expression</b> returns its maximum value. For example, if you enter 90, the object/group will be 90% full when the expression returns its maximum value. You can change the percentage by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p>

Property	Description
<b>Fill Direction</b>	The direction in which the color will spread when increasing. There are four options (each represented by an arrow): <b>Up, Down, Left, Right</b> . If you choose Up, the object/group will be filled from the bottom up. If you choose Left, the object/group will be filled from right to left, and so on.
<b>Background color</b>	<p>The color of any unfilled part of the object/group (for example, if the object/group is only 90% full, the unfilled 10% will be displayed using this color). The background is often made transparent. Using transparent, you would see the outline of the object/group, and anything behind the object/group on the page.</p> <p><b>Note:</b> If an object in a group is a slider, it might change the overall size of the group when used at runtime. If it does, the fill level of the group will adjust accordingly.</p>
<b>Group and Object Fill Level: Examples</b>	A group and its objects can be configured with different fill levels. The group fill level, however, is usually thought of as a reveal of the objects in the group. Group fill level and object fill level operate independently of each other; the group fill level just determines how much of the objects display.

**Example 1: The fill level of the objects****Example 2: Group the objects and configure a fill level for the group as well**

In this example, the objects' fill levels can still be adjusted normally. The group's fill level determines how much

of the objects you can see (and how much will be obscured by the groups background color; white, in this case).

## See Also

[Edit Common Object Properties](#)

## Sliders

You can create slider controls to enable an operator to interact with your runtime system by dragging an object on a graphics page.

### To configure a slider:

1. Draw the object/group (or paste a symbol). The properties tab dialog will automatically display, unless you have turned off the **Display properties on new** option in the Graphics Builder. (For a group, the properties dialog will not display automatically; you need to double-click the group.)
2. Click the **Slider** tab.
3. Click the **Horizontal**, **Vertical** or **Rotational** tab (to the right of the dialog).
4. Enter the **Tag** to link to the slider.
5. Enter any additional details.
6. Click **OK**.

## See Also

[Object Properties - Slider \(Horizontal\)](#)

[Object Properties - Slider \(Vertical\)](#)

[Object Properties - Slider \(Rotational\)](#)

[Edit Common Object Properties](#)

## Object Properties - Slider (Horizontal)

Objects and groups can be linked to variable tags in such a way that horizontal sliding of the object/group changes the value of the tag. As the slider moves to the right, the variable tag increases in value. As the slider moves to the left, the variable tag decreases in value. The slider also moves automatically to reflect the changing values of the tag.

---

**Note:** The horizontal slider cannot be used if the rotational slider is enabled, or if horizontal movement is enabled.

---

## Horizontal Slider Properties

Objects and groups have the following horizontal slider properties.

Property	Description
Tag	The value of the tag entered in this field (79 characters)

Property	Description
	<p>maximum) will change when the slider is moved left or right. You can define two slider limits on your graphics page. The object/group will not slide beyond these two points. During runtime, when the slider reaches its left-hand limit (<b>Offset At minimum</b>), the tag value changes to its minimum limit. When the slider reaches its right-hand limit (<b>Offset At maximum</b>), the tag value changes to its maximum limit.</p> <p>To insert a tag, click the <b>Wizard</b> button to the right of this field.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>[Tag] Continuous update of tag</b>	<p>Select this box if you want the variable tag to be updated continuously while the slider is being moved. If you leave this box unchecked, the tag will only be updated when the slider has been released (i.e. it has been moved, and the operator has released the mouse button).</p>
<b>[Offset] At minimum</b>	<p>The distance (number of pixels from the original object/group center) that the object/group can slide to the left. When it reaches the point defined by this distance, the tag value changes to its minimum limit. You can change the offset value by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p>
<b>[Offset] At maximum</b>	<p>The distance (number of pixels from the original object/group center) that the object/group can slide to the right. When it reaches the point defined by this distance, the tag value changes to its maximum limit. You can change the offset value by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p> <p>You can increase the value of the tag with a left-slide, and decrease it with a right-slide, by entering negative distances in the Offset fields.</p>

**Note:** If an object in a group is a slider, it might change the overall size of the group when used at runtime. If it does, the fill level of the group will adjust accordingly. If a group and one of its objects are both defined as

---

sliders, and they slide in the same direction or one is rotational, the object will take precedence (i.e. only the object will operate as a slider).

---

[Object Properties - Slider \(Rotational\)](#)

### Object Properties - Slider (Vertical)

You can link objects and groups to variable tags in such a way that vertical sliding of the object/group changes the value of the tag. As the slider moves to the up, the variable tag increases in value. As the slider moves to the down, the variable tag decreases in value. The slider also moves automatically to reflect the changing values of the tag.

**Note:** The vertical slider cannot be used if the rotational slider is enabled, or if vertical movement is enabled.

---

## Vertical Slider Properties

Objects and groups have the following vertical slider properties:

Property	Description
<b>Tag</b>	<p>The value of the tag entered in this field (79 characters maximum) will change when the slider is moved up or down. You can define two slider limits on your graphics page. The object/group will not slide beyond these two points. During runtime, when the slider reaches its upper limit (<b>Offset At maximum</b>), the tag value changes to its maximum limit. When the slider reaches its lower limit (<b>Offset At minimum</b>), the tag value changes to its minimum limit.</p> <p>To insert a tag, click the <b>Wizard</b> button to the right of this field.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>[Tag] Continuous update of tag</b>	Select this box if you want the variable tag to be updated continuously while the slider is being moved. If you leave this box unchecked, the tag will only be updated when the slider has been released (i.e., it has been moved, and the operator has released the mouse button).

Property	Description
<b>[Offset] At maximum</b>	<p>The distance (number of pixels from the original object/group center) that the object/group can slide up. When it reaches the point defined by this distance, the <b>Tag</b> value changes to its maximum limit.</p> <p>You can change the offset value by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p>
<b>[Offset] At minimum</b>	<p>The distance (number of pixels from the original object/group center) that the object/group can slide down. When it reaches the point defined by this distance, the tag value changes to its minimum limit.</p> <p>You can change the offset value by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p> <p>You can increase the value of the tag with a down-slide, and decrease it with an up-slide, by entering negative distances in the Offset fields.</p>

**Note:** If an object in a group is a slider, it might change the overall size of the group when used at runtime. If it does, the fill level of the group will adjust accordingly. If a group and one of its objects are both defined as sliders, the object will take precedence (i.e. only the object will operate as a slider).

## See Also

[Object Properties - Slider \(Horizontal\)](#)

[Object Properties - Slider \(Rotational\)](#)

## Object Properties - Slider (Rotational)

Objects and groups can be linked to variable tags in such a way that rotational sliding of the object/group changes the value of the tag. As the slider rotates clockwise, the variable tag increases in value. As the slider rotates anti-clockwise, the variable tag decreases in value. The slider also moves automatically to reflect the changing values of the tag.

**Note:** The rotational slider cannot be used if either of the other sliders is enabled, or if rotational movement is enabled.

## Rotational Slider Properties

Objects and groups have the following rotational slider properties.

Property	Description
<b>Tag</b>	<p>The value of the tag entered in this field (79 characters maximum) will change as the slider is rotated. You can</p>

Property	Description
	<p>define two slider limits on your graphics page. The object/group will not rotate beyond these two points. During runtime, when the slider reaches its anti-clockwise limit (<b>Offset At minimum</b>), the tag value changes to its minimum limit. When the slider reaches its clockwise limit (<b>Offset At maximum</b>), the tag value changes to its maximum limit.</p> <p>To insert a tag, click the <b>Wizard</b> button to the right of this field.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>[Tag] Continuous update of tag</b>	<p>Select this box if you want the variable tag to be updated continuously while the slider is being moved. If leave this box unchecked, the tag will only be updated when the slider has been released (i.e. it has been moved, and the operator has released the mouse button).</p>
<b>[Angle] At minimum</b>	<p>Enter an anti-clockwise angle (in degrees relative to 0 degrees). The slider cannot rotate anti-clockwise beyond this limit. When it reaches this limit, the <b>Tag</b> value changes to its minimum limit.</p> <p>You can change the angle value by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p>
<b>[Angle] At maximum</b>	<p>Enter an clockwise angle (in degrees relative to 0 degrees). The slider cannot rotate clockwise beyond this limit. When it reaches this limit, the <b>Tag</b> value changes to its maximum limit.</p> <p>You can change the angle value by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p> <p><b>Note:</b> You can increase the value of the tag with an anti-clockwise slide, and decrease it with a clockwise-slide, by entering negative distances in the Angle fields.</p>
<b>[Center axis offset] Express</b>	<p>Click this radio button for the quick and easy way of selecting the point about which the object/group will rotate. The express option gives you the choice of 9</p>

Property	Description
	points (Top Left, Bottom Right and so on), which are displayed in the picture field on the dialog. To select one, just click it with your mouse.
<b>[Center axis offset] Custom</b>	Click this radio button to define your own center axis. When you select this radio button, two fields will display to the right, allowing you to plot the position of your center axis. Specify the distance to the right in the first field, and the distance down in the second. The Center axis is plotted based on these two values.  For example, if you enter 8 as the horizontal offset and 13 as the vertical, the center axis will be 8 pixels to the right and 13 pixels below the center of the object/group.  Enter negative values in the offset distance fields to move the center axis left instead of right, and up instead of down.

**Note:** If a group and one of its objects are both defined as sliders, the object will take precedence (i.e., only the object will operate as a slider).

## Input

Click the **Input** tab to specify the command to be executed, and the message to be logged when an operator clicks on the object. You can also define keyboard commands for the object, and limit their scope with area and privilege settings.

The check mark to the left of the Input tab tells you when an Input property has been configured. The check marks in the tabs down the right of the dialog indicate which property is configured.

## See Also

[Object Touch Commands](#)

[Object Keyboard Commands](#)

[Edit Common Object Properties](#)

## Object Touch Commands

You can assign touch commands to an object or group.

**To assign a touch command to an object or group:**

1. Draw the object/group (or paste a symbol). The properties tab dialog will automatically display, unless you have turned off the **Display properties on new** option in the Graphics Builder. (For a group, the properties dialog will not display automatically; you need to double-click the group.)
2. Click the **Input** tab.
3. Click the **Touch** tab (to the right of the dialog).
4. Enter a command in the command field (the command that will be executed when the object/group is touched at runtime).
5. Enter further details as necessary, using the **Help** button for detailed information about each field.
6. Click **OK**.

**Input Touch Commands - Properties**

The touch property lets you assign commands to the object/group. These commands are then executed when the object/group is touched at runtime (i.e., an operator clicks on the object/group). You can also define messages which will log at these times.

For example, a drive can be jogged by starting it when the mouse button is depressed and stopping it when the mouse button released; variables can be incremented while the mouse button is held, and so on. At the same time, it could log the time and date, and the name of the operator.

Operators without appropriate access requirements cannot touch the object/group at runtime.

Objects and groups have the following input (touch) properties.

Property	Description
Action	There are three actions to which commands can be attached. You can select more than one type of action. Unique commands and log messages can be attached to each action (i.e. you can perform one task on the down action, and another on the up action, and log a separate message for each).
[Action] Up	Select this option if you want a command to be executed (and a unique message to be logged) when the operator positions the mouse pointer over the object/group, and clicks <i>and releases</i> the left mouse button.  As with standard Windows buttons, if the operator moves the cursor away from the object/group before releasing the mouse button, the command isn't executed (unless you also select the <b>Down</b> option).
[Action] Down	Select this option if you want a command to be executed (and a unique message to be logged) when the operator positions the mouse pointer over the object/group, and clicks the left mouse button. The command will execute as soon as the mouse button is

Property	Description
	clicked.
<b>[Action] Repeat</b>	<p>Select this option if you want a command to execute continually (and a unique message to log continually) whenever the operator has the mouse pointer positioned over the object/group, and is holding the left mouse button depressed. If the operator moves the mouse pointer away from the object/group without releasing the mouse button, the command will stop executing, but will start again as soon as the mouse pointer is re-positioned over the object/group. The only exception is when you also have the Down option selected, in which case, the command will execute continually even if the mouse pointer has been moved away from the object/group.</p> <p>To set the delay which precedes the first execution of the command (and the first log of the message), and the delay between each repeat.</p>
<b>Up/Down/Repeat command</b>	<p>The commands (set of instructions) to be executed immediately when the selected action is performed. The command(s) can be a maximum of 253 characters long.</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options: Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p>
<b>[Logging] Log Message</b>	<p>The text message sent to the <i>MsgLog</i> field of the Log Device when the selected action is performed by the operator at runtime. The message is plain text, and can include tag name substitutions using Genie or Super Genie syntax. When using Super Genie syntax, the data type needs to be specified. The name of the tag will then be included in the text. The log message can be a maximum of 32 characters long.</p>  <p>To include field data as part of a logged message,</p>

Property	Description
	<p>insert the field name as part of the device format when configuring the device. For instance, in the <b>Format</b> field of the <b>Devices</b> form, you could enter {MsgLog,20} {FullName,15}. This would accommodate the logging of messages such as <b>P2 started by John Smith</b>.</p> <p>The log device to which the message is sent is specified through the General Access tab.</p> <p><b>Note:</b> If the object is part of a Genie or symbol, this property can be defined after the Genie/symbol is pasted onto a page. (Hold down the <b>Control</b> (CTRL) key and double-click the object.) If you define it before pasting (i.e. you define it for the original in the library), you cannot edit it after. Similarly, if the object is part of a template, it can be defined after a page has been created using that template (again, with Control + double-click). If you define it for the actual template, you cannot edit it for pages based on the template.</p>
<b>Repeat rate</b>	<p>This option sets the delay which precedes the first execution of the command(s), and the delay between each subsequent repeat of the command(s).</p> <p>You can change the rate by pressing the up and down arrows to the right of the field, or by entering another value in this field.</p> <p><b>Note:</b> If you define a touch command for an object in a group, the group's touch command will not work.</p>

### Object Keyboard Commands

You can assign a keyboard command to an object or group.

#### To assign a keyboard command to an object or group:

1. Draw the object/group (or paste a symbol). The object properties tab dialog will automatically display, unless you have turned off the **Display properties on new** option in the Graphics Builder. (For a group, the properties dialog will not display automatically; you need to double-click the group.)
2. Click the **Input** tab.
3. Click the **Keyboard Commands** tab (to the right of the dialog).
4. Enter the key sequence (see [Define Key Sequences for Commands](#)).

5. Enter a command in the command field (the command that will be executed when the key sequence above is entered by the operator at runtime).
6. Enter additional details as necessary.
7. Click **OK**.

## Input Keyboard Commands - Properties

The keyboard commands properties let you assign keyboard commands to the object/group. A keyboard command is a particular key sequence which executes a command when it is typed in by the operator at runtime. To execute an object/group keyboard command, the operator positions the cursor over the object/group and enters the key sequence using the keyboard.

You can also define a message which will log every time the key sequence is entered.

For example, the operator could change the water level in a tank by placing the mouse over the symbol representing the tank, and typing in the new level. At the same time, a message could be logged, listing the time and date, and the name of the operator.

Operators without the access requirements specified under **Security** (see below) cannot enter keyboard commands for this object/group at runtime.

For a detailed explanation of keyboard command input see the topic Getting Runtime Operator Input in the Cicode Programming Reference.

Property	Description
<b>Key sequence</b>	<p>Enter the key sequences that the operator can enter to execute a command. For example, you might define the key sequence <b>### Enter</b>. During runtime, this key sequence would allow you to type in any three digit number, and click <b>Enter</b> to change variable tag values from mimic pages and so on</p> <p>You can enter as many key sequences as you like. To add a key sequence, click <b>Add</b> and type in the sequence or select one from the menu. To edit an existing sequence, click the relevant line and click <b>Edit</b>. You can also remove key sequences by clicking <b>Delete</b>.</p>
<b>Key sequence command</b>	<p>The commands (set of instructions) to be executed immediately when the selected key sequence is entered. The commands can be a maximum of 253 characters long.</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options: Insert Tag and Insert Function.</p> <p><b>Note:</b> You can also insert Equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with</p>

Property	Description
	available tags.
<b>[Security]</b> <b>Same area as object/group</b>	<p>Select this box to assign the keyboard command to the same area as the object/group. Only users with access to this area (and any necessary privileges) will be able to issue this command or log the message. If you want to assign this keyboard command to another area, leave this box unchecked and enter another area below.</p>
<b>[Security]</b> <b>Command area</b>	<p>Enter the area to which this keyboard command belongs. Only users with access to this area (and any necessary privileges) will be able to issue this command or log the message. For example, if you enter Area 1 here, operators need to have access to Area 1 (plus any necessary privileges) to issue this command.</p> <p>Click the menu to the right of this field to select an area, or type in an area number directly.</p> <p><b>Note:</b> If the object is part of a Genie or symbol, this property can be defined after the Genie/symbol is pasted onto a page (<b>Ctrl + double-click</b>). Similarly, if the object is part of a template, this property can be defined after a page has been created using that template (<b>Ctrl + double-click</b>).</p> <p>You can leave this field blank by selecting the <b>Same privilege as object/group</b> box.</p>
<b>[Security]</b> <b>Same privilege as object/group</b>	<p>Select this box to assign the keyboard command the same privilege as the object/group. Only users with this privilege level will be able to issue this command, or log the message. If you want to assign this keyboard command a different privilege, leave the box unchecked and enter another privilege below.</p>
<b>[Security]</b> <b>Privilege level</b>	<p>Enter the privilege level that a user needs to possess to be able to issue this command or log the message. For example, if you enter Privilege Level 1 here, operators need to possess Privilege Level 1 to be able to issue this command. You can also combine this restriction with area restrictions. For example, if you assign the keyboard command to Area 5, with Privilege Level 2, the user needs to be set up with Privilege 2 for Area 5.</p> <p>Click the menu to the right of this field to select a privilege, or type in an area number directly.</p>

Property	Description
	<p><b>Note:</b> If the object is part of a Genie or symbol, this property can be defined after the Genie/symbol is pasted onto a page (<b>Ctrl</b> + double-click). Similarly, if the object is part of a template, this property can be defined after a page has been created using that template (<b>Ctrl</b> + double-click).</p> <p>You can leave this field blank by selecting the <b>Same privilege as object/group</b> box.</p>
<b>[Logging] Log Message</b>	<p>The text message sent to the <i>MsgLog</i> field of the Log Device when the selected action is performed by the operator at runtime. The message is plain text, and can include tag name substitutions using Genie or Super Genie syntax. When using Super Genie syntax, the data type needs to be specified. The name of the tag will then be included in the text. The message can be a maximum of 32 characters long.</p>  <p>If you want to include field data as part of a logged message, you need to insert the field name as part of the device format when you configure the device. For instance, in the <b>Format</b> field of the <b>Devices</b> form, you could enter {MsgLog,20} {FullName,15}. This would accommodate the logging of messages such as <b>P2 started by John Smith</b>.</p> <p>The log device to which the message is sent is specified through the General Access tab.</p> <p><b>Note:</b> If a group and one of its objects are both assigned a keyboard command with the same key sequence, the object's command will take precedence (i.e., the group's command will not execute).</p>

## Access

Use the Access tab to assign an area or privilege to an object. Operators without appropriate access rights will not be able to use sliders, object specific keyboard commands, and so on. It also allows you to disable the object under certain runtime circumstances. This means that the object can be embossed, grayed, or even hidden.

You can determine the kind of access you want to have to your objects.

- General Access to Objects
- Disable Access to Objects

## General Access to Objects

Use the General tab to define the general access characteristics of objects.

**To define general access properties for objects:**

1. Double-click the object.
2. Click the **Access** tab.
3. Click the **General** tab.
4. Enter details as necessary, then click **OK**.

Use the Object Properties dialog to set up general identification, security, logging, and privilege parameters for your ActiveX object.

## General Access Properties

Objects and groups have the following general access properties.

Property	Description
[Identification] Object/Group AN	<p>Displays the automatically generated Animation Number of the object/group. The AN (Animation number) uniquely identifies the object/group, and can be used in Cicode functions and so on. This field cannot be edited.</p> <p><b>Note:</b> The Animation name should not be used as a substitute in those Graphics Automation Interface or Cicode Functions that use Animation numbers, unless specified.</p> <p>(Optional) In the <b>Name</b> field, type a name for the graphics object or group. Names need to be unique to the page, symbol, template, super genie, and genie the graphics object may belong to. The animation name should not start with a number or a special character.</p> <p><b>Note:</b> If the object is part of a Genie or symbol, the following properties can be completed after the Genie/Symbol is pasted onto a page (<b>Ctrl</b> + double-click). Similarly, if the object is part of a template, the properties can be defined after a page has been created using that template (<b>Ctrl</b> + double-click).</p>
[Identification] Description	Enter a description of the object/group, and its various functions and so on. This field is purely for the

Property	Description
	entry of information which you consider beneficial to the smooth running and maintenance of your system. It will not affect the way the system runs, and it will not display during runtime.
<b>[Identification] Tool tip</b>	<p>Enter a short, meaningful description (48 characters maximum) of the object/group. During runtime, this description appears when the operator moves the cursor onto the object/group. The message can be plain text, Super Genie syntax or both. When using Super Genie syntax, the data type needs to be included. The name of the tag will then be included in the text.</p> <p>If an object in a group has a tool tip, this object's tool tip will be displayed, and not the group's tool tip. If the object does not have a tool tip, the group tool tip will display. In this instance, if the object is a member of a group, and that group is part of another group, the tool tip for the first group will display.</p> <p>If you place an object behind a group, its tool tip will not display. Remember, however, that group boundaries are rectangular, no matter what shape is formed by the objects in the group. This means that 'blank' spaces between objects in a group are actually part of the group. Even if you can see the individual object, if it is behind the group, its tool tip will not display.</p>
<b>[Security] Same area as page</b>	Select this box to assign the object/group to the same area as the page on which it has been drawn; otherwise, leave it blank, and enter another area in the <b>Object/Group area</b> field (below).
<b>[Security] Object/Group area</b>	Enter the area to which this object/group belongs. Users without access to this area (and any necessary privileges) will not be able to make full use of the object/group. They will not be able to use touch command, keyboard commands, movement, sliders and so on. (In order to avoid confusion for such operators, it is sometimes a good idea to disable the object/group when it is unavailable due to lack of security rights. Disabled objects/groups can be grayed, hidden or embossed.) For example, if you enter Area 1 here, operators need to have access to Area 1 (plus any necessary privileges) to make use of this object/group.

Property	Description
	Click the menu to the right of this field to select an area, or type in an area number directly.
<b>[Security] No privilege restrictions</b>	<p>Select this box to disable privilege restrictions; otherwise, leave it blank, and enter another privilege below. The implications of not assigning a privilege restriction depend upon whether you have used areas in your security setup:</p> <ul style="list-style-type: none"> <li>• <b>No Areas:</b> Every operator has full control of the object/group.</li> <li>• <b>Areas:</b> An operator will only need view access to control the object/group if it does not have privilege restrictions.</li> </ul>
<b>[Security] Privilege level</b>	<p>Enter the privilege level necessary for an operator to use this object/group. Operators without the necessary privileges will not be able to make full use of the object/group. They will not be able to use touch command, keyboard commands, movement, sliders and so on. (To avoid confusion for such operators, disable the object/group when it is unavailable due to lack of security rights. Disabled objects/groups can be grayed, hidden or embossed.) For example, if you enter Privilege Level 1 here, operators need to possess Privilege Level 1 to use of this object/group. You can also combine this restriction with area restrictions. For example, if you assign the object/group to Area 5, with Privilege Level 2, the user needs to have Privilege 2 for Area 5.</p> <p>Click the menu to the right of this field to select a privilege, or type in an privilege number directly.</p> <p><b>Note:</b> If an object is part of a group, users need to have access to the group in order to have access to the object.</p>
<b>[Logging] Log device</b>	<p>This is the device to which messages will be logged for the object/group's keyboard and touch commands. Click the menu to the right of the field to select a device, or type a device name.</p> <p><b>Note:</b> You need to include the <i>MsgLog</i> field in the format of the log device for the message to be sent.</p>

[Edit Common Object Properties](#)

### Disable Access to Objects

If you need to, you can disable access to objects.

**To disable access to an object:**

1. Double-click the object.
2. Click the **Access** tab.
3. Click the **Disable** tab.
4. Specify the condition which will disable the object as well as the appearance of the object when disabled.
5. Click **OK**.

### Disable Access Properties

Objects and groups have the following access (disable) properties

Property	Description
<b>Disable when</b>	<p>The object/group will be disabled whenever the expression entered here (254 characters maximum) is true. If the object/group is disabled, the operator will not be able to use any form of input, such as sliders, touch commands, keyboard commands and so on.</p> <p>To insert a tag or a function, click the <b>Wizard</b> button to the right of this field. This button displays two options: <b>Insert Tag</b> and <b>Insert Function</b>.</p> <p><b>Note:</b> You can also insert equipment.item references into expression fields using the <b>insert tag</b> option; however if no equipment has been configured in your system the list will be empty. You will need to configure equipment to populate the list with available tags.</p> <p>There are three ways of indicating a disabled object/group: Embossed, Grayed, and Hidden.</p>
<b>[Disable when] Disable on insufficient area or privilege</b>	The object/group will be disabled if an operator does not meet the area and privilege right defined in the Access.
<b>Disable style:</b>	<ul style="list-style-type: none"><li>• <b>Embossed</b> - When disabled, the object/group will look as if it has been embossed on the graphics page.</li></ul>

Property	Description
	<ul style="list-style-type: none"><li>• <b>Grayed</b> - When disabled, the object/group will be grayed out (all color detail will be removed).</li><li>• <b>Hidden</b> - When disabled, the object/group will be entirely hidden from view.</li><li>• <b>Unchanged</b> - When disabled, the object/group will not change.</li></ul> <p><b>Note:</b> If a group is disabled, objects in that group are also disabled. The disabled style of the group is applied to all the objects within the group. When the group is enabled, each object uses the disabled style of itself.</p>

[Edit Common Object Properties](#)

## Metadata

Metadata is a list of names with corresponding values that is attached to an object's animation point. When using any of the [DspAnGetMetadata](#) Cicode functions this Metadata is processed, with the field values retrieved, and set at runtime. At runtime Metadata cannot be added or removed.

Metadata can be implemented when configuring the following animation objects:

- Free hand line
- Straight line
- Rectangle
- Ellipse
- Polygon
- Pipe
- Text
- Number
- Button
- Symbol Set
- Trend
- Paste Symbol
- Active X
- Process Analyst
- Database Exchange Control.

**Note:** Metadata can also be assigned to super genie associations. See [Passing Animation Point Metadata as](#)

---

[Super Genie Associations](#) for more information.

### To add a Metadata entry:

1. Click Add or double click on the row to make it editable.
2. Insert the **Name** of the metadata.
  - To start with an alphanumeric or "\_" character
  - To contain only those characters that are allowed as part of the tag name syntax (excluding the period character '.' and reserved keywords), and not contain any white space.
  - Be no more than 253 characters in length
  - To be unique across a specific animation point.
  - The name cannot be changed at runtime.
  - The name can contain Genie substitutions
3. Insert the corresponding **Value** of the specific metadata entry.
  - The Value can contain Genie substitutions. E.g. %Level%
  - To contain only those characters that are allowed in variable tag names or 'equipment.item' tag references, and not contain any white space.
  - To be no more than 255 characters in length.
  - Literal strings are supported and be specified within single quotes e.g.'Literal'.
- **Note:** At runtime values can be changed, however when the graphics page is closed the values will revert to the original configuration.
4. Click Add to save the row. The next row is highlighted and is now editable. Click on the ESC key to cancel this row or continue to enter name | value pairs until finished.

### To edit a metadata entry:

1. Double-click the cell you want to edit, or select a row and click the edit button.
2. Modify the Name or Value . Click Apply to bring your changes into effect and then OK to close the graphic object properties dialog.

Refer to [Using Metadata](#) for examples on how you can implement metadata in your project.

## See Also

[Edit Common Object Properties](#)

## Using Metadata

The following examples provide a guide into how you can implement metadata within your project. In the first example you will set parameters using metadata, and in the second example see how genie substitutions can be used in metadata.

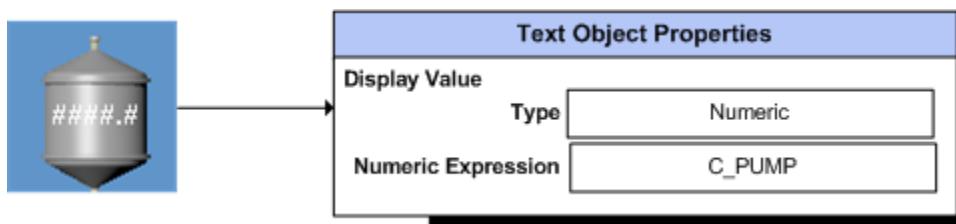

In the first two examples a paint factory needs to control the amount of Cyan, Magenta, Yellow, and Key (Black) (CMYK), which is mixed to create different colors in their color chart.

The third example illustrates how substituting the equipment name, in an equipment.item reference when

configuring a Super Genies lessens the need to define large amounts of metadata in the genie calling it.

## Example 1: Setting Parameters Using Metadata

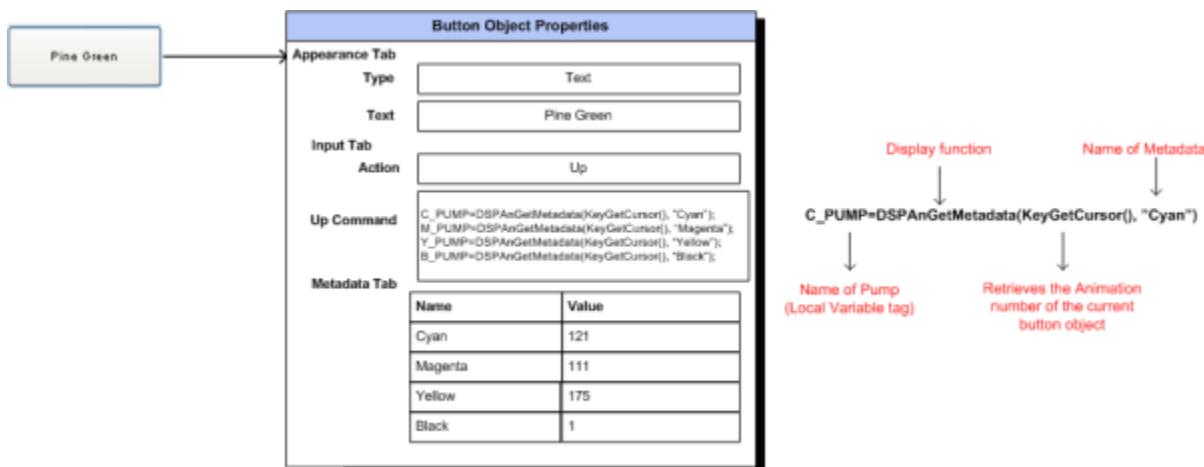

- From the toolbox select the 'number' tool and in the Text Properties dialog configure as below. This is the pump that represents the color Cyan.

- Repeat to create the remaining pumps M\_PUMP, Y\_PUMP, B\_PUMP

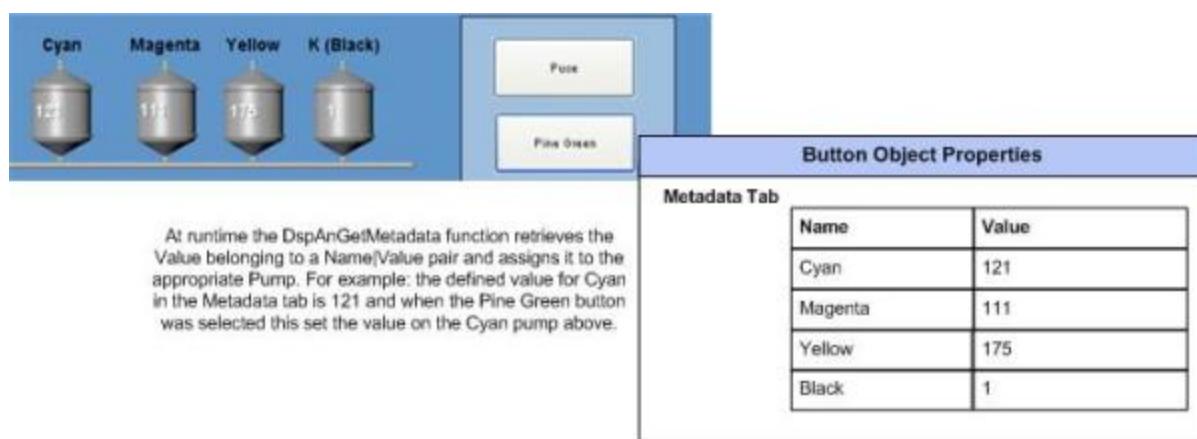

**Note:** Add these pumps to the example project as Local Variable tags

- Create a button object. This button when selected at runtime will set the CMYK values for a specific color e.g Pine Green

**Note:** For Display functions DspAnGetMetadataAt, DspAnSetMetadata, DspAnGetMetadata, and DspAnSetMetadataAt -2 is the default value used to retrieve the unique animation number for the button object. When you need to know the AN that triggered the input/command, the KeyGetCursor() function may be used as it returns the AN where the cursor is currently positioned.

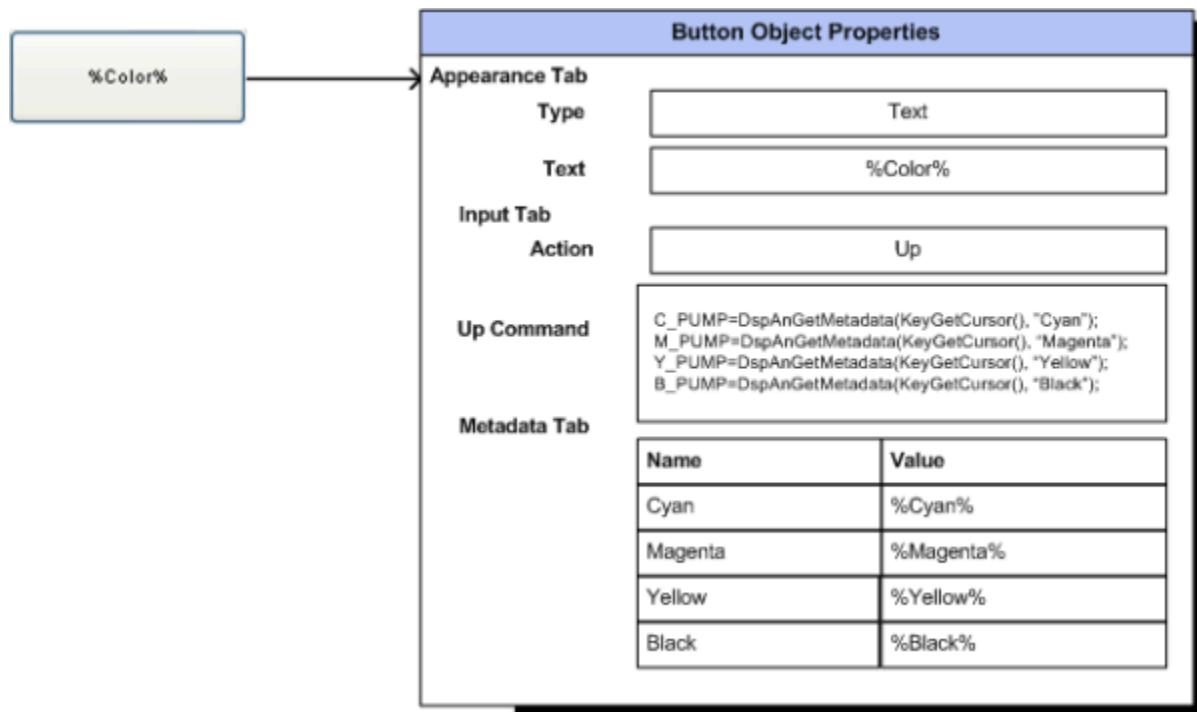

- At runtime when the 'Pine green' button is selected the values of the metadata defined for Cyan, Magenta, Yellow and Black are retrieved and the relevant pumps set.

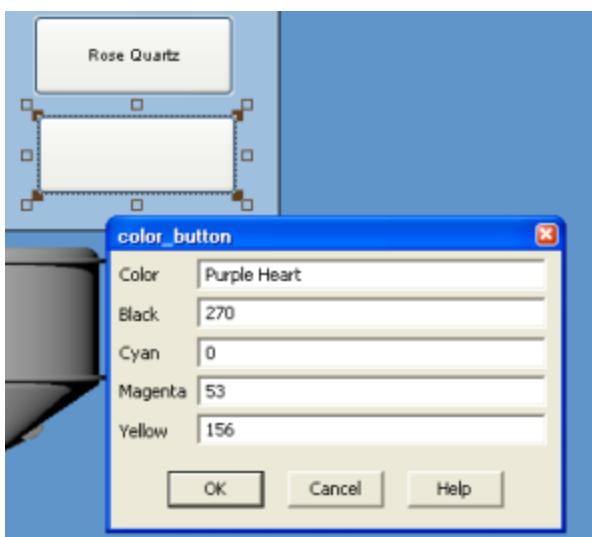

## Example 2: Using Genie Substitutions in Metadata

Instead of creating a new button for every color as you did in the previous example, you can create a genie and save it in the genie library. You can use the genie every time you need to create a new color button. Only needing to configure the name of the button and the CMYK values that belong to it.

1. From File New-> Genie
2. Add a button object onto the page
3. Configure the button – the title of the button and the Value of the Metadata have been defined using genie substitutions e.g %Color% and %Cyan%.

4. Save the genie in the appropriate genie library
5. At design time paste the genie onto the graphics page. A dialog will open prompting you for the name of the button, and the numeric values for Cyan, Magenta, Yellow and Black. In this example the name of the color is "Purple Heart"

6. At runtime when the 'Purple Heart' color button is selected the values of the metadata (that were entered in the genie prompt) are retrieved and the relevant pumps set.

### Example 3: Using Partial Associations in Metadata

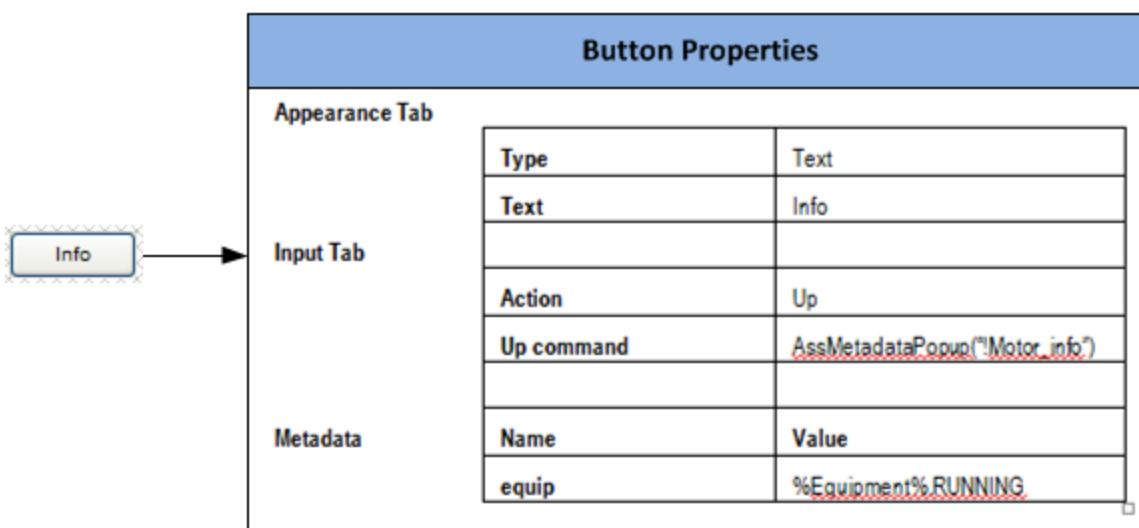

Partial associations, where only part of the variable tag, or equipment.item reference is substituted (with a name) in the Super Genie, can now be used lessening the need to define large amounts of metadata which is not easily maintainable.

In this example you will:

- Create a Genie.
- Create a Super Genie Library object.
- Attach the Super Genie to the Genie.
- Paste onto a graphics page.

#### Create the Genie

1. In Graphics Builder go to File | New | Genie.
2. A new genie will open.
3. From the graphics toolbox select the select the Button tool and click on the page to position it.
4. Draw the button and in the Button properties dialog configure the following:

5. Click **OK** to close the dialog and save the button properties
6. Click the Save tool, or choose **File | Save**.
7. Select the Project and Library in which to store the Genie.
8. Name the Genie e.g. Motor\_Genie and click **OK** to save

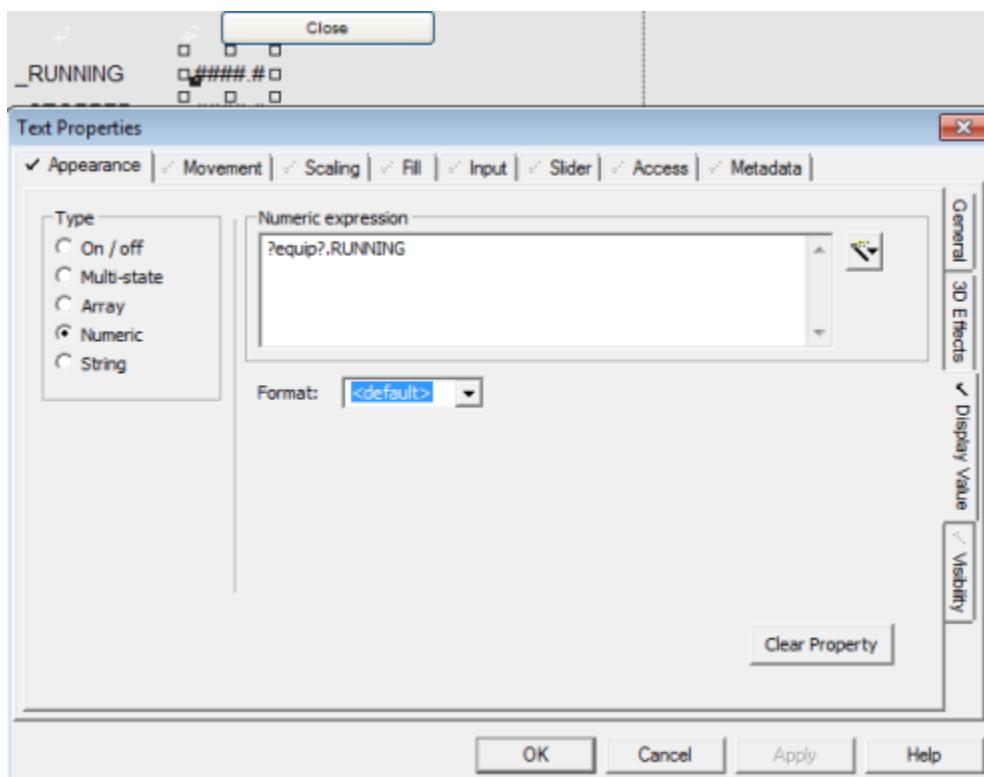

### Create a Super Genie Library Object

Close	
_RUNNING	#####.#
_STOPPED	#####.#
_AUTO	#####.#
_LOCAL	#####.#
_OutOfService	#####.#
_FAIL	#####.#
_ILOCK	#####.#
_STARTCMD	#####.#
_STOPCMD	#####.#
_ILOCKCMD	#####.#
_RESETCMD	#####.#
_FAILSTART	#####.#
_FAILSTOP	#####.#

### To create the Super Genie shown above:

1. From the toolbar select New, or choose File | New.
2. Click the Super Genie option.
3. A blank Super Genie library object page will open.
4. In this example a pop up that displays 13 values will be created.
5. Select the Text tool and click to position the text on the page and to open the Text properties dialog.
6. In the text properties dialog enter \_RUNNING.
7. Repeat steps 5 and 6 for the remainder of the labels.

8. Select the Numeric tool from the graphic toolbox and position next to the first label e.g \_Running.
9. Click to paste onto the page and to open the Text Properties dialog. Configure the Numeric expression as below with ?equip? being the substitution name.

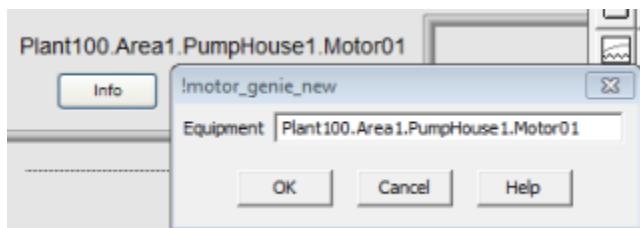

10. Click **OK** to save the text object and close the dialog.
11. Repeat steps 9 and 10 for the remaining equipment.items, matching the label with the end of the expression. For example ?equip?.STOPPED.
12. Click **OK** to apply the changes.
13. Select **File | Save**.
14. In the Save dialog, select the project the page will belong to.
15. Name the Super Genie page (e.g.!Motor\_Info) and click **OK**.
16. Once saved you will need to Attach the Super Genie to the Genie you created previously.

### Attach the Super Genie to a Genie

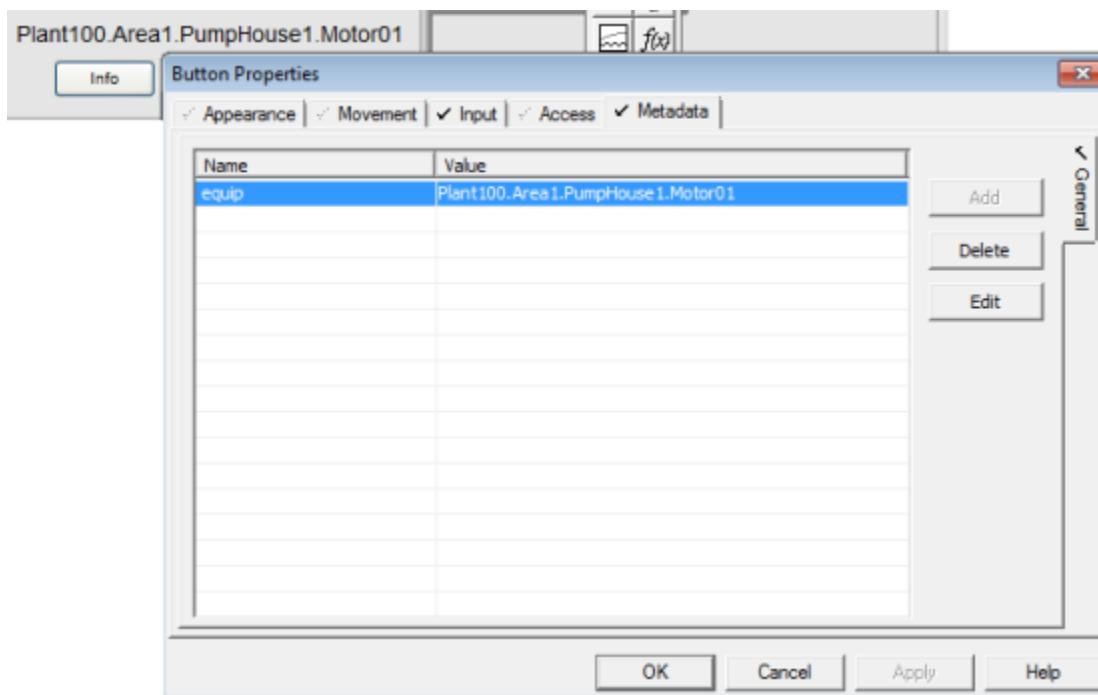

1. Open the Genie.
2. With the Genie open, select **Edit | Attach Super Genie**.
3. Click **Add**, and the Super Genie Dialog box will open.
4. Select the library the Super Genie belongs to.
5. Select the Super Genie to attach e.g. !motor\_info and click **OK**.
6. The Super Genie is added to the Attach Super Genie list.
7. Click **OK** to save the changes, or click **Cancel**.

## Paste onto Graphics Page

1. Create or open an existing graphics page.
2. From the graphics page select Edit | Paste Genie, browse for the genie you created previously and select it.
3. On pasting the genie, the dialog will open prompting you to fill in the 'Equipment' field with the name of equipment for example Plant100.Area1.PumpHouse1.Motor01.

4. The Equipment name entered will replace the value in the metadata tab (in your button as part of the genie). For example %Equipment% becomes Plant100.Area1.PumpHouse1.Motor01.

At runtime, when the 'info' button is pressed the values of the equipment are dynamically generated and assigned to the matching Super Genie Association. E.g. All occurrences of the substitution name ?equip? will be replaced with Plant100.Area1.PumpHouse1.Motor01 (creating the full equipment.item reference) and the values for the equipment.item displayed.

!motor_info

[Edit Common Object Properties](#)

### Passing Animation Point Metadata as Super Genie Associations

The metadata you define can be assigned to Super Genie associations. The name of the metadata and the name of the association in the Super Genie need to be the same. If the name matches, the value defined for that name | value pair is then inserted into the relevant 'association' field in the Super Genie. At runtime the value is dynamically generated and then displayed on the Super Genie page.

When configuring the object that will call the Super Genie, you can use a Cicode function that will perform the associations individually (DspAnGetMetadataAt()) or at once (AssMetadata()).

The table below outlines the possible display results when passing animation point metadata as Super Genie associations:

where - Y = Defined, N= Not Defined, \* =N/A, and

**VoE** - used when Tag value is not resolved.

**Default Value** is used when the Metadata Value is not defined

**Empty String** is treated as "Not defined"

Animation Point Metadata Pairs		Associations			Display Results at runtime		
Name	Value	Name	Default Value	Value on Error	Tag Resolution	Unresolved Tag	Literal
Y	Y	Y	Y	Y	Tag Value	VoE	Literal
Y	Y	Y	Y	N	Tag Value	#ASC	Literal

Y	Y	Y	N	Y	Tag Value	VoE	Literal
Y	Y	Y	N	N	Tag Value	#ASC	Literal
Y	Y	N	*	*	Tag Value	#ASC	Literal
Y	N	Y	Y	Y	Default Value	VoE	Default Value (literal)
Y	N	Y	Y	N	Default Value	#ASC	N/A
Y	N	Y	N	Y	#ASC	*	*
Y	N	Y	N	N	#ASC	*	*
N	N	N	*	*	#ASC	*	*
N	*	Y	Y	Y	Default Value	VoE	Default Value (literal)
N	*	Y	Y	N	Default Value	#ASC	N/A
N	*	Y	N	Y	#ASC	*	*
N	*	Y	N	N	#ASC	*	*
N	*	N	*	*	#ASC	*	*

[Page Properties - Associations](#)

[Super Genies](#)

## Alarm Indicator

An alarm indicator can be used to show the occurrence and status of alarms associated with an object group or Genie. It consists of two main elements:

- Alarm border
- Alarm flag.

For more information, see [Use Alarm Indicators](#).

**Note:** On Composite Genies, alarm indicators are displayed around each piece of related equipment included in the Composite Genie. You can also group individual independent objects, such as pumps, into an equipment group and apply an alarm indicator to the group. In this case, the equipment should be defined as "hidden" with its **Hidden** property set to TRUE.

### To apply an alarm indicator to an object group or Genie:

1. Display the properties for the object group or Genie to which you would like to add an alarm indicator.
2. Click the **Alarm Indicator** tab.
3. Select the **Has Alarm Indicator** check box to enable an alarm indicator.
4. In the **Highest priority alarm from** section, enter the **Equipment** that will be used to determine the highest priority alarm for the alarm indicator.
5. Select the **Include equipment references in count** check box to include equipment references when determining the highest priority alarm for the alarm indicator.
6. Configure the **Border Appearance** and **Flag Appearance** properties (see below).
7. Click **OK**.

When you return to Graphics Builder, the alarm indicator will appear on the graphics page around the object group or Genie.

#### Note:

- Using an Alarm Indicator with a group of Trend objects is not recommended.
- Genies that include legacy objects (from the v3.x/v4.x toolbox), do not support Alarm Indicators. If a Genie contains both a legacy object and a new object, then at runtime the alarm indicator will only be shown around the new object. If a Genie contains only legacy objects, an alarm indicator will not display.

## Alarm Indicator Properties

Property	Description
<b>Has Alarm Indicator</b>	Select this check box to apply an alarm indicator to the object group or Genie.
<b>[Highest priority alarm from]</b> <b>Equipment</b>	Specifies the location in the equipment hierarchy that will be used to determine the highest priority alarm for the alarm indicator. You can choose to include alarm conditions that occur at locations down the equipment hierarchy (referred to as "children") by selecting one of the following options: <ul style="list-style-type: none"><li>• Equipment and Children</li><li>• Equipment Only</li><li>• Children Only.</li></ul> Be aware that any triggering alarms that occur down the equipment hierarchy will not appear in the

Property	Description
	<p>Information Zone when the object is selected (see note below).</p> <p>By default, the page cluster context will be used. However, you can specify a particular cluster using dot (.) notation.</p> <p>You can also use Genie and Super Genie syntax.</p>
<b>[Highest priority alarm from]</b> <b>Include equipment references in count</b>	<p>Select this check box to include equipment references when determining the highest priority alarm for an alarm indicator.</p> <p>Be aware that any triggering alarms that occur in referenced equipment will not appear in the Information Zone when the object is selected (see note below).</p>
<b>[Border Appearance]</b> <b>Is Inside</b>	<p>Select this check box to locate the border within the extent of the object group or Genie. This means no additional space will be required to support a border.</p> <p>If this option is selected, <b>Padding</b> is disabled.</p>
<b>[Border Appearance]</b> <b>Width</b>	<p>Specifies the width of the alarm border (in pixels).</p>
<b>[Border Appearance]</b> <b>Padding</b>	<p>Specifies the amount of space between the extent of the object group or Genie and the inside edge of the alarm border (in pixels).</p>
<b>[Border Appearance]</b> <b>Frame Color</b>	<p>Specifies the color used for the inside and outside edge of the alarm border. Use the drop-down to select a color.</p>
<b>[Flag Appearance]</b> <b>Show Flag</b>	<p>Select this check box to apply a flag to the alarm indicator.</p>
<b>[Flag Appearance]</b> <b>Position</b>	<p>Select the position for the alarm flag on the alarm border. The alarm flag will be attached to the outside edge of the alarm border at the specified location.</p>

**Note:** If you configure an alarm indicator to respond to alarm conditions that occur down the equipment hierarchy ("children") or within referenced equipment, these indirect alarms will not appear in the Information Zone when the object is selected at runtime. If this occurs for an object with an active alarm indicator, use a higher level alarm count or an alarm page to determine the location of the active alarm.

[Edit Common Object Properties](#)

## Manipulate Graphics Objects

Objects can be manipulated in various ways, such as moving, resizing, and grouping.

- [Select Objects](#)
- [Move Objects](#)
- [Resize Objects](#)
- [Delete Objects](#)
- [Lock/Unlock Objects](#)
- [Group Objects](#)
- [Copy and Paste Objects](#)
- [Change the Overlap of Objects](#)
- [Align Objects](#)
- [Rotate Objects](#)
- [Mirror Objects](#)
- [Locate an Object](#)
- [Adjust Position and Size Dialog](#)

### Select Objects

You can select a single object or a group of objects at a time.

#### To select a single graphics object:

1. In Graphics Builder, click **Select**.
2. Click the object. The object's sizing handles appear, and the cursor changes from an arrow to a hand while on the object.

---

**Note:** To add other objects to the selection, hold the **Ctrl** key and click each object in turn. To deselect an object from a group selection, while still holding the **Ctrl** key, click the object again. To select every object in the drawing, use **Select All** from the Edit menu. To deselect every object, click anywhere other than on an object.

---

#### To select a group of graphics objects using a marquee box:

1. In Graphics Builder, click **Select**.
2. Click and hold the left mouse button and drag the cursor across the page. This creates a temporary bounding box. Any objects within the box will be selected when you release the mouse button.
3. Release the mouse button.

---

**Note:** To add other objects to the selection, or remove objects from the selection, hold the **Ctrl** key and click each object in turn. To quickly select every object in the drawing, you can use **Select All** from the Edit menu or the keyboard shortcut **Ctrl +A**. To deselect every object, click anywhere other than on an object.

---

## See Also

[Manipulate Graphics Objects](#)

[Move Objects](#)

## Move Objects

You can move an object by doing one of the following:

- Click the object and drag it to a new location.
- Select the object and use the direction keys (left, right, up and down arrows) and diagonal keys (page up, page down, end, and home) on the keyboard to position the object to a new location.
- Use the Adjust Position and Size dialog to move the object to a new location set by X and Y co-ordinates. See [Adjust Position and Size Dialog](#) for more information.

If you move an object as soon as you select it, an outline of the object boundary displays as you move it on your page. If you hold the mouse stationary for 1 second or more before you move the object, the object itself displays as you move it, enabling you to better see the result for more accurate placement.

## See Also

[Manipulate Graphics Objects](#)

[Resize Objects](#)

## Resize Objects

You can re-size objects and manage a node of an object in the following ways.

### To resize an object:

1. Select the object, and then move the cursor over a sizing handle. The cursor changes to a two-sided arrow showing the directions that you can drag the handle to re-size the object.
2. Click and drag the handle to a new location. The object's bounding box appears as you drag.
3. Release the mouse button.

Select a sizing handle at a corner of the object to change the height and width at the same time. If you hold the **CTRL** key while you move a corner sizing handle, the object maintains its aspect ratio (that is, a square remains a square).

Or:

Select the object, and then hold the **SHIFT** key while you press any of the direction keys to resize the object. The selected object is resized in the appropriate direction, anchored to the top-left corner.

If you hold the **CTRL** and **SHIFT** key while you press any of the direction keys, the object maintains its aspect ratio (that is, a rectangle remains a rectangle).

You can also use the Adjust Position and Size dialog to move the object to a new location set by X and Y co-ordinates. See [Adjust Position and Size Dialog](#) for more information.

**To select an object's node:**

1. Select the object. Node selection is only applicable to a Line, Pipe, Polyline, or Polygon object.
2. Position and hold the mouse pointer over the node. The mouse pointer will change to a small cross shape.
3. Click the left mouse button. The color of the selected node will change to the inverse of the background (light on a dark background, dark on a light background).

If you have a node selected and then click another node within the same object, the first node will deselect. To select multiple nodes, hold down the **Ctrl** key and click each node you want to select. (With the **Ctrl** key held down, you can click a previously selected node to deselect it.) Clicking the same node again toggles the selection of the node alternately on and off. To deselect every node, click anywhere other than on a node.

**To move a node of an object:**

1. Select the node(s).
2. Position and hold the mouse pointer over the node. The mouse pointer will change to a small cross shape.
3. Click and hold the left mouse button. The cursor changes to a positioning symbol.
4. Drag the selected node(s) to the desired position.
5. Release the mouse button.

Selecting and moving multiple nodes maintains the aspect ratio of the graphic object between the selected nodes.

**To add a node to an object:**

1. Select the object.
2. Position and hold the mouse pointer directly over the graphic object at the exact point where the new node will be added. The mouse pointer will change to a pointing hand shape.
3. Press **Insert**, or either of the available plus (+) keys.

Depending upon the keyboard you're using, the plus key could be either on the number pad section, or accessed on the main keyboard via the **Shift** key.

**To delete a node from an object**

1. Select the node(s).
2. Press **Delete** or a minus (-) key.

If no nodes are selected, pressing the **Delete** or minus keys deletes the object.

**See Also**

[Manipulate Graphics Objects](#)

[Reshape Objects](#)

[Adjust Position and Size Dialog](#)

## Reshape Objects

Pipe, Polyline, or Polygon objects can be edited to change their shape. Each of these objects consist of a continuous series of lines drawn between structural anchor points called nodes. Nodes are visible when an object is selected. Each node appears as a small square located at specific anchor points along the object. There will be a node located at the start and end of a polyline or pipe, and at every change of direction in an object's shape.

Pipe, Polyline, and Polygon objects can have their shapes changed in many ways. Their nodes can be selected individually or by group and moved to a different position, thus changing the shape of the object. The Pipe, Polyline, and Polygon objects also support node adding and deleting.

Line objects also have nodes, but behave in a more restricted manner than Pipe, Polyline, or Polygon objects.

A straight line can only consist of two nodes, (a start node point and an end node point). These can be individually selected to move the line to a different position, or at least change its direction. The Line object does not support node adding. To achieve the same result as adding a node to a Line object, create a Polyline object instead. Deleting either of the (only two) nodes of a Line object will delete the whole Line object completely.

## See Also

[Manipulate Graphics Objects](#)

[Delete Objects](#)

## Delete Objects

You can delete unwanted objects.

**To delete an object (or a group of objects):**

1. Select the object (or group of objects)
2. Choose **Edit|Delete** or press the **Delete** key (or a minus (-) key).

## See Also

[Manipulate Graphics Objects](#)

[Lock/Unlock Objects](#)

## Lock/Unlock Objects

On complex drawings (with many objects), selecting a discrete group of objects without including every object (in the selected area) can be difficult (for example when an object is hidden by another object). To avoid unintentionally selecting an object, you can 'lock' it in position. When an object is 'locked', it cannot be selected, deleted, moved, or edited. Objects are locked only when the **Edit** menu **Break Lock Mode** option is not selected.

**To lock an object:**

1. Select the object.
2. Choose **Edit | Lock Object**.

**To unlock an object:**

1. Choose **Edit | Break Lock Mode**.
2. Select the object.
3. Choose **Edit | Unlock Object**.

**See Also**

[Manipulate Graphics Objects](#)  
[Group Objects](#)

**Group Objects**

You can group objects to make them easier to manipulate.

**To group objects:**

1. Click **Select**.
2. Select the objects to group, and then click **Group** (or choose **Arrange | Group Objects** or **Ctrl + Shift + G**).

**To ungroup objects:**

1. Click **Select**.
2. Select the objects to group, and then click **Ungroup** (or choose **Arrange | Ungroup Objects** or **Ctrl + Shift + U**).

**To change the properties of a group:**

1. Click **Select**.
2. Double-click the group. The Properties dialog box appears.
3. Change the properties as necessary.
4. Alternatively, choose **Tools | Goto Object**, select the group, and then click **OK**.

**See Also**

[Manipulate Graphics Objects](#)  
[Copy and Paste Objects](#)

**Copy and Paste Objects**

You can copy and paste objects onto other graphics pages. You can use the clipboard to transfer objects between different graphics pages and from other graphics applications.

**To copy an object to the clipboard:**

1. Click **Select**.

2. Select the object (or group of objects).
3. Click **Copy** or choose **Edit | Copy**.

**To paste an object (or group of objects) from the clipboard:**

1. Click **Paste** or choose **Edit | Paste**.

**To cut (remove) an object:**

1. Click **Select**.
2. Select the object (or group of objects).
3. Click **Cut** or choose **Edit | Cut**.

**To cancel your last drawing operation(s):**

1. Click **Undo**, or choose **Edit | Undo**.

You can undo operations performed during the current drawing session apart from edits to bitmaps.

**To cancel the Undo (or Redo) the last drawing operation(s):**

1. Choose **Edit | Redo**.

[Manipulate Graphics Objects](#)

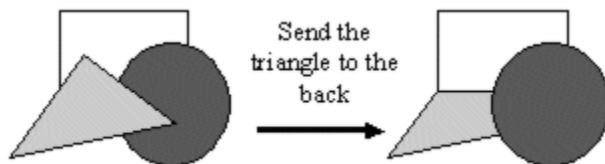

[Change the Overlap of Objects](#)

## Change the Overlap of Objects

In the Graphics Builder, objects can overlap. Where there is an overlap, new objects are placed on top of existing objects. You can move objects backwards and forwards through this display sequence to change the way they overlap. An object can be moved backwards and forwards one step at a time (rather than completely to the back, or completely to the front).

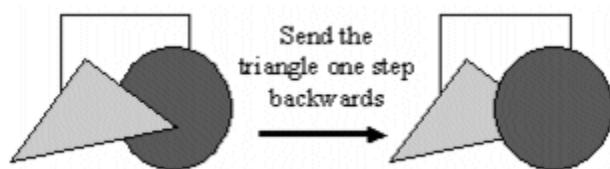

**To position an object (or group of objects) behind other objects so that objects overlap it:**

1. Click **Select**.
2. Select the object (or group of objects).
3. Click **Send to Back** or choose **Arrange | Send to Back**.

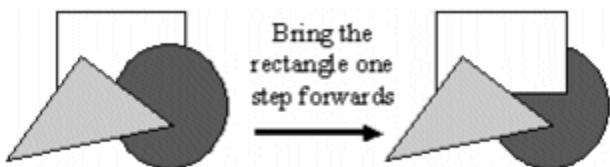

**To send an object (or group of objects) one step backwards:**

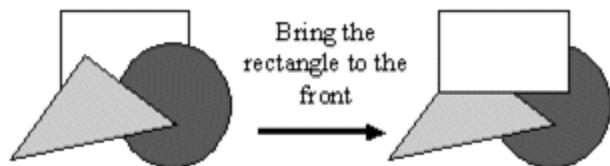

1. Click **Select**.
2. Select the object (or group of objects).
3. Click **Send Backwards** or choose **Arrange | Send Backwards**.

**To bring an object (or group of objects) one step forwards:**

1. Click **Select**.
2. Select the object (or group of objects)
3. Click **Bring Forwards** or choose **Arrange | Bring Forwards**.

**To bring an object to the front:**

1. Click **Select** tool.
2. Select the object (or group of objects).
3. Click **Bring to Front** or choose **Arrange | Bring to Front**.

**See Also**

[Manipulate Graphics Objects](#)

[Align Objects](#)

**Align Objects**

You can precisely align a group of objects vertically, horizontally, or both.

**To align objects:**

1. Click **Select**.
2. Select the objects.
3. Choose **Arrange | Align** or **(Ctrl + Shift + A)**. The Align dialog box appears.

Option	Description	
Vertical	Top	Aligns the top edges of the selected objects
	Center	Vertically aligns the midpoints of the selected objects
	Bottom	Aligns the bottom edges of the selected objects
	Even	Vertically aligns the midpoints of the selected objects with even spacing
	None	Doesn't change the vertical alignment of the selected objects
Horizontal	Left	Aligns the left edges of the selected objects
	Center	Horizontally aligns the midpoints of the selected objects
	Right	Aligns the right edges of the selected objects
	Even	Horizontally aligns the midpoints of the selected objects with even spacing
	None	Doesn't change the horizontal alignment of the selected objects

**See Also**[Manipulate Graphics Objects](#)[Rotate Objects](#)**Rotate Objects**

You can rotate an object 90° right (clockwise) or 90° left (counter-clockwise).

**To rotate an object (or group of objects):**

1. Click **Select**.
2. Select the object(s).
3. Choose **Arrange | Rotate or (Ctrl + Shift + R)**.

**To rotate a text object:**

1. Click **Select**.
2. Select the object(s).
3. Choose **Tools | Convert to Bitmap**.
4. Choose **Arrange | Rotate or (Ctrl + Shift + R)**.
5. Select the direction to rotate the object (or group of objects).

The object(s) are rotated 90 degrees in the direction you select. To rotate the object(s) 180 degrees, click the direction button twice.

**See Also**

[Manipulate Graphics Objects](#)

[Mirror Objects](#)

**Mirror Objects**

You can mirror an object relative to its horizontal or vertical axis.

**To mirror an object (or group of objects) relative to its horizontal or vertical axis:**

1. Click **Select**.
2. Select the object(s).
3. Choose **Arrange | Mirror or (Ctrl + Shift + M)**.
4. Choose the axis about which to mirror the object (or group of objects).

**See Also**

[Locate an Object](#)

[Manipulate Graphics Objects](#)

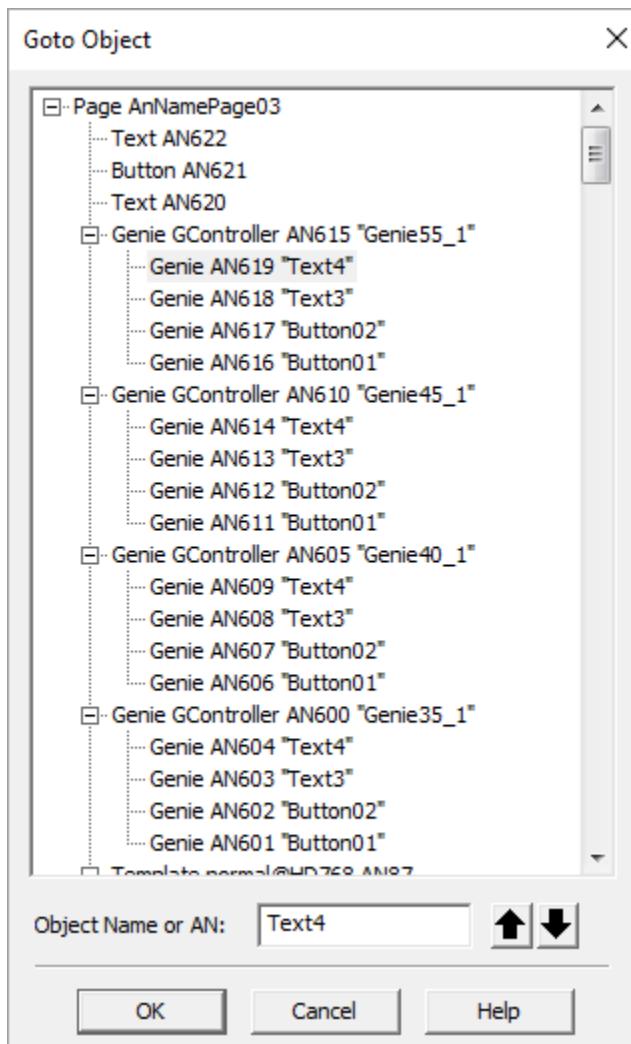

**Locate an Object**

You use the Goto Object dialog box to find, select and access the properties of objects on your current page or on page templates used by the current page. You can select objects, Genies, symbols, and groups on the page (or template) as well as the graphical elements that make up those Genies, symbols, and groups.

**To locate an object (or a group, Genie, symbol, or page template) on the current page and display its**

**properties:**

1. Choose **Tools | Goto Object**.
  2. Locate the object (or group, Genie, symbol, or page template) in the tree structure or type the relevant Animation number or Animation name in the **Object AN** box.
- Objects that are made up of several objects (or other graphical elements) have a plus sign (+) next to them. Click the + sign to see these component objects.
- The Animation name is unique to the page, page template, group, genie and graphics object it belongs to. When you search using a name, up and down arrows are displayed so you can scroll through each instance of the name on the page.

3. Double click the object in the tree structure, or click **OK** to display the object's properties.

**See Also**

[Manipulate Graphics Objects](#)

## Copy an Object to the Library

You can copy an object to the library so that you can use it later on other graphics pages.

### To copy an object to the library (and make it a symbol):

1. Click **Select**.
2. Select the object (or group of objects).
3. Choose **Edit | Copy to Library**. The Copy To dialog box appears.

## Copy To dialog box

This dialog box lets you copy an object (or group of objects) to the library as a symbol.

Feature	Description
Symbol	A name for the symbol.
Library	The project library where the symbol is stored.
Project	The project where the library is stored.
Preview Enable	Displays a thumbnail image of the symbol.

**Note:** To edit the symbol, select it and click **Edit**. To create a new symbol, click **New**.

## New Library dialog box

This dialog box lets you create a new library for the symbol, Genie, or Super Genie. Enter a **Name** for your new library (64 characters maximum).

## Adjust Position and Size Dialog

You can move and resize an object using the Adjust Position and Size Dialog.

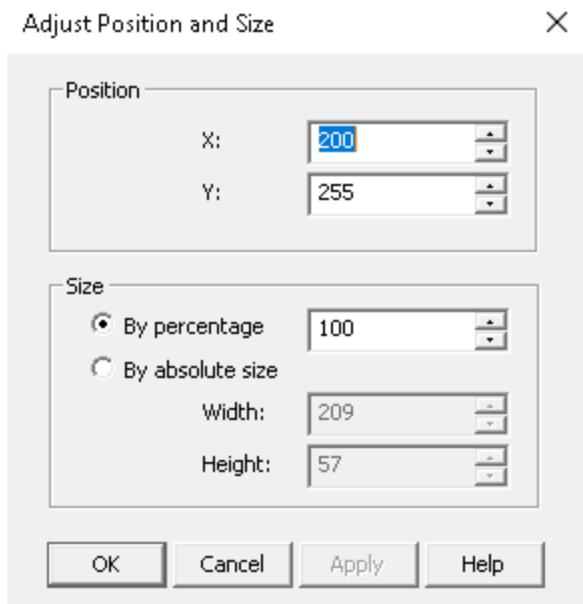

### To move or resize an object:

1. Open Graphics Builder.
2. Select an object or objects on a graphics page.
3. On the **Arrange** menu, select **Adjust Position and Size**.

Or:

Press the **CTRL** plus **Shift** plus **P** keys.

The Adjust Position and Size dialog will appear.

4. Move the object to a new position by adjusting the **X** and **Y** co-ordinates.
5. Resize the object by adjusting the **By percentage** value.

Or:

Adjust the **Width** and **Height** values.

The absolute size of the object is in pixels.

6. Click **Apply** to implement the changes.
7. Click **OK** to close the dialog.

## See Also

[Manipulate Graphics Objects](#)

[Resize Objects](#)

## Symbols

Symbols are a collection of graphics objects that can be used to represent a particular component of a system, from a simple switch to a complex piece of machinery such as a mixer or a tank. They are useful where a component needs to be represented multiple times across a project's graphics pages.

The appearance of a symbol will usually look like the physical piece of equipment it represents so that its meaning is immediately clear to an operator. You can also animate symbols so that they indicate the current operational state of the associated piece of equipment.

You can use symbols in the following ways:

- Paste a symbol to a graphics page, template, Genie, Super Genie or another symbol (see [Paste a Symbol](#))
- Paste a collection of symbols to a page as a "symbol set" that changes appearance in response to condition changes (see [Add a Symbol Set](#))
- Save a graphics object or grouped graphics object to a library as a symbol, allowing it to be reused (see [Save](#))

[a Symbol to a Library\)](#)

- Link a symbol to a library symbol so that any changes to the library are automatically instantiated (see [Paste a Symbol](#)).

A comprehensive range of symbols are installed with Plant SCADA. These symbols are stored in several libraries in the "Include" system project. To browse the symbols associated with the active project, use the **Libraries** view in the **Visualization** activity (see [Browse Libraries in Plant SCADA Studio](#)).

**Note:** To display the properties for one of the grouped objects that form a symbol, hold the Control (CTRL) key down and double-click the specific object. Alternatively, you can use the Goto Object tool, accessible via the **Tools** menu (see [Locate an Object](#)).

## See Also

[Create a Symbol](#)

[Open an Existing Symbol](#)

## Create a Symbol

You can create a new symbol from scratch, or you can create a symbol from objects selected on a graphics page.

### To create a new symbol:

1. Open Graphics Builder.
2. On the **File** menu, select **New**.

Or:

Select the **New** button.

3. On the New dialog box, click **Symbol**.

The symbol will open in Graphics Builder ready for editing. The small cross that appears in the middle of the workspace represents the symbol's anchor point.

4. Edit and save the symbol (see [Save a Symbol to a Library](#)).

### To create a symbol from selected objects:

1. Open the page that contains the required object(s).
2. Select the object(s) you would like to save as a symbol.
3. From the Edit menu, select **Copy to Library**. The Copy To dialog box will appear.
4. Edit the dialog using the steps described in [Save a Symbol to a Library](#).

**Note:** To delete a symbol from the library, select the symbol name and click **Delete**.

## See Also

[Open an Existing Symbol](#)

[Paste a Symbol](#)

## Open an Existing Symbol

**To open an existing symbol for editing:**

1. Open Graphics Builder.
2. On the **File** menu, select **Open**.  
Or:  
Select the **Open** button.

3. On the Open dialog box, select the **Symbol** tab.
4. Select the **Project** where the symbol is stored.
5. Select the **Library** where the symbol is stored.
6. Select the **Symbol** you would like to open.
7. Click **OK**.

You can now edit and save the symbol (see [Save a Symbol to a Library](#)).

---

**Note:** To delete a symbol from the library, select the symbol name and click **Delete**.

---

## See Also

[Paste a Symbol](#)

## Save a Symbol to a Library

You can store frequently used objects or groups of objects (including bitmap objects) in a library as [Symbols](#).

**To save a symbol to a library:**

1. Create a symbol using one of the methods described in [Create a Symbol](#).
2. On the **Copy To** or **Save As** dialog box, select the **Project** in which the symbol is to be stored.
3. Select the **Library** in which the symbol is to be stored.
4. Enter a **Name** for the symbol.
5. To display a preview of the symbol, select the **Enable** check box.
6. Click **OK**.

When you save an object in a library, the current properties of that object are saved with it. When you paste it as a symbol to a graphics page, they are used as defaults for the symbol.

---

**Note:** Pasted symbols have different **Appearance** properties to those of normal objects as you can only specify a visibility property.

---

[Paste a Symbol](#)

## Genies

A Genie is a graphic object (or group of related graphic objects) that you configure and save in a Genie library for reuse in your project. When configuring the Genie, you use a substitution for part of or all of an object's expression. This means when you use the Genie, you only need to configure these substitutions and not all of the properties for the object or objects within the Genie.

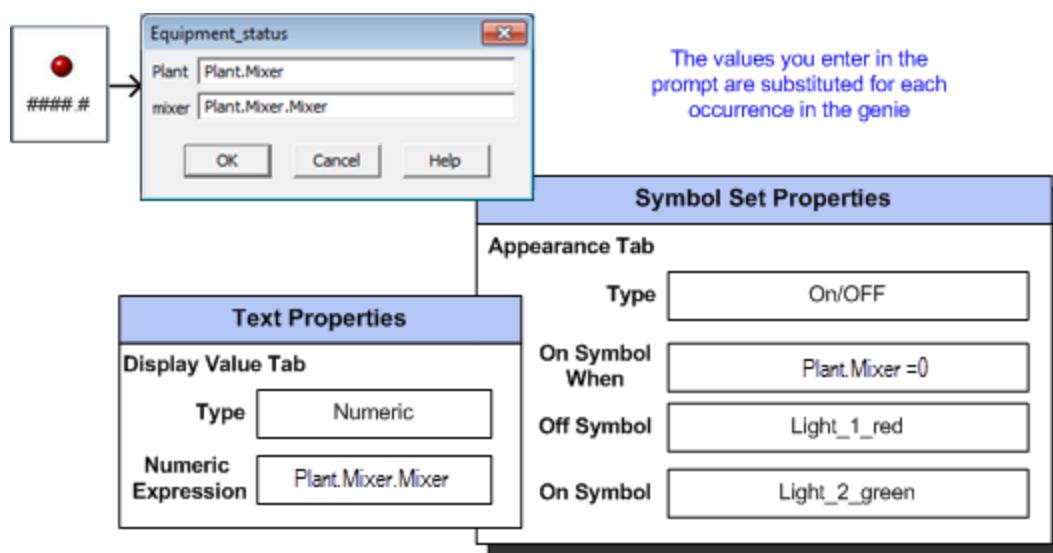

**Note:** To browse the Genies associated with the active project, use the **Libraries** view in the **Visualization** activity (see [Browse Libraries](#) in Plant SCADA Studio).

In the illustration below observe how part of the expression in the 'On Symbol When' field has been substituted with %Plant%. The percentage symbols (%%) denote that "Plant" is a Genie substitution (see [Define Genie Substitutions](#)).

When the Genie is pasted onto the graphics page a dialog will open, prompting you to configure the substitutions used in the Genie. The properties of a Genie can also be accessed by double clicking on the Genie.

In the illustration below observe how the field names in the Status Indicator match the 'substitutions' used when creating the Genie. For the Genie substitution 'Plant', an equipment reference is entered in the prompt.

During compilation the equipment, 'equipment.item' or variable tag you entered into the prompt replace each substitution in the Genie. When you reuse this Genie in the project, you can enter different references to customize each use of the Genie on a page.

**Note:** To display the properties of the objects in a Genie (instead of the Genie Properties), select the Genie and hold the Control (CTRL) key down and double-click the object. The object dialog will open with the properties of the object read-only.

- [Create a New Genie](#)
- [Paste a Genie](#)
- [Configure a Genie](#)
- [Dynamically Instantiate a Genie at Runtime](#)

## Create a New Genie

Configuring a new Genie is similar to creating a page with graphical objects, but with genies there is no background. Typically you create a new Genie using the Graphics Builder, add the objects, define the Genie substitutions, and save the Genie in a Genie library.

### To create a new Genie:

1. Open Graphics Builder.
2. From the **File** menu select **New**.
3. Click **Genie**.
4. Create your Genie object, and define the required substitutions (see [Define Genie Substitutions](#)).
5. Click the **Save** button on the Graphics Builder toolbar, or choose **Save** from **File** menu.

6. Select the **Project** and **Library** in which you would like to store the Genie.
7. Enter a name for the Genie in **Genie** field.
8. Click **OK**.

To create a new library for the Genie, click **New**. The New Library dialog will display. In the field provided, name the new library and click **OK**. The new library will be added to the library list. You can now [Paste a Genie](#) on a graphics page.

[Use the IFDEF Macro](#)

## Define Genie Substitutions

A Genie substitution can be a number or name you use to define an object's expression. Used as a placeholder the expression is replaced with a real value when you compile the project.

To define a Genie, you use substitution strings in the properties of the objects that will be specific to each instance. You can use substitutions for any expression in an object (or in a group of objects). To specify an expression as a substitution, enclose the placeholder text between percentage (%) characters. For example:

%title% %example%

---

**Note:** Area is a reserved name in Plant SCADA, thus the use of %AREA% within a Genie substitution is not supported. See Reserved Words for more information.

For static STRING substitutions, enclose the %% characters in quotation marks, for example:

"%title%" "%example%"

This will stop Plant SCADA from reading the placeholder text as a tag.

Only fields that accept expressions can have Genie substitutions; however any expression can be substituted, including constants or labels, or 'equipment.item' tag references.

You can also define substitutions for variables that do not exist in the current project. By using the IFDEF function, you can hide the variables at runtime. Refer to [Use the IFDEF Macro](#) for more information.

## See Also

[Use Equipment.Item References with Genies](#)

[Use Structured Tags with Genies](#)

[Use the IFDEF Macro](#)

## Use Genie Substitutions in Templates

When you create a new custom template and add objects to the template, you can use Genie substitutions directly in the expressions of the object.

Configure the template using substitution strings (enclosed between percentage characters '% %') for the relevant properties of each object.

When finished save the new template.

When you subsequently create a new page based on the template, double-click the template (typically a graphics object on the template), and a dialog will appear prompting you for the values for the substitutions used in the template.

[Create a New Genie](#)

[Define Genie Substitutions](#)

[Use Equipment.Item References with Genies](#)

[Use Structured Tags with Genies](#)

[Use the IFDEF Macro](#)

## Use Equipment.Item References with Genies

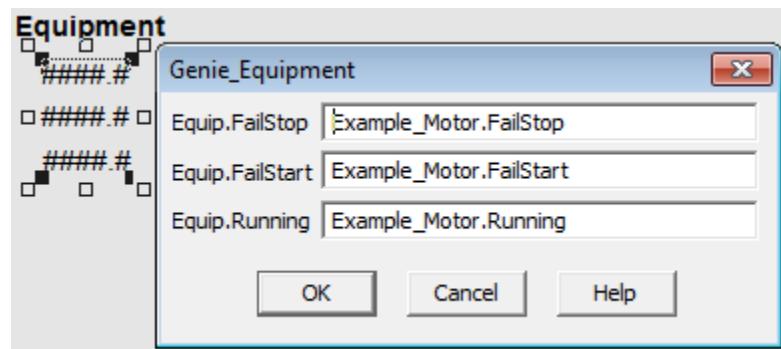

When you define a Genie, you can use full or partial Genie substitutions to generate the complete 'equipment.item' reference when the Genie is used.

If you needed to define a Genie to display the values of the equipment "Example\_Motor.FailStop", "Example\_Motor.FailStart" and " Example\_Motor.Running", you could configure a Genie as follows:

Numeric expression	%Equip.FailStop%
Numeric expression	%Equip.FailStart%
Numeric expression	%Equip.Running%

By using full substitutions, each numeric expression is a separate Genie substitution.

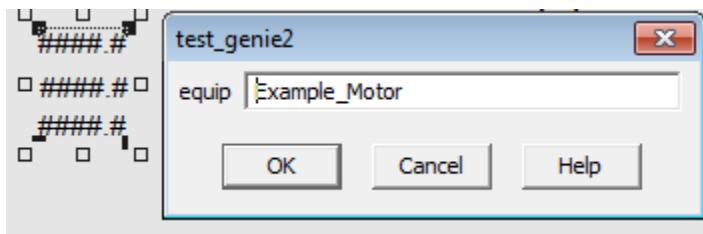

When the Genie is pasted onto a graphics page you would be prompted to enter the 'equipment.item' reference for each expression.

Using a partial substitution where only part of the 'equipment.item' reference is substituted, you could configure the numeric expressions as follows:

Numeric expression	%Equip%.FailStop
Numeric expression	%Equip%.FailStart
Numeric expression	%Equip%.Running

When the Genie is pasted onto a graphics page you would be prompted to enter just one 'equipment.item' reference (for example, "Example\_motor").

The partial substitution is then used in the Genie to create the complete 'equipment.item' reference for all three objects.

[Create a New Genie](#)

[Define Genie Substitutions](#)

[Use Genie Substitutions in Templates](#)

[Use Structured Tags with Genies](#)

[Use the IFDEF Macro](#)

## Use Structured Tags with Genies

When you define a Genie, you can add a prefix or suffix to a Genie property to generate the complete tag when the Genie is used. For example, you could define a Genie property as follows:

`%tag%_PV`

If you then use "DEV1" for the tag, the Genie will generate the complete tag:

`DEV1_PV`

This is also the case if you reference the variable tag using the associated equipment and item name:

`%equipment.item%_PV`

If you use "PUMP.SPEED" for equipment.item, the Genie will generate the complete tag:

`PUMP.SPEED_PV`

You can add extra information at the beginning (prefix), or on the end (suffix) of the Genie property, or use both a prefix and suffix in the same Genie property. For example, if you have defined a loop controller with three bar graphs (created using the fill property in a rectangle) to display the tags DEV1\_PV, DEV1\_SP and DEV1\_OP, you can configure a Genie as follows:

Level expression	<code>%PV_Tag%</code>
Level expression	<code>%SP_Tag%</code>
Level expression	<code>%OP_Tag%</code>

This configuration means each rectangle has a separate Genie tag.

When you configure the Genie (with the Genie dialog), you have to enter three separate tags: DEV1\_PV, DEV1\_SP and DEV1\_OP. However, if you use structured tags, you can configure the rectangles as follows:

Level expression	%Tag%_PV
Level expression	%Tag%_SP
Level expression	%Tag%_OP

In this case, you only have to enter one tag (DEV1) to generate six objects. The Genie automatically concatenates DEV1 with either \_PV, \_SP, or \_OP, depending on where the tag is substituted. As well as a reduction in configuration time, this Genie is easier to maintain.

**Note:** The above example illustrates the power of Genies. The more complex and the greater number of objects in a Genie, the greater the advantage of using structured tags. You can also make complex Genies by using multiple variables for a Genie property. For example, "%Level%\_TIC\_%Occ%\_PV" or any combination of prefix, suffix and number of Genie variables.

[Use Genie Substitutions in Templates](#)

[Use Equipment.Item References with Genies](#)

[Use the IFDEF Macro](#)

## Use the IFDEF Macro

Genies are customizable, reusable objects that are even more flexible when used with the IFDEF macro. With the IFDEF macro, during compilation it is able to detect if a Genie substitution is valid or not. If the substitution is not valid you are able to hide it from the page, thus making your Genies more generic and reusable in more contexts.

**Note:** In Plant SCADA, using the IFDEF macro is considered an advanced configuration scenario.

The expression entered in the **Hidden When** field of an object's property is used to determine if the object will be visible on the page at runtime. The expression evaluates to either TRUE or FALSE and the object is hidden when the expression is TRUE.

You define the variable tag and conditions under which the object is hidden by entering an IFDEF statement into the **Hidden When** field when you configure the object. The IFDEF statement is evaluated by the compiler and the value of the resulting expression or variable tag will determine whether or not the object is hidden.

This can significantly reduce the number of necessary Genies, as the configuration engineer does not need to generate several smaller Genies to cater to operations driven by a slightly different range of tags.

The IFDEF statement consists of three arguments:

```
IFDEF (<"Tag Reference">, <Result value if tag defined>, <Result value if tag undefined>)
```

The first includes a tag reference (variable tag name or 'Equipment.Item'). If the variable tag is defined in the tag database at project compilation, the IFDEF statement is replaced in the Expression field by the second argument. If the variable tag is undefined, the Expression field will contain the third argument, displaying a value of a tag that may not be defined in your project.

## Example - Hidden When

```
IFDEF("Bit_1", 0, 1)
```

In the above example, if Bit\_1 is defined in the tag database, the value in the **Hidden When** field will be 0. If Bit\_1 is undefined, the value will be 1. Since the object is hidden when the value is TRUE, the object will be hidden when BIT\_1 is undefined (i.e. when the **Hidden When** field contains 1).

## Example - Display Value

```
IFDEF("Bit_2", "NA")
```

If the second argument is omitted, as in Example 2, the variable tag specified in the first argument is used. If Bit\_2 is defined, therefore, the display value will contain Bit\_2. If the tag is not defined, then NA would be displayed.

If Bit\_2 is undefined, the Hidden When expression evaluates to 1 (TRUE) and the object is hidden.

### To enter an IFDEF statement in the Hidden When Field:

1. Double-click the graphics object for which you want to edit the field.
2. Select the **Appearance** tab.
3. Click the **Hidden When** field and enter the IFDEF statement.
4. Click **OK**.

## Genie Forms

The Genies that are included with Plant SCADA often have drop-down lists that list the available variable tags. However, the forms on the custom Genies only have blank fields to enter the required information.

Customized drop-down lists are created by using Genie Forms. A Genie Library is a file with a .ctm extension and each Genie Library can have an associated form file (for example, Drives.ctm would have Drives.frm). The Genie form (.frm) file should reside in the same directory as the Genie Library (.ctm) file. A form definition for each Genie in the associated library can be provided. If one is not provided, a default form is created.

A Genie form follows the following format:

```
FORM "<genie>" [, "<form title>"];
<field number>: "<field name>", <field size> [, readonly/readwrite [, "<list form>", <"list
field>"[, "<list filter>"]]];
NORMAL
"<prompt> {<field number> }"
```

## Example

This is the form file for the standard Genie - Pump

```
FORM "Pump_East", "Genie - Pump";
1: "Tag", 32, readwrite, "Variable Tags", "NAME", "TYPE=DIGITAL";
NORMAL
"Tag{ 1 }"
```

## Genie Form Format

The Genie Form format is divided into three distinct sections:

- [Genie Definition and Title](#)
- [Record Definition](#)
- [Form Definition](#)

### Genie Definition and Title

This section defines the look of the Genie form.

Field	Definition
Form Keyword	Start the Genie form definition with the keyword FORM. FORM
Name	This is the Name of the Genie as it is specified in the Genie library. FORM "Pump_East"
Genie Title Bar	Text that will appear in the Genie Form title bar. FORM "Pump_East", "Genie - Pump"; <b>Note:</b> To enhance debugging of the project, it may be useful to set the Genie Title Bar to <libraryname>.<geniename>.

## See Also

[Genie Forms](#)

## Record Definition

The Record Definition section defines each of the fields that will appear on the Genie Forms.

Field	Definition
Field Number	Number for each field: 1:
Field Name	Field Name inserted between quotation marks " ". This is the word that appears between the percentage marks in the Genie. For example, %Tag%. 1: "Tag"
Field Size	Variable tags may be up to 79 characters in length. However, for display purposes it may be desirable to display fewer characters on the form field. 1: "Tag", 32
Write Access	The two options for this are <b>readwrite</b> and <b>readonly</b> . 1: "Tag", 32, readwrite

If a dropdown list is not going to be used (for example, formatting the field for privileges), this is enough to define the field. Finish the line with a semicolon (;).

However, if the field is being defined for something that will extract values from a .dbf file, additional definition is needed.

Field	Definition
List Form	The next field identifies the project database name, as defined in BIN\citect.frm, which contains the options to go into the list. The name of the list form needs to have quotation marks. 1: "Tag", 32, readwrite, "Variable Tags"
List Field	This field contains the values that will appear in the dropdown list. It also needs to be specified within quotation marks. 1: "Tag", 32, readwrite, "Variable Tags", "NAME"
List Filter	This is the format of the List Filter <field> = <filtertext>, where: <field> is the field name to filter by. This defaults to the field name specified as the List Field, so <field> = may be left out if filtering by the List Field. <filtertext> is the text to search for in the field. Only records that have the specified filter text in the specified field will be added to the dropdown list.

Field	Definition
	<p>A <b>Type</b> filter could be used for a Genie that is an on/off switch and will only apply to digital tags. If this is the case, the filter would be <b>TYPE=DIGITAL</b>.</p> <p><i>1: "Tag", 32, readwrite, "Variable Tags", "NAME", "TYPE=DIGITAL";</i></p> <p>If the list is going to be filtered on an extension, a wildcard (*) is used. For example, to list only the _CMD tags:</p> <p><i>1: "Tag", 32, readwrite, "Variable Tags", "NAME", "*_CMD";</i></p> <p>When a list is filtered this way, the dropdown list will remove the filter characters, that is, _CMD, from the end of the tag name. This is desirable when using structured tag names as the Genie will probably add the extension.</p> <p>It is also possible to filter for both type and extension. The following example shows a list that filters for an INTEGER type and a _CMD extension :</p> <p><i>1: "Tag", 32, readwrite, "Variable Tags", "NAME", "TYPE=INT, NAME=*_CMD";</i></p>

## Form Definition

This section defines the look of the Genie form.

Field	Definition
Normal Keyword	<p>Starts with the Keyword NORMAL.</p> <p>NORMAL</p>
Field Prompt	<p>The string that describes the form. The string consists of a prompt for the field.</p> <p>NORMAL</p> <p>"TAG</p>
Field Number	<p>The field itself is indicated by the Field Number enclosed in braces. Spaces need to be entered between the braces to display the size of the field. This string is copied across to the form and since it is a string it needs to be entirely enclosed in quotes.</p> <p>NORMAL</p> <p>"TAG {1 }"</p>

**Note:** The Form Definition may span multiple lines. Check that there is only one pair of quotation marks.

## Paste a Genie

A Genie can be pasted on any graphics page.

1. Open Graphics Builder.
2. Click the **Paste Genie** button in the objects toolbox, or select **Paste Genie** from the **Edit** menu.
3. In the Paste Genie dialog, select the library to which the required Genie belongs.
4. Select the Genie from the **Genie** list and click **OK**. You can also double-click the thumbnail of the Genie.  
The Genie is pasted onto the graphics page. A dialog will open, prompting you to configure the properties of the Genie (see [Genie Parameters Dialog Box](#)).
5. Enter the required values, and click **OK** to close the dialog.

To reuse this Genie in the project, you would enter a different title and text when prompted.

**Note:** To display the properties of the individual objects in a Genie (instead of the Genie Properties), hold the Control (CTRL) key down and double-click the object. The properties will be read-only.

## See Also

[Configure a Genie](#)

## Genie Parameters Dialog Box

The Genie Parameters Dialog Box displays the configuration fields associated with a Genie.

If the Genie was user created, the dialog will display the fields defined to support the required Genie substitutions (see [Define Genie Substitutions](#)).

If the Genie was provided in a Plant SCADA system project, select the Genie from one of the lists below for a description of the fields.

[Genies](#)

## Configure a Genie

All Genies need to be configured for them to be functional at runtime. Depending on the type of Genie, you may need to perform one or more of the following steps.

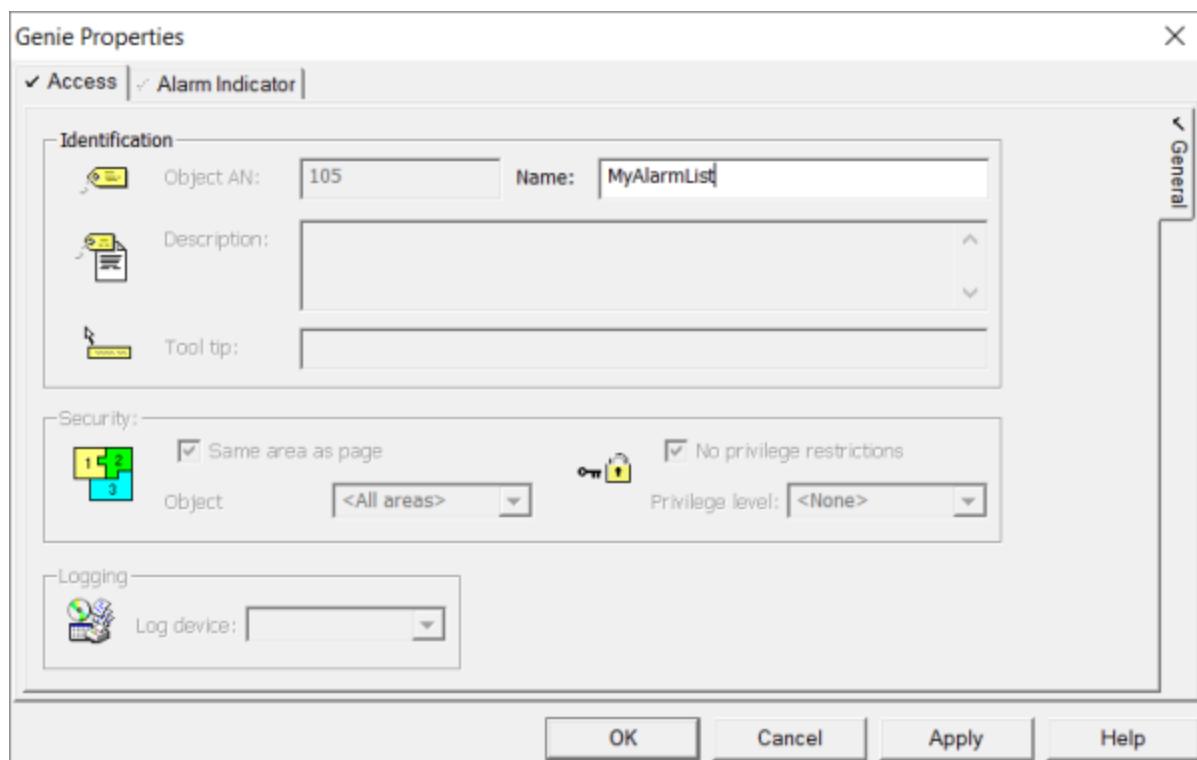

---

**Note:** To display the properties of the individual objects in a Genie (instead of the Genie Properties), hold the Control (CTRL) key down and double-click the object. The properties will be read-only.

---

- **Set Genie Properties**

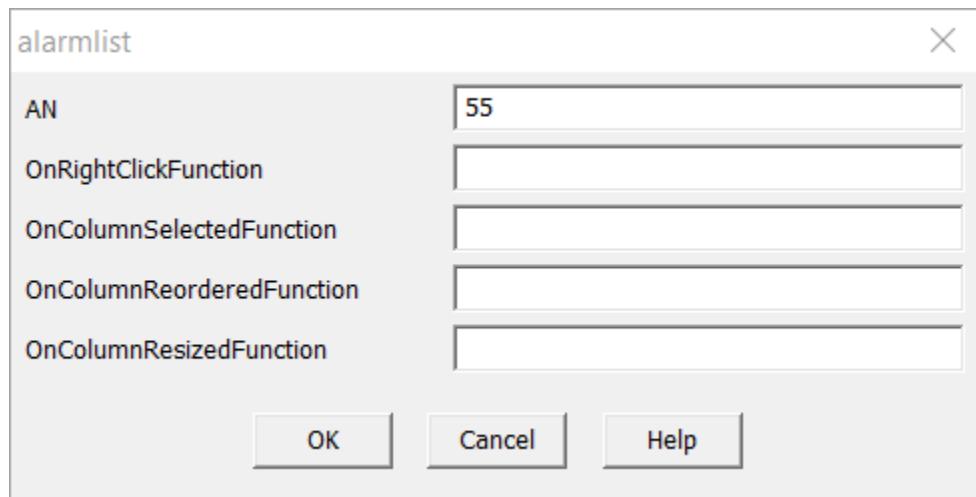

Select the Genie and from the right-click menu, select **Properties**. Set the required properties for the Genie. The image below shows the properties for the Alarm List Genie.

- **Set Genie Parameters**

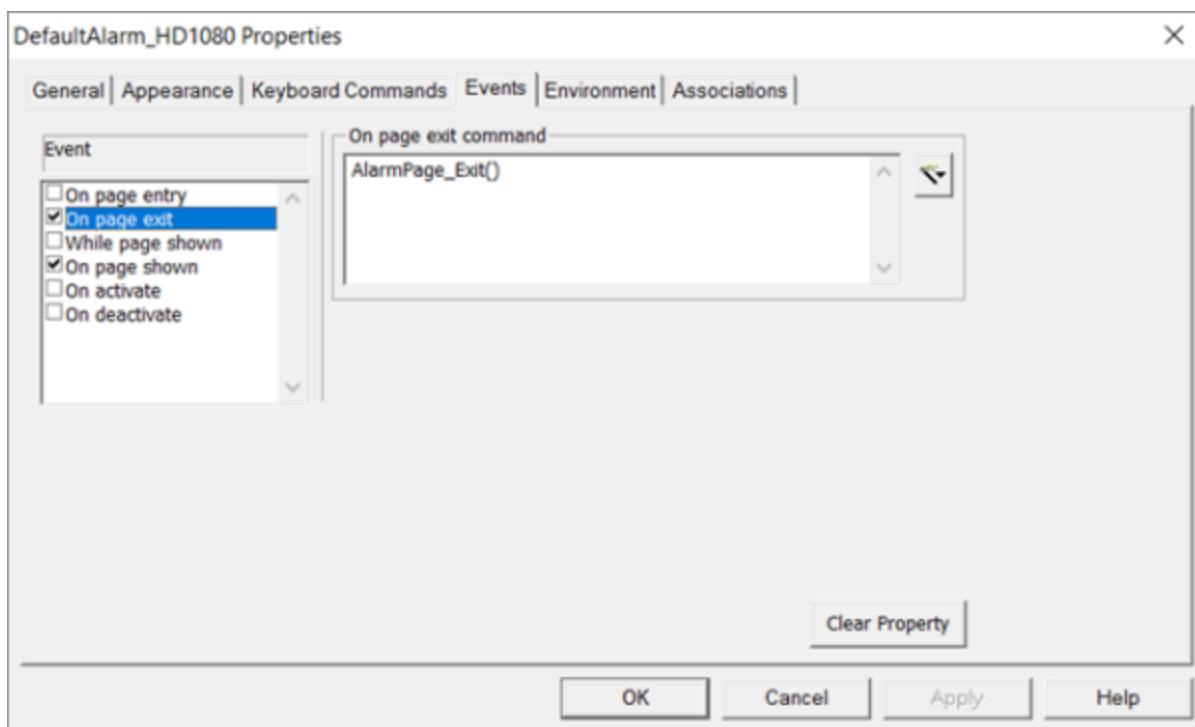

As soon as you insert a Genie, the [Genie Parameters Dialog Box](#) is displayed. You can also open this dialog box by double-clicking on the Genie, or from the right-click menu by selecting the **Genie Parameters** option.

As a default, the parameters are configured to perform certain operations. For example, the *OnColumnResizedFunction* parameter for the AlarmList Genie allows the user to re-size columns at runtime. The functionality provided by the parameters can be extended through user Cicode functions. The image below shows the parameters for the AlarmList Genie.

- **Set Page Properties**

Right-click on the page, and select **Page Properties**. On the **Events** tab, select the required events and specify the Cicode command for the event. There may be some events that need to be configured for the Genie to function correctly at runtime. The set of events to be configured differs for each Genie.

If you modify a Genie after you have used it in your project, occurrences of the Genie may be automatically updated throughout the project.

If you modify a Genie when the project is running in the background, you need to select one of the [Update Pages](#) commands to see the changes in the runtime project. If a runtime page containing the Genie is displayed when the change is made, it will not be updated until after you exit then re-display it.

You can access a list of Genies provided in Plant SCADA's system projects in the topic [Genie Parameters Dialog Box](#).

## See Also

[Paste a Genie](#)

## Dynamically Instantiate a Genie at Runtime

Use the [DspSym](#) Cicode function with a Genie to dynamically display content that is only generated at runtime. DspSym can be used with or without an expression.

At runtime when the page is refreshed or the operator clicks away from the page the instantiated Genie is deleted.

---

**Note:** ActiveX objects and controls (such as Process Analyst, Database Exchange Control and Scheduler) are not supported. If used and the "I want to use this Genie with Cicode Function DspSym" is selected, then on saving the page the following error message will be displayed:

*Genie cannot be saved.*

*Genies cannot contain ActiveX controls when configured to be used with the cicode function DspSym.*

*You must remove all ActiveX controls to continue.*

---

To save the page, deselect the checkbox or remove or delete the ActiveX controls used in the Genie.

**To edit the properties of the Genie:**

1. Open Graphics Builder.
2. Click the **Open** button on the toolbar, or select **Open** from **File** menu.
3. Select the **Genie** tab.
4. Select the **Project** and **Library** in which the Genie is stored.
5. Select the **Genie**.
6. Click **OK**.
7. Right click on the page and select **Page Properties**
8. Select the option "I want to use this Genie with Cicode Function DspSym"
9. Click **OK**
10. If the Genie or an object within the genie uses substitution '%%' syntax in the expression, replace the substitution with the full expression so it can be used at runtime. If you do not edit the substitution a compile error message may be displayed.

**Note:** You can define [Metadata](#) instead of using the full expression.

---

**See Also**

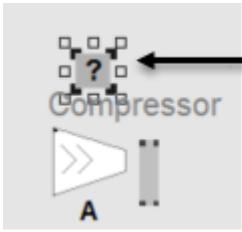

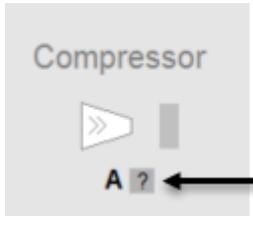

[Configure a Genie](#)

## Composite Genies

A Composite Genie is a collection of individual Genies assembled to form a single object. The individual objects and their properties are defined in an XML template file along with layouts for the collection, that is, the Composite Genie. You can insert multiple instances of the composite object on to a graphics page, and specify different parameter settings including values, alignment and display options for each instance to tailor the Composite Genie to suit your requirements.

For example, you want to build a mirrorable compressor object that is capable of optionally displaying a label, a mode indicator and a meter alongside the symbol. Previously, you could either create separate genies for each of the permutations, or you could build a single genie that used visibility to show/hide elements at runtime.

With Composite Genies, you can simply select the [XML template](#) for a compressor, which provides a set of presentation options for you to configure (label, orientation, etc). All you need to do is set values for these options and insert the object on to a page. See [Insert a Composite Genie](#) for more information.

Without Composite Genies	Using Composite Genies
<p>Instead of inserting and configuring individual Genies:</p>  <p>You need to change the layout and alignment of these Genies manually.</p>	<p><a href="#">Insert a Composite Genie:</a></p>  <p>All components laid out neatly with alignment and layout options that engineers can customize.</p>
<p>If you add related equipment indication to your compressor Genie above, the alignment of the objects needs to be adjusted to accommodate the new Genie:</p>  <p><b>Alignment of newly added sub-equipment</b></p>	<p>With a Composite Genie, simply bring up the <a href="#">presentation options</a> and select to add an output bar resulting in:</p>  <p><b>Newly added sub-equipment aligned automatically</b></p>

With the use of Composite Genies:

- The size of the object libraries can be reduced significantly as only a single Composite Genie needs to be maintained as opposed to maintaining multiple permutations of each object used in graphics pages.
- Engineers can get a clearer picture of their page design because the Composite Genie displays only those parameters that have been selected.
- A richer options interface for parameters is available. Using the XML template, library designers can enrich the options interface that allows operators to select from different layouts, modes, presents parameters taking into account dependencies, naming rules and so on.

As with Genies and Symbols, Composite Genies can be inserted for use in a graphics page, template or super genie. You can perform the following operations:

- [Insert a Composite Genie](#)
- [Edit/Update a Composite Genie](#)
- [Delete Unused Composite Genie Instances](#)
- [Delete a Composite Genie](#)

## Insert a Composite Genie

A Composite Genie can be inserted into any graphics page, template or Super Genie. It cannot be inserted into a Genie or symbol.

**Note:** The appearance of Composite Genies can be affected by different DPI settings. It is recommended that when running Graphics Builder, the **Scale and Layout** setting should be set to "100%" in the Windows™ **Display** settings. After changing the Scale and Layout setting for a computer, you should restart it.

**To insert a Composite Genie:**

1. Open Graphics Builder.
2. Click the **Paste Composite Genie** button in the Objects toolbox.

The Open dialog box is displayed.

3. Select the XML template for the Composite Genie from the list of templates.

**Note:** The template file that you select needs to be located in the Composite Genies folder in the current project folder (or one of its included projects).

4. Click **OK**. The Presentation Options dialog box is displayed.

**Presentation Options - Meter**

Template ID - {1e49c603-fcbc-4913-abd1-97920283c6bd}

The following options are available for this composite genie:

Search Options	
Meter Type	Level
Equipment Name	LevelMeter
Equipment Item Prefix	
Size	Small
Orientation	Vertical
Display Label	Above
Label	Meter
Display Alarm Indicator	<input type="checkbox"/>
Display Status Indicator	None
Display Process Variable	<input checked="" type="checkbox"/>
Display Control Mode	<input checked="" type="checkbox"/>
Display Controller Output	<input checked="" type="checkbox"/>
Display Setpoint	<input checked="" type="checkbox"/>

**Meter Type**  
Controls the visual presentation for this meter on the graphics page.

Show only parameters with invalid input

OK CANCEL

5. Type or select the values for the parameters displayed.

**Note:** Depending upon the options you choose, some items may be hidden or displayed. For example, on the Meter Composite Genies, when you select the **Display Control Output** check box, the **Display Trend** and **Trend Type** options are displayed.

6. Use the **Search** box to search for parameters in the dialog box. Type the parameter name or part of the parameter name to locate a parameter.

**Note:** Clear the Search box before clicking **OK** on the Presentation Options dialog box.

7. Use the **Show only parameters with invalid input** option to display options for which incorrect or no values have been selected or specified.

8. Click **OK** to insert the Composite Genie, or **Cancel** to close the Presentation Options dialog box without inserting the Composite Genie.

**Note:** You cannot rotate or mirror a Composite Genie that has been inserted on a page.

## See Also

[Composite Genies](#)

[Delete Unused Composite Genie Instances](#)

[Delete a Composite Genie](#)

## Edit/Update a Composite Genie

To edit the parameter options for an existing Composite Genie:

1. Open Graphics Builder.
2. Click to select the inserted Composite Genie.
3. Right-click the Composite Genie, and select **Edit Composite Genie** from the context menu. The Presentation Options dialog box is displayed with the Composite Genie instance name and template ID.
4. Edit the parameters as required.
5. Click **OK**.

Double-clicking on the template ID selects the ID. You can copy the ID and use it to locate duplicate instances of the template in Windows Explorer.

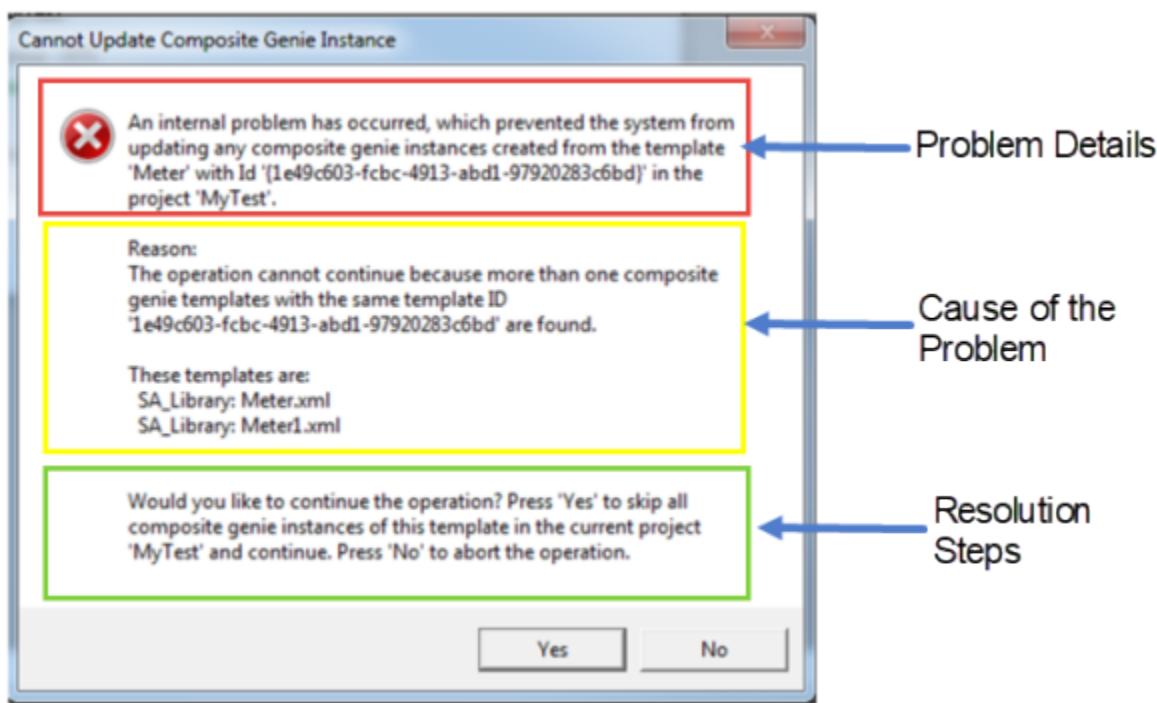

If you modify a Composite Genie after you have used it in your project, all instances of the Composite Genie may be automatically updated with the latest version of the template. Changes including updates to labels, genies and layout will be propagated to all instances. If a template is up to date, associated instances will not be updated.

**Note:** You should not modify the properties of the folder in which Composite Genie instances are stored (%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\User\<Project Name>\\_CompositionCaches). You should not manually delete or modify files in this folder. Doing so many result in errors when inserting Composite Genies on graphics pages.

An error message is displayed if a problem is encountered during the update process. The message details the cause and the options available for resolving the issue. An error may occur if a Composite Genie does not exist or

if the project is erroneous.

For example, if you create a copy of an existing template, but retain the same GUID in the XML file of the copied template, you will see the following message:

## Update a Particular Instance

Updating a particular instance of a Composite Genie allows you to verify the changes to a Composite Genie without affecting other instances of the object on other pages.

### To update a particular instance of a Composite Genie:

1. Open Graphics Builder.
2. Update the Composite Genie template as required.
3. Double-click the instance represented by the template. The Presentation Options dialog box is displayed with the modified parameters. For example if you have added a new parameter, the Presentation Options dialog should show the parameter.
4. Click **OK**. The changes including updates to labels, genies and layout will be propagated to this instance of the Composite Genie.
5. Save the page.

---

**Note:** Before you apply the changes to all instances of Composite Genies across all pages, verify the changes using the instructions above.

---

## Update All Instances

### To update instances of Composite Genies:

1. Open Graphics Builder.
2. On the **Tools** menu, select **Update Pages**. This command will replace an existing Composite Genie with its newest version available. This command will only affect the Active project and its includes. Compile the project for the changes to take effect for runtime.

---

**Note:** This change cannot be reversed.

---

**Note:** If a runtime page contains an updated Composite Genie instance, an online change will update runtime. Refer to [Online Changes](#) for more information.

---

[Delete a Composite Genie](#)

## Delete Unused Composite Genie Instances

When you add a graphic object as a Composite Genie on a page, a Composite Genie instance that is uniquely identified by its presentation options, is automatically created in the project folder. This establishes a reference from the graphic object to this Composite Genie instance. There can be multiple graphic objects that refer to the same instance of a Composite Genie if their presentation options are the same. Therefore, deleting a graphic object does not delete the associated Composite Genie instance.

Over time there can be a number of Composite Genie instances that are not associated with any graphic object. These unused Composite Genie instances can slow down operations and occupy project disk space. You can use the **Pack Libraries** option to remove unused instances.

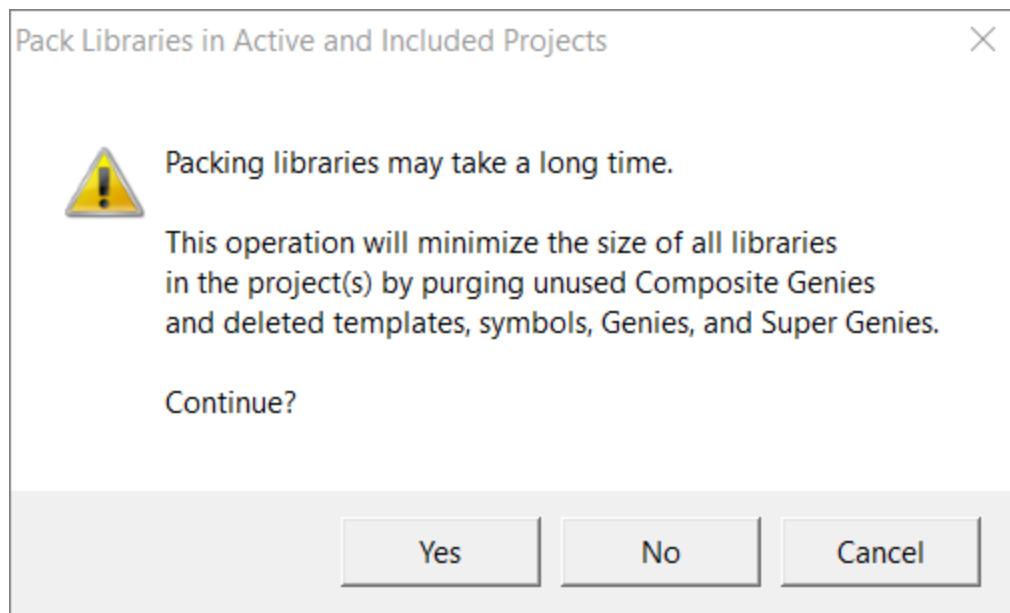

---

**Note:** You should not modify the properties of the folder in which Composite Genie instances are stored (%PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\User\<Project Name>\\_CompositionCaches). You should not manually delete or modify files in this folder. Doing so may either prevent your pages from opening or cause your Composite Genies to be displayed incorrectly.

---

### To delete unused instances:

1. Open Graphics Builder.
2. On the **Tools** menu, select **Pack Libraries in Active Projects** or **Pack Libraries in Active and Included Projects**. The following message is displayed.

3. Click **Yes**. All unused instances of Composite Genies will be deleted.

## Composite Genie Templates

Plant SCADA provides a wide range of out-of-the box Composite Genies in the form of XML templates. An XML template contains the definition of a Composite Genie. A library engineer may modify an existing XML template or create new templates defining their own Composite Genies. It is recommended that you make a copy of the template before you modify it so that templates are not overwritten if you re-install Plant SCADA.

---

**IMPORTANT:** If you make a copy of a template, you need to assign a new GUID to the template and all the compositions in the template. For more information, see [Visual Template](#) and [Compositions](#).

---

XML templates for Composite Genies are located in the %PROGRAMDATA%\AVEVA Plant SCADA <VersionNumber>\User\<project name>\ Composite Genies folder.

The **CompositionTemplate.xsd** file, located in the %PROGRAMFILES(X86)%\AVEVA Plant SCADA\Bin, contains the schema for the Composite Genie XML templates. This file describes the elements and attributes that may be contained in an XML template for a Composite Genie, and the order in which the elements and attributes need to be added to the XML template. The XML template file is validated against the XSD file. When you modify an XML template or create a new one, it is recommended that you use a good XML editor that supports schema error detection so that errors are highlighted and can be addressed easily.

Errors may be encountered if the XML file for a Composite Genie does not conform to the definitions in the underlying XSD. Alternatively, errors may be encountered if there are duplicate IDs for elements, undefined conditions, and so on. In both cases, errors will be reported with details of the line number and position of the error when an operator inserts the Composite Genie on to a page. For more details, see [Edit/Update a Composite Genie](#).

An XML template for a Composite Genie contains the following elements:

- [Visual Template](#)
- [Parameters](#)
- [Content Items](#)
- [Compositions](#)
- [Conditions](#)
- [Alarm Indicators](#)

Each of these elements is explained in detail in the sections below. It is recommended that you review these sections before you modify existing XML templates or create new templates.

### Visual Template

This section comprises standard XML declarations. In addition, this section contains the GUID, which is a unique identifier for the XML template.

---

**Note:** If you modify an existing template or create a new Composite Genie template, you should validate the XML file by loading the schema definition file (CompositionTemplate.xsd which is in the <Plant SCADA installation folder>\bin folder) into your XML editor.

---

If you create your own Composite Genie, you will need to create a GUID for it. Several online tools are available for generating a GUID.

**To generate a GUID:**

1. Search for the term "generate GUID" in a browser using any search engine. A list of websites that can generate a GUID is displayed.
2. Access any one of the sites.
3. Select the format for the GUID. The GUID format should include braces and hyphens and should be in upper case. For example, {1E49C603-FCBC-4913-ABD1-97920283C6BD}.
4. Generate the GUID.

**Example**

```
<?xml version="1.0" encoding="utf-8"?>
<VisualTemplate
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="CompositionTemplate.xsd"
    Guid="{1E49C603-FCBC-4913-ABD1-97920283C6BD}"
    Name="Meter"
    Thumbnail="encodedstring">
```

**See Also**

[Parameters](#)  
[Content Items](#)  
[Compositions](#)  
[Prerequisites](#)  
[Container](#)  
[Conditions](#)  
[Alarm Indicators](#)

**Parameters**

The <Parameter> element defines the attributes that will be displayed as Presentation Options to the user when they insert a Composite Genie on to a graphics page. It is comprised of the following attributes for each parameter:

Attribute	Description
Name	Unique name for the parameter.
Label	Display name for the parameter.
Type	Data type of the parameter – Boolean, Integer or String.

Attribute	Description
MinLength	Minimum number of characters that the parameter value needs to contain.
MaxLength	Maximum allowable characters for the parameter value
MinValue	Minimum value that can be specified for the parameter
MaxValue	Maximum allowable value for the parameter
DefaultValue	Default value set for the parameter
NamingRules	Naming rules can be used to force the user to enter parameter values in a particular format. For example, to use equipment naming rules, set this attribute to "Equipment". Refer to the Equipment Naming Rules and Tag Naming Rules sections for more information.
Description	Description of the parameter. This appears at the bottom of the Parameter Options dialog box when the operator clicks to specify the value for a parameter. It is recommended that you enter a description for the parameter in order to help engineers to specify valid values for the parameters.
Values	<p>List of selectable values if an option is to be displayed as a dropdown list in the Parameter Options dialog box. To create a list of values, each value needs to be declared with a unique ID and Label. The label will appear as one of the values the user can select. For example, if you need an option titled "Orientation" with the values "Vertical" and "Horizontal" available for selection, the following code needs to be included in the Parameters element:</p> <pre data-bbox="871 1486 1527 1592">&lt;/Parameter&gt; &lt;Parameter Name="Orientation" Label="Orientation" Type="String" DefaultValue="Vertical"&gt;   &lt;Values&gt;     &lt;Value Id="1" Label="Vertical"/&gt;     &lt;Value Id="2" Label="Horizontal"/&gt;   &lt;/Values&gt; &lt;/Parameter&gt;</pre>

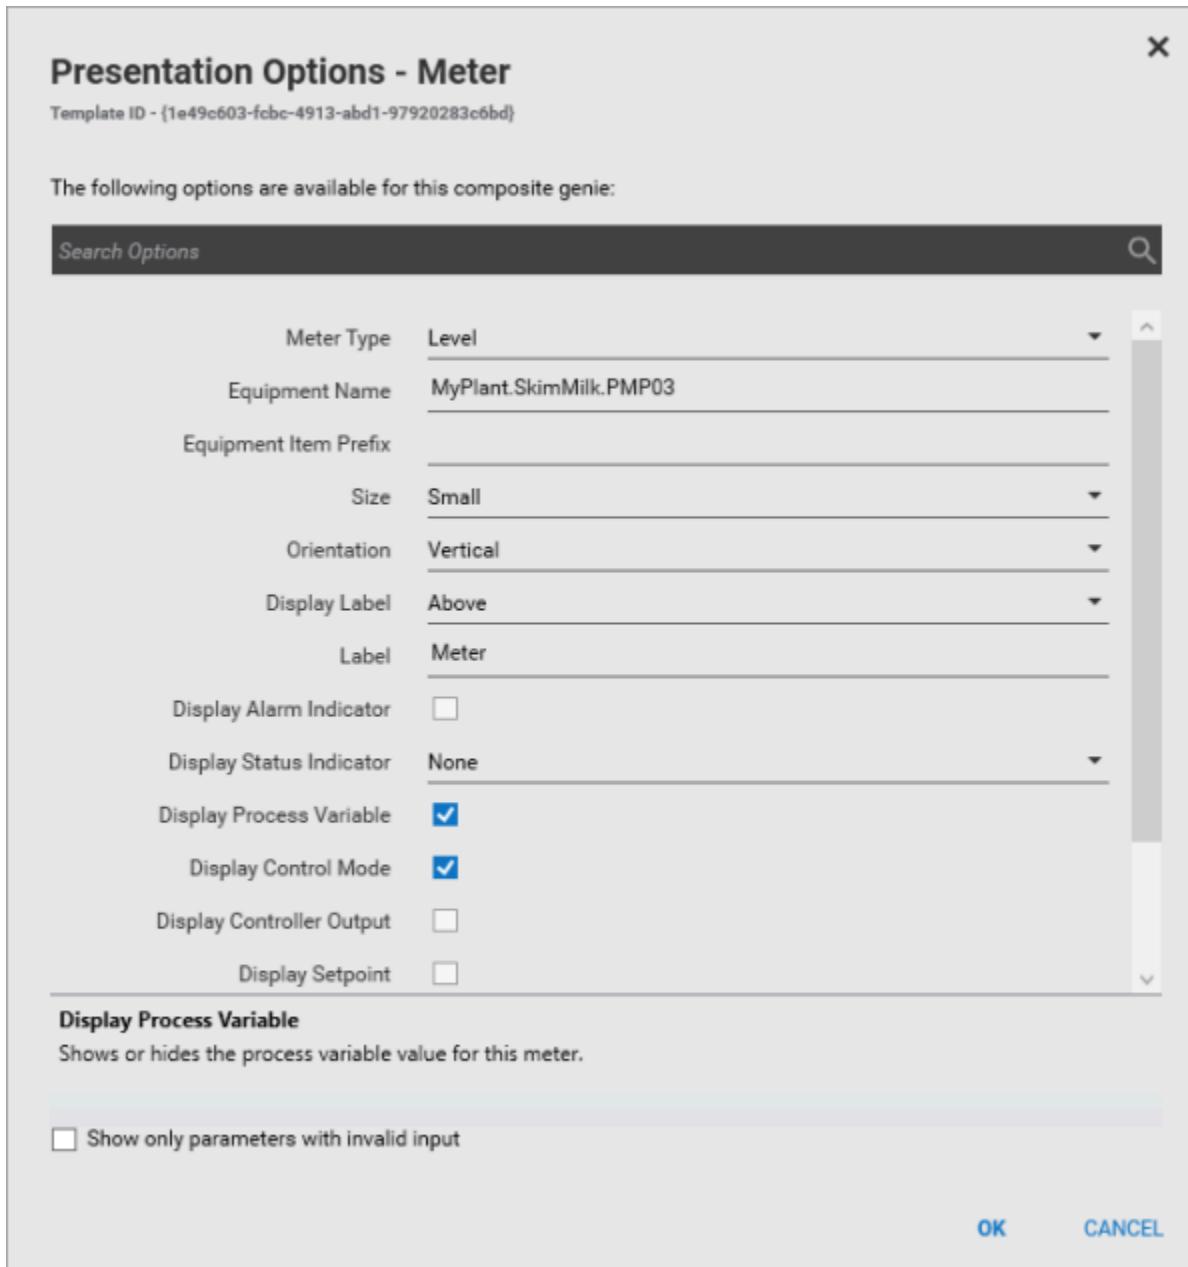

Parameter definitions can include the `<Dependency>` element to show or hide parameters. This element can use Global, Parameter or Composite conditions to show or hide a parameter based on the operator's selection of an option or value. For more information about conditions, refer to [Conditions](#).

## Example - Simple

This is a simple example where a dependency has been defined using the `<Dependency>` element to show the **Label** parameter only if the operator selects the **Display Label** checkbox. This is achieved through the use of a [Conditions](#). You can also use Parameter and/or Composite conditions within the `<Dependency>` element.

```
</Parameter>
<Parameter Name="DisplayLabel" Label="Display Label" Type="Bool" DefaultValue="true"/>
<Parameter Name="Label" Label="Label" Type="String" MinLength="1" MaxLength="79"
DefaultValue="Meter" Description="Enter the common name used to help identify the reading">
<Dependency>
  <ParameterCondition Name="DisplayLabel" Comparison="IsEqualTo" Value="true"/>
</Dependency>
</Parameter>
```

The above code will display the following presentation options.

## Example - Complex

This example provides a slightly more complex scenario with parameters to be displayed based on the operator's selection of value. Therefore, a list of values and a dependency need to be defined.

- Refer to the XML code for the "Number of sub equipment" parameter. This parameter can take the values 0, 1, 2, 3, 4 or 5. The <Values> attribute defines this list of selectable values (see the sample code below).

```
<Parameter Name="MEO" Label="Number of equipment" Type="Int" DefaultValue="1"
Description="If the object will represent multiple pieces of equipment, select
how many pieces of equipment the object group will include. When the object displays,
it will include a corresponding number of MEOs.">
  <Values>
    <Value Id="1" Label="0"/>
    <Value Id="2" Label="1"/>
    <Value Id="3" Label="2"/>
    <Value Id="4" Label="3"/>
    <Value Id="5" Label="4"/>
    <Value Id="5" Label="5"/>
  </Values>
</Parameter>
```

- Depending upon the value the operator selects for this parameter, the Sub Equipment parameter(s) will be displayed. For example, if the operator selects 0 for the "Number of sub equipment" parameter, the Sub Equipment parameter will not be displayed, if the user selects 1, a single Sub Equipment parameter with the label Sub Equipment #1 Name will be displayed, if the user selects 2, two Sub Equipment parameters with the labels Sub Equipment #1 Name and Sub Equipment #2 Name will be displayed and so on. The user can choose up to 5 pieces of sub equipment.

To be able to select 5 pieces of sub equipment, a parameter each needs to be defined for each piece of sub equipment. In addition, each of these parameters needs to have a dependency defined within it (see below for sample code that shows the definition for two sub equipment pieces).

- A dependency is defined using the <Dependency> attribute. For Sub Equipment 1, global condition "Show\_MEO1" needs to be satisfied. For detailed information about conditions, see the Conditions topic.

```
<Parameter Name="MEO_Equip1" Label="Sub Equipment #1 Name" Type="String" MinLength="1"
MaxLength="79" DefaultValue="" NamingRules="Equipment" Description="Enter a name for the
first piece of equipment in the group.">
  <Dependency>
    <GlobalConditionRef Id="Show_MEO2" />
  </Dependency>
</Parameter>
<Parameter Name="MEO_Equip2" Label="Sub Equipment #2 Name" Type="String" MinLength="1"
MaxLength="79" DefaultValue="" NamingRules="Equipment" Description="Enter a name for the
second piece of equipment in the group.">
  <Dependency>
    <GlobalConditionRef Id="Show_MEO2" />
  </Dependency>
</Parameter>
```

## Presentation Options - Drive

Template ID - {e91e1230-c421-4dec-b7cf-f6bc99b978df}

The following options are available for this composite genie:

Search Options

Equipment Name	Drive
Drive Type	Compressor
Size	Small
Orientation	Right
Display Label	None
Display Alarm Indicator	<input type="checkbox"/>
Display Status Indicator	None
Number of Equipment	1
Display Compact Running State	<input type="checkbox"/>
Display Control Mode	<input checked="" type="checkbox"/>
Display Meter	<input type="checkbox"/>
Display Output Bar	<input type="checkbox"/>

**Drive Type**  
Controls the visual presentation for this drive on the graphics page.

## Alarm Indicators

The <AlarmIndicators> element is an optional element for displaying alarm indicators for equipment. It comprises the following child elements:

Element	Description	Attribute	Description
EquipmentLink	Defines each piece of related equipment for which an alarm needs to be displayed.	Id	A unique string identifier with which <AlarmIndicator> elements in compositions can refer to the forward-declared equipment link.
		TemplateParameter	Name of the template parameter. The value of this is used as the equipment expression of the alarm indicator. The template parameter needs to be defined in the <Parameters> element in the same document.
		IncludeEquipmentReference	Set this to 'true' to include equipment references when determining the highest priority alarm for the alarm indicator. Set this to 'false' if you do not want to include equipment references.
		Hierarchy	Node in the equipment hierarchy that will be used to determine the highest priority alarm for the alarm indicator. You can set this to include equipment that occur at nodes down the equipment hierarchy (referred to as "children"). Set this to one of the following: EquipmentOnly EquipmentAndChildren ChildrenOnly

BorderStyle	Defines the alarm display settings.	Id  Width  Padding  IsInside	A unique string identifier with which <AlarmIndicator> elements in compositions can refer to the forward declared border style.
			Sets the width of the alarm border (in pixels).
			Sets the amount of space (in pixels) between the extent of the object group or Genie and the inside edge of the alarm border.
			Set this to 'true' to place the border within the extent of the object group or Composite Genie. Note that you cannot set a padding in this case.

**Note:** An alarm indicator is applied to all equipment items within the Composite Genie. The items are automatically grouped and the alarm border is applied to the composite if there are more than two visible items in the container.

## Example

```
<AlarmIndicators>
  <!-- Here optional attributes are set to explicit value deliberately so that the template can still stick with the requirement even when application default behavior changes in the future. -->
  <EquipmentLinks>
    <EquipmentLink Id="EM001" TemplateParameter="EM01_Equip1" IncludeEquipmentReference="false" Hierarchy="EquipmentOnly" />
    <EquipmentLink Id="EM002" TemplateParameter="EM02_Equip2" IncludeEquipmentReference="false" Hierarchy="EquipmentOnly" />
    <EquipmentLink Id="EM003" TemplateParameter="EM03_Equip3" IncludeEquipmentReference="false" Hierarchy="EquipmentOnly" />
    <EquipmentLink Id="EM004" TemplateParameter="EM04_Equip4" IncludeEquipmentReference="false" Hierarchy="EquipmentOnly" />
    <EquipmentLink Id="EM005" TemplateParameter="EM05_Equip5" IncludeEquipmentReference="false" Hierarchy="EquipmentOnly" />
  </EquipmentLinks>
  <!-- DefaultStyle will be implicitly applied. Use explicit 'BorderStyle' attribute in <AlarmIndicator> element if a different border style is desired. -->
  <BorderStyles>
    <BorderStyle Id="DefaultStyle" Width="2" Padding="0" IsInside="false" IsDefault="true" />
    <BorderStyle Id="OuterInsidePaddingStyle" Width="2" Padding="1" IsInside="false" />
    <BorderStyle Id="InsideStyle" Width="2" IsInside="true" />
  </BorderStyles>
</AlarmIndicators>
```

## Content Items

The <ContentItems> element defines the library objects (Genies) that are available to be included in compositions for the Composite Genie. It contains one or more <ContentItem> child elements, each of which comprises the following attributes:

Attribute	Description
Id	Unique numeric identifier within the <ContentItems> section.  <b>Note:</b> You should not use the same numeric Id for more than one <ContentItem> elements. Doing so would result in an error when the system reads this visual template document.
Type	This is set to the type of the object that makes up the Composite Genie and should not be modified.  <b>Note:</b> In this version Composite Genies constitute only Genies. So, Type is set to "Genie" in the XML templates.
Project	Name of the project which contains the referred library object. The project needs to be either the same as the project in which the visual template resides or one of its include projects.  <b>Note:</b> If the project is renamed, the Genie will not be available for use unless this attribute is modified in the XML template. Keep this in mind when renaming a project.
Library	Name of the object library to which this item belongs.
Item	Name of the item to be included in the Composite Genie.

**Note:** You need to explicitly define each and every item that you want to include in your compositions.

## Example

Each line in the code below defines an item, in this case a Genie, that will be available to be included in a composition.

```
<ContentItems>
<Content Id="01" Type="Genie" Project="SA_Library" Library="sa_common" Item="selection_adorner_auto" />
<Content Id="02" Type="Genie" Project="SA_Library" Library="sa_common" Item="label_12_c" />
<Content Id="03" Type="Genie" Project="SA_Library" Library="sa_common" Item="label_12_l" />
<Content Id="04" Type="Genie" Project="SA_Library" Library="sa_common" Item="label_15_c" />
<Content Id="05" Type="Genie" Project="SA_Library" Library="sa_common" Item="label_15_l" />
<Content Id="06" Type="Genie" Project="SA_Library" Library="sa_common" Item="clocktimer" />
<Content Id="07" Type="Genie" Project="SA_Library" Library="sa_common" Item="delta" />
<!-- Meter Types - Small -->
<Content Id="011" Type="Genie" Project="SA_Library" Library="sa_meter" Item="level_128_h" />
<Content Id="012" Type="Genie" Project="SA_Library" Library="sa_meter" Item="level_128_v" />
...

```

## See Also

[Conditions](#)  
[Alarm Indicators](#)

## Compositions

The <Composition> element details the “composition” of the Composite Genie, that is, the possible layouts, parameter conditions and parameters that constitute the Composite Genie. It contains multiple elements each with a set of attributes. Typically, the XML template for a Composite Genie is made up of several compositions to represent the different layouts available. Each composition can define only one layout. The template needs to have at least one composition.

Attribute	Description
Composition Id	Unique identifier for the composition. This is an ID that is generated using the GUID Generator tool.

## Example

```
<Compositions>
  <Composition Id="{0C2B5CD5-F0FD-4021-8461-2864AFE24226}" >
```

## See Also

[Visual Template](#)  
[Parameters](#)  
[Content Items](#)  
[Prerequisites](#)  
[Container](#)  
[Conditions](#)  
[Alarm Indicator](#)

## Prerequisites

Within a composition, one or more prerequisites may be defined within the <Prerequisite> element. Prerequisites are made up of conditions, which are evaluated at runtime. If a prerequisite is true, the corresponding composition will be applied. Otherwise, the next composition will be evaluated, and a

composition will be applied only when the prerequisite is satisfied. Prerequisites are applied sequentially. For more information, refer to the Conditions topic.

**Note:** When defining conditions, it is recommended that you start with the most complex condition first and then add conditions in decreasing order of complexity. This is so that the most specific composition is selected for the Composite Genie.

Attribute	Description
GlobalConditionRef	Used to refer to a predefined Global condition
ParameterCondition	Used to specify conditions by comparing a template parameter value to a predefined value.
CompositeCondition	Used to combine more than one condition with either AND or OR relation specified in its attribute. Its child conditions can be made up of predefined Global conditions <GlobalConditionRef Id="..." />, a Parameter condition and nested Composite conditions.

## Example

```
<GlobalCondition Id="Show_LabelSmall">
  <CompositeCondition Operator="And">
    <ParameterCondition Name="DisplayLabel" Comparison="IsNotEqualTo" Value="None" />
    <GlobalConditionRef Id="IsSmall" />
  </CompositeCondition>
</GlobalCondition>
<GlobalCondition Id="Show_LabelLarge">
  <CompositeCondition Operator="And">
    <ParameterCondition Name="DisplayLabel" Comparison="IsNotEqualTo" Value="None" />
    <GlobalConditionRef Id="IsLarge" />
  </CompositeCondition>
</GlobalCondition>
```

[Content Items](#)  
[Container](#)  
[Conditions](#)  
[Alarm Indicator](#)

## Container

The Container element is mandatory, and contains the details of the layout, Plant SCADA content items (library objects) to be included in the Composite Genie, their alignment and other display options such as margins (left,

right, top and bottom).

Attribute	Description	Attribute	Description
Layout		Hotspot	Specifies the page co-ordinates where the Composite Genie is placed when inserted on to a page.
Container	Defines the layout options for the Composite Genie including the alignment, margin and stacking options.	Margin	Positioning (left, top, right and bottom margins) of the object on the page relative to the alignment.
		Layout	Specifies how the container is laid out - Stacked Horizontal, Stacked Vertical or Overlaid. For more information, refer to the More about Layouts section.
		VisibleWhen	Used to show/hide the container based on a Global condition. The container will be visible only when the condition is satisfied.
		CreateGroup	Determines whether the contents of the container will be a group. When the contents of a container are in a group, the placement of the contents are automatically adjusted to accommodate the largest object/text when the container is re-sized and also at runtime if animations are included. By default, the contents of a container are placed in a group. If the contents are not grouped, each item needs to be re-sized and placed manually. You can use the

			<p>GoTo Object dialog to view the hierarchy of items in a container.</p> <p><b>Note:</b> The size of a container is defined by the biggest object in the container.</p>
	AnimationName		<p>Sets the animation name to apply to the object. This is unique to the layout.</p> <p><b>Note:</b> An animation name should begin with a letter and contain only letters, numbers and the following symbols: _, %, \$, @ and #. It should not exceed 26 characters.</p>
	HorizontalAlignment		<p>Sets the alignment of the container to display horizontally within its parent.</p>
	VerticalAlignment		<p>Sets the alignment of the container to display vertically within its parent.</p>
	ZIndex		<p>Determines the position of the container when multiple containers are overlaid. The object with the lowest ZIndex is stacked on top of the pile while the object with the highest ZIndex is placed at the bottom of the stack of containers. The ZIndex is relative within a container whether or not objects in the container are grouped. For more information, refer to the More about Layouts section.</p>
AlarmIndicator	Sets the alarm indicator	VisibleWhen	Alarm Indicator will be

	that needs to be displayed for this composition.		displayed if the condition specified here is satisfied.
		EquipmentLink	Reference to the Alarm Indicator to be displayed as defined in the <AlarmIndicators> element.
		BorderStyle	Reference to the border style to be used for the Alarm Indicator as defined in the <AlarmIndicators> element.
Contents	Defines the Plant SCADA content items that are available within this composition.	Item ID	Reference to the Plant SCADA content item such as a Genie. Each item included here should have been included in the <ContentItems> element.
		HorizontalAlignment	Whether the item will be left, right or center-aligned.
		VerticalAlignment	Whether the item will be top, middle or bottom aligned.
		Margin	Left, top, bottom and right margins. For information, see the More about Margins topic.
		VisibleWhen	Item will be displayed if the condition specified here is satisfied.
		AnimationName	Name of the item as configured in the General Access properties. <b>Note:</b> An animation name should begin with a letter and contain only letters, numbers and the following symbols: _, %, \$, @ and #. It should not exceed 26 characters.

		ZIndex	Determines the position of the item when multiple items are overlaid. The item with the lowest ZIndex is placed on top of the stack.
Parameters	For each item that you add to a composition, you need to link it to a parameter defined in the XML template. This is done so that the value of the parameters can be passed into the substitution in the content item (for example, %Equipment%) through the Composite Genie.	Name	Name of the substitution parameter specified without the % (for example, "Equipment" for %Equipment% substitution). This name is case sensitive.
		TemplateParameter	Name of parameter as specified in the Parameter element, the value of which is passed into the substitution in the content item.

## Example - Layout

This example shows the Hotspot co-ordinates for positioning the Composite Genie at a particular location on the page.

```
<Layout Hotspot="10,10">
```

## Example - Container

This example shows the code for a container, which includes:

- layout options for the container and conditions when it is to be displayed (using the VisibleWhen attribute)
- content items and conditions when they are to be displayed (using the VisibleWhen attribute)
- parameters to be passed into template parameters

```
<Container Layout="StackedHorizontal" HorizontalAlignment="Center" AnimationName="MEO1Horz_Small">
  <AlarmIndicator VisibleWhen="Show_MEOAlarm" EquipmentLink="MEO1" />
  <Content VisibleWhen="Show_ControlMode" ItemId="031" Margin="0,-4,2,-1" VerticalAlignment="Center">
    <Parameters>
      <Parameter Name="Equipment" TemplateParameter="MEO_Equip1"/>
    </Parameters>
  </Content>
  <Content ItemId="081" Margin="0,0,0,0" VerticalAlignment="Center">
    <Parameters>
      <Parameter Name="Equipment" TemplateParameter="MEO_Equip1"/>
    </Parameters>
  </Content>
</Container>
```

## More About Margins and Alignment

Margins and alignment determine the positioning of a Composite Genie. They can be used in conjunction to set the [More About Layouts](#) of Composite Genies.

## Margins

Margins may be specified for a container or a content item within a container. Margins can be used to set the distance between an object and its child, and determine the positioning of an object relative to its parent.

Margins are specified as a set of four numbers separated by a comma. For example, 2, 0, 1, 3. Here 2 is the Left margin, 0 is the Top margin, 1 is the right margin and 3 is the bottom margin. The values for margins may be the same or different depending upon your requirements. Margins are specified in pixels.

Margins are applied to the container as a whole, and/or to each individual item. For example, a container margin of 2 pixels for the left, top, right and bottom can be defined with:

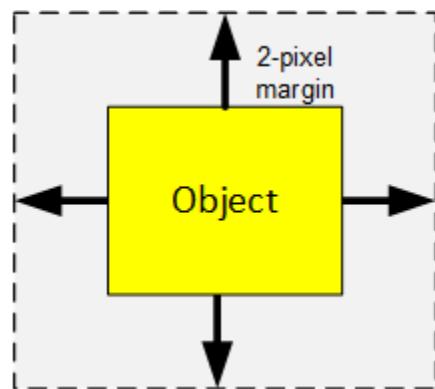

```
<Container Margin="2,2,2,2" Layout="StackedVertical" HorizontalAlignment="Left" AnimationName="Label">
```

This will apply a 2-pixel margin to the group of items within the container.

Margins can be applied to an item within the container as follows:

```
<Content ItemId="1" Margin="2,2,2,2">
```

This will apply a 2-pixel margin on all sides of the object that has the ItemID 1.

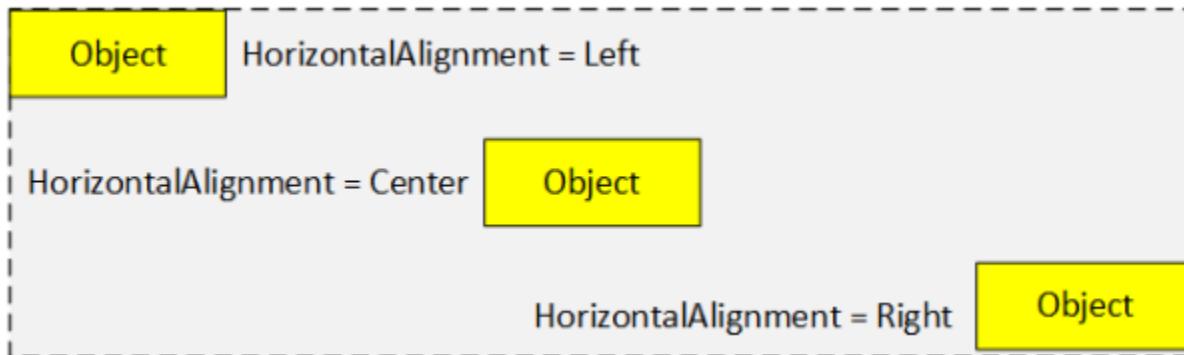

## Alignment

### HorizontalAlignment

The HorizontalAlignment attribute sets the alignment that will be applied to child objects. It can set to:

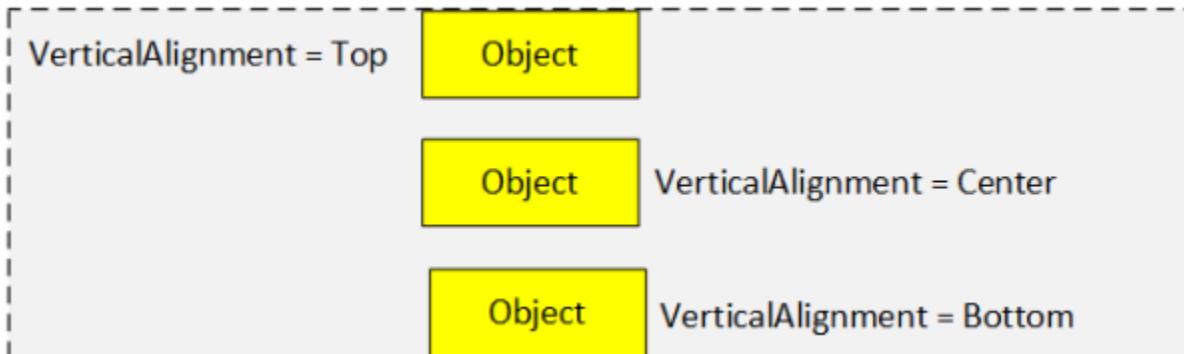

- Left - Child objects are aligned to the left of the parent object's allocated space.
- Center - Child objects are aligned to the center of the parent object's allocated space.
- Right - Child objects are aligned to the right of the parent object's allocated space.

### VerticalAlignment

The VerticalAlignment attribute sets the alignment that will be applied to child objects. It can be set to:

- Top - Child objects are aligned to the top of the parent object's allocated space.
- Center - Child objects are aligned to the center of the parent object's allocated space.
- Bottom - Child objects are aligned to the bottom of the parent object's allocated space.

## See Also

[More About Layouts](#)

### More About Layouts

Layouts can be defined at the container level or at the object level. It is recommended that layout attributes be defined for the parent object with respect to the positioning required for the child object as shown in the examples below.

**Note:** It is recommended that you group objects if you have changing animations, size or positions at runtime.

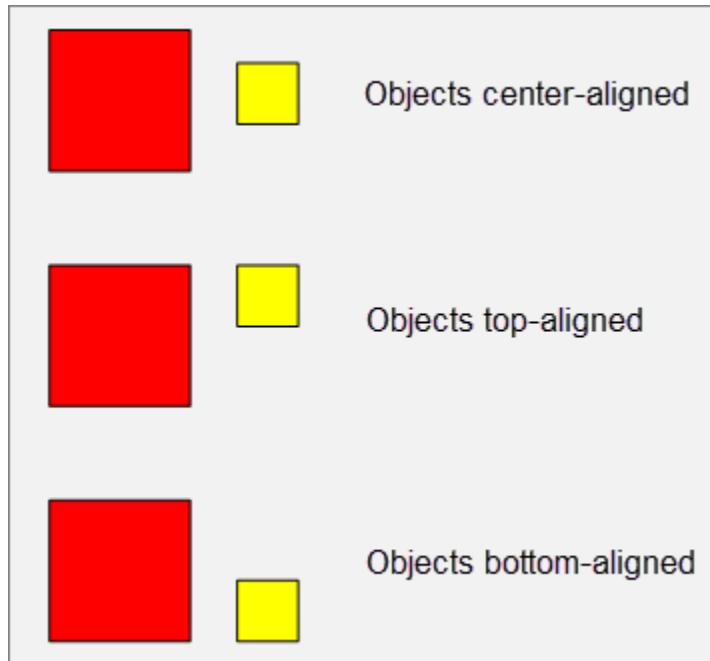

Layouts are of the following types:

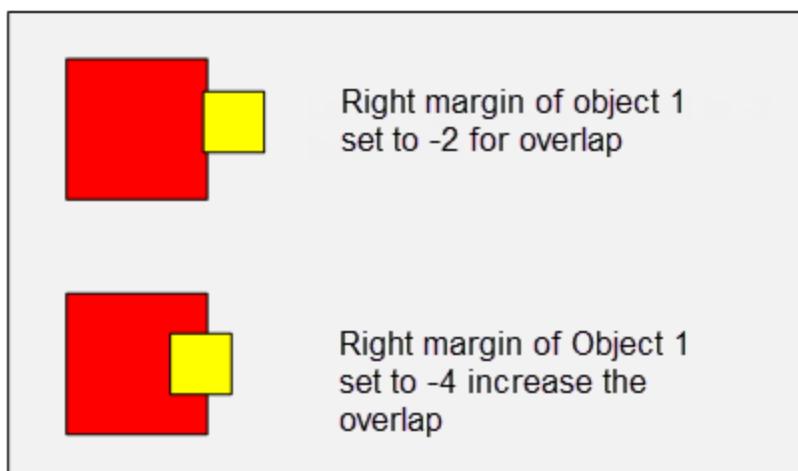

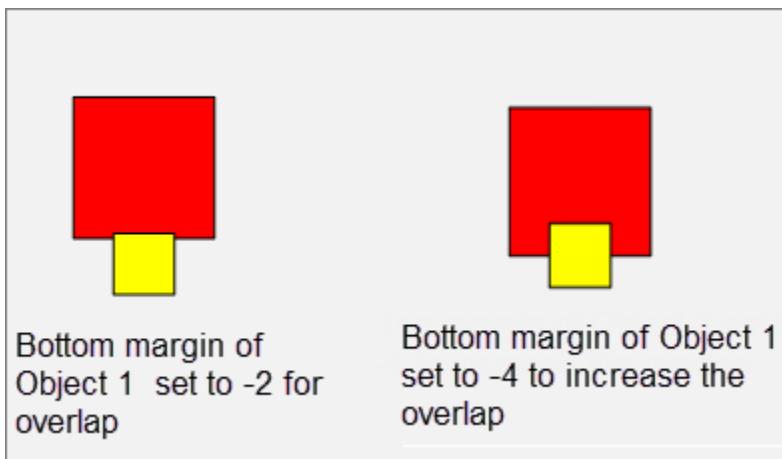

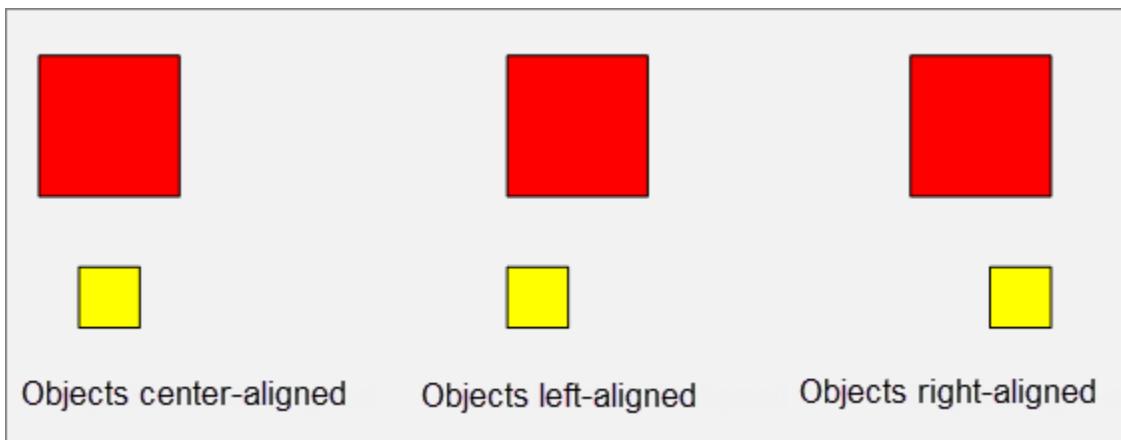

- **StackedHorizontal:** Objects are aligned from left to right. By default, the objects as a group, are center

aligned. To top- or bottom-align the objects within the group, set the VerticalAlignment attribute to "Top" or "Bottom", respectively. This needs to be set in in the XML template. If you have two objects in a group, you need to specify the vertical alignment only for the second item. The second item will then be aligned relative to the first one. Use the Margin attribute to control overlap of objects. A negative margin setting will position an item closer to the object next to it.

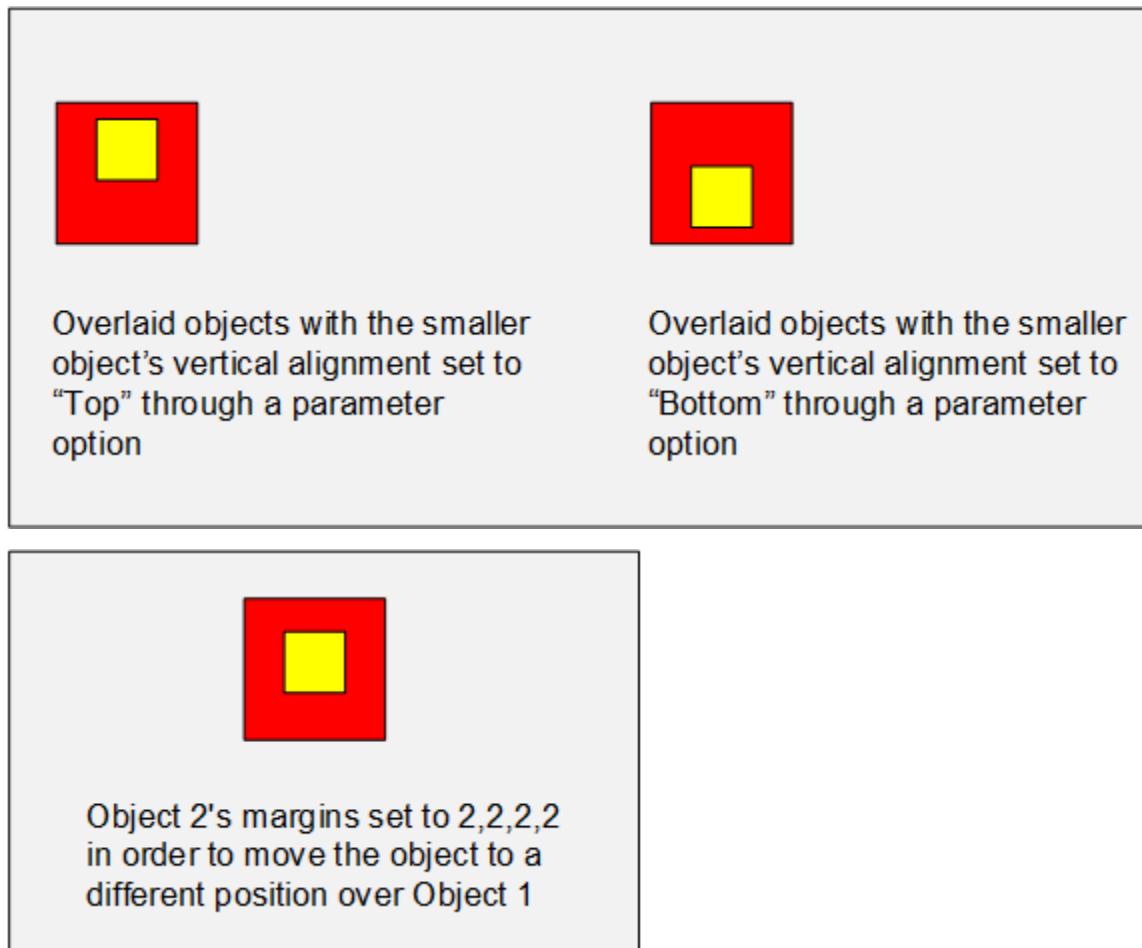

- **StackedVertical:** Objects are aligned from top to bottom. By default, the objects, as a group, are center aligned. To left- or right-align the objects within the group, set the HorizontalAlignment attribute to "Left" or "Right", respectively. If you have two objects in a group, you need to specify the horizontal alignment only for the second object. The second item will then be aligned relative to the first object. This needs to be set in in the XML template. Use the Margin attribute to control overlap of objects. A negative margin setting will position an item closer to the item below it.
- **Overlaid:** All objects are placed at the same spot, and the order in which they are placed is controlled by the value of the ZIndex. The object with the lowest ZIndex will be at the top of the overlaid stack. Bigger objects can be stacked at the bottom and overlaid with smaller objects with the smallest object on the top.

### Example: StackedHorizontal

**Example: StackedVertical**

## Example: Overlaid

## More About Alarm Indicators

Alarm indicators may be applied to a Composite Genie as a group or to an individual Genie within the composite. Alarm indicators can be applied in one of two ways:

- Using the pre-defined alarm indicators from the <AlarmIndicators> attribute. For more information see, [Alarm Indicators](#).
- Making a declaration within a composition using the <AlarmIndicator> attribute (see the example below).

## Example

In the examples below, we have defined alarm indicators within the composition instead of using the pre-defined indicators.

In the example below, the alarm indicator has been defined for the container using the <AlarmIndicator> attribute. The alarm indicator will be visible around the Composite Genie with the specified width and padding when the condition is satisfied.

```
<Container Layout="StackedVertical" AnimationName="MEO1_Small">
<AlarmIndicator VisibleWhen="Show_MEOAlarm" width="2" Padding="1" IsInside="false" />
<Content ItemId="081" Margin="0,0,0,0" VerticalAlignment="Center">
  <Parameters>
    <Parameter Name="Equipment" TemplateParameter="MEO_Equip1"/>
  </Parameters>
</Content>
```

You can also define an alarm indicator for a specific content item (Genie) using the `<AlarmIndicator>` attribute. The alarm indicator will be visible only around the content item with the specified width and padding when the "VisibleWhen" condition you have specified is satisfied.

**Note:** If a condition is not defined, the alarm indicator will be displayed regardless of user input.

## Conditions

Conditions can be used for defining dependencies in a composition. For example, if a parameter needs to be displayed based on the value selected for another parameter or a composition needs to be applied based on a set of conditions. Conditions are of the following types:

- Global Conditions
- Parameter Conditions
- Composite Conditions

The order in which conditions are defined is important because only a condition defined later can use conditions defined before it. This is to avoid cyclical reference. For example, you have defined Global condition "MEO" first followed by condition "SmallMeter". The "SmallMeter" condition can use "MEO" as a Parameter condition, but the "MEO" condition cannot use the "SmallMeter" condition (shown in Example 1 below).

Before going through details about the types of conditions, it is important to understand operators that can be used to define conditions. The section below provides details of the different types of operators.

## Operators

Conditions can be defined with the help of operators. Operators are of two types:

- Logical – This include "AND" and "OR". These operators can be used when defining Composite conditions.
- Comparison – The following comparison operators are available to perform comparisons for string, integer and Boolean values:

Operator	Used for Comparing Values of Data Types...
IsEqualTo	Boolean, String and Integer
IsNotEqualTo	Boolean
IsGreaterThan	Integer
IsGreaterThanOrEqualTo	
IsLessThan	

Operator	Used for Comparing Values of Data Types...
IsLessThanOrEqualTo	
StartsWith	String
EndsWith	
Contains	

## Global Conditions

Global conditions are conditions that need to be used frequently within an XML template. They are defined once and can be used anywhere within an XML template to incorporate parameter dependencies or selection of a composition. Global conditions can also be used:

- to pre-define the components of the Composite Genie that can be enabled or disabled
- in determining parameter dependency, and can be used in one or more compositions within the XML template.

They may include nested Parameter as well as Composite conditions (shown in Example 2 below).

Global conditions are defined using the GlobalCondition element, which comprises the following attributes:

Attribute	Description
Name	User friendly name for the condition, which needs to be unique.

### Example

In this example, the Global condition "Show\_LabelPadding" is met when the one of the predefined Global conditions in the Composite condition is met.

```
<GlobalCondition Id="Show_LabelPadding">
  <CompositeCondition Operator="Or">
    <GlobalConditionRef Id="IsLabelSideDiff" />
    <GlobalConditionRef Id="IsNotModeCompact" />
    <GlobalConditionRef Id="IsDrivePump" />
    <GlobalConditionRef Id="IsDriveBorePump" />
    <GlobalConditionRef Id="IsDriveBlower" />
  </CompositeCondition>
</GlobalCondition>
```

### Example

This example shows a nested condition that can be used to evaluate a Global condition.

```
<GlobalCondition Id="IsModeCompact">
  <CompositeCondition Operator="Or">
    <!--First Sub-condition of Composite Condition -->
    <ParameterCondition Name="MEO" Comparison="IsEqualTo" Value="0" />
    <!--Second Sub-condition of Composite Condition, which is a Composite condition joined by an "AND" operator -->
    <CompositeCondition Operator="And">
      <ParameterCondition Name="MEO" Comparison="IsEqualTo" Value="1" />
      <ParameterCondition Name="DisplayMEOCompact" Comparison="IsEqualTo" Value="true" />
    </CompositeCondition>
  </CompositeCondition>
</GlobalCondition>
```

## Parameter Conditions

Parameter conditions can be used in a composition within the Prerequisite element to determine the composition that will be selected based on user input and to toggle visibility of a parameter. Parameter conditions are also used to define Global conditions. The attributes of a Parameter condition include:

Attribute	Description
Name	User friendly name for the condition, which needs to be unique.
Value	Expected value of the parameter against which the condition will be evaluated.

### Example

```
<ParameterCondition Name="Meter" Value="true" />
```

## Composite Conditions

Composite conditions are conditions that are joined together with the AND or OR operator and function as a group. Composite conditions can be made up of Global or Parameter conditions.

Attribute	Description
Operator	This can be set to "AND" or "OR" and determines how the conditions needs to be evaluated.

### Example

In the sample code, two parameter conditions are joined together using the AND operator.

```
<CompositeCondition Operator="And">
  <ParameterCondition Name="MEO" Comparison="IsGreaterThan" Value="0"/>
  <ParameterCondition Name="MEO" Comparison="IsLessThanOrEqualTo" Value="4"/>
</CompositeCondition>
```

Container

Alarm Indicators

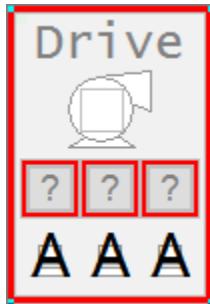

## Alarm Indicators and Alarm Flags

Alarm indicators and alarm flags are defined using Global conditions, and are included within a composition to be made visible to the user via the Presentation Options dialog box.

Given below is the code snippet for the Global condition that defines an alarm indicator.

```
<GlobalCondition Id="Show_AlarmBorder">
  <ParameterCondition Name="DisplayAlarm" Comparison="IsEqualTo" Value="true" />
</GlobalCondition>
```

Alarm indicators can be displayed on a Composite Genie and/or the related equipment associated with it (shown below).

Given below is the code snippet for the Global condition that defines an alarm flag and its positioning.

```
<GlobalCondition Id="Show_AlarmFlagTopLeft">
  <ParameterCondition Name="DisplayAlarmFlag" Comparison="IsEqualTo" Value="Top Left" />
</GlobalCondition>
<GlobalCondition Id="Show_AlarmFlagTopCenter">
  <ParameterCondition Name="DisplayAlarmFlag" Comparison="IsEqualTo" Value="Top Center" />
</GlobalCondition>
<GlobalCondition Id="Show_AlarmFlagTopRight">
  <ParameterCondition Name="DisplayAlarmFlag" Comparison="IsEqualTo" Value="Top Right" />
</GlobalCondition>
<GlobalCondition Id="Show_AlarmFlagMiddleLeft">
  <ParameterCondition Name="DisplayAlarmFlag" Comparison="IsEqualTo" Value="Middle Left" />
</GlobalCondition>
<GlobalCondition Id="Show_AlarmFlagMiddleRight">
  <ParameterCondition Name="DisplayAlarmFlag" Comparison="IsEqualTo" Value="Middle Right" />
</GlobalCondition>
<GlobalCondition Id="Show_AlarmFlagBottomLeft">
  <ParameterCondition Name="DisplayAlarmFlag" Comparison="IsEqualTo" Value="Bottom Left" />
</GlobalCondition>
<GlobalCondition Id="Show_AlarmFlagBottomCenter">
  <ParameterCondition Name="DisplayAlarmFlag" Comparison="IsEqualTo" Value="Bottom Center" />
</GlobalCondition>
<GlobalCondition Id="Show_AlarmFlagBottomRight">
  <ParameterCondition Name="DisplayAlarmFlag" Comparison="IsEqualTo" Value="Bottom Right" />
</GlobalCondition>
```

Alarm flags need to be included in a composition within the **Alarm Indicators** for them to be displayed in the Presentation Options dialog box.

```
<AlarmIndicator VisibleWhen="Show_AlarmBorder" EquipmentLink="Equip" BorderStyle="MainStyle" FlagStyle="Hidden">
  <Triggers>
    <Trigger When="Show_AlarmFlagTopLeft" FlagStyle="TopLeft" />
    <Trigger When="Show_AlarmFlagTopCenter" FlagStyle="Top" />
    <Trigger When="Show_AlarmFlagTopRight" FlagStyle="TopRight" />
    <Trigger When="Show_AlarmFlagMiddleLeft" FlagStyle="Left" />
    <Trigger When="Show_AlarmFlagMiddleRight" FlagStyle="Right" />
    <Trigger When="Show_AlarmFlagBottomLeft" FlagStyle="BottomLeft" />
    <Trigger When="Show_AlarmFlagBottomCenter" FlagStyle="Bottom" />
    <Trigger When="Show_AlarmFlagBottomRight" FlagStyle="BottomRight" />
  </Triggers>
</AlarmIndicator>
```

The triggers are used to define FlagStyle conditionally. When none of the When conditions is satisfied, the FlagStyle is set to the fallback value specified by `<AlarmIndicator FlagStyle="<fallback_value>">` element.

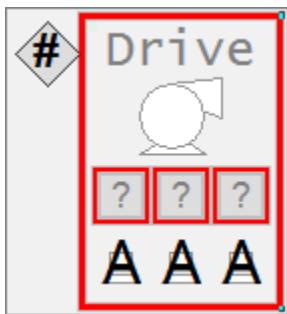

You can also set up the FlagStyle attribute within `<AlarmIndicator>` without Triggers. The FlagStyle attribute is "Hidden" by default if it is not specified.

An alarm flag can be positioned at one of the following locations:

- None: Alarm flag is not displayed. This is the default.
- Top Left
- Top Center
- Top Right
- Center Left
- Center Right
- Bottom Left
- Bottom Center
- Bottom Right

---

**Note:** If you change the size of an alarm flag and run the Update Pages command, the Composite Genie instances are re-sized to accommodate the size of the alarm flag.

## Super Genies

Super Genie library objects are non-instantiated pages that are linked to a Genie. When you save your Super Genie as a library object, it is not saved as a normal page and thus is not instantiated by default in your project. A Super Genie library object is only instantiated when it has been attached to a Genie and the Genie is placed on a graphics page in your project.

You can configure the Super Genie library object to display static and dynamic content using association Cicode functions. See [Dynamic Associations](#) for more information.

**Note:** To browse the Super Genies associated with the active project, use the **Libraries** view in the **Visualization** activity (see [Browse Libraries](#) in Plant SCADA Studio).

## See Also

[Super Genie Library Objects and the Page Properties Associations Tab](#)

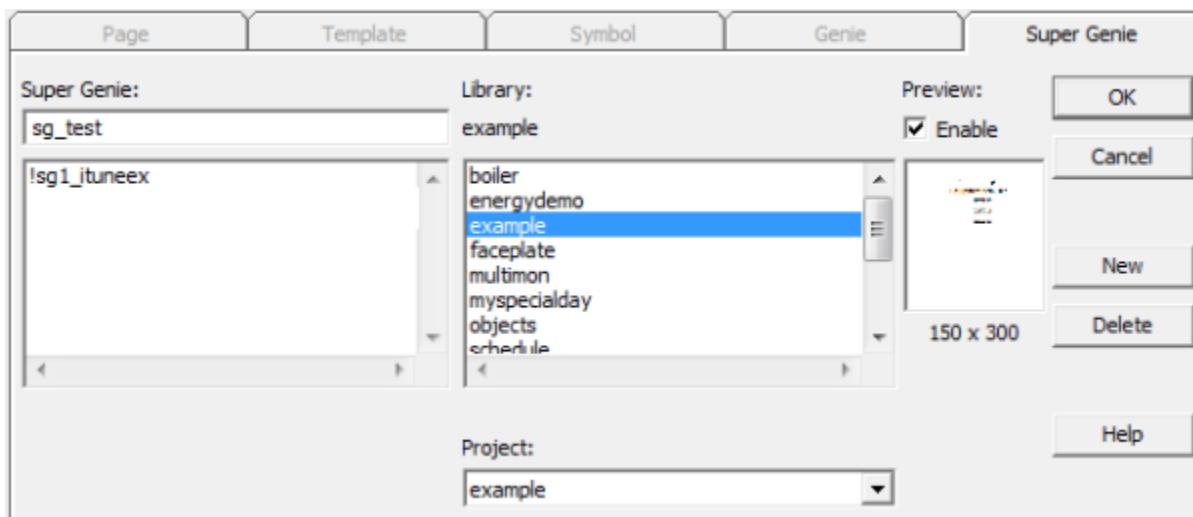

## Create a New Super Genie

You can configure and save a Super Genie page as a library object. If you save your Super Genie as a library object it is not saved as a normal page and thus is not instantiated by default in your project. A Super Genie library object is only instantiated when it has been attached to a Genie and the Genie is placed on a page in your project. Once the library object is instantiated the Super Genie is available for use in your project.

**Note:** If you configure a Super Genie in this way and name the page with an ! prefix, then you need to select **List System Pages** from the Graphics Builder Options menu to show the page with the other pages, so you can then select it and edit the page. Otherwise it will be hidden.

### To create a new Super Genie:

1. Open Graphics Builder.
2. From the toolbar select the **New** button, or select **New** from the **File** menu.
3. Click the Super Genie option. A blank Super Genie page will open.
4. Create your Super Genie as you would any graphics page.

5. From the toolbar select **Save**, or select **Save** from the **File** menu.
6. The Save as dialog opens. The Super Genie tab is active, with no other options available.
7. Enter a name for the Super Genie in the **Super Genie** field (for example, "!sg2\_test").
8. Select the **Library** and **Project** in which you would like to store the Super Genie.

Like Genie libraries, Super Genies libraries are global and can be used between projects.

9. Click **OK**.

**Note:** Save it in a Super Genie library using an exclamation mark (!) prefix. This keeps the pages hidden in the

---

configuration environment (they are visible only if attached to a Genie).

---

[Super Genies](#)

[Dynamic Associations](#)

## Super Genie Library Objects and the Page Properties Associations Tab

When you define a Super Genie, you are actually creating a Super Genie template, similar to a page template. When the Super Genie is instantiated in the project, this template is used to create a new Super Genie page. At this point, any associations saved with the template are copied across to the Super Genie page. However, if subsequent changes are made to the page association definitions of the template (under page properties), the corresponding associations of the Super Genie page are not updated.

After the Super Genie page content has been modified, the Super Genie page created from the template needs to be updated. In the Graphics Builder select **Tools | Update Pages** (see [Update Pages](#)).

If it is not updated, then your page may display out-of-date content.

## Attach a Super Genie to a Genie

### To attach a Super Genie to a Genie:

1. Open Graphics Builder.
2. With the Genie open, select **Attach Super Genie** from the **Edit** menu.
3. Click **Add**. The Super Genie Dialog box will open.
4. Select the library to which the Super Genie belongs.
5. Select the Super Genie to attach (for example, "!PopUp\_SG") and click **OK**.  
The Super Genie is added to the Attach Super Genie list.
6. Click **OK** to save the changes, or click **Cancel**.

---

**Note:** A Super Genie can be attached to more than one Genie.

---

[Edit a Super Genie Library Object](#)

[Edit a Super Genie Page](#)

[Dynamic Associations](#)

## Edit a Super Genie Library Object

If you modify a Super Genie while its project is running in the background, you will be prompted to 'Update Pages'. This will update your changes in the runtime environment. If a runtime page containing the Super Genie is displayed when the change is made, it will not be updated until after you exit the page and display it again.

For those pages created from a Super Genie, if the parameter [CtDraw.RSC]AllowEditSuperGeniePage is set to 0 (the default), a message will be displayed that will help prevent you from editing the Super Genie page directly. Instead you will need to edit the Super Genie Library object that created that page.

If the parameter [CtDraw.RSC]AllowEditSuperGeniePage is set to 1, a message will display that asks for confirmation before allowing you to edit the page directly.

---

**Note:** Changes made directly to a page (created from a Super Genie) will be overridden when you 'Update Pages'.

---

### To open an existing Super Genie library object:

1. Open Graphics Builder.
2. Click the **Open** toolbar button, or select **Open** from the **File** menu.
3. Select the **Super Genie** tab.
4. Select the **Project** and **Library** in which the Super Genie is stored.
5. Select the **Super Genie**.
6. Click **OK**.

### To delete a Super Genie library object:

1. Open Graphics Builder.
2. Click the **Open** toolbar button, or select **Open** from the **File** menu.
3. Select the **Super Genie** tab.
4. Select the **Project** and **Library** in which the Super Genie is stored.
5. Select the **Super Genie** and click **Delete**.  
A confirmation message will display.
6. Click **OK** to delete the library object.

Deleting a Super Genie that has been attached to a Genie will not cause that Genie to become inoperable at runtime.

---

**Note:** If you delete a Super Genie that is in use, the object configured to call the page at runtime will become inoperable.

---

## See Also

[Super Genies](#)

## Edit a Super Genie Page

If you modify a Super Genie while its project is running in the background, you will be prompted to 'Update Pages'. This will update your changes in the runtime environment. If a runtime page containing the Super Genie is displayed when the change is made, it will not be updated until after you exit the page and display it again.

### To open an existing Super Genie page:

1. Go to Graphics Builder.

2. Click the **Open** toolbar button, or select **Open** from the **File** menu.
3. Select the **Pages** tab.
4. Select the **Project** to which the page belongs.
5. Select the **Super Genie**.
6. Click **OK**.

#### To delete a Super Genie page from the project:

1. Click the **Open** toolbar button, or select **Open** from the **File** menu.
2. Select the **Pages** tab.
3. Select the **Project** to which the page belongs.
4. Select the **Super Genie** and click **Delete**.
5. A confirmation message will display.
6. Click **Yes** to delete the page and its records from the project. Click **No** to delete the page from the project only. Click **Cancel** to cancel the operation.

**Note:** If you delete a Super Genie page that is in use, the object configured to call the page at runtime will become inoperable.

[Super Genies](#)

## Web Content

Plant SCADA allows you to natively incorporate web-based content into your runtime system. This is achieved by adding a Web Content object to a page in Graphics Builder (see [Add a Web Content Object](#)).

Each instance of a Web Content object has a **URL** property that allows you to specify the content that is displayed when the host graphics page is launched. If required, you can update the URL at runtime using the Cicode function [DspWebContentSetURL](#).

### **WARNING**

#### **LOSS OF CONTROL**

- Do not use the Plant SCADA Web Content control to display an untrusted or potentially unsafe web site, as this may leave your runtime system vulnerable to malicious activity.
- Do not enter a URL in the Web Content control that will allow users to navigate to an untrusted or potentially unsafe web site (for example, a search engine).

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

**Note:** Before you implement the Web Content control as part of your runtime system, you should carefully consider the security implications of the content that will be accessible. If using an internet-based website or application, you will be externally exposing your SCADA system and network.

When open at runtime, the Web Content browser operates in the same way as a typical web browser. However, the following functionality is not supported:

- Signing in to Google sites is not supported.
- A current Windows user login cannot be used for Single Sign-On support.
- Links that launch a popup window or a new tab will open the destination in the current browser window.
- Download links will not work.
- Upload links will not work (including drag-and-drop uploads).
- Javascript functions that open prompt or confirm dialogs (`window.alert`, `window.prompt` and `window.confirm`) will not work.
- Dialogs that prompt a user to confirm if they want to leave a page (specifically those generated by the Javascript `window.onbeforeunload` event handler) will not appear. Navigation will proceed immediately.
- HTTP Basic Authentication is not supported (the login dialog does not display).
- DRM-protected video streams are not supported.
- You cannot choose to accept the risks and continue to a site that has certificate issues (for example, if a certificate has expired). This means you cannot connect to an Industrial Graphics page using the server's IP address instead of a hostname.

When a Web Content control is displayed, any user-specific data (such as cookies, storage and browsing history) is stored in the profile folder for the current Windows user (for example, `C:\Users\<Windows User Name>`). The following sub-directory is used:

`\AppData\Local\AVEVA Plant SCADA\WebContent\Profiles\<User>\`

Where `<User>` is the name of the user that is currently logged in to Plant SCADA. Some changes to the user name may be required to create a valid path.

If no one is currently logged in to Plant SCADA, this directory changes to:

`\AppData\Local\AVEVA Plant SCADA\WebContent\Profiles\$ViewOnly\`

Any data that is not user-specific is stored in the following directory:

`\AppData\Local\AVEVA Plant SCADA\WebContent\CommonData`

If you want to automatically delete the application data associated with a Web Content user when they log out, you can use the parameter [\[Security\]DeleteWebContentProfile](#).

The current browser session will be closed when you navigate away from a graphics page that hosts a web content object.

---

**Note:** If a second (or subsequent) instance of the Plant SCADA runtime client is launched on a computer by the same user, the process ID (PID) of the client process will be included in the path used by the Web Content objects in the second (or subsequent) instances of the client. For example:

`\AppData\Local\AVEVA Plant SCADA\WebContent.<PID>`

When this occurs, all browser instances will use incognito mode. The Profiles sub-directory will not be created, and any user-specific data will not be stored. The PID folder will be deleted when the client process exits.

---

You can use the INI parameter [\[Debug\]ChromiumDevToolsPort](#) to enable debugging for a Web Content browser.

---

**Note:** You need to consider which users will be logging in to the runtime system and if they need their Web Content user data protected. For more information, see [Securing Web Content User Data](#).

## See Also

[Graphics Objects](#)

[Graphics Object Types](#)

## Securing Web Content User Data

When you include a [Web Content](#) object in a project, you need to consider which users will be logging in to the runtime system and if they have any requirements to protect their user data (such as cookies, storage and browsing history).

Plant SCADA's runtime security system supports two types of user account:

- Windows™ users (see [Integrate Windows™ User Groups](#)).
- User defined in a Plant SCADA project (see [Add a Plant SCADA User](#)).

The following information describes the security implications for these two types of users.

- **Plant SCADA Users**

When a Plant SCADA user logs in and opens a page containing a Web Content object, their user data will end up in an individual folder. However, this folder is stored under the user account of the Windows user that is currently logged into the operating system.

For example:

C:\Users\<OS Windows User>\AppData\Local\AVEVA Plant SCADA\WebContent\Profiles\<Plant SCADA User>\

If any users are able to access the file system, they could potentially view the user data files of other Plant SCADA users.

- **Windows Users**

When a Windows user logs in and opens a page containing a Web Content object, their user data will end up in an individual folder. However, this folder is stored under the user account of the Windows user that is currently logged into the operating system.

For example:

C:\Users\<OS Windows User>\AppData\Local\AVEVA Plant SCADA\WebContent\Profiles\<Windows User>\

If any users are able to access the file system, they could potentially view the user data files of other Windows users.

This is not a concern if the Windows user attempting to access Plant SCADA is also logged into the operating system using their own account. This way, their user data folder will be secured within their individual Windows user account.

---

**Note:** If a Web Content object hosts a website or application that stores sensitive user data, it is recommended that you use Windows user accounts to secure Plant SCADA runtime. Each user also needs to be logged into the local operating system before they use the same account to log in to Plant SCADA.

[Graphics Objects](#)

## Graphics Object Types

# Dynamic Associations

Dynamic associations are placeholders you can use on a graphics page to link to equipment, 'equipment.item' and/or variable tag references via association Cicode functions at runtime.

**Note:** Prior to Plant SCADA 2015, dynamic associations were referenced within Super Genie pages. With the introduction of equipment, 'equipment.item' references and partial associations, the concept is now referred to as dynamic associations.

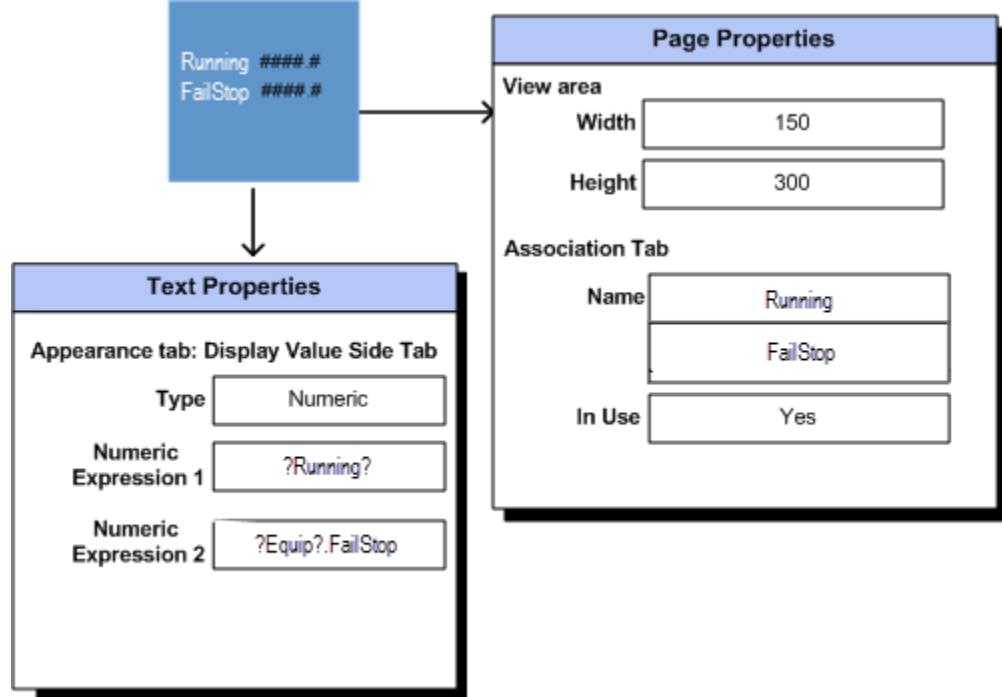

When you replace part or all of a command or expression with a placeholder, the placeholder is called an association.

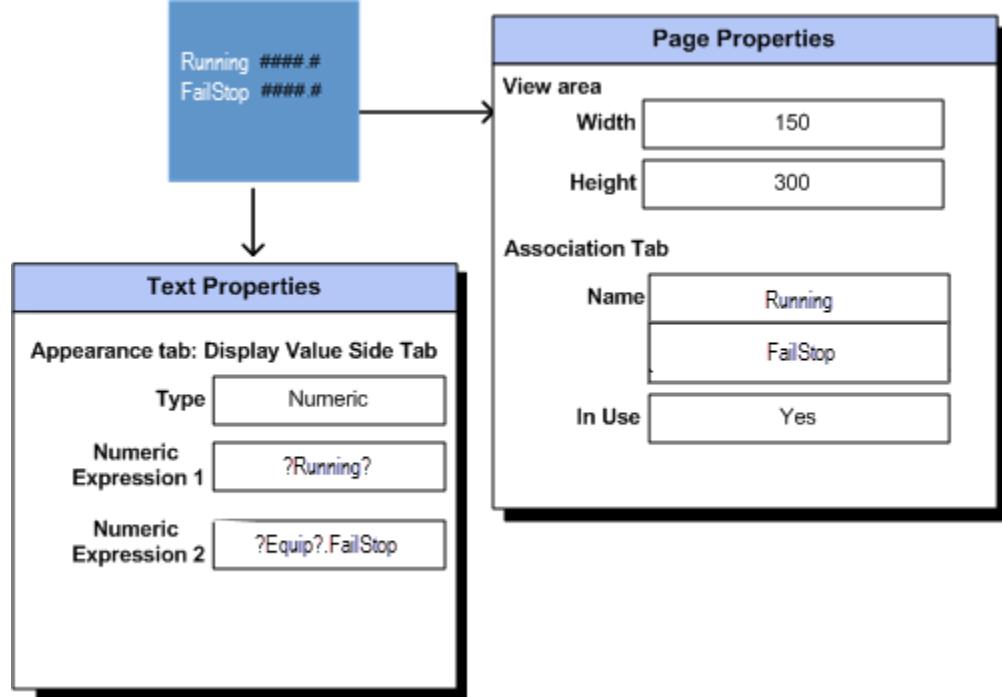

You can use associations in any graphics object properties that accept tags, commands and expressions. You can also use associations in:

- log messages for object touch and keyboard commands
- tool tips
- page keyboard commands
- the comment for Trend objects.

However, you cannot use the dynamic association syntax in a report, alarm, trend, or background Cicode function.

In the illustration below, Numeric Expression 1 has been replaced with a placeholder '?Running?'. The question marks ('? ?') denote it is a dynamic association.

Only part of Numeric Expression 2 has been replaced with the placeholder '?Equip?'.  

## See Also

- [Define Dynamic Associations](#)
- [Use Equipment References with Dynamic Associations](#)
- [Use Structured Tags with Dynamic Associations](#)
- [Link Dynamic Associations](#)
- [Dynamic Associations and Areas](#)
- [Use Constants with Dynamic Associations](#)
- [Use Arrays and Array Offsets with Dynamic Associations](#)

## Define Dynamic Associations

To define a dynamic association, enclose the association name between question mark (?) characters. You can also include the data type, though this is optional.

?<Association>?

?<Data Type> <Association>?

Everything between the question mark characters will be replaced at runtime with the associated value. The association may be referenced as many times as necessary on a graphics page.

---

**Note:** If you have upgraded and historically used numbers in your associations, these will continue to work as numbers are regarded the same as a name.

The data types for an association allow you to pass tags of the following types:

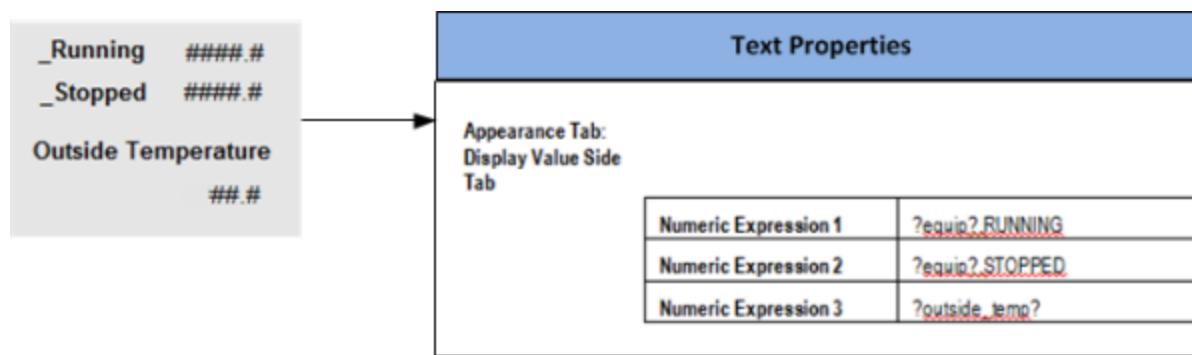

- BYTE
- BCD
- DIGITAL
- INT
- UINT
- LONG
- LONGBCD
- STRING
- REAL

When the <Data\_Type> is not specified, Plant SCADA will automatically use the relevant typecast variable type at runtime.

---

**Note:** Explicit type casting to BCD, BYTE, LONGBCD, UINT and ULONG types is not supported for the associated tag. Use automatic data type associations for these types. If using automatic data type associations, be aware that it may be more difficult to decipher error logs.

In the following example an association has been used in numeric expressions 1 to 3. The names used are "equip" and "outside\_temp". As they are associations, the names have been placed within "? ?".

For Numeric expression 1 and 2, only part of the expression has been associated with a placeholder. For numeric expression 3, the whole expression has been replaced with an association.

This means at runtime, a variable tag, equipment name or 'equipment.item' reference will replace the associations "?equip?" and "?outside\_temp?" in the expression.

You can also use the association with prefixes, suffixes and logical operators. For example:

- ?INT equip?.Running
- Plant100.?INT equip?.Running
- ?INT 1?\_PV , TAG\_?INT 1?, TAG\_?INT 1?\_PV
- (NOT(?30?)OR(?52?)OR(?152?)) AND(?54?)
- (NOT ?30? OR ?52? OR ?152?) AND ?54?).

**Note:** When using logical operators, use brackets or spaces in the dynamic associations. If brackets or spaces are not used, the compiler will produce an "Incompatible type" error message.

This will be expanded to the complete reference at runtime. For example, an association of "?equip?.Running" when associated with equipment named "Pump1" at runtime, will become "Pump1.Running".

**Note:** Tag elements (for example, Field, Override Mode or Control Mode) and Tag Items (for example, V, Q, T) are not supported for partial associations in dynamic associations.

## See Also

[Use Equipment References with Dynamic Associations](#)

## Use Equipment References with Dynamic Associations

When defining dynamic associations, you can use full or partial associations to generate the complete 'equipment.item' reference when a page is displayed at runtime.

For example, you can define dynamic associations to display the values of the following equipment from the Example Project:

- Example\_Motor.FailStop
- Example\_Motor.FailStart
- Example\_Motor.Running.

To do this, you can configure object properties as follows:

Numeric expression	?Equip.FailStop?
Numeric expression	?Equip.FailStart?
Numeric expression	?Equip.Running?

For each numeric expression, a full association has been used as a dynamic association.

When configuring an object to call the dynamic association page, each 'equipment.item' reference will be passed to the dynamic association using an association Cicode function. Each dynamic association needs to be configured in the object.

```
Ass(-2, "Equip.FailStop", "Example_Motor.FailStop"); Ass(-2, "Equip.FailStart",
"Example_Motor.FailStart"); Ass(-2, "Equip.Running", "Example_Motor.Running");
WinNewAt("equipSg",100,100,0);
```

Using a partial association (where only part of the 'equipment.item' reference is used), you can configure the numeric expressions as follows:

Numeric expression	?Equip?.FailStop
Numeric expression	?Equip?.FailStart
Numeric expression	?Equip?.Running

When configuring the object to call the dynamic association page, only one 'equipment.item' reference needs to be passed to the dynamic association using an association Cicode function.

```
Ass(-2, "Equip", "Example_Motor"); WinNewAt("equipSg",100,100,0);
```

## See Also

[Create a Dynamic Association Page](#)

[Display a Dynamic Association Page](#)

## Use Structured Tags with Dynamic Associations

Dynamic associations support direct concatenation of the tag with other information (as do Genies). For example, the following is valid:

```
?INT 1?_PV , TAG_?INT 1?, TAG_ ?INT 1?_PV
```

## See Also

[Link Dynamic Associations](#)

## Link Dynamic Associations

Plant SCADA allows you to link dynamic associations. Linking refers to a situation where an existing set of associations are passed onto a new page.

To do this, configure the graphics object's input command to use the AssChain Cicode functions when displaying

the related pop up.

## See Also

[Dynamic Associations and Areas](#)

## Dynamic Associations and Areas

When you display a dynamic association, the area of the page is inherited from its parent. For example, if the parent page is in area 1, when you display a dynamic association it will also be area 1. This allows you to call the same dynamic association from different pages in different areas.

The inherited area may be avoided by defining a specific area for the dynamic association. This means, every instance of the dynamic association will have the same area, despite the area inherited from its parent.

Dynamic associations will only inherit areas if their area is blank.

## See Also

[Use Constants with Dynamic Associations](#)

## Use Constants with Dynamic Associations

You can use the following types of constants with dynamic associations:

- STRING
- INTEGER
- DIGITAL
- REAL
- LONG.

To pass a constant you need to format the argument in the association function to include a single quote on either side. For example, to pass the constant data **1.2345** into a dynamic association, you would call the association function like this:

```
Ass(hWin, sArg, "'1.2345'");
```

To pass a variable tag or 'equipment.item' tag reference, you don't need the single quotes. For example, to pass variable tag **TAG1** into a dynamic association, you would call the association function as follows;

```
Ass(hWin, sArg, "TAG1");
```

Or if using 'equipment.item' to reference the variable tag:

```
Ass(hWin, sArg, "Pump.Speed");
```

The ability to pass constants into dynamic associations is restricted in that the constant association can be used where you can enter a normal Cicode tag. For example, a keyboard command, a symbol address field, and so on.

## See Also

[Use Arrays and Array Offsets with Dynamic Associations](#)

## Use Arrays and Array Offsets with Dynamic Associations

Dynamic association can accept array elements or entire arrays as substitution. Passing an element of an array is achieved by referencing the element, as shown here:

```
AssPopUp("MyPopUp", "DigArray[42]");
```

To pass an entire array to a dynamic association, only the array name is used. For example:

```
AssPopUp("MyPopUp", "DigArray");
```

## Use Arrays with Dynamic Associations

To pass an entire array to a dynamic association, configure it to accept the array instead of a single value. Use the following syntax for the dynamic association substitution string:

```
?<Data Type><Substitution String>? [<element>]
```

Only arrays of data type DIGITAL, INT, REAL, and LONG are supported.

## Use Array Offsets with Dynamic Associations

You can use array offsets with a tag that is an array.

For example, you may have a tag (named *Tag1*) defined as an array of four elements. When using the GENERIC protocol, the tag has an address I1[4]:

Tag1 = I1[4] ->	I1
	I2
	I3
	I4

Tag1 represents the registers I1, I2, I3 and I4. When Tag1 is used with the Ass() Cicode function it behaves as follows:

- If you associate a value using Ass(hWin, "X", "Tag1", 0) then the substitution string ?X?[0] gives the value in I1.
- If you associate a value using Ass(hWin, "X", "Tag1", 0) then the substitution string ?X?[2] gives the value in I3.
- If you associate a value using Ass(hWin, "X", "Tag1[0]", 0) then the substitution string ?X?[2] gives the value in I3.
- If you associate a value using Ass(hWin, "X", "Tag1[1]", 0) then the substitution string ?X?[2] gives the value in I4. This is because the two offsets are added together to determine the final offset within the array variable.
- If you associate a value using Ass(hWin, "X", "Tag1[2]", 0) then the substitution string ?X?[2] gives the error

#ERR. This is because the sum of the two array offsets gives a position (Tag1[4]) that is outside the bounds of the array.

You can also use array offsets with a tag that is not an array.

For example, you may have a tag (named *Tag2*) defined as a single value. When using the GENERIC protocol, the tag has an address I1:

Tag2 = I1 ->	I1
--------------	----

When Tag2 is used with the Ass() Cicode function, it behaves as follows:

- If you associate a value using Ass(hWin, "X", "Tag2", 0) then the substitution string ?X?[0] gives the value in I1. This is because a non-array tag is equivalent to an array with one element.
- If you associate a value using Ass(hWin, "X", "Tag2[0]", 0) then the substitution string ?X?[0] gives the value in I1. This is because a non-array tag is equivalent to an array with one element.
- If you associate a value using Ass(hWin, "X", "Tag2", 0) then the substitution string ?X?[2] gives the notification #ERR. This is because a non-zero offset cannot be applied to a non-array tag.
- If you associate a value using Ass(hWin, "X", "Tag2[0]", 0) then the substitution string ?X?[2] gives the notification #ERR. This is because a non-zero offset cannot be applied to a non-array tag.
- If you associate a value using Ass(hWin, "X", "Tag2[1]", 0) then the substitution string ?X?[2] gives the notification #ERR. This is because a non-zero offset cannot be applied to a non-array tag.
- If you associate a value using Ass(hWin, "X", "Tag2[2]", 0) then the substitution string ?X?[2] gives the notification #ERR. This is because a non-zero offset cannot be applied to a non-array tag.

## See Also

[Dynamic Associations](#)

## Create a Dynamic Association Page

You can configure any graphics page (normal or Super Genie) to use dynamic associations. This allows the page to be reused in different contexts as the actual data that is used is assigned at runtime when the page displays.

### To create a dynamic association page:

1. Open Graphics Builder.
2. From the toolbar select **New**.

Or:

From the **File** menu, select **New**.

3. On the New dialog box, select **Page** or **Super Genie**.

If you select Page, the Page Template dialog box will display. Choose the required **Template** and click **OK**.

4. Add the required objects to the page.
5. Right-click on an object and select **Properties**.
6. Configure the dynamic associations in the required property fields.
7. Click **OK** to apply the changes.

8. From the **File** menu select **Save**.
9. In the Save dialog, select the project to which the page will belong.
10. Name the page and click **OK**.

## See Also

[Display a Dynamic Association Page](#)

## Display a Dynamic Association Page

To display a page that uses dynamic associations, you need to add an object to a graphics page that is configured to call the page. For example, you could use a new menu item, a button, or a symbol.

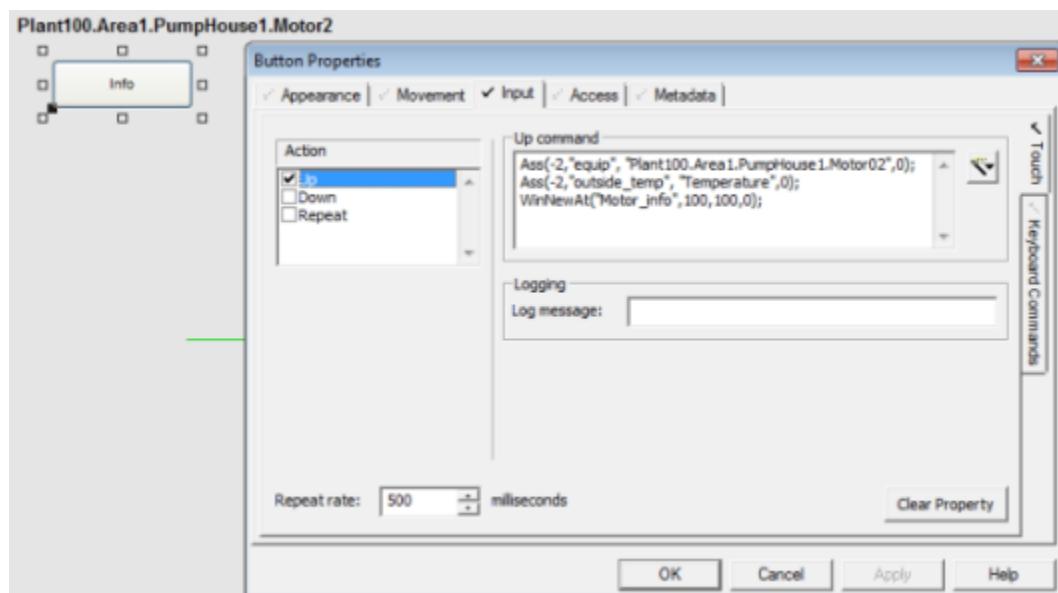

When configuring the object, you use one of the Association Cicode functions. At runtime, this links the associations with the equipment, 'equipment.item' or variable tag references.

If you use the association Cicode function, you need to use it once for each value you want to pass to the Super Genie.

### To use a Dynamic Association:

1. Open Graphics Builder.
2. Open the page to which you would like to add an object that calls the dynamic association page.
3. Place and configure an input object on the page. This object will process the dynamic associations.

This is illustrated in the screen shot below, where a button was placed on the graphics page that will process two associations before displaying the popup page.

The **Up** input command for the button has been configured as follows:

```
Ass (-2,"equip","Plant100.Area1.PumpHouse1.Motor2",0);
Ass(-2,"outside_temp","Temperature",0); WinNewAt("Motor_info",100,100,0);
```

Where:

- "equip" is the name of the substitution and "Plant100.Area1.PumpHouse1.Motor2" is the equipment

name assigned to the association.

- "outside\_temp" is the name of the substitution and "Temperature" is the tag name assigned to the association.
  - "Motor\_info" is the name of the dynamic association page.
4. Save the graphics page.

## See Also

[Dynamic Associations](#)

## Animation Points

A graphics page in Plant SCADA is typically made up of several objects. Each point on a graphics page where an object is displayed is called an Animation Point. When you add a graphics object to your page, it is automatically allocated an animation number (AN) to represent the associated animation point.

Animation Numbers can be linked to static items (such as a bitmap or an object without an animation expression), or animated items where an animation expression is defined.

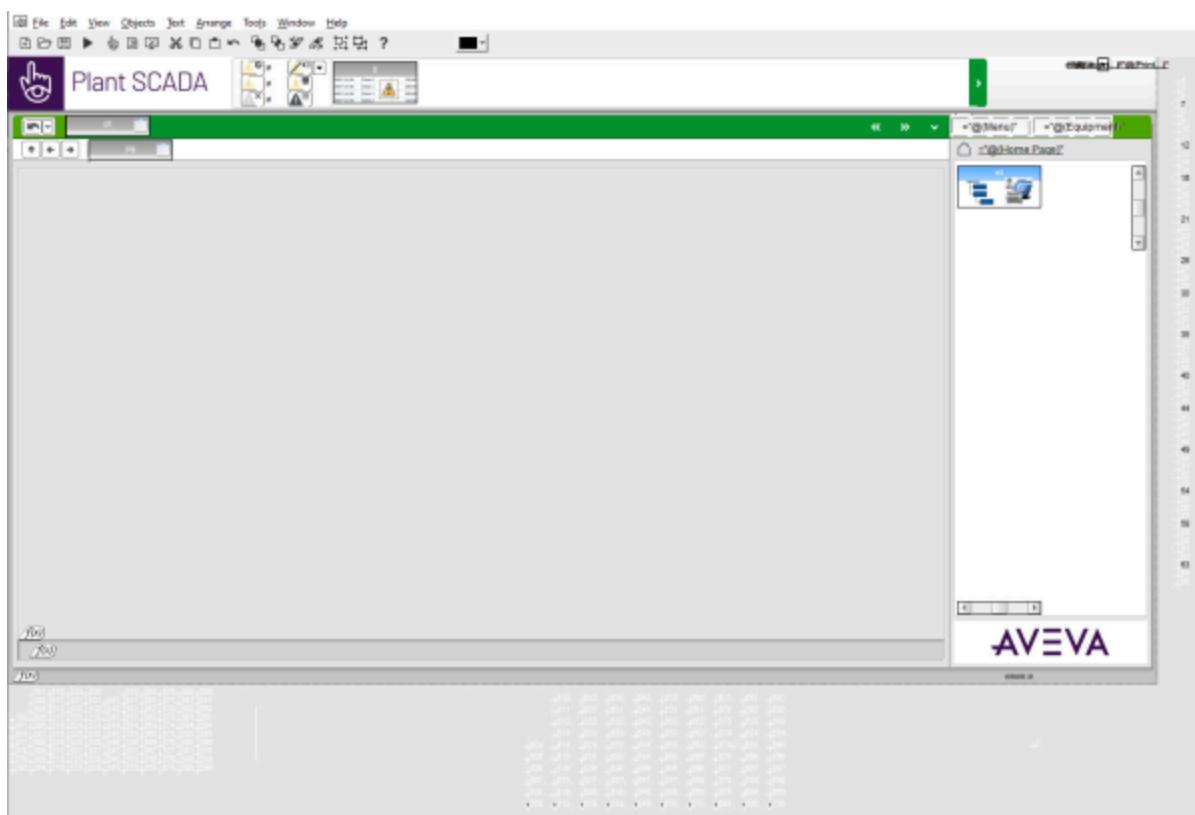

---

**Note:** The number of graphic objects that you can use is limited by the performance of your computer, and the number (and complexity) of the animation expressions used. A good rule of thumb is to try and keep the number of objects (and hence ANs) to less than 3000.

---

AN's are automatically generated for graphics objects; however the AN's 1 and 2 are used for automatically displaying system information such as messages and keyboard entry. In the case of the SxW and Tab Style templates, a large number of ANs are reserved for future development. These reserved ANs are listed around the edges of a page when it is displayed in Graphics Builder.

- [Animation Numbers on a SxW Page](#)

- Animation Numbers on a Tab Style Page

Genies are a combined set of one or more graphics objects. This means each Genie results in two or more ANs and animation records being saved to the project configuration; one for the Genie and one for at least one object within it. The total number of Genies that can be used on a single page is determined by the number of graphics objects that are defined within each Genie, and the total number of ANs and animation records.

You can add individual animation points to a graphics page by using the **Cicode Object** tool (add a Cicode Object

without a command).

When configuring the graphics object on the page you can name the object and use that name to retrieve the object at runtime. See [Naming Graphic Objects](#) for more information.

**Note:** You can locate any object on a page by referencing its AN (Animation Number or Name). To locate an object using its AN or Name, use the **Goto Object** tool (accessible via the **Tools** menu). See [Locate an Object](#).

## See Also

[Naming Graphic Objects](#)

[Symbols](#)

## Naming Graphic Objects

In Plant SCADA animation numbers are not static, meaning the number allocated to the object may change to the next available animation number on the graphics page. For example; a symbol comprised of two objects may use AN's 4 and 5; however when the symbol is pasted onto the graphics page, these AN's may already be in use. In this case the AN's would change to the next two available AN's. This may make it difficult to reference the object at runtime, as the AN does not uniquely identify the object. To make it easier to reference an object at runtime you can now name individual graphics objects within a Page, Template, Super Genie, Genie and Symbol. Graphic objects include: AN, Line, Rectangle, Pipe, Symbol, Symbol Set, Group, and Trend. (See [General Access to Objects](#) for more information).

The name of the object is unique to the name space to which the object belongs to. For example;

- an object on a page <Graphics Object Name>
- an object in a group <Group Name>.<Graphics Object Name>
- an object in a genie <Genie Instance Name>.<Graphics Object Name>

This means if you have a text object named Text4 within a symbol, the full name is actually <SymbolName>.Text4. As a result, you could potentially have multiple text objects named Text4 on the page, with the name given to the symbol making it unique. The animation name is static, thus you can search for the object at runtime using the name.

**Note:** You can locate any object on a page by referencing its AN (Animation Number or Name). To locate an object using its AN or Name, use the **Goto Object** tool (accessible via the **Tools** menu). See [Locate an Object](#).

## See Also

[Symbols](#)

## Interaction with Graphics Pages at Runtime

To enable an operator to interact with a graphics page at runtime, you can use the following commands and controls:

- **Touch commands** — triggered via a mouse click, or similar (see [Touch Commands](#))

- **Keyboard commands** — triggered via a keyboard key, or sequence of keys (see [Keyboard Commands](#))
- **Slider controls** — change the value of an analog variable by dragging an object on the graphics page (see [Slider Controls](#)).

You can assign privileges to commands and controls, and send a message to the command log each time an operator issues a command.

## Touch Commands

You can assign touch commands to the objects on a graphics pages. Touch commands allow an operator to send commands to the runtime system by clicking (with the mouse or similar) on an object on the graphics page. (For buttons, the command can be executed by highlighting the button with the cursor keys on the keyboard and pressing Enter.)

You can define several commands for an object, one command to execute when the operator clicks on the object, another for when the operator releases the mouse button, and another to operate continuously while the operator holds the mouse button down.

For example, a drive can be jogged by starting it when the mouse button is depressed and stopping it when the mouse button released; variables can be incremented while the mouse button is held, and so on.

---

**Note:** You can define a disable condition for any object on a page (including buttons). When the condition is active, the operator cannot interact with the object.

---

## See Also

- [Object Touch Commands](#)
- [Edit Common Object Properties](#)

## Slider Controls

Slider controls allow an operator to change the value of an analog variable by dragging an object on a graphics page. Sliders also move automatically to reflect the value of the associated variable tag.

To configure a slider, you associate a variable with an object. When the operator moves the object, the value of the variable will change. Objects can be set up to slide vertically and/or horizontally, or they can be rotated.

A slider is configured via the **Slider** tab on the Object Properties dialog box. Slider properties can be configured to work in tandem with other object properties, such as Fill Color, Movement, and Scaling.

## See Also

- [Sliders](#)

## Configuring Commands - Frequently Asked Questions

### Q: How do I start a motor with the keyboard?

**A:** Define a Page Keyboard command that sets the value of the digital variable to 1, for example:

- Key Sequence: **ENTER** or **F5**
- Command: **Conv\_Motor = 1**

**Q: How do I start a motor with a button?**

**A:** Define a Button command that sets the value of the digital variable to 1 (for example **Conv\_Motor = 1**).

**Q: How do I adjust a setpoint from a keyboard entry?**

**A:** Define a Page Keyboard command to set the setpoint to a new value, for example:

- Key Sequence: **##### ENTER**
- Command: **SP1 = Arg1**

**Q: How do I enter a command that is bigger than the width of the field?**

**A:** Use an Include file or write a Cicode function and call that function. For details, see [Using Include \(Text\) Files](#) and [Writing Functions](#) respectively.

## AVEVA™ Industrial Graphics

AVEVA Industrial Graphics is a thin-client solution for the delivery of HTML5 graphics and functional content to desktop and mobile browsers. Content is created using the Plant SCADA Industrial Graphics Editor.

Plant SCADA supports two types of Industrial Graphics:

- **Pages** — used to host a set of symbols.
- **Symbols** — Industrial Graphics objects that are stored within libraries.

These are managed in Plant SCADA Studio, along with Industrial Graphics **Menus** and **Styles** (see [Design an Industrial Graphics Application](#)).

The following tools and components are also provided with Plant SCADA to create and run Industrial Graphics applications.

### Industrial Graphics Editor

Pages and symbols are edited using the AVEVA Industrial Graphics Editor. This tool allows you to create basic elements, such as rectangles, lines, and text elements that can support real-time animations. You can also embed symbols to develop complex graphics with common components, and incorporate symbols from the Industrial Graphics libraries provided with Plant SCADA.

### Industrial Graphics Server

AVEVA Industrial Graphics are accessed by clients via an Industrial Graphics Server. It authenticates clients details and provides access to the graphical and functional content. See [Install an Industrial Graphics Server](#).

For runtime operation, it is recommended that you set up a dedicated Industrial Graphics Server. Use Plant SCADA's **Deployment** functionality to remotely manage and deploy project versions to the Industrial Graphics Server. To do this, you need to set up the host computer as a deployment client (see [Deployment](#)).

With any update method of deployment (Prompt, Notify or Force) the Industrial Graphics Web Server

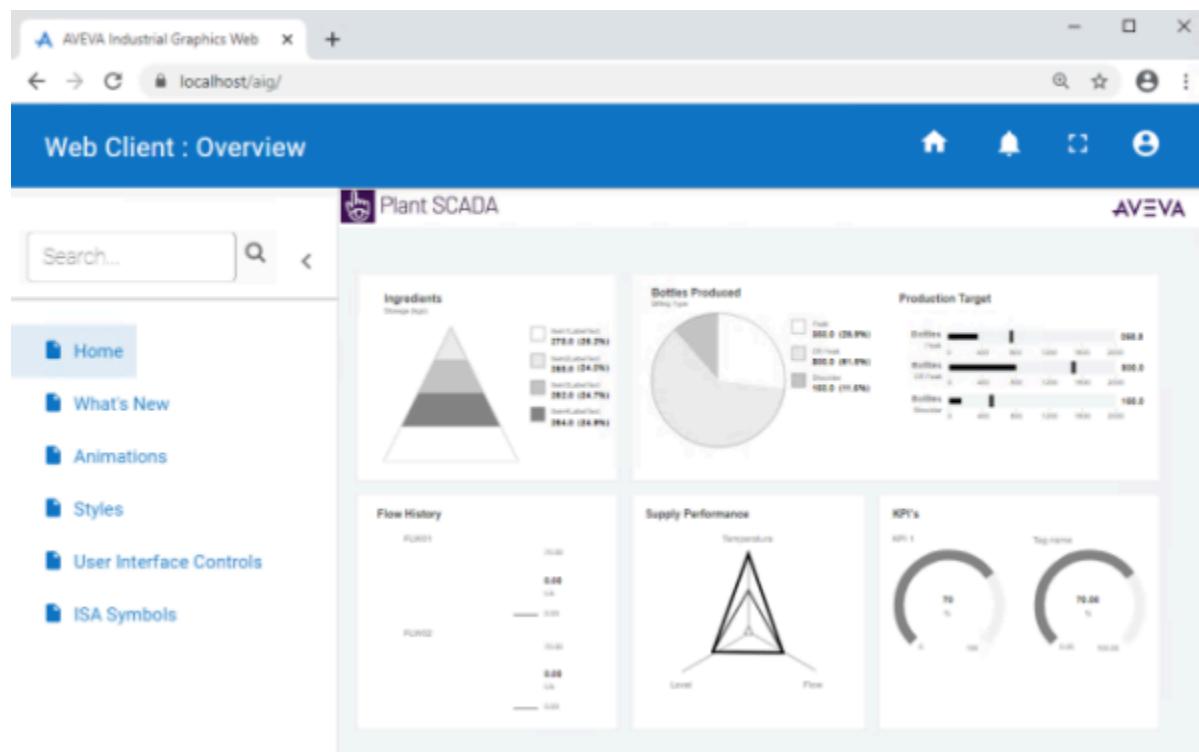

automatically activates the newly deployed project and version. When this occurs, the client shows content from the most recent deployment and informs you of the update with a notification.

If Runtime Manager is installed on the same machine and you are using the "Prompt" or "Notify" update method for deployment, then you have to restart the Runtime Manager to activate the newly deployed project and version. For more information refer to [Specify the Update Method](#).

**Note:** If you would like to review an Industrial Graphics application during development, you need to have an Industrial Graphics Server (connected to a System Management Server) installed locally on your development workstation.

## Industrial Graphics Client

An Industrial Graphics application can be viewed in an HTML browser on any computer or device that is authenticated by the Industrial Graphics Server. When connected, you will see the pages you have created, arranged according to the menu structure defined in the Visualization activity (see [Use the Industrial Graphics Web Client](#)).

The page displayed above is an example of an Industrial Graphics Web Client application that you can access in the ExampleSA project.

If you would like to view this content on a development workstation with a locally installed Industrial Graphics Server, run the ExampleSA project and direct a browser to the following address:

- <https://localhost/aig>

To view the project on a remote Industrial Graphics Server you need to:

1. Set up an Industrial Graphics Server (see [Install an Industrial Graphics Server](#)).
2. Deploy the ExampleSA project to the Industrial Graphics Server.

3. Connect a remote browser to the Industrial Graphics Server.

For a full description of how to build an Industrial Graphics application and run the Web Client, see [Design an Industrial Graphics Application](#).

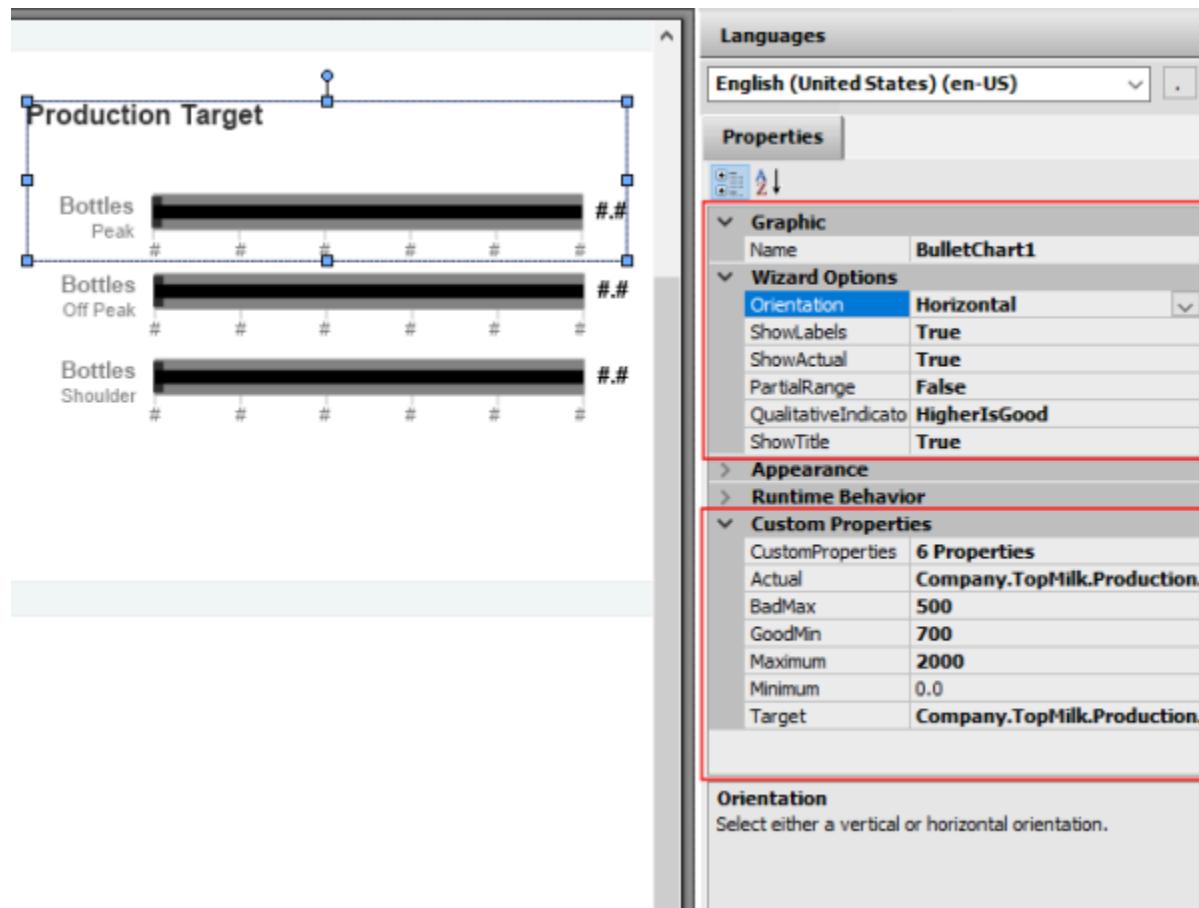

**Note:** The Industrial Graphics Web Client does not use indicators such #COM, #BAD or a dithered background to show the quality or status of device communications. For Industrial Graphics applications, quality and status is indicated by using a status element, or by applying styles to primitive objects that reflect the quality and/or status of I/O communications. For more information, see [Configure Style Overrides for Quality and Status Elements](#).

## IndustrialGraphics\_Include Project

The IndustrialGraphics\_Include project is a system project that is installed with Plant SCADA. It contains a default set of Industrial Graphics which includes charting and dashboard symbols as well as ISA symbols. These can only be embedded within Industrial Graphics pages and symbols.

The included symbols have been designed to support Industrial Graphic Styles, which allow you to centrally manage the appearance of elements, status animations and numeric values via the **Standards | Styles** view in Plant SCADA Studio (see [Styles](#)).

The charting symbols also offer many configuration options when selected within the Industrial Graphics Editor. These are accessible via the **Wizard Options** and **Custom Properties** sections of the Properties grid.

Help is provided for a selected option at the bottom of the Property grid.

If you would like to use these symbols when creating Industrial Graphics content, you need to add **IndustrialGraphics\_Include** to your project as an included project (see [Add an Included Project](#)). It is not automatically included when you create a project using a Situational Awareness, SxW, Tab Style or any other starter project.

---

**Note:** The **IndustrialGraphics\_Include** project is a system include project, and only appears in the Projects tree if the **System Projects** filter is applied to the Projects activity.

---

Licensing for AVEVA Industrial Graphics is managed using the AVEVA Enterprise Licensing system, a common platform for AVEVA Enterprise Software product licenses. For more information, see [AVEVA™ Enterprise Licensing](#).

## Design an Industrial Graphics Application

Creating an application that displays in an Industrial Graphics Web Client involves the stages described below.

---

**Note:** If you would like to review the output of a design during development, you need to have an Industrial Graphics Server (connected to a System Management Server) installed locally on the development workstation. While this is suitable for the design process, it is recommended that you deploy the project to a dedicated Industrial Graphics Server for runtime operation.

---

### Project Setup

You can add Industrial Graphics to any new or existing Plant SCADA project. However, if you want to make use of the default set of Industrial Graphics symbols provided with Plant SCADA, you need to add the system project **IndustrialGraphics\_Include** as an included project.

The symbols contained in this project will then be available to embed within your Industrial Graphics pages and symbols.

### Design

1. Create the required pages and symbols. The pages you create can be used to host a set of symbols.
  - Pages are accessible via the **Pages** view in Plant SCADA Studio (see [Browse Industrial Graphics Pages in Plant SCADA Studio](#))
  - Symbols are accessible via the **Libraries** view Plant SCADA Studio (see [Browse Industrial Graphics Libraries in Plant SCADA Studio](#)).

From these views you can create and open items in the Industrial Graphics Editor. You can also create new Libraries to organize your symbols.

2. In the Industrial Graphics Editor, configure any animations so that they point to the required tags and equipment.items.
3. Configure the application **Menu**.

The **Visualization** activity can be used to build a hierarchical menu that an operator can use to access your Industrial Graphic pages in a client. See [Configure a Menu for Industrial Graphics Pages](#).

4. If required, you can modify the **Styles** used for elements, status animations and numeric values.

Styles define a set of visual properties for text, lines, graphic outlines, and interior fill. They allow you to establish consistent visual standards. They are defined in Plant SCADA Studio's **Standards** activity. See [Styles](#).

---

**Note:** It is recommended that you review the list of supported graphical elements and limitations before you start creating an application. See [Supported Graphical Elements and Known Limitations](#).

---

## Compile the Project

1. To build your Industrial Graphics application, compile the project.
2. Run the project to engage live I/O data.

## Iterative Development

To review your design on the development workstation (using a local Industrial Graphics Server) enter the following address in a browser:

- `https://localhost/aig`

Be aware, however, that the connected System Management Server may be configured to use a non-default port (see [Advanced Configuration for a System Management Server](#)). This changes the port the AIG server uses to listen, which means you need to include the current **HTTPS Port** setting in the address as follows:

- `https://localhost:<HTTPS Port value>/aig`

You can continue to build the application and test the output in the browser. However, you will need to recompile the project to view all changes, particularly if you have added or deleted embedded symbols.

## Deploy

1. Follow the normal [deployment](#) procedure to deliver a project version to the deployment client located on the Industrial Graphics Server.
2. To see live data, make sure your Plant SCADA I/O servers are running with your project.  
After the application is deployed, it will be available to any computer or device that can access the Industrial Graphics Server.

## View the Industrial Graphics Web Client in a Browser

Before you can view the Web Client in a browser, you need to consider the following:

- **Authentication** — does the current client user have appropriate access?

The person logging in to the Industrial Graphics application needs to be part of a domain group associated with the "Industrial Graphics Users" or "Industrial Graphics RW Users" security role. See [Secure the Industrial Graphics Web Client](#) for more information.

The Windows security group their account is a member of should also be assigned to a Role within the Plant SCADA project to allow authorization by the I/O server. See [Roles](#).

- **Licensing** — is the Industrial Graphics Server appropriately licensed?

If the Industrial Graphics Server cannot acquire a license, it will run in Single Session Mode. This provides access to a single user on a first-come-first-serve basis. However, if more users require access the server will need an available license. See [AVEVA™ Enterprise Licensing](#).

You can then point the browser to one of the following addresses:

- `http://<IPAddress>/aig`
- Or:
- `http://<NodeName>/aig`

Where `<IPAddress>` or `<NodeName>` corresponds to the computer where the application is deployed.

As with a development workstation, if the connected System Management Server is configured to use a non-default port (see [Advanced Configuration for a System Management Server](#)) you will need to include the current **HTTPS Port** setting in the address as follows:

- `https://<IPAddress:<HTTPS Port value>/aig`
- `https://<NodeName:<HTTPS Port value>/aig`

## See Also

[Use the Industrial Graphics Web Client](#)

[Enable Tag Writes for Industrial Graphics Applications](#)

## Enable Tag Writes for Industrial Graphics Applications

You can use an AVEVA™ Industrial Graphics application to write to variable tags in a Plant SCADA project. However, to restrict access to this functionality, it is not enabled by default.

To allow tag writes to occur from an Industrial Graphics client, there are three things you need to consider.

1. The "Industrial Graphics R/W Users" security role on the Industrial Graphics Server.

This security role is created locally by Plant SCADA when you install an Industrial Graphics Server on a computer. It is used to manage access for client application users that require read/write access to a Plant SCADA runtime system.

You need to confirm that users of an Industrial Graphics application are part of this group. See [Configure User Access for an Industrial Graphics Web Client](#).

2. Configuration of your variable tags.

Your variable tags need to be configured to support writes from one or more Plant SCADA roles.

To do this, you need to set the **Write Roles** property for each variable tag that will have writes enabled. The Property Grid allows you to select one of the roles configured in your Plant SCADA project, or you can manually enter a comma-separated list to include multiple roles. See [Add a Variable Tag](#).

---

**Note:** Plant SCADA runtime does not support online changes for variables, which means any changes you make to the Write Roles setting for a variable tag will not be implemented until you restart the I/O server.

3. The roles in your Plant SCADA project.

The user that is currently logged in to the Industrial Graphics application needs to be part of a Windows™ domain group that is associated with the role specified in the **Write Roles** property.

For more information on how to associate a Windows domain group with a **role**, see [Integrate Windows™ User Groups](#).

To cover the requirements of points 1 and 3, it is recommended that you establish a Windows domain group for any Industrial Graphics users that require write access to your runtime system. You can then associate this group with the relevant role in your Plant SCADA project, and with the **Industrial Graphics R/W Users** security role on the Industrial Graphics Server.

**Note:** If you have renamed any Roles in your project, you should also restart the I/O server to synchronize the changes at runtime, particularly if you use the Cicode function [UserUpdateRecord](#) to recompile a local project configuration.

## **WARNING**

### **UNINTENDED EQUIPMENT OPERATION**

The status of write operations is not reflected by the status element or quality styles applied to elements. Design your pages so that an operator can determine if a value they have selected/entered has been set or rejected by displaying the current value.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

## **WARNING**

### **UNINTENDED EQUIPMENT OPERATION**

A computer that hosts an Industrial Graphics Server must be configured to use an English regional locale. This ensures that any values with unit separators are interpreted correctly when entered by an operator.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

**Note:** When a write occurs for a tag that is a byte data type, you need to confirm that the value is within the range 0-255, otherwise an incorrect value may be written to the tag. It is recommended you use range checking to avoid an unexpected value being written to a tags that are a byte data type.

## **See Also**

[Design an Industrial Graphics Application](#)

[Use the Industrial Graphics Web Client](#)

## **Create Industrial Graphics**

Industrial Graphics are graphics you can create to visualize data in an HMI/SCADA system.

The Industrial Graphic Editor is used to create Industrial Graphics from basic elements, such as rectangles, lines, and text elements. You can also use the Industrial Graphic Editor to embed and configure an Industrial Graphic from the Graphic Toolbox library of graphics.

After you create an Industrial Graphic, you can embed it into another graphic or an HMI system window and use it at run time.

You can embed an Industrial Graphic in a template or instance of an object providing several ways to visualize object-specific information quickly and easily. Embedding a graphic in a template means that you can update one graphic and cascade the changes throughout your application.

Depending on your development requirements, you can select where and how to store industrial graphics.

- Create and store graphics as a standard set that you can re-use, such as a generic valve graphic.
- Store graphics as templates if you want to use the graphics in multiple instances at run time.
- Store graphics for use in a specific application.

## In This Chapter

[The Industrial Graphic Editor](#)

[Embedding Graphics](#)

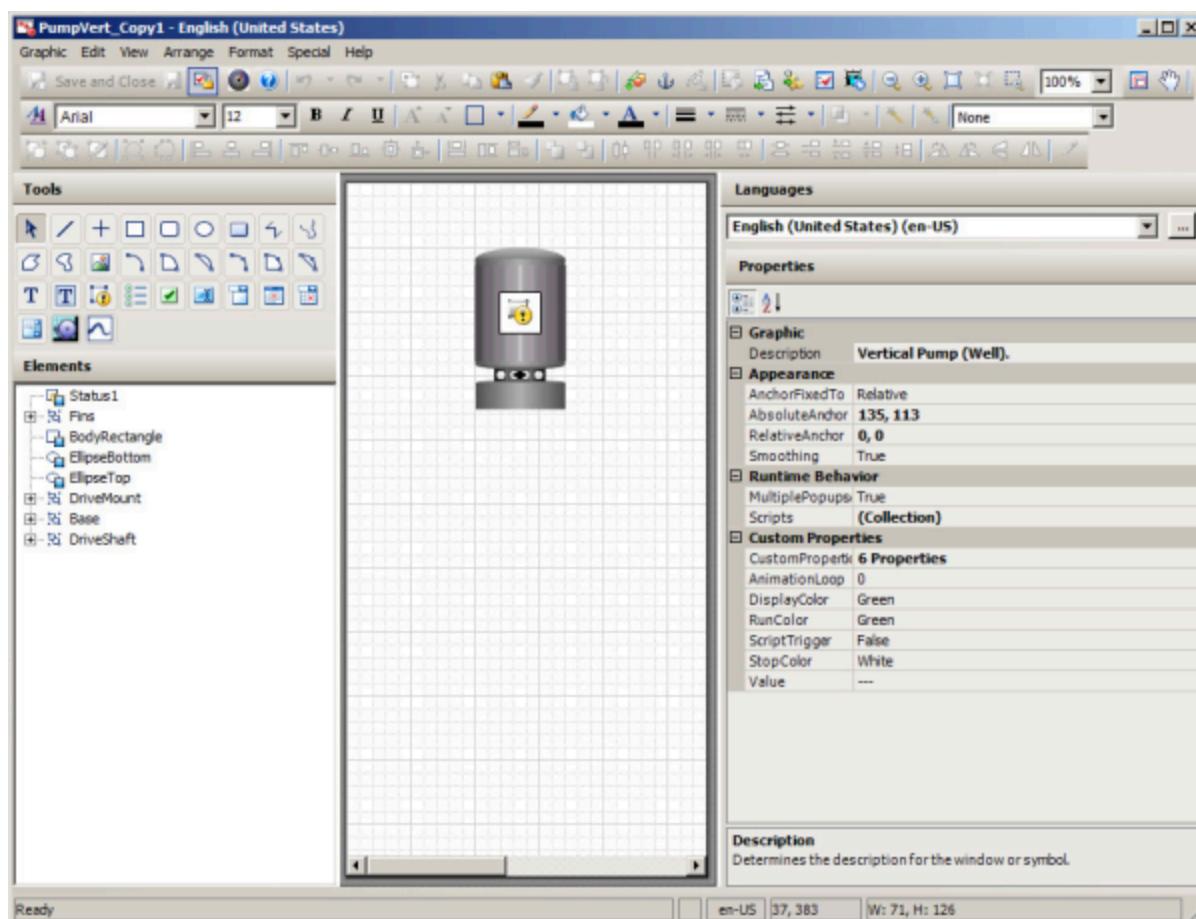

## The Industrial Graphic Editor

The Industrial Graphic Editor allows you to create an Industrial Graphic. It also allows you to open an existing graphic created in your HMI/SCADA software for editing.

To create an Industrial Graphic in the editor, select a basic graphical object, called an element, from the Tools panel and place it on the drawing area, called the canvas. Typical elements are lines, rectangles, ellipses, curves, and so on.

Then, change the appearance of drawn elements by accessing their properties directly or by graphically manipulating them. You can also change the appearance of an embedded Industrial Graphic by configuring the associated custom properties. Finally, you can configure animations for the elements or the graphics.

After you open the Industrial Graphic Editor, you will see the various tools and palettes to create and customize graphics.

The Industrial Graphic Editor includes the following areas:

- **Tools Panel:** A collection of elements you use to create your graphic.
- **Canvas:** The area in which you place and edit elements to create a graphic.
- **Elements List:** List that displays named elements on the canvas in a hierarchical view.
- **Language Selector:** List that displays the configured languages for the graphic. For more information, see .
- **Properties Editor:** Shows the properties belonging to one or more currently selected elements.
- **Animation Summary:** Area that shows you a list of animations belonging to the currently selected element. It is only visible if an element is selected.
- **Symbol Wizard Editor:** The Symbol Wizard Editor is a feature of the Industrial Graphic Editor to create graphics containing multiple visual and functional configurations called Symbol Wizards. For more information, see [Creating Multiple Configurations of a Graphic](#).

**Note:** The Industrial Graphics Editor (and its associated Styles and Languages dialogs) are only available in English, French, German, Simplified Chinese and Japanese.

## Tools Panel

The Tools panel contains elements you can select to create your graphic on the canvas.

The Tools panel includes:

- Basic objects, such as lines, rectangles, polygons, arcs, and so on.
- A pointer tool to select and move elements on the canvas.
- Windows controls, such as combo boxes, calendar controls, radio button groups, and so on.
- A status element that you can use to show quality and status of a selected equipment.item.

For more conceptual information, see [Elements](#).

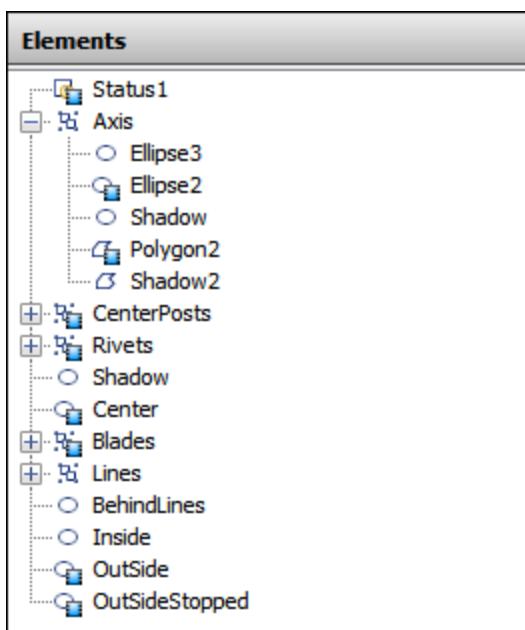

For more information on how to use elements, see [Working with Graphic Elements](#).

## Related Topics

[The Industrial Graphic Editor](#)

## Elements List

The Elements List is a list of all elements on the canvas.

The Elements List is particularly useful for selecting one or more elements that are visually hidden by other elements on the canvas. Use the Elements List to:

- See a list of all elements, groups of elements, and embedded graphics on the canvas.
- Select elements or groups of elements to work with them.
- Rename an element or a group of elements.

---

**Caution:** If you rename an element or a group, the animation references to it do not automatically update. You must manually change all animation links referencing the old name. For more information, see [Substituting References in Elements](#).

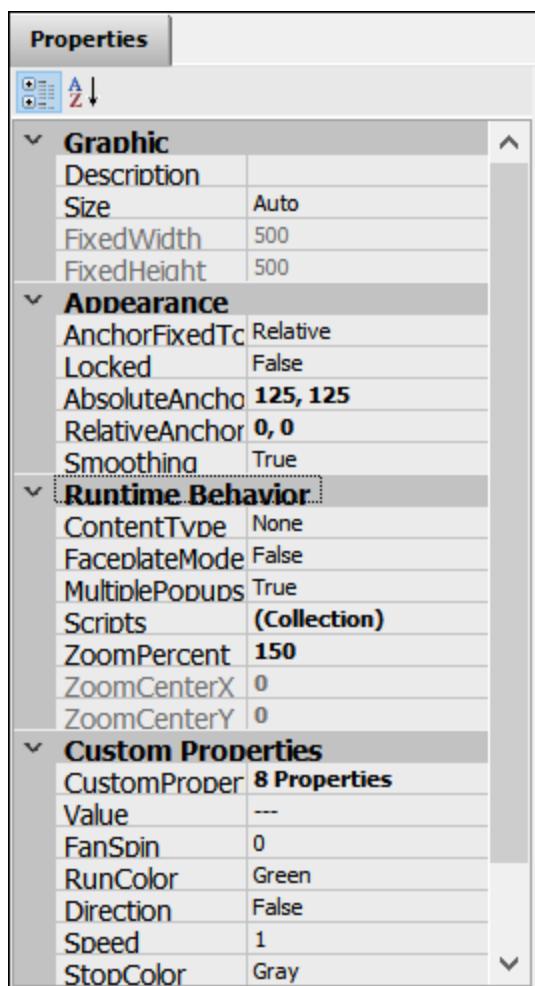

---

Use the Properties Editor to view and set properties for the selected element or group of elements.

For more conceptual information about element properties, see [Properties](#).

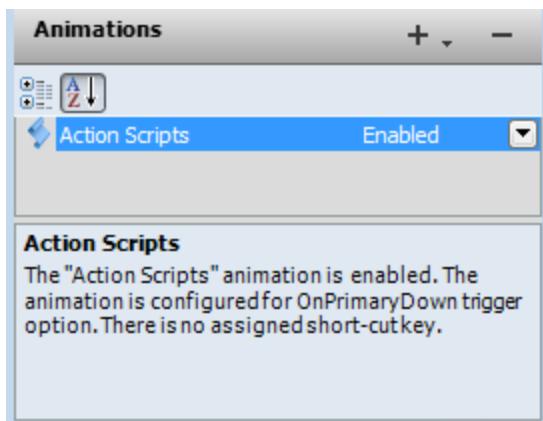

For more information on how to use element properties, see [Editing Common Properties of Elements and Graphics](#).

## Related Topics

[The Industrial Graphic Editor](#)

## Animations Summary

Use the Animations summary to review, select, and configure the animation behavior of a selected element.

For an overview of the different animation types, see [Animation Types](#).

For more information on how to use the animations, see [Animating Graphic Elements](#).

## Related Topics

[The Industrial Graphic Editor](#)

## Canvas

The canvas is your drawing area. Use it like any image editing software by drawing elements and changing them to suit your requirements.

## Related Topics

[The Industrial Graphic Editor](#)

## Elements

You use elements to create a graphic. The Industrial Graphic Editor provides the following:

- Basic elements such as lines, rectangles, ellipses, arcs, and so on
- Status element to show a quality status icon
- Windows controls, such as combo boxes, calendar controls, radio button groups, and so on

You can create the following from existing elements on the canvas:

- Groups
- Path graphics

You can embed the following on the canvas:

- Imported Client Controls.

## Related Topics

[The Industrial Graphic Editor](#)

[Basic Elements](#)

[Status Element](#)

[Windows Common Controls](#)

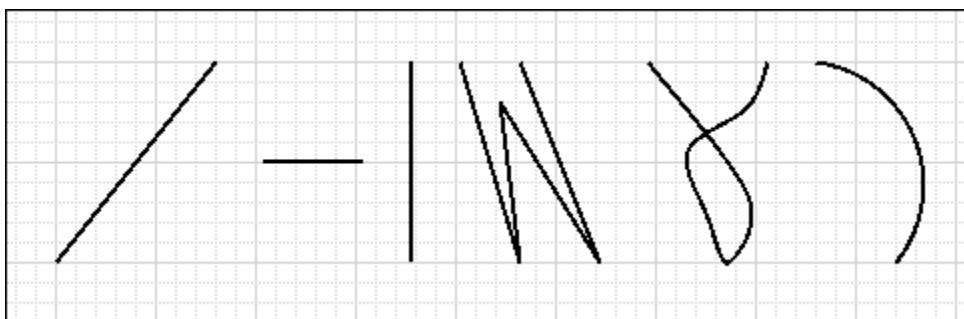

[Groups](#)

[Path Graphics](#)

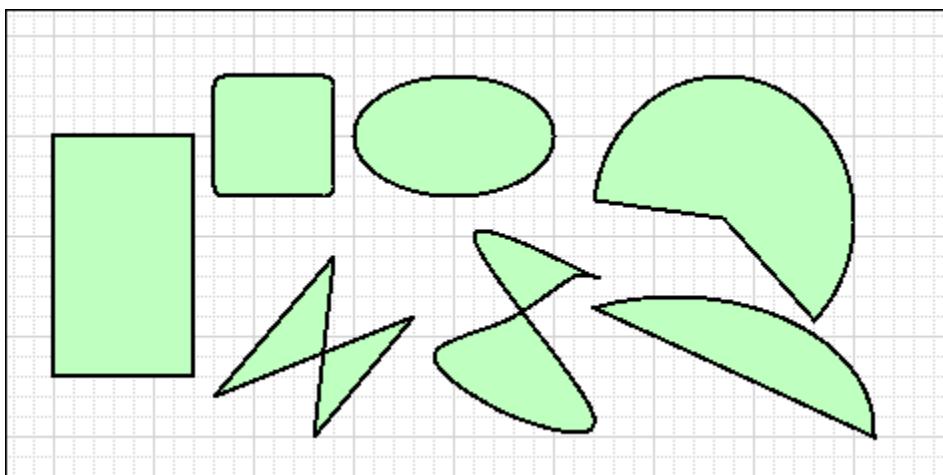

## Basic Elements

You can use the following basic elements to create a graphic:

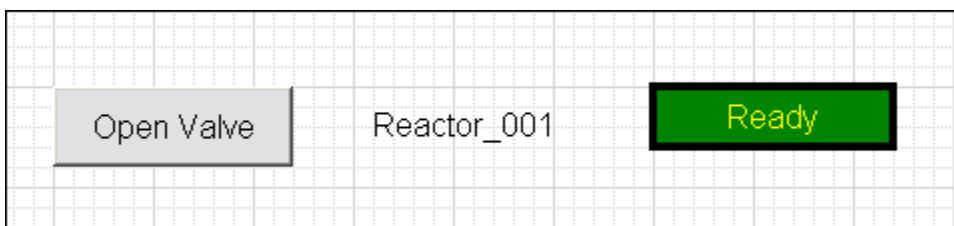

- Open elements, such as lines, H/V lines, polylines, curves, and arcs.

- Closed elements, such as rectangle, rounded rectangle, ellipse, polygon, closed curve, pie, and chord. You can draw arcs, pies, and chords from two points or from three points.

- Text elements, such as buttons, text, and text boxes.

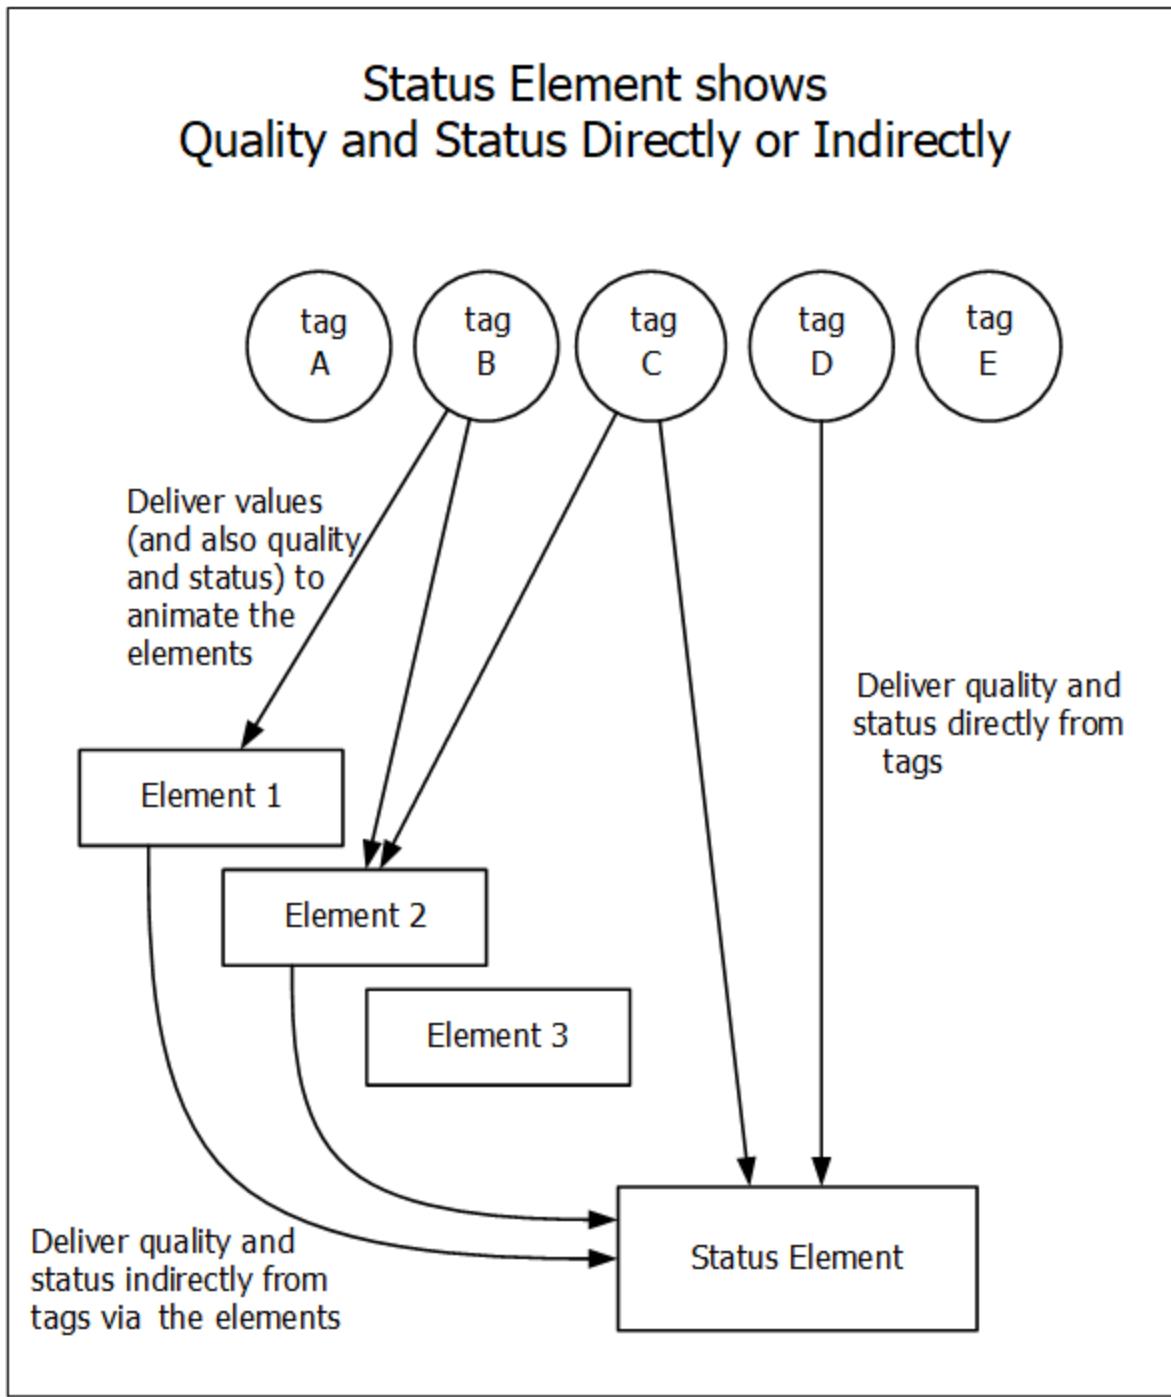

## Related Topics

[Elements](#)

### Status Element

The status element provides a graphical representation of the communications status of an equipment.item or a tag, and the data quality of the equipment.item or tag's value. Use the status element to monitor and indicate communications status and data quality of:

- All equipment.items or tags used in one or more specified animated elements at the same hierarchical level.
- One or more specified equipment.items or tags.

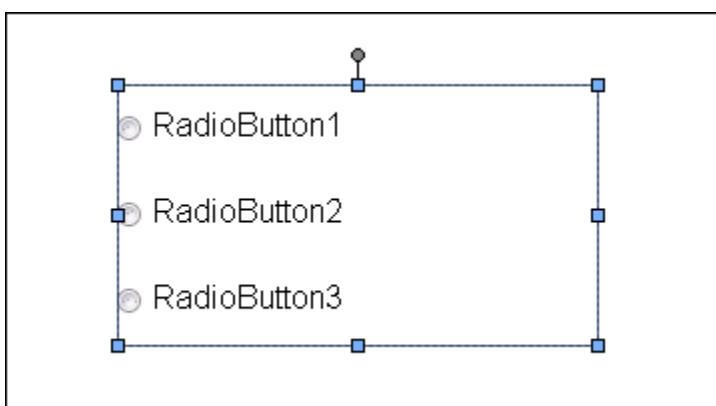

## Related Topics

[Elements](#)

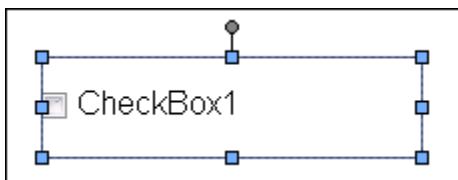

## Windows Common Controls

Using Windows common controls, you can add extended user interaction to your graphic. You can use:

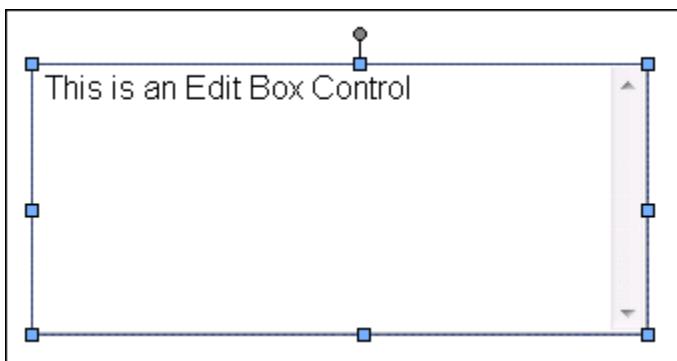

- A radio button group to select an option from a mutually exclusive group of options.

- A check box to add a selectable option.

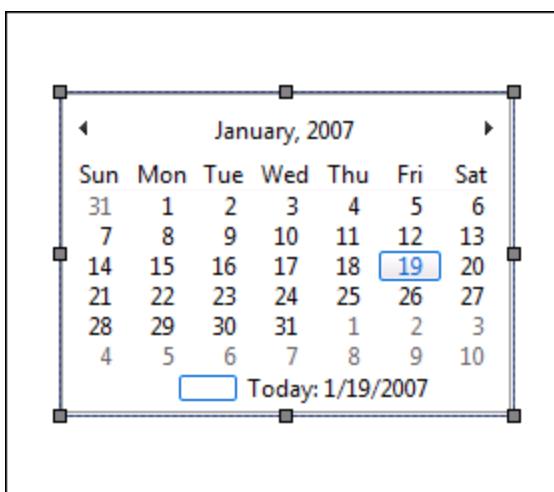

- An edit box to add an entry box for text.

- A combo box to select an option from a drop-down list.

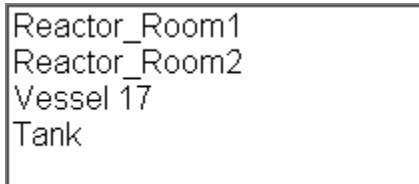

- A calendar to use a date selection control.

- A date and time picker to select a date and time in a compact format.

- A list box to select one or more options from a list.

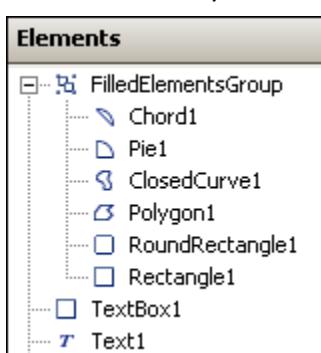

## Related Topics

[Elements](#)

## Groups

Grouping enables you to combine elements as a unit. Groups can contain elements and other groups.

Groups are shown in the Elements List with a default name, such as Group1. They are shown as a branch in the element hierarchy.

For example, you can create a series of elements that model a valve in your facility. When the valve has all the properties and animations you want, you can group the elements together.

You can then work with the elements as one set of elements or, by selecting the elements in the Elements List,

you can work with the individual elements in the group without having to break the group. This is called inline editing.

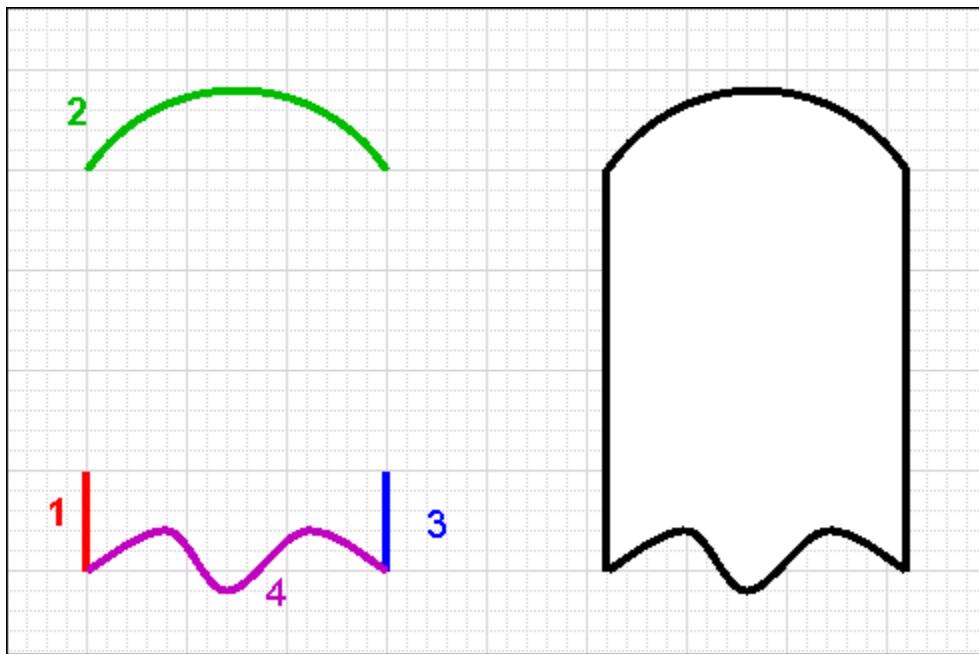

Another advantage of inline editing is that you can easily select an individual element graphically without having to know its element name.

## Related Topics

[Elements](#)

## Path Graphics

Path graphics are elements that combine selected open elements, such as lines, H/V lines, polylines, curves, and arcs, into a single closed graphic element.

A path graphic depends on the:

- Order in which you drew the elements. Each element is linked to the next element by z-order. The z-order of the elements is the order shown in the Elements List.
- Direction in which you drew its elements. The ending point of one element is connected to the starting point of the next element.

The properties of the elements contained within a path graphic are retained. When you break a path graphic, the elements it contains appear as they did before you created the path graphic.

A path graphic has the same properties as a rectangle, ellipse, or polygon. These properties are lost when you break the path.

## Related Topics

[Elements](#)

## Properties

Properties determine the appearance and behavior of an element or the graphic. For example, the width property determines the width in pixels of the selected element.

There are two types of properties:

- Predefined properties
- Custom properties

## Related Topics

[The Industrial Graphic Editor](#)

[Predefined Properties](#)

[Custom Properties](#)

[Properties of Groups](#)

### Predefined Properties

Properties are specific to the selected element and can vary between elements of different types. All elements have the following property categories:

- Graphic - the name of the element (or group)
- Appearance - element dimension, location, rotation, transparency, and locked status

You can view specific properties for a specific kind of element or group by clicking a drawing tool and drawing an element.

You set properties at design time. Some properties can be read or written to at run time, such as X, Y, Width, Height, Visible, and so on. The element type determines which properties are available and can be read or written at run time.

## Related Topics

[Properties](#)

### Custom Properties

Use custom properties to extend the functionality of a graphic. A custom property can contain:

- A value that can be read and written to.
- An expression that can be read.
- An object equipment.item that can be read and written to if the equipment.item allows being written to.
- A property of an element or graphic.
- A custom property of a graphic.
- A reference to a tag.

For example, for a tank graphic called TankSym you can create a custom property called TankLevel that is calculated from an equipment.item reference to Tank\_001.PV. You can then reference the tank level by TankSym.TankLevel.

Custom properties appear in the Properties Editor when no elements are selected. You can edit default initial values of custom properties in the editor directly or use the **Edit Custom Properties** dialog box to do so.

For more information, see [Using Custom Properties](#).

## Related Topics

[Properties](#)

### Properties of Groups

Groups have their own properties you can view and set in the Properties Editor. For most properties, changing group properties indirectly affects the properties of its contained elements.

You can change the following group properties:

- Name (Name)
- Position (X, Y)
- Size (Width, Height)
- Orientation (Angle)
- Point of Origin (AbsoluteOrigin, RelativeOrigin)
- Transparency (Transparency)
- Locked (Locked)
- Enablement (Enabled)
- Tab Order (TabOrder)
- Tab Stop (TabStop)
- Single Object Treatment (TreatAsIcon)
- Visibility (Visible)

## Related Topics

[Properties](#)

[Changing/Renaming a Group Name](#)

[Changing the Position of a Group](#)

[Changing the Size of a Group](#)

[Changing the Orientation of a Group](#)

[Locking the Group](#)

[Run-Time Properties of a Group](#)

[Renaming a Group or its Elements](#)

# Changing/Renaming a Group Name

If you change the group name, it has no affect on the contained elements. The contained elements keep their name.

If you rename an element or a group, the animation references to it are not automatically updated. You must manually change all animation links referencing the old name. For more information, see [Substituting References in Elements](#).

## Related Topics

[Properties of Groups](#)

# Changing the Position of a Group

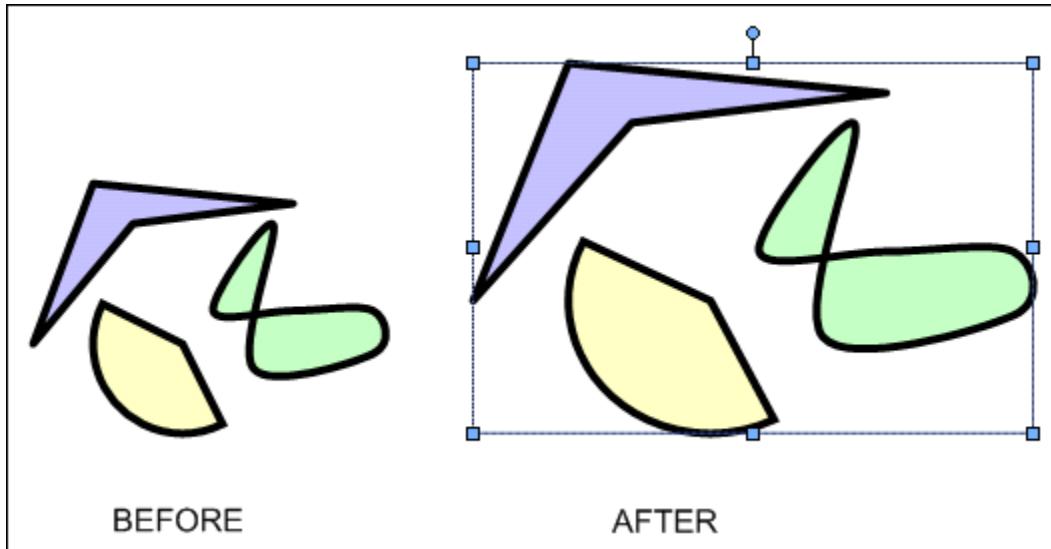

If you change the position of the group, all contained objects are moved with the group. They maintain the relative position to each other, but their absolute positions change.

## Related Topics

[Properties of Groups](#)

# Changing the Size of a Group

If you change the size of the group, all contained objects are resized proportionally.

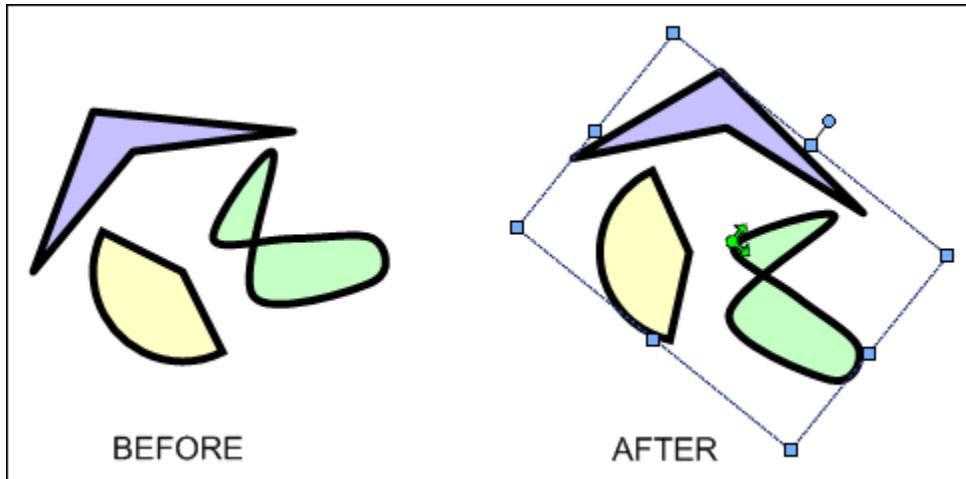

## Related Topics

[Properties of Groups](#)

# Changing the Orientation of a Group

If you change the angle of the group, all contained objects are rotated with the group around the origin of the group, so that the group remains visually intact.

## Related Topics

[Properties of Groups](#)

# Changing the Transparency of a Group

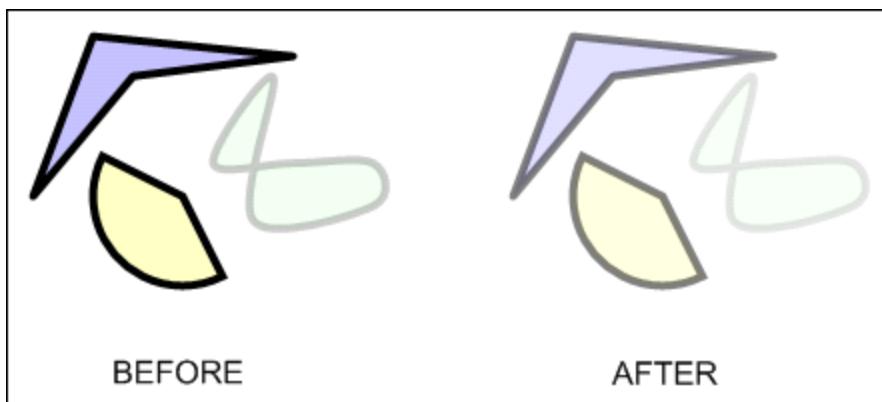

If you increase the transparency of the group, all contained objects appear more transparent, but their own transparency property values do not change. If you change their transparency values, it is in relation to the transparency level of the group.

For example, if you add an element with 80 percent transparency to a group, and then apply 50 percent transparency to the group, the element appears to have 90 percent transparency.

This is calculated as follows:

$$1 - (1 - 0.8) * (1 - 0.5) = 0.9$$

The transparency property values, however, stay unchanged at 80 percent for the element and 50 percent for the group.

## Related Topics

[Properties of Groups](#)

## Locking the Group

If you lock the group, it has no effect on the contained elements. You can still edit the contained elements in inline editing mode. You cannot move, resize, or rotate the group.

## Related Topics

[Properties of Groups](#)

## Run-Time Properties of a Group

If you change the run-time properties of a group, the elements do not inherit the property value of the group, but they do inherit the behavior of the group.

For example, if you create a group from elements, some of which have their visibility set to true and some to false, then set the group visibility to false, ALL elements in that group are invisible.

However the Visible property values of the contained elements still maintain their original values (true or false).

## Related Topics

[Properties of Groups](#)

## Renaming a Group or its Elements

If you rename an element or a group, the animation references to it are not automatically updated. You must manually change all animation links referencing the old name. For more information, see [Substituting References in Elements](#).

## Related Topics

[Properties of Groups](#)

## Animations

You can use animations to bind the run-time behavior and appearance of elements to equipment.items and tags, custom properties, and other element's properties.

For example, you can bind the vertical fill of a rectangle to a tag or equipment.item that contains the current level of a tank.

Animations are specific to the selected element and vary between elements of different types.

## Related Topics

[The Industrial Graphic Editor](#)

[Animation Types](#)

[Data Sources for Animations](#)

[Animation Capabilities of Groups](#)

[Animation States](#)

## Animation Types

There are two types of animations:

- Visualization animations determine the element's appearance, such as blinking, fill style, percent fill horizontal, value display, and so on.
- Interaction animations determine the element's behavior, such as horizontal sliders, user input, and so on.

There are visualization and interaction animations that are specific to certain elements. For example, the DataStatus animation is specific to the Status element. Element-specific animations also determine element behavior and appearance.

You can configure the following common animation types:

Animation Type	Description
Visibility	Shows or hides the element depending on a value or an expression.
Fill Style	Specifies the interior fill style depending on a discrete or analog expression or one or more conditions.
Line Style	Specifies the style and pattern of the element line depending on a discrete or analog expression or one or more conditions.
Text Style	Specifies the style of the element text depending on a

<b>Animation Type</b>	<b>Description</b>
	discrete or analog expression or one or more conditions.
<b>Blink</b>	Sets the element to blink invisibly or with specified colors depending on a discrete value or expression.
<b>Element Style</b>	Defines a set of visual properties that determine the appearance of text, lines, graphic outlines, and interior fill shown in Industrial graphics.
<b>% Fill Horizontal</b>	Fills the element with color partially from left to right or vice versa, depending on an analog value or expression.
<b>% Fill Vertical</b>	Fills the element with color partially from top to bottom or vice versa, depending on an analog value or expression.
<b>Location Horizontal</b>	Positions the element with a horizontal offset depending on an analog value or expression.
<b>Location Vertical</b>	Positions the element with a vertical offset depending on an analog value or expression.
<b>Width</b>	Increases or decreases the element width depending on an analog value or expression.
<b>Height</b>	Increases or decreases the element height depending on an analog value or expression.
<b>Point</b>	Changes the X and Y coordinate values of one or more selected points on a graphic or graphic element.
<b>Orientation</b>	Rotates the element by an angle around its center point or any other point depending on an analog value or expression.
<b>Value Display</b>	Shows a discrete, analog, string value, time value, name or expression.
<b>Tooltip</b>	Shows a value or expression as a tooltip when the mouse is moved over the element.
<b>Disable</b>	Disables the element's animation depending on a Boolean value or expression.
<b>User Input</b>	Enables the run-time user to type a Boolean, analog, string, time or elapsed time value that is then assigned to an equipment.item.

Animation Type	Description
<b>Slider Horizontal</b>	Enables the run-time user to drag the element left or right and write back the offset to an analog equipment.item.
<b>Slider Vertical</b>	Enables the run-time user to drag the element up or down and write back the offset to an analog equipment.item.
<b>Pushbutton</b>	Writes predetermined values to Boolean or analog references when the user clicks on the element.
<b>Action Scripts</b>	Runs an action script when the run-time user clicks on the element.
<b>Show Symbol</b>	Shows a specified graphic at a specified position when the run-time user clicks on the element.
<b>Hide Symbol</b>	Hides a specified graphic when the run-time user clicks on the element.

## Related Topics

[Animations](#)

### Data Sources for Animations

The data used for animations can come from various sources. You can configure the animation to point at these sources. Animation data can come from:

- Tag values.
- Tag extensions.
- Equipment and equipment.items.
- Predefined properties of an element or graphic.
- Custom properties of a graphic.

---

**Note:** Arrays are not supported.

---

When entering an expression or reference for an animation, text auto-complete is supported.

For the top level entries, suggestions will include up to 10000 items from the full list of clusters, top-level equipment, variable tags and alarm tags (presented as a combined list). Each subsequent level is defined by a entering a period (.). The suggested list is filtered based on what you type.

## Related Topics

[Animations](#)

## Animation Capabilities of Groups

By default, a group of elements has limited animation capabilities of its own. For a group you can configure the following animations:

- Blinking
- Enabling/disabling
- Vertical and horizontal location
- Orientation
- Height and width
- Visibility

However, you can set the TreatAsIcon property value to True. The group is then treated as a single object and you can configure more animations. These animations take precedence over animations defined for the elements within the group.

## Related Topics

[Animations](#)

## Animation States

Some animations have multiple configuration panels.

A state selection panel appears, where you can select the animation state. Depending on what you select, the configuration panel is populated differently. The animation state can be a:

- Data type, where the animation is tied to a specific data type.
- Truth table, where the animation is tied to a set of Boolean conditions.

## Related Topics

[Animations](#)

[Data Type Animation State](#)

[Truth Table Animation State](#)

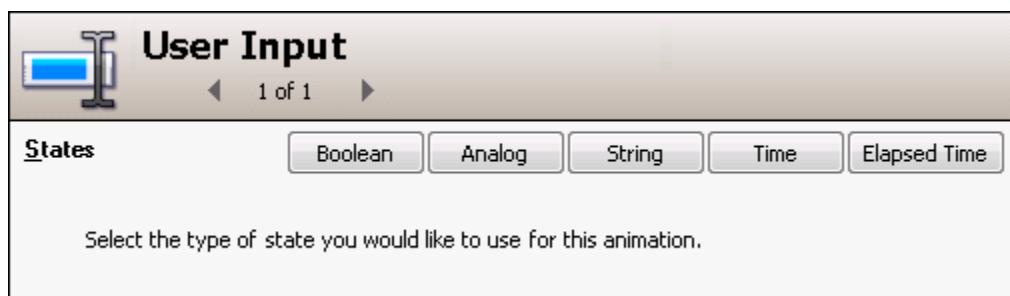

# Data Type Animation State

Certain animations support configuration of one or more data types. In the configuration panel of an animation, select the data type you want to configure, such as:

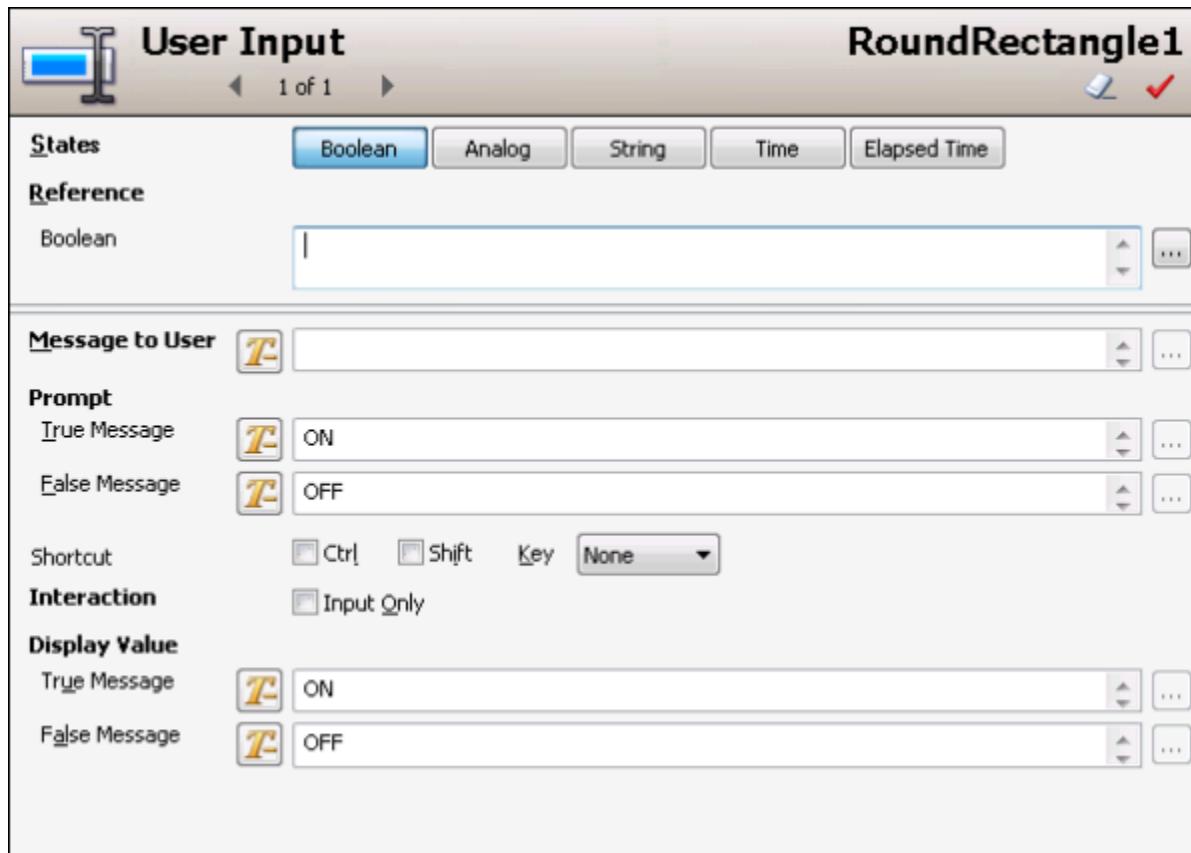

- Boolean
- Analog
- String

- Time
- Elapsed Time
- Name

For example, if you select the **User Input** animation link, the **User Input** state selection page appears on the right in the **Edit Animations** dialog box.

A configuration panel appears below the **States** buttons. For example, a configuration panel that is specific to the user input of a Boolean value.

## Related Topics

[Animation States](#)

# Truth Table Animation State

Certain animations support the configuration of a truth table. The truth table is a collection of up to 100 Boolean conditions you can configure to determine the output.

You can configure the default appearance for the case that none of the conditions are fulfilled.

The conditions are evaluated from top to bottom of the list. When the first true condition is met, its assigned appearance is the one used and the condition evaluation stops.

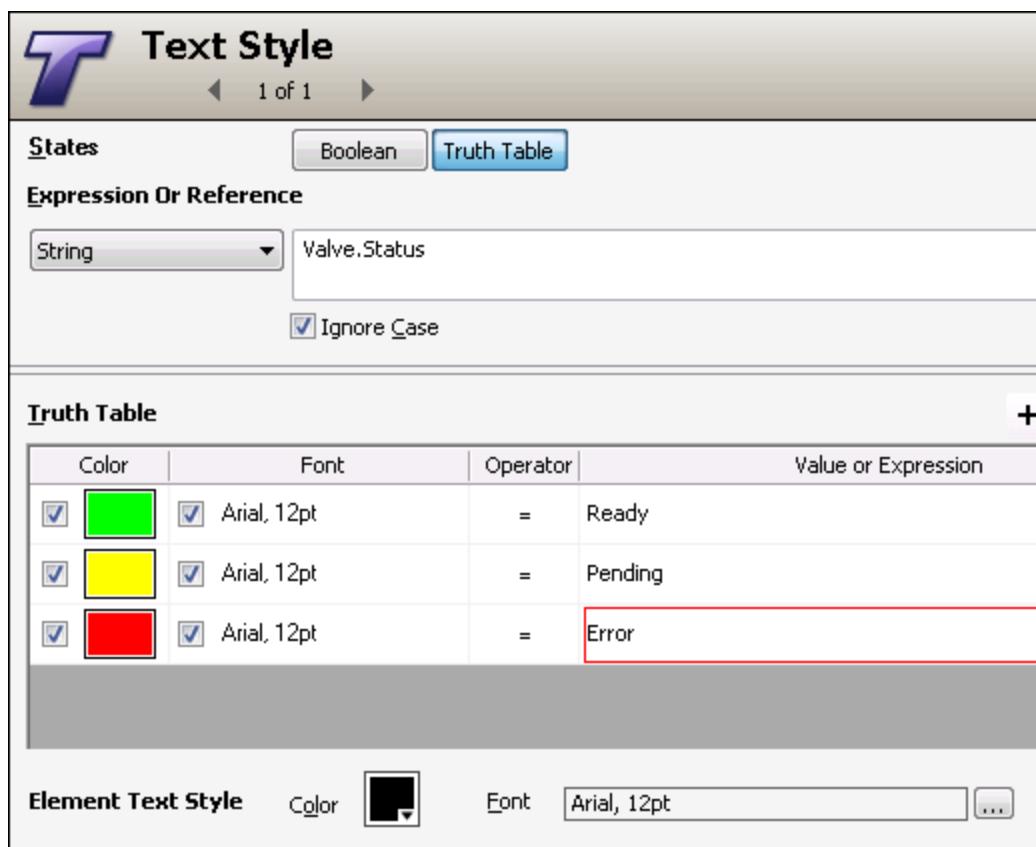

For example, you want a text animation to use a different text color depending on the value of a string equipment.item, such as a status indicator.

Status indicator	Text color
Ready	Green
Pending	Yellow
Error	Red

If you select the **Text Style** animation link, the **Text Style** state selection page appears on the **Edit Animations** dialog box.

You can click the **Truth Table** button to configure conditions for the appearance of the text style.

By default the text color is black if none of the conditions are fulfilled at run time.

## Related Topics

[Animation States](#)

## Embedding Graphics

You can embed graphics into other graphics. Embedding graphics enables you to rapidly develop more complex graphics with common components.

For example, you can create a single tank graphic, then embed it multiple times in another graphic to create a graphic representing a collection of tanks.

There is no limit to the number of levels of embedding.

Embedded graphics appear in the Elements List. The default name is the same as the source graphic, followed by a numeric sequence.

## Related Topics

[Appearance of Embedded Graphics](#)

[Size Propagation and Anchor Points](#)

[Embedding Graphics within Graphics](#)

## Appearance of Embedded Graphics

Embedded graphics appear in the Elements List. The default name is the same as the source graphic, followed by a numeric sequence.

## Related Topics

[Embedding Graphics](#)

## Size Propagation and Anchor Points

An anchor point controls how changes in graphic size are propagated to embedded instances. By default, the anchor point of the graphic is the center point of all elements on the canvas.

This can be done graphically on the canvas, or by setting anchor position properties in the Properties Editor.

There are two types of anchors:

- Use the `AbsoluteAnchor` property to specify its position as absolute coordinates.
- Use the `RelativeAnchor` property to specify its position as coordinates relative to the graphic center.

When you embed a graphic, the embedded graphic inherits the anchor point in relation to its own center point.

You can also set the `AnchorFixedTo` property. When you make changes to the graphic that affects its size, the `AnchorFixedTo` property determines if the absolute position or relative position of the anchor point is recalculated. This property can have following values:

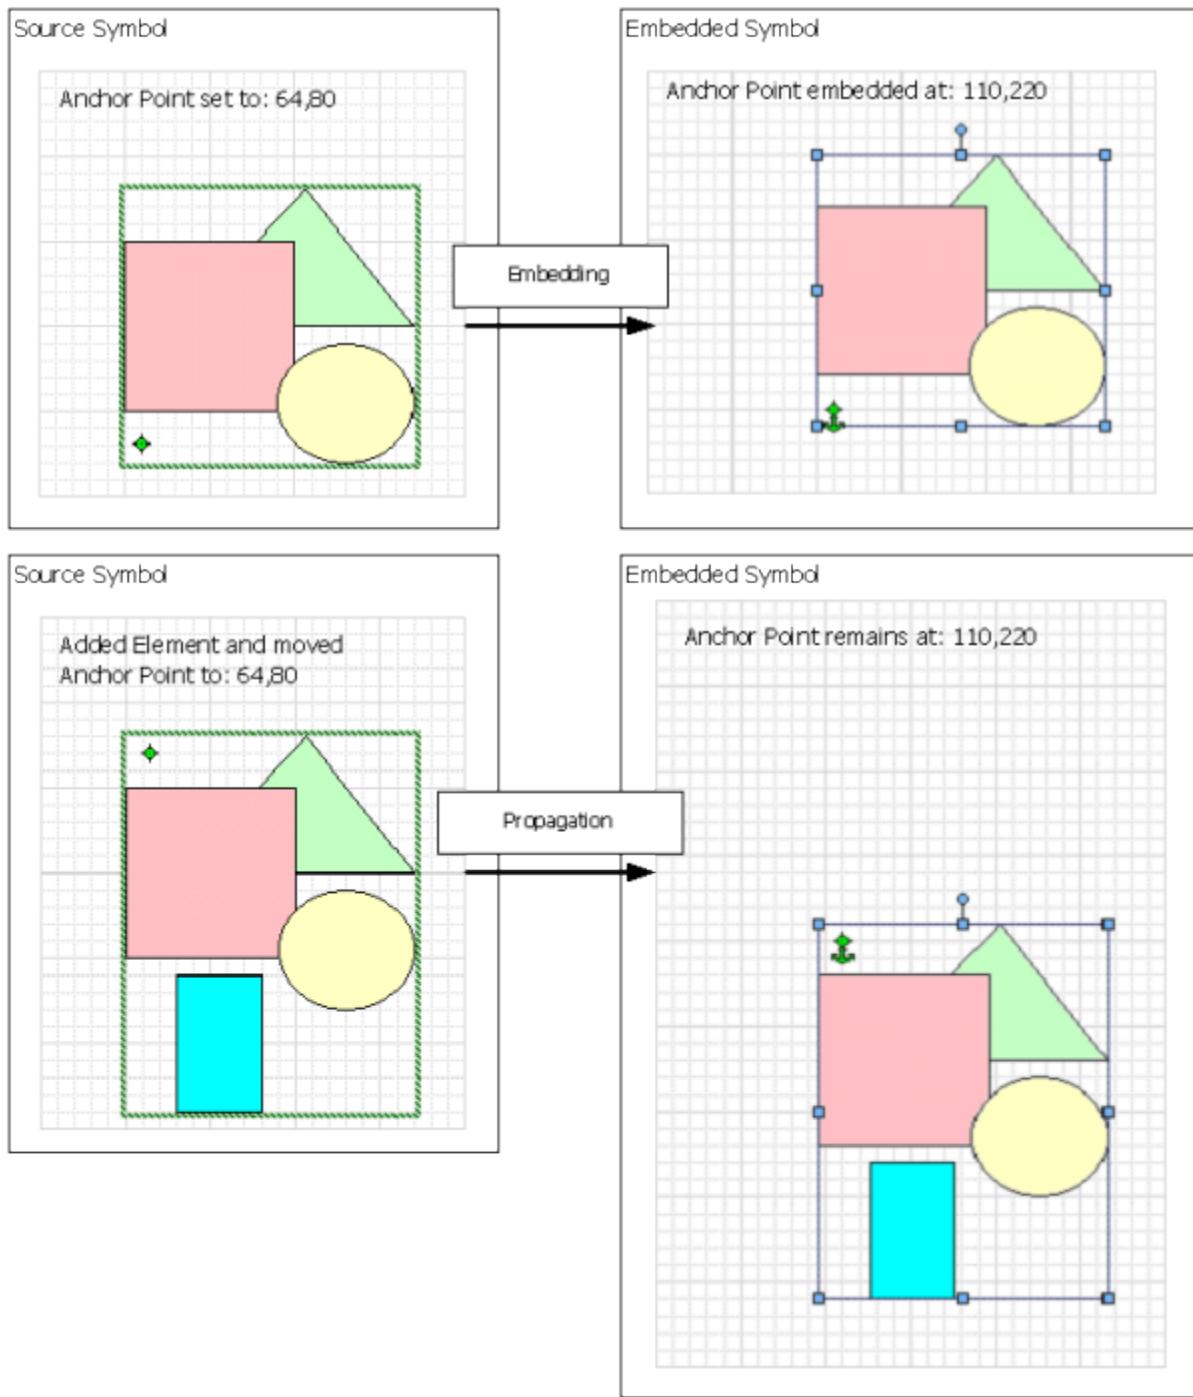

- **Absolute:** The absolute anchor point position is unchanged, and the relative anchor point position is recalculated.
- **Relative:** The absolute anchor point position is recalculated, and the relative anchor point position is unchanged.

---

**Note:** When you change the `AbsoluteAnchor` property, the `AnchorFixedTo` property is set to the value `Absolute`. When you change the `RelativeAnchor` property, the `AnchorFixedTo` property is set to the value `Relative`.

---

You can change the position of the anchor point of the graphic. This affects the position of the embedded instances. The anchor points of the embedded instances, however, remain unchanged.

**Note:** You can change the anchor point of an embedded graphic. This moves the embedded graphic. It does not change the anchor point position in relation to the graphic. You can resize or rotate the embedded graphic. The anchor point moves in relation to the embedded graphic. You can also use the AnchorPoint property in the Properties Editor to change the position.

## Creating Multiple Configurations of a Graphic

The Symbol Wizard Editor is a feature of the Industrial Graphic Editor to create multiple configurations of a graphic. A graphic configuration represents different visual or functional variations of a graphic.

Graphic configurations are created using layers containing associated graphic elements, custom properties, and named scripts. Based on graphic properties and possible values of these properties, rules are applied that specify when a layer is part of a graphic configuration.

### Related Topics

[Understanding Visual and Functional Graphic Configurations](#)

### Understanding Visual and Functional Graphic Configurations

Standard Industrial Graphics show reasonably realistic views of process objects. These graphics can be modified with the Symbol Wizard to incorporate multiple visual configurations in a graphic.

You can also use Symbol Wizards to create functional properties.

### Related Topics

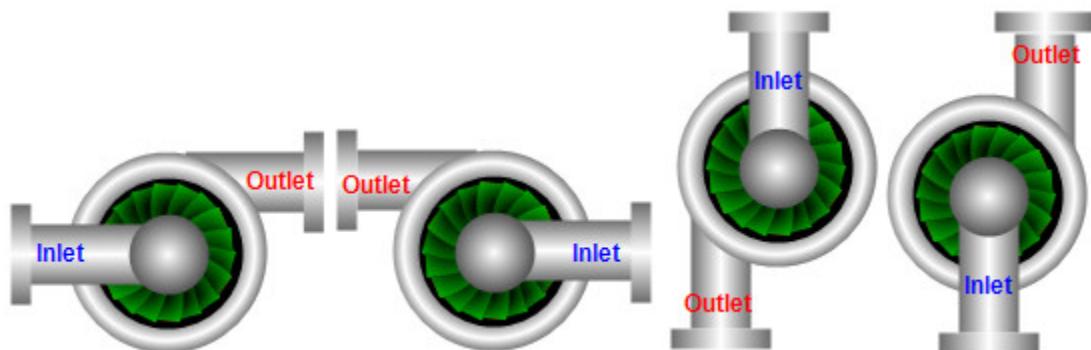

[Creating Multiple Configurations of a Graphic](#)

[Visual Graphic Configurations](#)

[Functional Graphic Configurations](#)

### Visual Graphic Configurations

Using an example of a centrifugal pump with separate inlet and outlet pipes, there are four practical visual configurations. The pump's blade housing is common and appears in all possible configurations. But, the pump's inlet and outlet pipes can be placed at the left or right in a horizontal direction or at the top or bottom when the pump is oriented vertically.

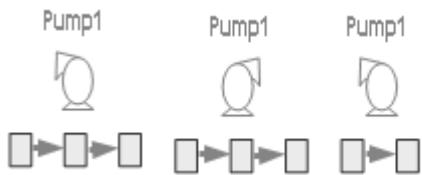

Orientation is the visual property that identifies the different configurations of a pump graphic. The equipment.items associated with the Orientation property are left, right, top, and bottom.

## Related Topics

[Understanding Visual and Functional Graphic Configurations](#)

### Functional Graphic Configurations

You can also use Symbol Wizards to create functional properties. For example, a multi-stage pump symbol could be built with a Wizard Option to select either a five-stage, three-stage, or single stage pump in addition to a visual Orientation property to select left or right pump configurations.

### In This Chapter

[Showing, Hiding and Adjusting Panels](#)

[Panning and Zooming the Canvas](#)

[Configuring Designer Preferences](#)

[Using the Symbol Wizard Editor](#)

### Showing, Hiding and Adjusting Panels

You can edit graphics using the Industrial Graphic Editor. Depending on where the graphic is contained, you can start the Industrial Graphic Editor from your HMI/SCADA software:

You can:

- Show and hide Industrial Graphic Editor panels to allocate more space on the canvas.
- Pan and zoom the canvas to make finer or more granular adjustments to elements.
- Place a grid on the canvas surface to align elements more precisely.

You can hide the Properties Editor and Animation Summary to allocate more space on the canvas.

### To show or hide the Properties Editor and Animation Summary panels

- Do either of the following:
  - Press ALT + ENTER.
  - On the **View** menu, click **Properties**.

You can also adjust the size of the Elements List and Properties Editor.

### To adjust the size of panels

1. Drag the dividing line between the panels to specify the new panel size.
2. Release the mouse button and the panels are resized.

## Related Topics

[Using the Industrial Graphic Editor](#)

## Panning and Zooming the Canvas

You can pan and zoom the canvas to make finer visual adjustments to the elements or to get a better overview of a large graphic.

Use the Pan and Zoom toolbar to pan and zoom.

# Using the Pan and Zoom Window to Pan

Use the **Pan and Zoom** window to pan the canvas area.

### To use the Pan and Zoom window for panning

1. On the Pan and Zoom toolbar, click the **Pan and Zoom** window icon. The **Pan and Zoom** window appears.
2. In the **Pan and Zoom** window, move the mouse within the red rectangle. The pointer hand icon appears.
3. Click and hold the left mouse button down.
4. Drag the mouse. The red rectangle moves with the mouse.
5. Release the mouse button. The area shown in the canvas is changed accordingly.

### Related Topics

[Panning](#)

## Using the Hand Tool to Pan

Use the Hand tool to pan the canvas area. This is equivalent to picking up the canvas and moving it so that the visible canvas area changes.

### To use the Hand tool to pan

1. On the **Pan and Zoom** toolbar, click the **Pan** icon.
2. Move the mouse over the canvas. The Hand tool pointer appears.
3. Click the canvas to grab the canvas and keep the mouse button down.
4. Move the mouse to change the area of canvas that is shown.
5. Release the mouse button.

### Related Topics

[Panning](#)

## Using the Mouse Scroll Wheel to Pan

You can use the mouse scroll wheel to:

- Pan up or down.
- Pan 360 degrees.

### To use the mouse scroll wheel to pan up or down

1. Click the canvas so that no elements are selected.
2. Move the mouse scroll wheel:
  - Forward to pan up.

- Backward to pan down.

### To use the mouse scroll wheel to pan in any direction

1. Click the canvas so that no elements are selected.
2. Click the mouse scroll wheel. The pointer appears in 360 degrees scroll mode.
3. Move the mouse. The visible area of the canvas is panned accordingly.
4. When you are done, click the canvas.

## Related Topics

[Panning](#)

### Zooming

Use the Pan and Zoom toolbar to:

- Zoom in on a specified point to magnify the current elements.
- Zoom out from a specified point.
- Zoom to the default zoom factor (100 percent).
- Zoom so that the currently selected element is shown across the available canvas area or zoomed to the maximum value of 500 percent.
- Zoom in on an area of the canvas using a "rubber band" selection with your mouse.
- Specify or select a zoom factor.

You can also use the CTRL key and the scroll wheel of the mouse to zoom in and zoom out the current canvas view.

## Configuring Designer Preferences

Use the **Designer Preferences** dialog box to set Industrial Graphic Editor preferences. Preferences can be configured for the following:

- Grid Settings - The grid helps you precisely place and move elements on the canvas.
- Canvas Settings - The settings for the appearance of the graphic on the canvas can also be configured.
- Graphics Performance Index Warning window visibility
- Image Editor selection

### To open the Designer Preferences dialog window

1. Open the Industrial Graphic Editor.
2. On the **View** menu, click **Preferences**. The **Designer Preferences** dialog box appears.

### To configure Grid Settings

1. Click the box next to the **Grid color** label. The **Select Grid Color** dialog box appears. For more information, see [Setting a Solid Color](#).
2. In the **Grid size** box, type a value from 1 to 100 to specify the distance in pixels between each line in the grid.
3. In the **Major subdivisions** box, type a value from 1 to 10 to specify the number of major subdivisions of the grid. Major subdivisions are emphasized lines that visually create larger grid cell blocks.
4. Clear or select the **Grid visible** check box to hide or show the grid.
5. Clear or select the **Snap to grid** check box. With the snap-to-grid option set, when you move elements or groups on the canvas they are moved to the closest grid intersection. If this option is not set, you can move the elements freely to any location on the canvas.

### To configure Canvas Settings and graphic appearance

1. Click the box next to the **Background Color** label. The **Select Canvas Color** dialog box appears. For more information, see [Setting a Solid Color](#).
2. Clear or select the **Symbol Smoothing** check box. If this option is not set, lines drawn on the canvas may show jagged edges. With this option set, lines drawn on the canvas show smooth edges.
3. Clear or select the **Show Anchor** check box. With this option selected, the graphic displays anchor icons, if anchors were created in the graphic.

### To select an Image Editor

- Choose the graphic editing tool from the **Image Editor** menu. If you select **Choose Custom Editor**, the **Select Image Editing Application** window appears so you can make a selection.

### To save your settings as default settings

1. Click **Save as Default**.
2. Click **Apply**.
3. Click **OK**.

## Related Topics

[Using the Industrial Graphic Editor](#)

## Using the Symbol Wizard Editor

The Symbol Wizard Editor in the Industrial Graphic Editor allows you to create graphics with multiple configurations called Symbol Wizards. They create Symbol Wizards with the Symbol Wizard Editor. You can embed Symbol Wizards and use the Symbol Wizard Editor to select the configuration needed for an application.

Start creating a multi-configuration graphic by opening a graphic element or graphic in the Industrial Graphic Editor. Show the Symbol Wizard Editor by clicking the Symbol Wizard icon from the Industrial Graphic Editor's menu bar, selecting it as an option of the **View** menu, or pressing the Alt+W key combination.

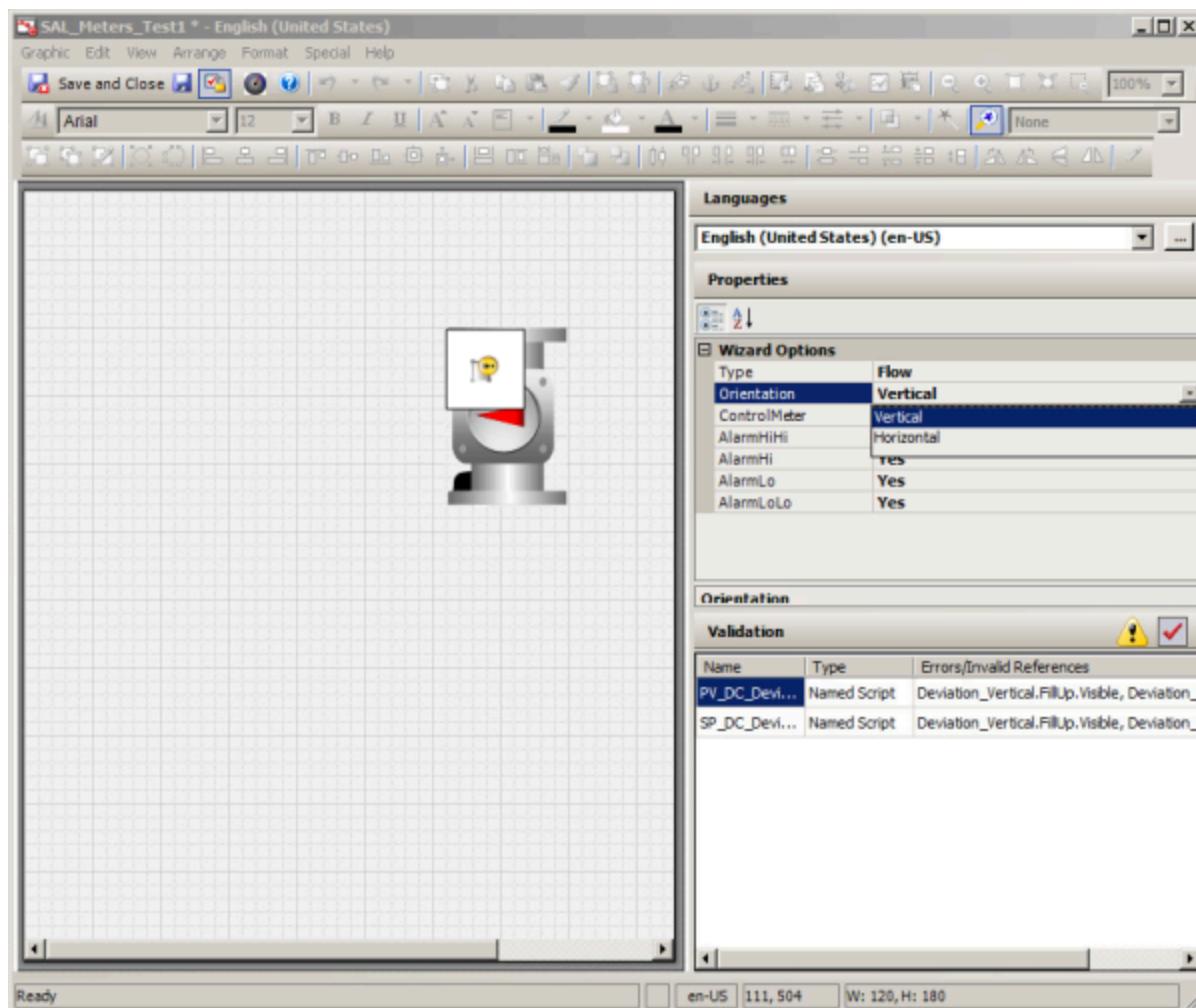

The Industrial Graphic Editor window updates to show tabbed Symbol Wizard panes at the left of the window. The top pane shows the graphic elements, named scripts, and custom properties of the graphic in separate views.

The bottom pane shows tabbed **Options** and **Layers** panes. The **Options** pane shows a hierarchical list of Choice Groups, Choices, and Options that define graphic properties and the possible values associated with each property. The **Layers** pane includes a list of defined graphic layers. Beneath each layer, separate folders contain the graphic's elements, custom properties, and named scripts associated with each layer. You can add, edit, or delete items associated with the **Options** and **Layers** panes.

Symbol Wizard **Option Properties** or **Layer Properties** panes appear to the right of the canvas area in the Industrial Graphic Editor window after selecting items from the **Options** or **Layers** panes.

Both properties pane shows the name of the selected item and any rule associated with the item. If a Choice Group is selected from the **Options** pane, the **Options Properties** pane also shows the default value of the Choice Group and a **Description** field.

After creating the configurations of a graphic with the Symbol Wizard Editor, use the Symbol Wizard Preview to verify that all configurations are correct. The Symbol Wizard Preview can be opened by clicking it from the menu bar, selecting it as an option of the **View** menu, or pressing the Alt+P key combination.

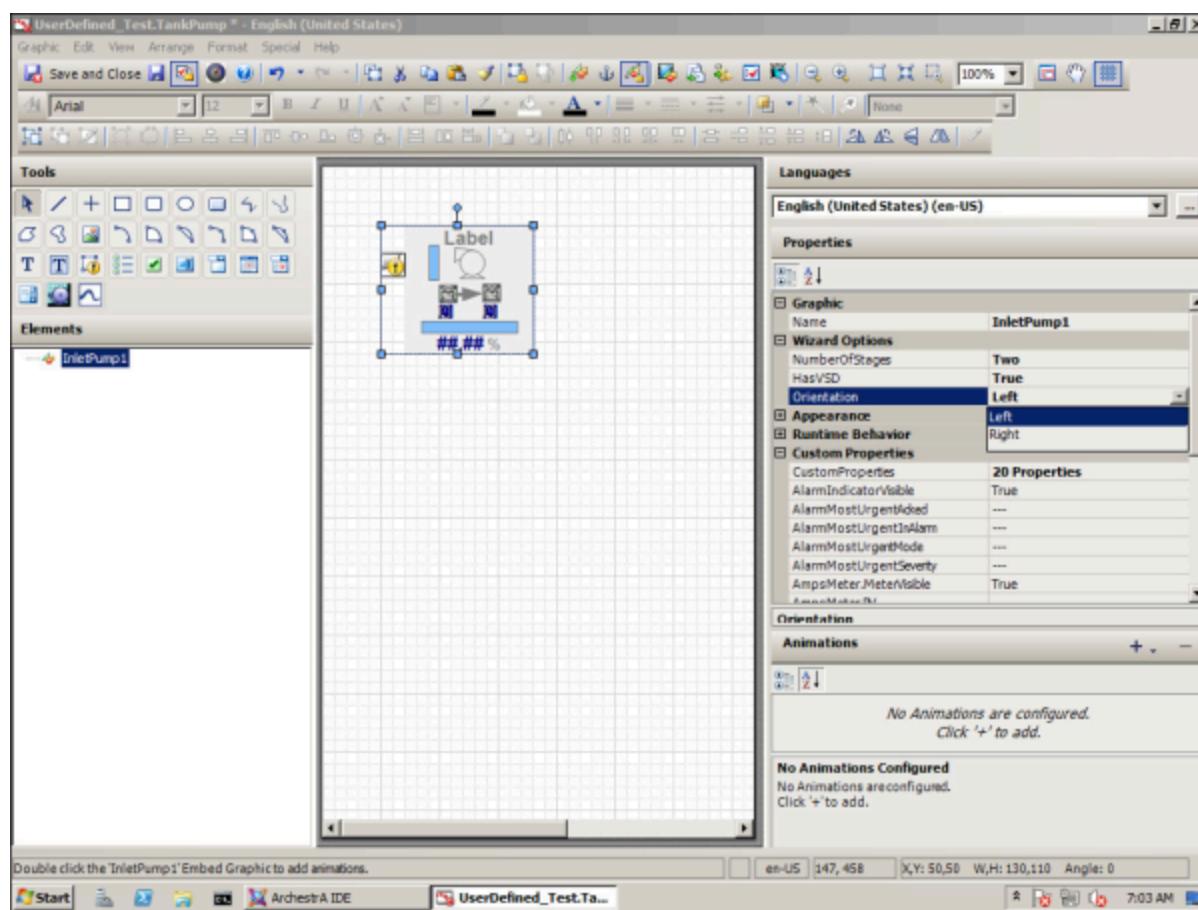

After opening Symbol Wizard Preview, the **Properties** pane shows **Wizard Options**, which includes drop-down menus to select options to show the different configurations created for the graphic. As options are selected, the graphic is updated to show the selected configuration.

The **Validation** pane shows any script or custom property errors within the graphic. Selecting a listed error from the **Validation** pane shows the **Custom Properties** or **Scripts** dialog box to identify and correct an error within the graphic.

After verifying that all graphic configurations are correct, save the graphic into the Graphic Toolbox. For more information about the Symbol Wizard tasks completed by a user, see [Designing a Symbol Wizard](#).

To create an application containing Symbol Wizards, add a graphic to an equipment reference or create a new graphic from the Graphic Toolbox. Then, embed a Symbol Wizard. The graphic appears with the default configuration selected.

The **Wizard Options** pane shows a set of drop-down lists with configuration options. Select options from the drop-down lists to change the graphic's configuration to meet the needs of an application. Finally, edit and update the custom properties and named scripts that are associated with the multi-configuration graphic. For more information about the Symbol Wizard tasks, see [Using Symbol Wizards in an Application](#).

## About Graphic Elements

This section explains how to work with the common features of graphic elements. For information about features specific to certain elements such as element properties, see [Editing Graphic-Specific and Element-Specific Properties](#).

Graphic elements are basic shapes and controls you can use to create a graphic to your specifications. You can:

- Draw an element by selecting an element from the Tools panel, placing it on the canvas, and then configuring its properties.

Select one or more elements on the canvas with the mouse or from the **Element** list.

- Edit certain elements in a special way called inline editing.
- Copy, cut, paste, and duplicate elements.
- Move elements around on the canvas.
- Align elements to each other.
- Change the spacing between elements.
- Resize elements.
- Change the z-order of elements to change which elements appear on top of others when they overlap.
- Rotate elements.
- Change the origin of elements to specify around which point the elements are rotated.
- Flip elements on their horizontal or vertical axis.
- Lock elements to stop them being moved or changed.
- Undo and redo any number of changes made previously to the graphic.
- Create groups of elements to bind them together.
- Create a path graphic from multiple open line elements.

### Drawing and Dragging Elements

You can create elements such as lines, curves, circles, squares, and so on. You can combine these elements to create complex drawings of all the equipment in your manufacturing environment.

After you draw an element, you can modify its properties. For more information about modifying properties, see [Editing Element Properties](#).

Regardless of the kind of element you are drawing, drawing each kind of element is very similar.

After you draw an element, the pointer tool is selected again by default. To draw multiple elements of the same type, double-click the element in the Tools panel. It remains selected after you draw your first element of that type. You can press the ESC key to return to the pointer tool again.

If you draw or drag an element outside of the visible canvas area to the right or bottom, horizontal and/or vertical scroll bars appear but the visible area does not follow the mouse. You can later use the scroll bars to scroll the canvas and see the element you drew or moved.

### Drawing Rectangles, Rounded Rectangles, Ellipses, and Lines

You can draw rectangles, rounded rectangles, ellipses, and lines on the canvas.

#### To draw a rectangle, rounded rectangle, ellipse, or line

1. Click the appropriate icon in the **Tools** panel.
2. Click the canvas and drag the shape of the element on the canvas.
3. When you are done, release the mouse button.

## Related Topics

[Drawing and Dragging Elements](#)

### Drawing Polylines, Polygons, Curves, and Closed Curves

You can draw polylines, polygons, curves, and closed curves on the canvas.

If you are drawing a closed element, the element automatically closes when you are done drawing.

#### To draw a polyline, polygon, curve, or closed curve

1. Click the appropriate icon in the **Tools** panel.
2. Click the canvas where you want to start the element.
3. Click the next point for the element.
4. Continue clicking until you have all the points you require.
5. When you are done, right-click.
6. You can change the shape of these elements anytime by editing their control points. For more information, see [Editing Control Points](#).

## Related Topics

[Drawing and Dragging Elements](#)

### Drawing 2-Point Arcs, 2-Point Pies and 2-Point Chords

You can draw 2-point arcs, 2-point pies, and 2-point chords on the canvas.

If you are drawing a closed element, the element automatically closes when you are done drawing.

#### To draw a 2-point arc, 2-point pie, or 2-point chord

1. Click the appropriate icon in the Tools panel.
2. Click the canvas where you want to start the element and hold the mouse button.
3. Drag the mouse to where you want the element to end.
4. When you are done, release the mouse button.
5. You can change the shape of these elements anytime by editing their control points. For more information, see [Editing Control Points](#).

## Related Topics

[Drawing and Dragging Elements](#)

### Drawing 3-Point Arcs, 3-Point Pies, and 3-Point Chords

You can draw 3-point arcs, 3-point pies and 3-point chords on the canvas.

If you are drawing a closed element, the element automatically closes when you are done drawing.

### To draw a 3-point arc, 3-point pie, or 3-point chord

1. Click the appropriate icon in the Tools panel.
2. Click the canvas where you want to start the element.
3. Click the canvas in two other places to define the element.
4. You can change the shape of these elements anytime by editing their control points. For more information, see [Editing Control Points](#).

## Related Topics

[Drawing and Dragging Elements](#)

## Placing and Importing Images

You can place an image element on the canvas and import an image into it.

### To draw an image

1. Click the image icon in the **Tools** panel.
2. Click the canvas and drag the shape of the image element.
3. Release the mouse button. The **Open** dialog box appears.
4. Browse to the image file, select it, and then click **Open**. The image file is loaded into the image element.

## Related Topics

[Drawing and Dragging Elements](#)

## Drawing Buttons

You can draw a button on the canvas. You can configure a button with a text label or an image.

For more information on how to configure a button with an image after drawing it on the canvas, see .

### To draw a button

1. Click the button icon in the Tools panel.
2. Click the canvas and drag the shape of the button element.
3. Release the mouse button. The button text appears in edit mode.
4. Type a text label for the button and click **Enter**.

## Related Topics

[Drawing and Dragging Elements](#)

## Placing Text

You can place text on the canvas.

The text element has no border and no background fill. The text does not wrap. When you type the text, the size of the Text element expands.

You can also drag the handles of the Text element to resize it.

### To place text

1. Click the text icon in the **Tools** panel.
2. Click the canvas where you want to place the text.
3. Type the single line of text you want.
4. When you are done, do one of the following:
  - Click **Enter** to type a new line of text. This new line is a new element.
  - Click the canvas outside the text element.

## Related Topics

[Drawing and Dragging Elements](#)

## Drawing Text Boxes

You can draw text boxes on the canvas. Text boxes can have borders and background fill.

You can also configure the text to wrap in the text box. For more information, see [Wrapping Text in Buttons](#).

### To draw a text box

1. Click the text box icon in the **Tools** panel.
2. Click the canvas where you want to place the text box.
3. Drag a rectangle on the canvas.
4. Release the mouse button. The text appears in edit mode.
5. Type a text label for the text box, and then click **Enter**.

## Related Topics

[Drawing and Dragging Elements](#)

## Drawing Status Elements

Use the status element to indicate specific quality and status conditions of equipment.items.

### To draw status elements

1. Click the status icon in the **Tools** panel.
2. Click the canvas where you want to place the status element.
3. Drag a rectangle on the canvas.

4. Release the mouse button.

## Related Topics

[Drawing and Dragging Elements](#)

### Drawing User Interface Common Controls

Draw user interface common controls on the canvas to add additional functionality to your graphic. Each of the controls has specific behavior when it is drawn. For example, you can change the width of a combo box, but not the height.

#### To draw a windows control

1. Click the appropriate common interface control icon in the **Tools** panel.
2. Click the canvas where you want to place the control.
3. Drag a rectangle on the canvas.
4. Release the mouse button.

## Related Topics

[Drawing and Dragging Elements](#)

### Dragging Elements

After you draw elements on the canvas, you can drag them to a new position.

#### To drag elements on the canvas

1. Select one or more elements.
2. Click one of them and hold the mouse button down.
3. Drag the mouse to the new position.
4. Release the mouse button.

### Import an SVG as an Industrial Graphic

The Industrial Graphic Editor supports the importing of Scalable Vector Graphics (SVG) as Industrial Graphics. You can perform the following:

- Import an SVG into the Industrial Graphic Editor. The graphic elements automatically get converted to an Industrial Graphic, which can include many primitives.  
Insert the SVG while using the **Image** icon from the **Tools** panel of the Industrial Graphic Editor.

- Use SVG for the **UpImage** and **DownImage** on a button. For more information, see [Configuring Buttons with Images](#).
- Use SVG for the **Quality & Status** display icons under **Styles** configuration.

A list of supported SVG elements can be found at <https://github.com/svg-net/SVG>.

#### To import an SVG and insert as an Industrial Graphic:

1. In the Industrial Graphic Editor, on the **Graphic** menu, click **Import SVG**.
2. Browse for the required SVG and click **Open**.

---

**Note:** You can import multiple SVG files at once.

---

3. To insert the SVG file as Industrial Graphics, click anywhere on the canvas.

OR

1. Open the SVG in a notepad and copy all the content.

---

**Note:** Make sure the format of the SVG is proper.

---

2. Either right-click in the Industrial Graphic Editor canvas and select **Paste SVG**, or, on the **Graphic** menu, select **Paste SVG**.
3. Click on the canvas where you want to paste the SVG.

OR

- Drag and drop the SVG to the canvas.

You can drag and drop multiple SVG files at once.

---

**Note:** You can drag and drop SVG files only if User Account Control (UAC) is turned off. Before turning off UAC, be sure to check your organization's security policy, as turning it off could cause a security issue. If you try to drag and drop an SVG file to the canvas with UAC turned on, a forbidden icon is displayed.

---

When importing an SVG, be aware of the following:

- If the imported SVG is bigger than the view area, then the SVG will be resized accordingly by maintaining the aspect ratio.
- If there are any unsupported characters in the name of the SVG or primitive, it will be converted to “\_”.
- The SVG element name is used to name the corresponding primitive. If a SVG element does not have a name, then Industrial Graphic primitive type is used to name the primitive. For example, if the SVG group name is "Header", the primitive name in Graphic Editor after import will also be Header. If the SVG group has no name, the same will be named as <primitive type>\_<number>, that is group\_01.
- Only three colors are supported in gradients. If the SVG file has more than three colors for primitive, the first, last, and middle colors are considered.

The middle color is calculated by the formula  $middle\ color = (int)((colors.Length) / 2)$ . That is, if there are four colors, then it will consider the second color as middle color.

For a list of supported and unsupported elements, see [SVG Limitations](#).

## SVG Limitations

The Industrial Graphic Editor includes support for SVG graphics. However, this support has some limitations. The table below shows the SVG graphic support status for each type of element.

Element Type	Element	Support
Animation elements	animate	NO
Animation elements	animatecolor	NO
Animation elements	animatemotion	NO
Animation elements	animatetransform	NO
Animation elements	set	NO

(\*) Gradients support up to 3 colors

## Editing Element Properties

You can control the appearance of an element, a group of elements, or multiple elements with functions on the toolbar and properties shown in the **Properties Editor** of the Industrial Graphic Editor.

Often you can edit an element by changing the values of its properties instead of using the mouse to perform the same function. This is useful when you want very exact editing, such as when you want to resize an element to a specific width.

The **Properties Editor** shows the properties common to all selected elements.

- Read-only properties appear in grey.
- Non-default values appear in bold.

---

**Note:** The **Properties Editor** not only supports values, but also allows input of color, font, and file information in the respective dialog boxes.

---

Properties are organized in categories so you can find them more easily. The following table shows the categories:

Property Category	Purpose
<b>Graphic</b>	Element name or other describing identifiers
<b>Appearance</b>	Element style, location, size, orientation, offset, transparency and locked status
<b>Fill Style</b>	Any parameters related to the fill appearance of the element
<b>Line Style</b>	Any parameters related to the appearance of element lines
<b>Text Style</b>	Any parameters related to the appearance of element text
<b>Runtime Behavior</b>	Element visibility, tab order and any other element behavior at run time
<b>Custom Properties</b>	Additional user-defined properties you can associate with any element

## Related Topics

## Selecting Elements

You can select one or more graphic elements from the Industrial Graphic Editor canvas by:

- Clicking on them with the mouse.
- Dragging a lasso around them with your mouse.
- Selecting them with a menu option or with a shortcut key.
- Selecting them by name from the **Elements** list.

When you select an element, handles appear around the border of the element that can be moved to control the size of the element. You can change the orientation of a graphic element by moving the handle connected to the top center border handle.

When you select multiple elements, the last selected element is the primary element. All other previously selected elements are secondary elements.

Selected Element	Description
Primary Element	Appears with color-filled handles. Behaves as an active selected element. Is the point of reference for all operations, such as aligning or spacing multiple selected elements.
Secondary Elements	Appear with white handles. Behave as inactive selected elements. Follow the edits made to the primary element.

To select a group, you need to click one of the elements contained in the group.

[Selecting Elements](#)

## Selecting Elements by Lasso

You can select one or more elements by lassoing them with your mouse. This is useful for selecting multiple elements within a specified rectangular area on the canvas.

### To select elements by lasso

1. On the canvas, click outside any element and hold the mouse button down.
2. Drag the mouse so that the lasso wraps around all elements that you want to select.
3. When you are done, release the mouse button. The elements that are fully enclosed within the lasso are selected.

## Related Topics

[Drawing and Dragging Elements](#)

## Selecting All Elements

You can select all elements using the Select All function.

### To select all elements

- On the **Edit** menu, click **Select All**. All elements on the canvas are selected.

---

**Note:** You can also press the F2 key to select all elements.

---

## Related Topics

[Drawing and Dragging Elements](#)

## Selecting Elements Using the Elements List

You can use the Elements List to select any elements on the canvas. The Elements List is particularly useful for selecting elements behind other elements.

The Elements List shows which elements are currently selected. The primary selected element appears by default in dark blue, the secondary selected elements appear by default in light blue.

---

**Note:** The color setting of the Elements List depends on the setting for the **Selected Items** option in the operating system's **Display Properties Appearance** panel.

### To select elements using the Elements List

1. In the **Elements List**, select the element name.
2. To select multiple elements, Ctrl + click the other elements.

## Related Topics

[Selecting Elements](#)

## Unselecting Elements

You can unselect one or more selected elements. You can do this by clicking on them individually on the canvas or in the Elements List.

If you want to remove the selected elements in a specified rectangular area, you can use the lasso.

### To unselect elements individually

1. Do one of the following:
  - Shift + click the selected element on the canvas.
  - Ctrl + click the selected element name in the Elements List.
2. Repeat the previous step for all elements you want to unselect.

### To unselect elements from a specified rectangular area

1. Shift + click the canvas outside of any element.
2. Drag the mouse so that the lasso surrounds the elements that you want to unselect.
3. Release the mouse button. The selected elements within the lasso are unselected, and the selected elements outside the lasso remain selected.

## Related Topics

[Selecting Elements](#)

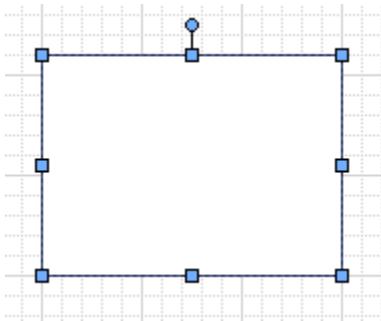

## Inline Editing

After you place graphic elements on the Industrial Graphic Editor canvas, you can edit them by selecting them and clicking on them again. This is called inline editing. The following elements support inline editing.:

Element	Use inline editing to
Button, text, text box	Edit the text.
Polyline, polygon, curve, closed curve	Edit the control points.
2-point arc, 2-point pie, 2-point chord, 3-point arc, 3-point pie, 3-point chord	Edit the start and sweep angles.
Group	Edit the individual elements and groups contained in the group.
Path	Edit the control points.

### To edit elements with inline editing

1. Select an element by clicking on it or selecting it from the **Elements** list. Element handles appear around the border of the element.

2. Click the element again to begin inline editing.
  - For buttons, text, and text boxes, the text is selected and you can type new text.
  - For polylines, polygons, curves, and closed curves, the control points of the element appear. Move a control point to change the shape of the element. You can also add and delete control points. For more information, see [Adding and Removing Control Points](#).
  - For arcs, pies, and chords, the handles for the start angle and sweep angle appear. Move a handle to change the start angle and sweep angle.
  - For groups, the group handle is replaced with a shaded outline. You can select individual elements and groups within the group to edit and move them.
3. Click the canvas outside the element to exit from inline editing.

### Related Topics

[Working with Graphic Elements](#)

### Copying, Cutting, and Pasting Elements

After you draw elements, you have the same cut, copy, and paste options available to you as in any other Windows application. However, some of these options behave differently in the Industrial Graphic Editor.

You can also duplicate elements. Duplicating elements lets you quickly make copies of existing selected elements without first copying or cutting. You can duplicate one or more selected elements at the same time.

When you copy or duplicate elements, all of its properties are copied with the element. If you do not want the properties to be identical, you must change the properties after you copy.

Locked grouped elements and the path element behave differently when you copy or duplicate them.

If you copy or duplicate:

- A set of elements that are locked, the copy is not locked.
- Grouped elements, the copy is still grouped.
- A path element, the copy is also a path.

## Related Topics

[Working with Graphic Elements](#)

[Cutting or Deleting Elements](#)

[Duplicating Elements](#)

## Copying Elements

After you select an element, you can copy it by using menu options or you can Ctrl + click.

### To copy one or more elements

Do any of the following:

- Select one or more elements to be copied on the canvas. On the **Edit** menu, click **Copy**. On the **Edit** menu, click **Paste**. The paste pointer appears. Click the canvas where you want to place the copy.
- Ctrl + click an element.
- Select one or more elements to be copied on the canvas. Press Ctrl + C. Press Ctrl + V. The paste pointer appears. Click the canvas where you want to place the copy.

## Related Topics

[Copying, Cutting, and Pasting Elements](#)

## Cutting or Deleting Elements

You can cut elements or groups or you can delete them. Cutting lets you select elements or groups and remove them from the canvas. You can paste the removed elements or groups.

Deleting elements or groups deletes them from the canvas. You cannot paste deleted elements or groups.

### To cut one or more elements

- Select one or more elements, and then do one of the following:
  - On the **Edit** menu, click **Cut**.

- Press Ctrl + X.

### To cut and paste elements on the canvas

1. Select the element or group.
2. On the **Edit** menu, click **Cut**.
3. Do one of the following:
  - Click **Paste** on the **Edit** menu.
  - Press Ctrl + V.
4. Click the canvas location where you want the element or group to be placed.

### To delete an element or a group

1. To remove the element or group and **not** use it in the future, select the element or group.
2. Do one of the following:
  - Click **Delete** on the **Edit** menu.
  - Press Delete on your keyboard.

## Related Topics

[Copying, Cutting, and Pasting Elements](#)

## Duplicating Elements

Duplicating elements enables you to select an element or elements and quickly make copies of them.

You can also specify the amount of overlap when you duplicate.

### To duplicate elements

1. Select one or more elements.
2. Do one of the following:
  - a. Click **Duplicate** on the **Edit** menu. The selected element is duplicated and appears offset to the original element.
  - b. Press Ctrl + D. The selected element is duplicated and appears offset to the original element.
  - c. Ctrl + click one of the selected elements to duplicate all selected elements. You can keep the mouse button down and drag them to the new position on the canvas.

### To set the overlap when you duplicate

1. Duplicate an element or elements. The element is copied overlapping the original.
2. Move the duplicated element to the location relative to the original. For example, move the duplicated element five grid spaces above the original element.
3. Duplicate the element again. The new duplicate is placed in the same offset you specified in the preceding step. For example, five grid spaces above the original element.

## Related Topics

[Copying, Cutting, and Pasting Elements](#)

## Moving Elements

After you create elements, you can move them to the location you want on the canvas.

You can move elements or groups by dragging them to the new location or you can open the properties for the element or group and change the X and Y properties.

If you turned on snap to grid, moving an element or group with the mouse snaps the element or group to the grid.

If you move an element or group by specifying X and Y coordinates, it does not snap to the grid.

You can move an element or group vertically or horizontally using the keyboard.

### To move an element or group using the mouse

1. Select the element or group you want to move.
2. Drag the elements or group to the new location.

### To move an element or group by specifying the X and Y properties

1. Select the element or group you want to move.
2. In the Properties Editor, expand **Appearance**.
3. Do the following:
  - In the **X** box, type the new X location.
  - In the **Y** box, type the new Y location.
4. Click in the canvas or click ENTER.

### To move an element or group vertically or horizontally using the mouse

1. Shift + click to select the element or group you want to move.
2. Drag the elements or group to the new location.

### To move an element or group vertically or horizontally using the keyboard

1. Select the element or group you want to move.
2. Do one of the following:
  - Press the Up or Down arrow keys to move the element or group vertically by one unit in the grid.
  - Press the Left or Right arrow keys to move the element or group horizontally by one unit in the grid.

---

**Note:** You can move the element or group by two units in the grid by additionally pressing the Shift key, by four units by additionally pressing the Ctrl key, and by 10 units by additionally pressing both keys.

### To move multiple elements or groups

1. Select the elements and/or groups.

2. Move them as you would with one single element. The elements are moved together and maintain their spatial relationship when moving.

## Aligning Elements

After you draw elements, you can align them:

- Horizontally so that their top or bottom sides or their center points are horizontally aligned.
- Vertically so that their left, right, or center points are vertically aligned.
- So that their center points are on top of each other.
- So that their points of origin are on top of each other.

When you align elements, the secondary elements are moved so that they align with the primary element. For more information about primary and secondary elements, see [Selecting Elements](#).

[Aligning Elements by their Center Points](#)

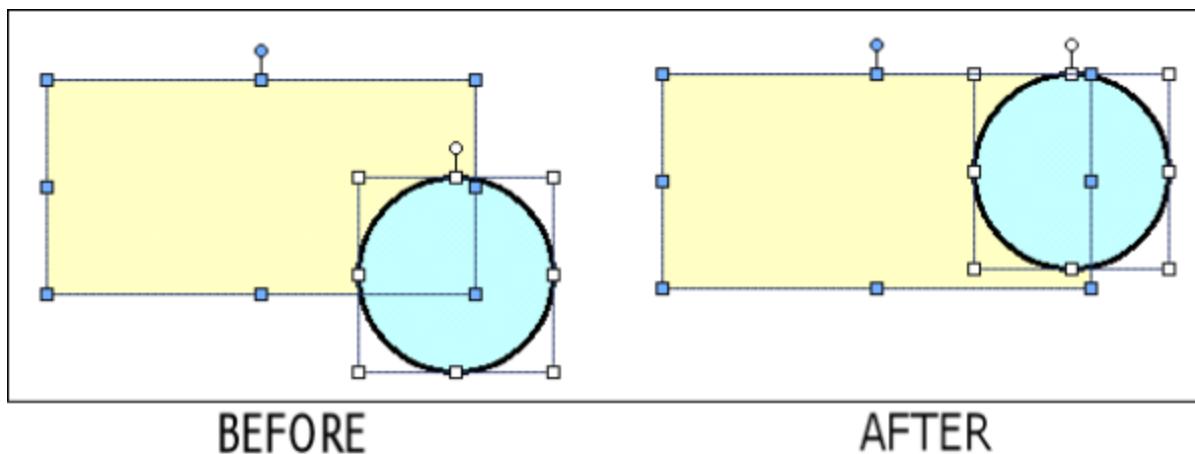

[Aligning Elements by their Points of Origin](#)

## Aligning Elements Horizontally

You can align multiple elements by their top or bottom sides or horizontally on their middle points.

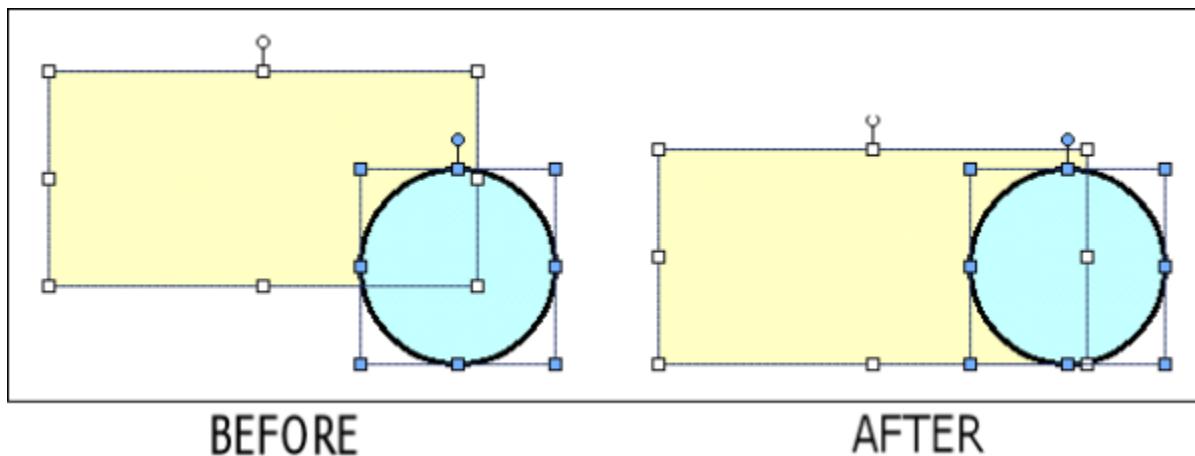

### To align elements by their top sides

1. Select all elements that you want to align. The element you want to align all other elements to needs to be the primary element.
2. On the **Arrange** menu, point to **Align**, and then click **Align Top**. The secondary elements are moved so that their top sides are aligned with the top side of the primary element.

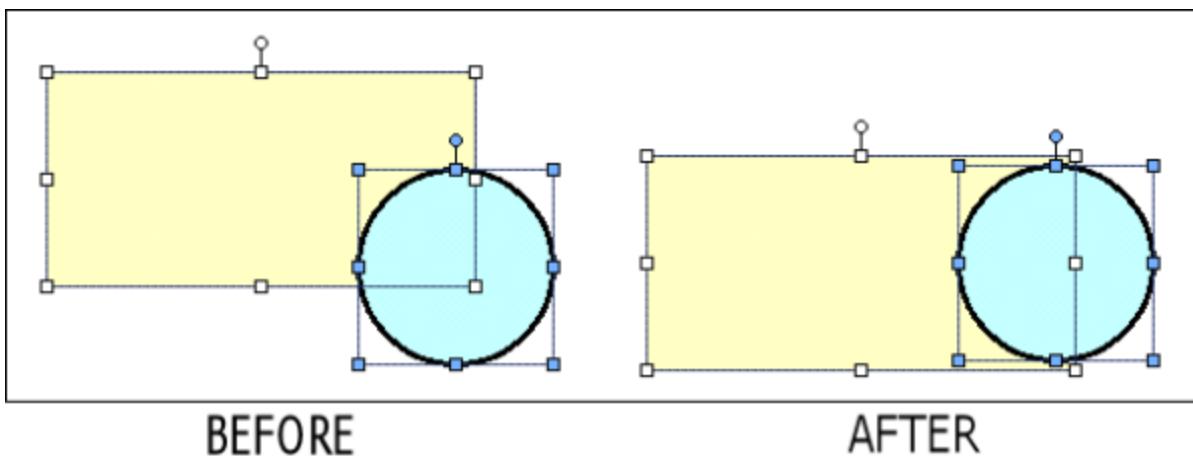

### To align elements by their bottom sides

1. Select all elements that you want to align. The element you want to align all other elements to needs to be the primary element.
2. On the **Arrange** menu, point to **Align**, and then click **Align Bottom**. The secondary elements are moved so that their bottom sides are aligned with the bottom side of the primary element.

### To align elements horizontally by their center points

1. Select all elements that you want to align. The element you want to align all other elements to needs to be the primary element.
2. On the **Arrange** menu, point to **Align**, and then click **Align Middle**. The secondary elements are moved vertically so that their center points are aligned with the center point of the primary element.

## Related Topics

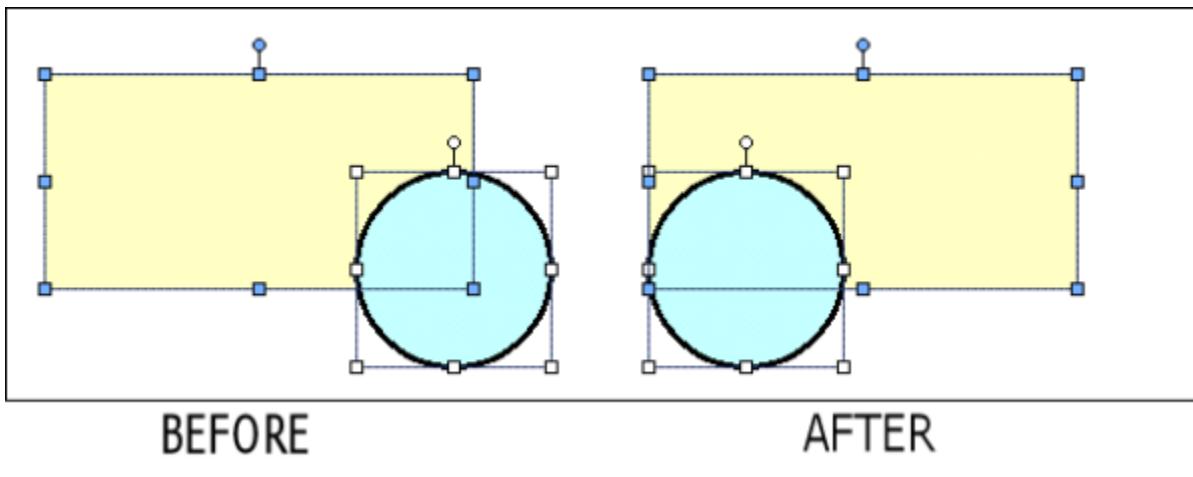

[Aligning Elements](#)

### Aligning Elements Vertically

You can vertically align multiple elements on the left, right, or their center points.

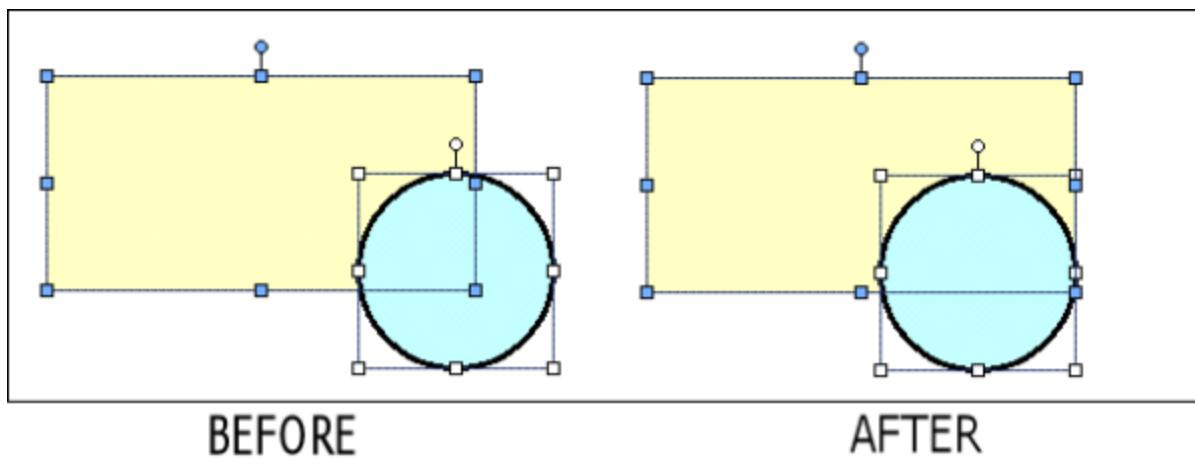

#### To align elements by their left sides

1. Select all elements that you want to align. The element you want to align all other elements to needs to be the primary element.
2. On the **Arrange** menu, point to **Align**, and then click **Align Left**. The secondary elements are moved so that their left sides are aligned with the left side of the primary element.

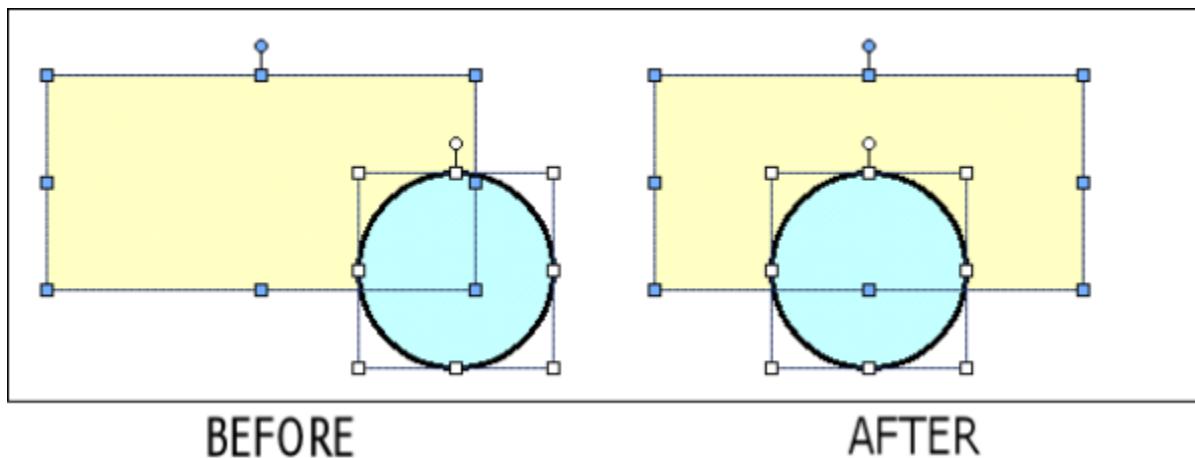

#### To align elements by their right sides

1. Select all elements that you want to align. The element you want to align all other elements to needs to be the primary element.
2. On the **Arrange** menu, point to **Align**, and then click **Align Right**. The secondary elements are moved so that their right sides are aligned with the right side of the primary element.

### To align elements vertically by their centers

1. Select all elements that you want to align. The element you want to align all other elements to needs to be the primary element.
2. On the **Arrange** menu, point to **Align**, and then click **Align Center**. The secondary elements are moved horizontally so that their center points are aligned with the center point of the primary element.

## Related Topics

[Aligning Elements](#)

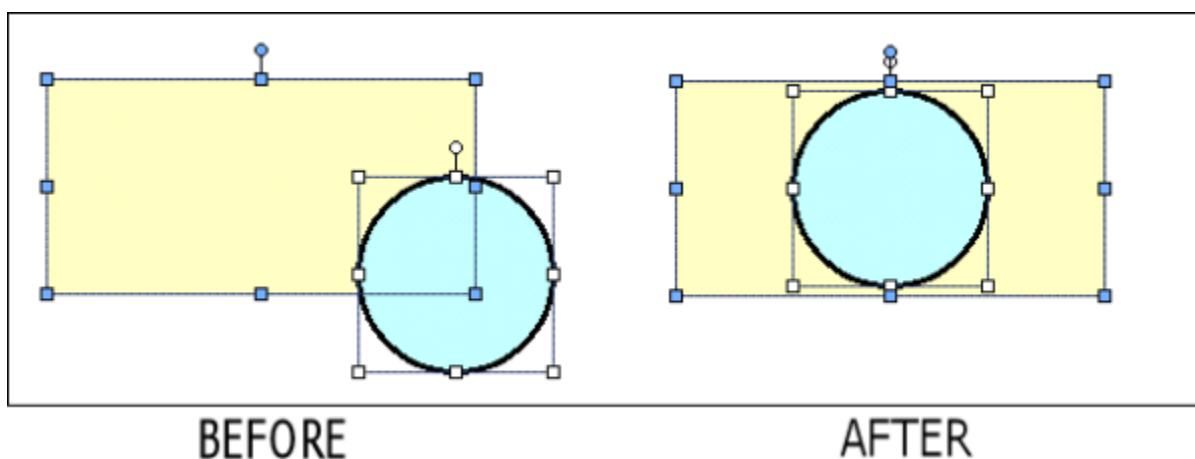

### Aligning Elements by their Center Points

You can align elements by their center points. The center point of one or more elements is the point halfway between the horizontal and vertical boundaries.

### To align elements on their center points

1. Select all elements that you want to align. The element you want to align all other elements to needs to be the primary element.
2. On the **Arrange** menu, point to **Align**, and then click **Align Centers**. The secondary elements are moved so

that their center points are placed on top of the center point of the primary element.

## Related Topics

[Aligning Elements](#)

### Aligning Elements by their Points of Origin

You can align elements by their points of origin. By default, the element's center point is the point of origin. But, an element's center point can be changed. The center point is the anchor point of an element to the canvas.

#### To align elements on their points of origin

1. Select all elements that you want to align. The element you want to align all other elements to needs to be the primary element.
2. On the **Arrange** menu, point to **Align**, and then click **Align Origins**. The secondary elements are moved so that their points of origins are placed on top of the point of origin of the primary element.

## Related Topics

[Aligning Elements](#)

### Adjusting the Spacing between Elements

You can adjust the space between elements according to specific rules.

You can adjust the spacing between elements in the following ways:

- Horizontally - moves the selected elements left or right without changing the vertical positions.
- Vertically - moves the selected elements up or down without changing the horizontal positions.
- Distribution - moves the selected elements so that their center points are distributed in equal distance to each other.
- Equal spacing - moves the selected elements so that the distance between their edges is equal.
- Increase spacing - moves all selected elements one pixel further away from each other. The primary element

does not move.

- Decrease spacing - moves all selected elements one pixel closer toward each other. The primary element does not move.
- Remove spacing - removes all space between selected elements so that their edges touch.

[Decreasing Space between Elements](#)

[Removing All Space between Elements](#)

## Distributing Elements

You can distribute elements so that their center points are distributed in equal distance to each other.

### To distribute elements horizontally

1. Select at least three elements.
2. On the **Arrange** menu, point to **Space**, and then click **Distribute Horizontal**. The selected elements are distributed horizontally.

### To distribute elements vertically

1. Select at least three elements.
2. On the **Arrange** menu, point to **Space**, and then click **Distribute Vertical**. The selected elements are distributed vertically.

## Related Topics

[Adjusting the Spacing between Elements](#)

## Making Space between Elements Equal

You can space elements so that the distances between their boundaries are equal.

The difference between making space between elements equal and distributing them is that making space equal uses the boundaries of the elements, whereas distributing uses the center points. Both do not necessarily lead to the same result.

### To make the horizontal space between elements equal

1. Select at least three elements.
2. On the **Arrange** menu, point to **Space**, and then click **Make Horizontal Space Equal**. The selected elements are moved so that the horizontal spaces between their boundaries are equal.

## To make the vertical space between elements equal

1. Select at least three elements.
2. On the **Arrange** menu, point to **Space**, and then click **Make Vertical Space Equal**. The selected elements are moved so that the vertical spaces between their boundaries are equal.

## Related Topics

[Adjusting the Spacing between Elements](#)

### Increasing Space between Elements

You can increase space between elements equally.

The primary element does not move. All secondary elements are moved away from the primary element.

#### To increase the horizontal space between elements

1. Select at least two elements.
2. On the **Arrange** menu, point to **Space**, and then click **Increase Horizontal Spacing**. The selected elements are moved so that the horizontal space between them is increased by one pixel.
3. Repeat the previous step to move the selected elements further away from each other.

#### To increase the vertical space between elements

1. Select at least two elements.
2. On the **Arrange** menu, point to **Space**, and then click **Increase Vertical Spacing**. The selected elements are moved so that the vertical space between them is increased by one pixel.
3. Repeat the previous step to move the selected elements further away from each other.

## Related Topics

[Adjusting the Spacing between Elements](#)

### Decreasing Space between Elements

You can decrease space between elements equally.

The primary element does not move. All secondary elements move toward the primary element. You can move them until the left sides of all elements are aligned.

#### To decrease the horizontal space between elements

1. Select at least two elements.
2. On the **Arrange** menu, point to **Space**, and then click **Decrease Horizontal Spacing**. The selected elements are moved so that the horizontal space between them is decreased by one pixel.
3. Repeat the previous step to move the selected elements closer toward each other.

## To decrease the vertical space between elements

1. Select at least two elements.
2. On the **Arrange** menu, point to **Space**, and then click **Decrease Vertical Spacing**. The selected elements are moved so that the vertical space between them is decreased by one pixel.
3. Repeat the previous step to move the selected elements closer toward each other.

## Related Topics

[Adjusting the Spacing between Elements](#)

## Removing All Space between Elements

You can remove all space between selected elements so that their boundaries touch.

The primary element does not move. All secondary elements move toward the primary element. You can move them until the left and right sides of all secondary elements are aligned.

## To remove all horizontal space between elements

1. Select all elements between which you want to remove the space.
2. On the **Arrange** menu, point to **Space**, and then click **Remove Horizontal Spacing**. The horizontal space between all selected elements is removed, so that their boundaries touch.

## To remove all vertical space between elements

1. Select all elements between which you want to remove the space.
2. On the **Arrange** menu, point to **Space**, and then click **Remove Vertical Spacing**. The vertical space between all selected elements is removed, so that their boundaries touch.

[Adjusting the Spacing between Elements](#)

## Resizing Elements

You can resize selected elements by:

- Dragging the handles of a single element to increase or decrease its horizontal or vertical size.
- Changing the Width and Height properties of one or more elements using the Properties Editor.
- Proportionally resizing multiple elements.
- Making multiple objects the same width and/or height.

Some elements cannot be resized or can only be resized in certain directions, such as the Calendar control or DateTime Picker. If the primary element has such restrictions, then any secondary elements resize proportional to the change in primary element's size and do not resize independently.

## Related Topics

- [Resizing Elements by Changing Size Properties](#)
- [Resizing Elements Proportionally](#)
- [Making Elements the Same Width, Height, or Size](#)

### Resizing a Single Element with the Mouse

You can resize a single selected element with the mouse.

You can resize most elements to any given width and height, or to a fixed width to height ratio.

#### To resize a single selected element with the mouse

1. Select an element. The handles of the selected element appear.
2. Drag one of the handles. The object is resized while you drag.
3. Release the mouse button.

#### To resize a single selected element with the mouse and keeping a fixed width/height ratio

1. Select an element. The handles of the selected element appear.
2. Press and hold the Shift key.
3. Drag one of the handles. The object is resized while you drag, the width/height ratio stays unchanged.
4. Release the mouse button and Shift key.

## Related Topics

- [Resizing Elements](#)

### Resizing Elements by Changing Size Properties

You can resize one or more elements by changing the width and/or height property of the selected elements.

#### To resize elements by changing their size properties

1. Select one or more elements.
2. In the Properties Editor, type a value for **Width** and for **Height**. The selected elements are resized accordingly.

## Related Topics

- [Resizing Elements](#)

## Resizing Elements Proportionally

You can resize multiple elements proportionally on the canvas. One element is the primary element you can use to resize. The secondary elements resize proportionally to the change of the primary element.

### To resize elements proportionally

1. Select multiple elements.
2. Drag one of the handles of the primary element. The secondary elements are resized accordingly by the same percentage.
3. Release the mouse button.

For example, assume the primary element is 100 pixels wide and 50 pixels high. A secondary element is 200 pixels wide and 20 pixels high.

You drag the handle of the primary element so that it is 120 pixels wide (20 percent increase) and 100 pixels high (100 percent increase).

Then the secondary element is resized to 240 pixels wide (20 percent increase of the original width of 200 pixels) and 40 pixels high (100 percent increase of the original width of 20 pixels).

## Related Topics

[Resizing Elements](#)

## Making Elements the Same Width, Height, or Size

You can make elements the same width, height, or size.

### To make elements the same width

1. Select at least two elements. The primary element is the element that provides the target width for all elements.
2. On the **Arrange** menu, point to **Size**, and then click **Make Same Width**. The width of the secondary elements are resized to the same width as the primary element.

### To make elements the same height

1. Select at least two elements. The primary element is the element that provides the target height for all elements.
2. On the **Arrange** menu, point to **Size**, and then click **Make Same Height**. The height of the secondary elements are resized to the same height as the primary element.

### To make elements the same size

1. Select at least two elements. The primary element is the element that provides the target size for all elements.
2. On the **Arrange** menu, point to **Size**, and then click **Make Same Size**. The size of the secondary elements are resized to the same size as the primary element.

## Related Topics

[Resizing Elements](#)

### Adjusting the z-Order of Elements

The z-order of elements specifies which element appears on top of other elements when the elements overlap on the canvas. The z-order also determines how the elements of a path graphic connect.

When you place new elements on the canvas, they are placed at the top and can cover all other elements.

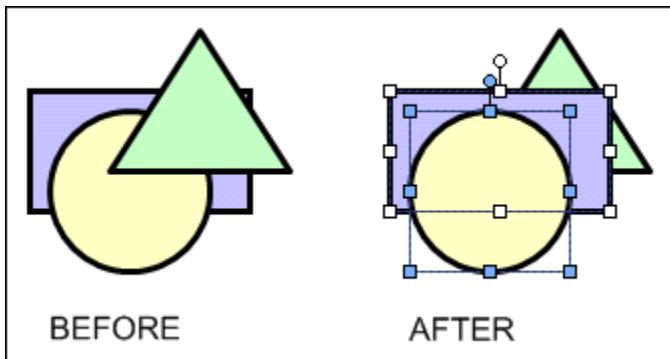

However, you might want to bring certain elements forward so that they are always visible or overlap certain other elements. Or you may want to use a large background element behind all other elements. You can:

- Bring one or more elements to the very front.
- Send one or more elements to the very back.
- Bring one or more elements one level forward.
- Send one or more elements one level backward.

You can use the Elements List to see or change the z-order of the elements.

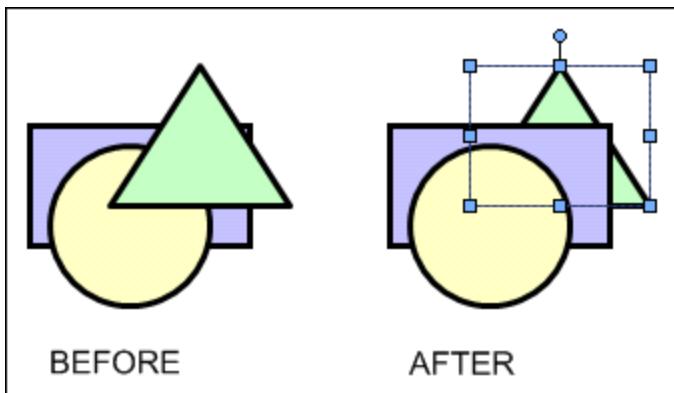

#### To bring selected elements to the front

- On the **Arrange** menu, point to **Order**, and then click **Bring To Front**. The selected elements are brought to the front. They do not change their relative z-order.

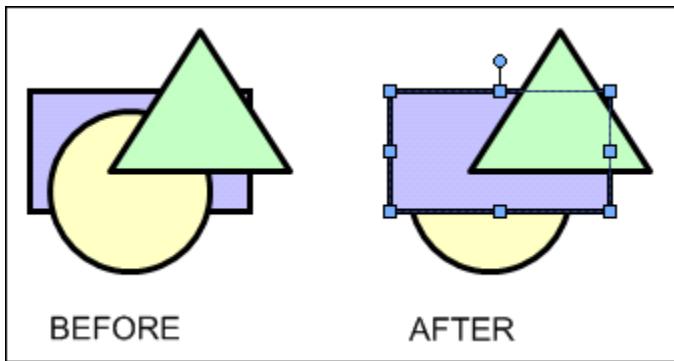

#### To send selected elements to the back

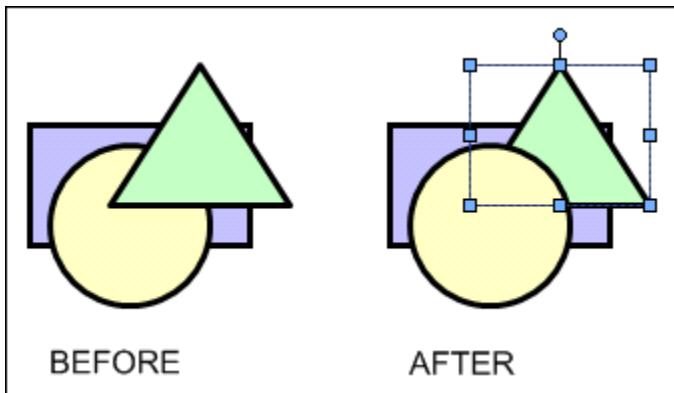

- On the **Arrange** menu, point to **Order**, and then click **Send To Back**. The selected elements are sent to the back. They do not change their relative z-order.

**To bring selected elements one level forward**

- On the **Arrange** menu, point to **Order**, and then click **Bring Forward**.

**To send selected elements one level backward**

- On the **Arrange** menu, point to **Order**, and then click **Bring Backward**.

## Rotating Elements

You can rotate elements to any orientation (0 - 359 degrees):

- Graphically with the rotation handle.
- Numerically by typing the orientation angle in the Properties Editor.
- By rotating in 90 degree increments in a clockwise or counter-clockwise direction.

The element rotates around its point of origin. By default, the point of origin is in the center of the element. You can move the point of origin to any other location, even outside of the object itself. To change the point of origin, see [Moving the Origin of an Element](#).

[Rotating Elements by 90 Degrees](#)

### Rotating Elements with the Mouse

You can rotate one or more elements with the mouse. If you select multiple elements, you can rotate the primary element. The secondary elements rotate in unison with the primary element.

You can rotate elements:

- Freely in the range 0 to 359 in integer degrees.
- In multiples of 15 degrees.
- In multiples of 45 degrees.

You can rotate an element with the rotation handle. The rotation handle is a light-blue circle at the top of a selected element.

#### To rotate elements freely with the mouse

1. Select one or more elements.
2. Grab the rotation handle of the primary element.
3. Drag the mouse across the screen. All selected elements are rotated around their own points of origin as you move the mouse.
4. Release the mouse button.

#### To rotate elements by multiple of 15 degrees with the mouse

1. Select one or more elements.
2. Grab the rotation handle of the primary element.
3. Press and hold the Shift key.

4. Drag the mouse across the screen. All selected elements are rotated in multiples of 15 degrees around their own points or origin as you move the mouse.
5. Release the mouse button and Shift key.

### To rotate elements by multiple of 45 degrees with the mouse

1. Select one or more elements.
2. Grab the rotation handle of the primary element.
3. Press and hold the Ctrl key.
4. Drag the mouse across the screen. All selected elements are rotated in multiples of 45 degrees around their own points or origin as you move the mouse.
5. Release the mouse button and Ctrl key.

### Rotating Elements by 90 Degrees

You can rotate elements in 90 degrees clockwise or counter-clockwise increments.

To rotate elements by multiples of 15 and 45 degrees, see [Rotating Elements with the Mouse](#).

#### To rotate elements by 90 degrees clockwise

1. Select one or more elements.
2. On the **Arrange** menu, point to **Transform**, and then click **Rotate Clockwise**. The selected elements rotate by 90 degrees clockwise.

#### To rotate elements by 90 degrees counter-clockwise

1. Select one or more elements.
2. On the **Arrange** menu, point to **Transform**, and then click **Rotate Counter Clockwise**. The selected elements

rotate by 90 degrees counter-clockwise.

## Related Topics

[Rotating Elements](#)

### Moving the Origin of an Element

You can change the point of origin of any element. The point of origin specifies around which point the element rotates or flips. By default the point of origin is in the center of the element.

You can change the point of origin:

- With the mouse on the canvas.
- By specifying the absolute origin in the Properties Editor.
- By specifying the relative origin in the Properties Editor.

## Related Topics

[Working with Graphic Elements](#)

[Changing Points of Origin in the Properties Editor](#)

### Changing Points of Origin with the Mouse

You can change the point of origin for an element with the mouse.

#### To change the point of origin for an element with the mouse

1. Select an element on the canvas.
2. Move the mouse over the rotation handle of the element. The point of origin icon for the element appears.
3. Drag the Point of Origin icon to where you want to place the new point of origin for the element.
4. Release the mouse button.

## Related Topics

[Moving the Origin of an Element](#)

### Changing Points of Origin in the Properties Editor

You can change the absolute or relative point of origin in the Properties Editor.

The absolute point of origin shows the position of the point of origin in relation to the canvas. The absolute point of origin changes when the element moves.

The relative point of origin shows the position of the point of origin in relation to the center of the element. The relative point of origin does not change when the element moves.

## To change the point of origin in the Properties Editor

1. Select one or more elements on the canvas.
2. In the Properties Editor, do one of the following:
  - Type the absolute coordinates in the x, y format for the point of origin.
  - Type the relative coordinates in the x, y format for the point of origin.
3. Click Enter. The points of origin move to the specified absolute position or to the specified position in relation to the center points of the selected elements.

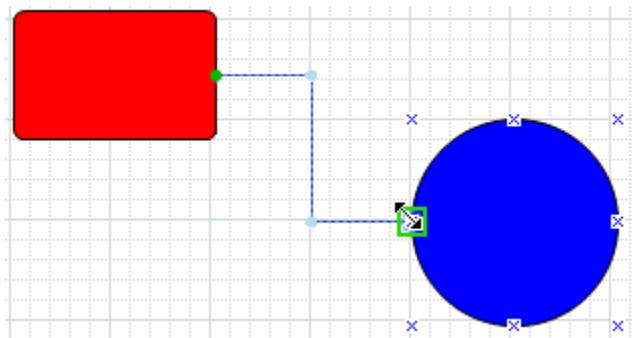

For example, if you have two elements, you can set the relative point of origin to 10, 10 to place the points of origin for both elements 10 pixels to the right and 10 pixels below the corresponding center points of each element.

## Related Topics

[Moving the Origin of an Element](#)

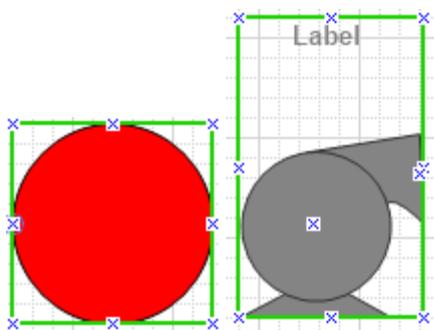

## Add Connectors Between Graphic Elements

A connector is a line drawn between graphic elements. A connector starts at a connection point on one graphic element and ends at a connection point on another element. Connectors are particularly useful for complex graphics like flow diagrams, industrial piping, or electrical wiring diagrams that incorporate many lines between graphic elements.

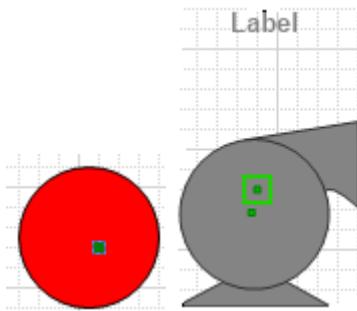

Connectors change length or orientation in response to changes to connected graphic elements during design time or run time. Graphic elements within a graphic can be moved, resized, or rotated and still maintain the connector between elements.

Connection points are the locations on a graphic element to attach a connector. A default set of eight connection points appear on the bounding rectangle around a graphic element or an embedded graphic.

You can also add custom connection points to graphic elements or embedded graphics if you want to place a connector at a different position than on a bounding rectangle.

One or more control points appear on an Angled connector based on the number of angles in the connector path. Using your mouse, you can move a control point horizontally or vertically to change the shape of a connector between the fixed connection points on both graphic elements. By default, a control point is placed at the intersection point of each right angle in a connector.

Connector lines do not maintain their horizontal and vertical orientation with 90 degree angles when placed in a graphic whose dimensions exceed 1280 by 1280 pixels. Instead, the connector will revert to a straight line between connection points.

You can also add control points to a connector if you want to change the shape of its path. For more information about adding control points to a connector, see [Change the Shape of a Connector](#).

## Related Topics

[Draw a Connector](#)

[Adding Connection Points](#)

[Change Connector Properties](#)

## Draw a Connector

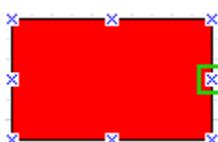

Use the Connector tool to draw a connector between graphic elements. The Connector tool initially attempts to draw a connector with a minimum number of angles. You can change the shape of the initial connector path using control points to redraw the path if necessary.

A connector supports Symbol Wizards like any other graphic element. You can associate a connector with a Symbol Wizard layer by dragging the connector element to the layer during design time. You can also remove the connector from a layer by removing the connector from the association list. If a connector is hidden based on the Symbol Wizard's Wizard Option configuration, the connector does not appear during run time.

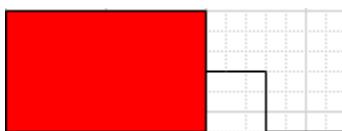

Press the Esc key to cancel drawing a connector. Also, clicking on the Industrial Graphic Editor's canvas takes you out of connector drawing mode.

### To draw a connector

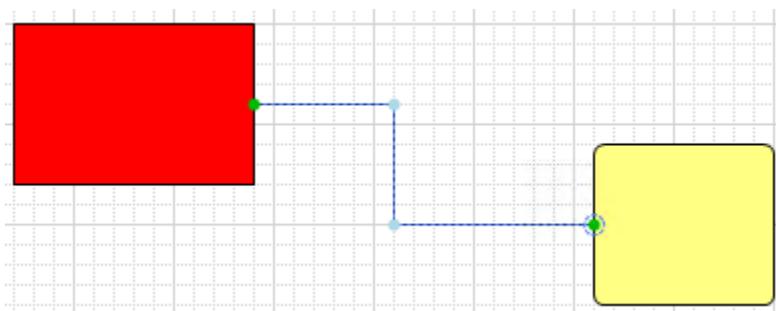

1. Open a graphic in Industrial Graphic Editor that you want to add a connector.
2. Click once on the **Connector** icon within the **Tools** pane to draw a single connector.  
If you want to draw multiple connectors, double click on the **Connector** icon.
3. Move your mouse over the first graphic element that you want to add a connector.  
The default connection points appear when you move your mouse over a graphic element.
4. Place the mouse over the connection point where you want to place the connector on the graphic element.  
A green rectangle appears around the connection point when it is selected.

A start connection point has an automatic offset, which is a perpendicular straight line segment from the start connection point to the first angle in the connector path. An automatic offset prevents the connector from following the border of the originating graphic element. No automatic offset is applied to the terminating connection point on the connected graphic element.

5. Press and hold your left mouse key and drag the mouse to the second graphic element.  
Connection points appear when you move the mouse over the second graphic element.

6. Release the mouse button when you are over a selected connection point on the second graphic element.  
The connector appears as a line between both graphic elements.
7. If necessary, use connector control points to change the shape of the connector between the connected graphic elements.

### Related Topics

[Add Connectors Between Graphic Elements](#)

## Adding Connection Points

Use the Connection Point tool to place additional connection points at other locations on a graphic element than the bounding rectangle. Also, you can place custom connection points on an embedded graphic and connect to them.

---

**Note:** Custom connection points are part of the parent graphic element and cannot be grouped. Also, custom connection points added to a graphic element that is part of a Symbol Wizard layer are shown when the graphic element is part of the Symbol Wizard's current configuration.

---

Press the Esc key to cancel adding a connection point. Also, clicking on the Industrial Graphic Editor's canvas takes you out of connection point addition mode.

### To add connection points

1. Open a graphic that you want to add one or more connection points.
2. Click once on the **Connection Point** icon from the **Tools** pane to draw a single connection point on a graphic element.

If you want to draw multiple connection points, double click on the **Connection Point** icon.

3. Move your mouse to a location within a graphic element that you want to place a new connection point.

---

**Note:** Connection points can be added within the bounding rectangle of a hosting element of an embedded graphic.

---

4. Click once.

The new connection point appears as a green rectangle at the location you selected.

### To change the position of a connection point

You can change the position of a connection point that you added to a graphic element or a graphic.

1. Click on the connection point you want to move to select it.
2. Keep the left mouse key pressed.
3. Drag the connection point to a new location and release the mouse key.

The **X** and **Y** properties show the coordinate position of the connection point.

You can also change the location of a connection point you added by changing the X and Y coordinate values assigned to the connection point's **X** and **Y** properties.

## Related Topics

[Add Connectors Between Graphic Elements](#)

### Change Connector Properties

A connector includes a set of **Appearance**, **Line Style**, and **Runtime Behavior** properties. These properties can be modified during design time.

During run time, you can use animation to change property values that affect the appearance or behavior of a connector. For Angled or Straight connectors, you can use Line Style or Element Style animation. A connection point does not support any type of animation.

	Property	Description
<b>Appearance Properties</b>		
	ConnectionType	Type of connector (Angled or Straight). Angled is the default, which contains a set of connector line segments with 90 degree angles between them.
	ElementStyle	Element style applied to a connector to change the line color, fill, and pattern. Line styles can be applied to Angled and Straight types of connectors. None is the default.
	X	Horizontal coordinate of the left most border of a selected graphic element or graphic that has an attached connector. The X coordinate value is the number of pixels between the left vertical border of the Industrial Graphic Editor's canvas area to the left most border position of the selected graphic element or graphic.
	Y	Vertical coordinate of the top border of a selected graphic element or graphic that has an attached connector. The Y coordinate value is the number of pixels between the top horizontal border of the Industrial Graphic Editor's canvas area to the top of the selected graphic element or graphic.
	Start	Read-only X and Y coordinates of a connector's start point with respect to the origin at the top left corner of the Industrial Graphic Editor's canvas.
	End	Read-only X and Y coordinates of a connector's end point with respect to the origin at the top left corner of the Industrial Graphic Editor's canvas.

	Property	Description
<b>Line Style Properties</b>		
	LineWeight	Line weight of an Angled or Straight type of connector. 1 is the default.
	LinePattern	Line pattern of an Angled or Straight type of connector. Solid is the default.
	StartCap	Shape of the line start point of an Angled or Straight type of connector. Flat is the default.
	EndCap	Shape of line end point of an Angled or Straight type of connector. Flat is the default.
	LineColor	Line color of an Angled or Straight type of connector. Black is the default.
<b>Runtime Behavior Properties</b>		
	Enabled	Connector animation is enabled or disabled during run time. Enabled is the default.
	Visible	Connector is visible or hidden during run time. Visible is the default.

## Related Topics

[Change the Type of Connector](#)

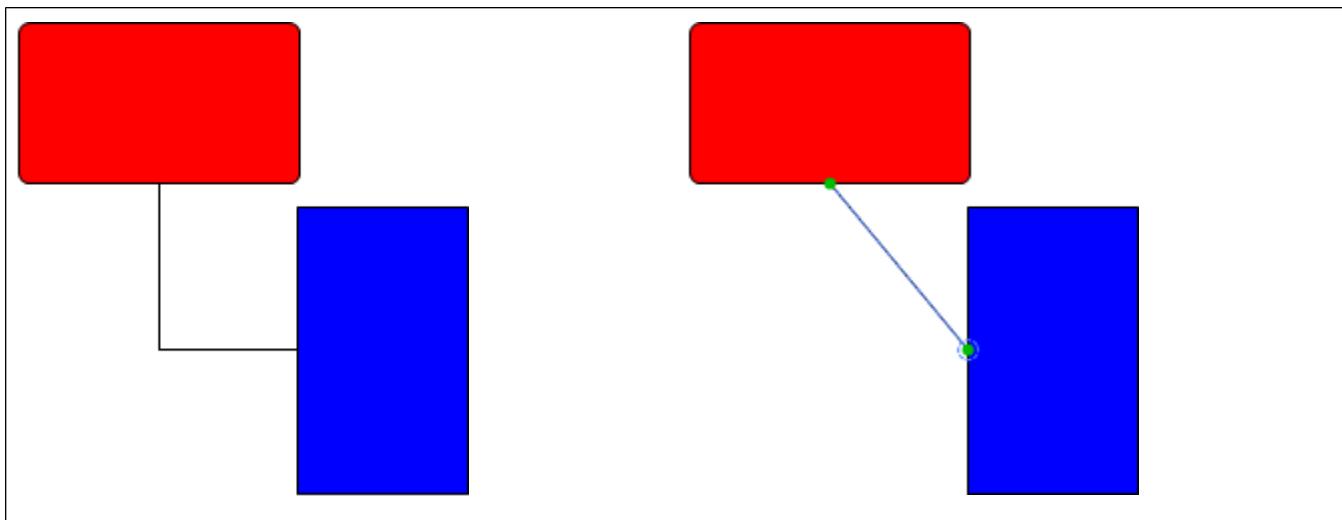

[Change the Length of a Connector](#)

[Change the Shape of a Connector](#)

# Change the Type of Connector

You can select the type of connector by setting an option for the **ConnectionType** property in the **Appearance** pane of the Industrial Graphic Editor.

The default connector type is Angled, which consists of horizontal and vertical lines with a 90 degree angle between them. A Straight connector is a straight line between the connection points on different graphic elements.

#### To change the type of connector

1. Click on a connector to select it.  
The **Connection Type** property appears in the **Appearance** pane of the Industrial Graphic Editor.
2. Select a connector type from the drop-down list of the **Connection** property.  
The appearance of the selected connector changes to the type you selected.

#### Related Topics

[Change Connector Properties](#)

## Change the Length of a Connector

You can change the length of a connector to move it to another connection point on a graphic element or detach it from a graphic element.

---

**Note:** A connector is not required to start or end at a connection point on a graphic element. Connectors can be drawn on the canvas detached from any graphic elements.

#### To change the length of a connector

1. Click on a connector to select it.  
The start point of a connector appears as a green circle. A halo appears around the end point.
  2. Select either the start or end point of the connector and keep your left mouse key pressed.
  3. Drag the start or end point of a connector to a new location and release the mouse key.  
The length of the connector changes until you release your mouse key. The **Start** or **End** properties show a new coordinate position based on whether you moved the connector's start or end point.
- You can also change the location of a connector's start or end points by changing the X and Y coordinate values assigned to the connector's **Start** or **End** properties.

## Related Topics

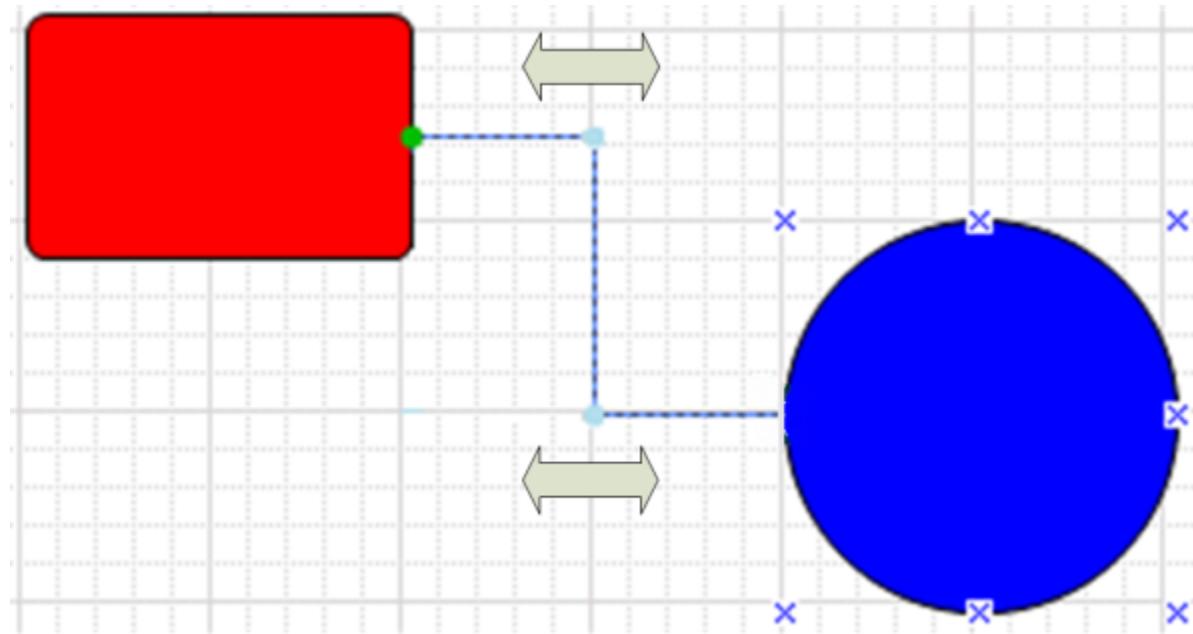

[Change Connector Properties](#)

# Change the Shape of a Connector

An Angled connector includes one or more control points that can be moved to change the shape of a connector.

The movement of control points is restricted to changing the shape of the connector without changing the fixed position of the connection points on graphic elements. For example, the two control points shown in the figure below are part of an Angled connector. Both control points can be moved horizontally to the same X coordinate position to change the position of the vertical line segment of the connector.

But, the line segments from the connection points of the graphic elements to their adjacent control points cannot be moved. In the following example, the control points cannot be moved vertically. To maintain the required right angles between line segments of an Angled connector would require the locations of the fixed connection points to be moved.

## To change the shape of a connector

1. Click on a connector to select it.  
A control point appears at the intersection point of each right angle in an Angled connector.
2. Click a control point and keep your mouse key pressed.  
The mouse cursor changes to a double arrow to indicate the control point can be moved.
3. Move the control point to change the shape of the connector and release the mouse key.

## Related Topics

[Change Connector Properties](#)

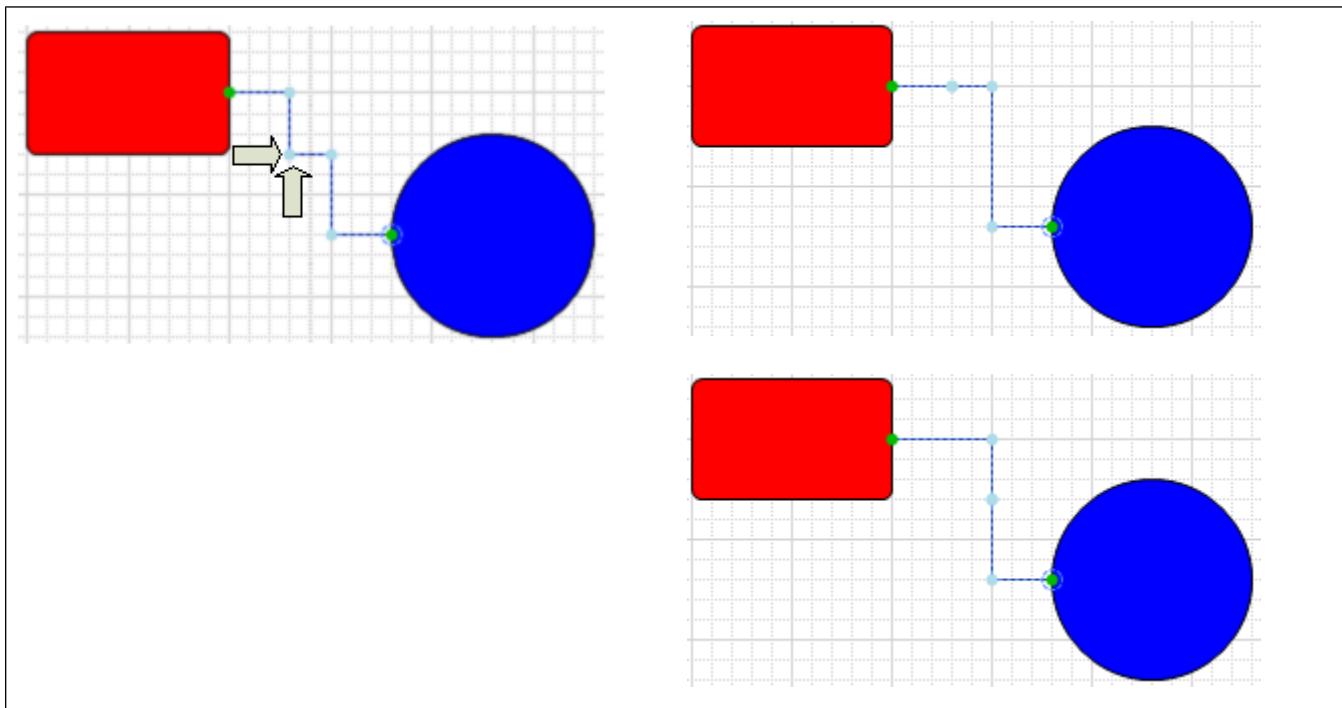

[Delete a Control Point](#)

## Delete a Control Point

### Delete a Control Point

If you want to remove a control point to change the shape of your connector, you must first reposition a line segment to ensure the resulting connector path contains only right angles before deleting a control point.

In the following example, a line segment needs to be repositioned vertically or horizontally to ensure the connector contains only right angles. After a line segment is repositioned, a control point can be deleted.

#### To delete a control point

1. Click on a connector to select it.
2. Move a line segment within the connector to ensure the connector path contains only right angles between its line segments.
3. With your Ctrl key pressed, place your cursor over the control point on the connector you want to delete.

The appearance of the cursor changes to a pen tip with a minus sign to indicate that a control point can be deleted from a connector.

---

**Note:** Control points at the right angles of a connector cannot be deleted. You can only remove control points on straight line segments.

---

4. Left click with your mouse to delete the control point.

The small blue circle on the connector disappears indicating the control point is deleted from the connector.

## Flipping Elements

You can flip elements on their horizontal or vertical axes. The axis for each element is determined by its point of origin. For more information on how to change the point of origin, see [Moving the Origin of an Element](#).

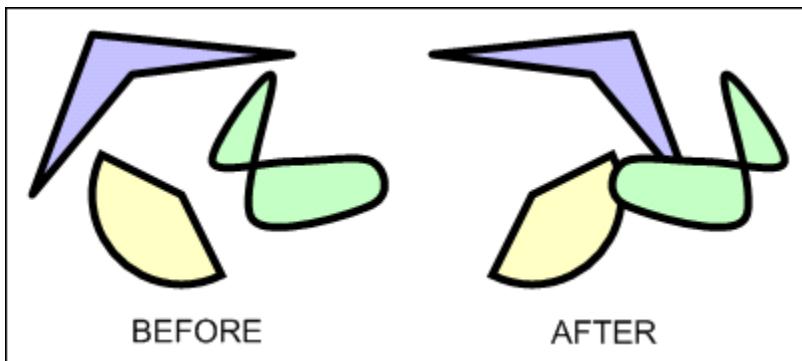

### To flip elements vertically

1. Select one or more elements.
2. On the **Arrange** menu, point to **Transform**, and then click **Flip Vertical**. The selected elements are flipped vertically on their horizontal axis.

### To flip elements horizontally

1. Select one or more elements.
2. On the **Arrange** menu, point to **Transform**, and then click **Flip Horizontal**. The selected elements are flipped horizontally on their vertical axis.

## Locking and Unlocking Elements

When you lock elements, they cannot be:

- Moved.
- Resized.
- Rotated.
- Aligned.
- Flipped.

You also cannot change the point of origin in locked elements. To enable these functions again, you need to unlock the elements.

### To lock elements

1. Select all elements that you want to lock.
2. Do one of the following:
  - On the **Arrange** menu, click **Lock**.
  - In the Properties Editor, set the Locked property to **True**.The selected elements appear with lock icons at their handles.

### To unlock elements

1. Select all elements that you want to unlock.
2. Do one of the following:
  - On the **Arrange** menu, click **Unlock**.
  - In the Properties Editor, set the Locked property to False.The lock icons disappear from the handles of the selected elements.

## Making Changes Using Undo and Redo

Use the Undo function to reverse an editing change you made to a graphic element in the Industrial Graphic Editor. After you undo a change, you can also restore the change by using the Redo function. The Undo and Redo functions appear as icons on the Industrial Graphic Editor's **Edit** menu.

You can undo one single change, or any number of changes that you have previously made. You can also redo any number of changes. These can be selected from a list.

### To undo a single change

- Do one of the following:

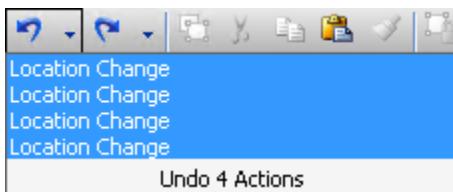

- Press Ctrl + Z.
- On the **Edit** menu, click **Undo**.

### To redo a single change

- Do one of the following:
  - Press Ctrl + Y.
  - On the **Edit** menu, click **Redo**.

### To undo a specified number of previous changes

1. On the toolbar, click the **Undo** icon. The **Undo** list appears with one or more descriptions of what changes were made.

2. Select a change from the list or click the bottom list entry to undo all changes. The changes up to and including the selected item are undone.

### To redo a specified number of previously undone changes

1. On the toolbar, click the **Redo** icon. The **Redo** list appears with a description of what the undone changes were.
2. Select a the change from the list or click the bottom list entry to redo all changes. The changes down to and including the selected item are redone.

## Working with Groups of Elements

You can group together multiple elements. This is useful to bind certain element together so that they are not inadvertently moved. The group is treated as a new element.

You can:

- Create a group from one or more elements.
- Ungroup the elements without losing their original configuration information.
- Add more elements to an existing group.
- Remove elements from a group.
- Edit the elements of a group without having to ungroup them.

## Related Topics

### Creating a Group of Elements

After you create elements, you can group them. Grouping elements lets you manage the elements as one unit. Groups are assigned default names when you create them, such as Group1, Group2, and so on. After you create a group, you can rename it.

Groups can have properties that are different than the properties of the elements.

#### To create a group

1. Select the elements you want as part of the new group.
2. On the **Arrange** menu, point to **Grouping**, and then click **Group**. The elements are combined into a group. The group is listed in the Elements List.
3. Rename the group as required. To do this:
  - a. In the Elements List, click the group name and click again. The group name is in edit mode.
  - b. Type a new name and click Enter. The group is renamed.
  - c. You can also rename a group or elements by changing the Name property in the Properties Editor.

## Related Topics

- [Working with Groups of Elements](#)

### Ungrouping

After you create a group, you can ungroup it if you no longer want it.

If the group included elements and other groups, when you ungroup, the original elements and groups again exist as independent items. To ungroup any subgroups, select each one and ungroup it separately.

If you ungroup a set of elements and elements already exist with the names of the grouped elements, then the newly ungrouped elements are renamed.

#### To ungroup

1. Select the groups you want to ungroup.
2. On the **Arrange** menu, point to **Grouping**, and then click **Ungroup**. The groups are converted to the original elements. The group name is removed from the Elements List and the element names appear.

### Adding Elements to Existing Groups

After you create a group, you can add elements or other groups to an existing group.

For example, you can combine a group that represents a valve with another group that represents a tank to create a new group that can be called a tank unit.

You can add:

- Elements to groups.
- Groups to the primary selected group.

#### To add elements to an existing group

- On the canvas, select the group and also elements and groups that you want to add.
- Right-click a selected element or on the group, point to **Grouping**, and then click **Add to Group**. The selected elements are added to the group.

---

**Note:** You can also add elements to existing groups by using the Elements List in similar way.

---

## Related Topics

[Working with Groups of Elements](#)

### Removing Elements from Groups

After you create a group, you can remove elements from the group. This lets you remove one or more elements you no longer want in that group.

Removing elements from the group removes them from the canvas. It also removes any scripts or animations you added to the element.

#### To remove an element from a group

1. On the canvas, select the group with the elements that you want to remove.
2. Click the group again to enter inline editing mode.
3. Select the elements that you want to remove from the group.
4. Right-click a selected elements, point to **Grouping**, and then click **Remove from Group**. The selected elements are removed from the group.

---

**Note:** You can also remove elements from existing groups by using the Elements List in similar way.

---

## Editing Components within a Group

You can edit components within a group without having to dissolve the group. Do this by:

- Selecting the element in Elements List.
- Using the **Edit Group** command on the shortcut menu.
- Slowly double-clicking to enter inline editing mode.

### To edit components within a group by using the Elements List

1. In the Elements List, expand the group that contains the element that you want to edit.
2. Select the element that you want to edit. The element appears selected in the group and the group is outlined with a diagonal pattern.
3. Edit the element with the Properties Editor, by mouse or by menu according to your requirements.
4. Click outside the group.

### To edit components within a group by using the Edit Group command

1. On the canvas, select the group that you want to edit.
2. On the menu **Edit**, click **Edit Group 'GroupName'**. The group is outlined with a diagonal pattern.
3. Select the element that you want to edit.
4. Edit the element with the Properties Editor, by mouse, by menu or pop-up menu according to your requirements.
5. Click outside the group.

---

**Note:** If you move the position of an element in a group outside the group, the group size is automatically changed to incorporate the new position of the element.

---

[Working with Groups of Elements](#)

## Using Path Graphics

You can join a set of open elements, such as lines, to create a new closed element. The new closed element is called a path graphic.

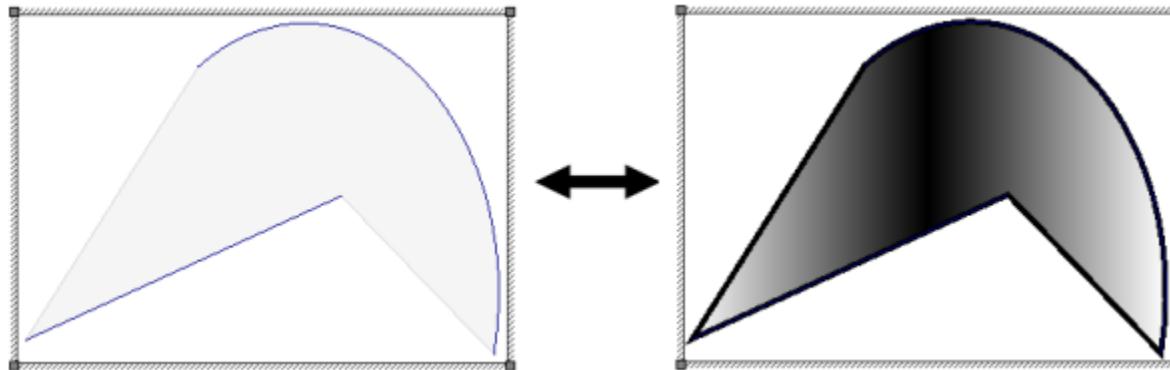

You can:

- Create a path graphic by joining open elements.
- Break the path graphic into its elements.
- Edit the path graphic in its entirety or by editing its elements.
- Add new elements to the path graphic.
- Remove elements from the path graphic.

You can view a path graphic in two modes:

- Element mode shows you the individual elements contained in the path graphic and determine its shape. Elements that make up the path graphic are shown as blue lines. The points where the elements are connected are shown as grey lines.
- Path mode shows you the path graphic in its final rendering, including fill styles and lines styles.

When you are in inline editing mode, you can switch between both modes by pressing the space bar. This lets you preview the path graphic without leaving the inline editing mode.

## Creating a Path Graphic

You can create a path graphic from one or more open elements such as lines, polylines, curves, and arcs.

The path graphic is created according to the start and end points and the z-order of the open elements that create it.

For example, if you draw a line from point A to point B, then an arc from point C to point D, and then join these elements in a path graphic, the path graphic is described by a straight edge from points A to B, a straight edge from points B to C, a curved edge from points C to D, and closed by a straight edge from points D to A.

**Note:** If the Path Graphic doesn't appear as you expected after you create it, then you can swap the end points or change the z-order of one or more elements. For more information, see and [Changing the Z-order of an Element in a Path Graphic](#).

#### To create a path graphic

1. Select one or more open elements.
2. On the **Arrange** menu, point to **Path**, and then click **Combine**. A new path graphic is created from the selected open elements.

## Related Topics

[Using Path Graphics](#)

### Breaking the Path of a Path Graphic

You can break the path of a path graphic so that it is broken into its individual open elements. When you do so, the path graphic loses its unique properties such as fill style and line style.

#### To break the path of a path graphic

1. Select one or more path graphics.
2. On the **Arrange** menu, point to **Path**, and then click **Break**.

## Related Topics

[Using Path Graphics](#)

### Changing a Path Graphic

You can edit an existing path graphic on the canvas by accessing the individual elements of which it consists. For each individual element, you can:

- Move.
- Rotate.
- Change size.
- Change start and sweep angles if the elements are arcs.
- Change control points if the elements are curves or polylines.
- Swap the end points of an element in a path graphic.
- Change the z-order or the elements in a path graphic.

The path graphic is updated while you edit the individual elements.

[Changing a Path Graphic](#)

# Swapping the End Points of an Element in a Path Graphic

The path graphic is created by following the direction in which you draw its elements.

If a path graphic does not appear as expected, this can be caused by drawing an element in a different direction as intended. You can see this if one of the path graphic edges appears crossed over when connecting to the previous and next element.

You can fix this by swapping the end points of the element where this appears.

### To swap the end points of an element within a path graphic

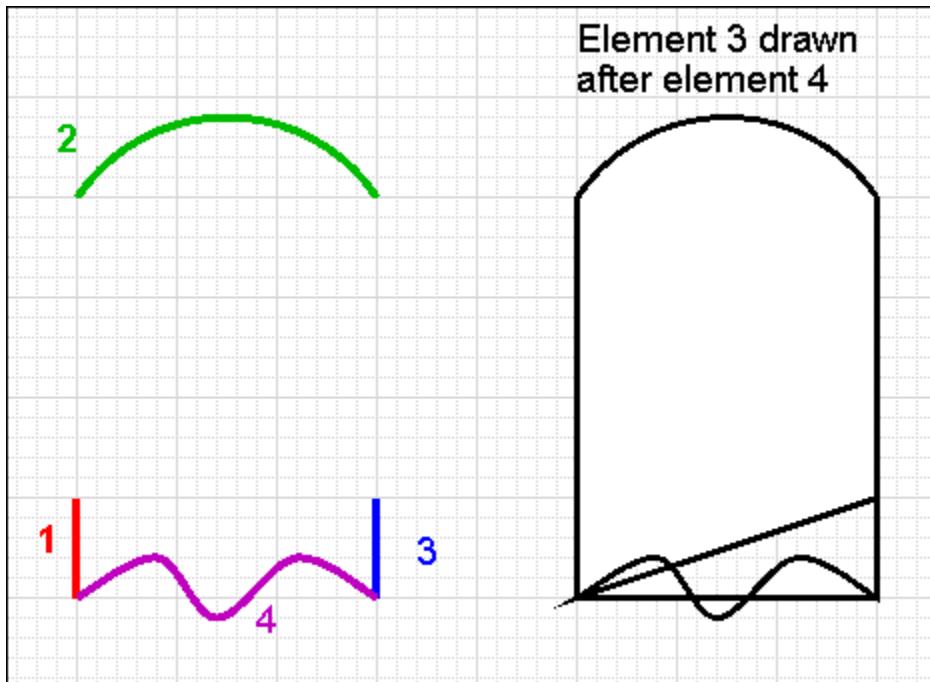

1. Select the path graphic you want to edit.
2. Do one of the following:
  - a. On the **Edit** menu, click **Edit Path**.
  - b. Slowly double-click the path graphic.  
The path graphic appears in element mode.
3. Select the individual element within the path graphic for which you want to swap the end points. You can also do this by selecting the element in the Elements List.
4. Right-click that element and select **Path, Swap End Points** on the context menu. The end points of the selected element are swapped and the path graphic is updated accordingly.
5. Click outside the path graphic on the canvas. The path graphic is shown in path mode.

# Changing the Z-order of an Element in a Path Graphic

If a path graphic does not appear as expected, this can be caused by drawing an element in a different z-order as intended. You can see this if one of the path graphic edges jumps across the path graphic area.

You can fix this by changing the z-order of the element where this appears.

**Note:** The z-order of elements in a path graphic is only applicable within the path graphic.

### To change the z-order of an element within a path graphic

1. Select the path graphic you want to edit.
2. Do one of the following:
  - a. On the **Edit** menu, click **Edit Path**.
  - b. Slowly double-click the path graphic.  
The path graphic appears in element mode.
3. Select the individual element within the path graphic for which you want to change the z-order. You can also do this by selecting the element in the Elements List.
- Note:** You can see the elements in their z-order in the Elements List. Alternatively, you can select one from the Elements List and change its z-order.
4. On the **Arrange** menu, point to **Order**, and then click:

- **Send To Back** to send the element to the back of the set of elements of the path graphic.
  - **Send Backward** to send the element one order backward.
  - **Sent To Front** to send the element to the front of the set of elements of the path graphic.
  - **Send Forward** to send the element one order forward.
5. Click outside the path graphic on the canvas. The path graphic is shown in path mode.

## Related Topics

[Changing a Path Graphic](#)

### Adding Elements to an Existing Path Graphic

You can easily add elements to an existing path graphic. You can add:

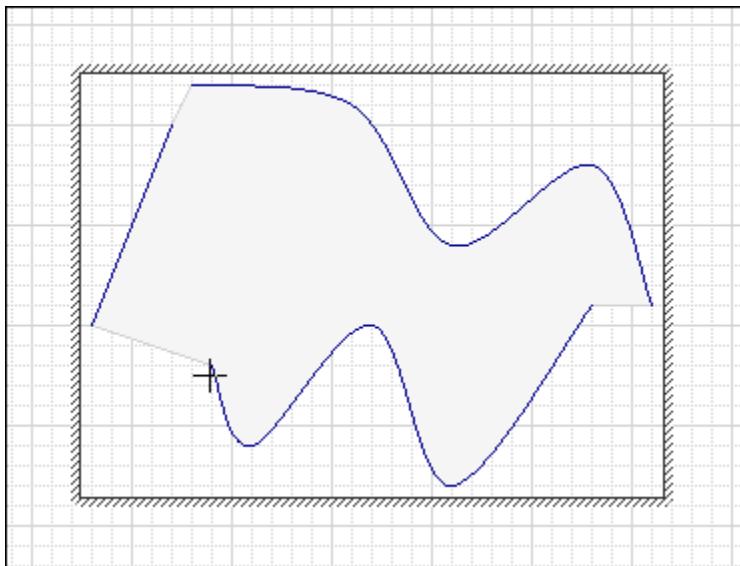

- New elements, which you draw while the path graphic is in edit mode.
- Existing elements, which are already on the canvas.

You can only add open elements such as lines, polylines, curves, and arcs to an existing path graphic.

You can only set the origin of a new element within the frame of the existing path graphic. If you click anywhere outside the path graphic, the edit mode is exited and the element you are drawing is a new element.

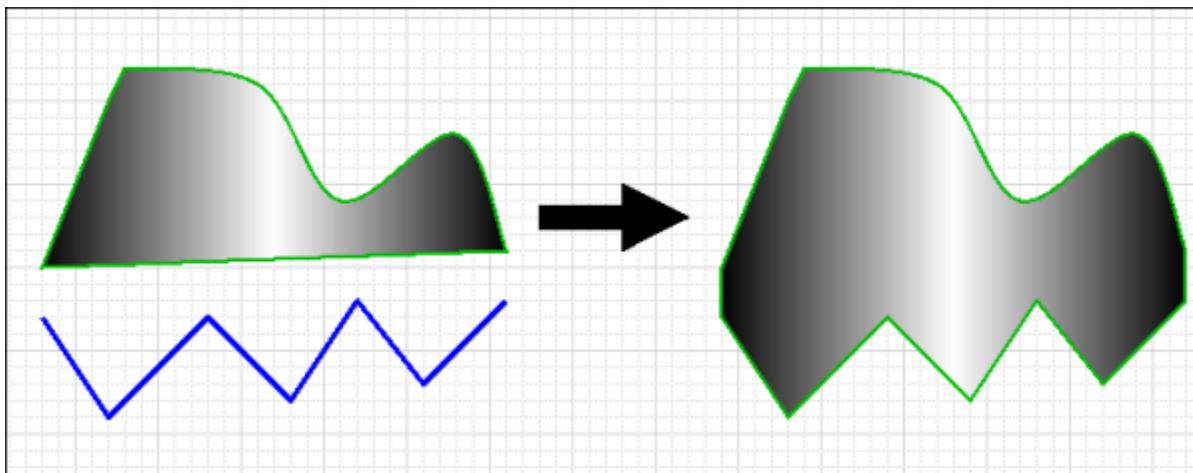

#### To add new elements to an existing path graphic

1. Select the path graphic to which you want to add a new element.
2. On the **Edit** menu, click **Edit Path**. The path graphic appears in element mode.
3. Select the new element you want to add from the Tools panel.
4. Draw the element as you would normally. While you are drawing the element, the path graphic is updated.

### To add existing elements to an existing path graphic

1. Select the path graphic and all elements that you want to add to the path graphic.
2. Right-click a solid part of a selected element, point to **Path**, and then click **Add To Path**. The selected elements are added to the selected path graphic.

### Related Topics

[Using Path Graphics](#)

### Removing Elements from a Path Graphic

You can remove individual elements from a path graphic. The elements are not deleted, but appear outside the path graphic.

You cannot remove the last element of a path graphic.

### To remove elements from a path graphic

1. Select the path graphic from which you want to delete individual elements.
2. On the **Edit** menu, click **Edit Path**. The path graphic appears in element mode.
3. Shift + click one or more elements to remove.

---

**Note:** You can also select the elements to remove from the Elements List by holding CTRL key during the selection.

---

4. Right-click any selected element, point to **Path**, and then click **Remove From Path**. The selected element is removed from the path graphic and the path graphic is updated accordingly.

- [Enabling and Disabling Elements for Run-Time Interaction](#)
- [Changing the Visibility of Elements](#)
- [Editing the Tab Order of an Element](#)
- [Using the Format Painter to Format Elements](#)
- [Editing the General Properties of a Graphic](#)

### Editing the Name of an Element

Some properties are common to most types of elements, such as fill, line styles, and visibility. You can:

- Edit the name of an element.
- Edit the fill properties of an element.
- Edit the line properties of an element.
- Edit the text properties of an element.
- Set the style.
- Set the transparency level of an element.
- Adjusting colors and style for an element's gradient style.
- Enable and disable elements for run-time interaction.
- Change the visibility of an element.
- Change the tab order of an element.
- Use the Format Painter to format elements.
- Edit the general properties of a graphic.

The name of an element uniquely identifies the element on the drawing surface.

When you draw a new element on the drawing surface, it is assigned a default name. You can then change its name in the Properties Editor or the Elements List.

Element names are case-insensitive and unique within the same element hierarchy. It is possible to have two elements with the same name if one is, for example, in a group and the other outside that group.

### To change an element's name in the Properties Editor

1. Select the element on the drawing surface.
2. In the Properties Editor, click the value for the **Name** box.
3. Type a new name and click Enter.

### To change an element's name in the Elements List

1. Select the element in the Elements List.
2. Click the element in the Elements List again.
3. Type a new name and click Enter.

## Related Topics

### Setting Fill Style

You can configure the fill style of one or more elements. You can do this to:

- Selected elements on the toolbar.
- Style properties in the Properties Editor.
- Nested style properties, such as just one color of a multi-colored gradient.

### To configure the fill style of an element with the toolbar

1. Select one or more elements you want to configure.
2. On the toolbar, click the down arrow to the right of the **Fill Color** icon. The fill style list appears.
3. Configure the fill color. Do any of the following:
  - Click **No Fill** to configure an empty element.
  - Click a predefined solid color in the display.
  - Click **More Solid Colors** to open the style selection dialog box and select a solid color.
  - Click **Color Picker** to select a color from the screen.
4. Configure the fill gradient, pattern, or texture. Do any of the following:
  - Click a predefined gradient.
  - Click **More Gradients** to open the style selection dialog box and configure a gradient.
  - Click **Patterns** to open the style selection dialog box and select a pattern.
  - Click **Textures** to open the style selection dialog box and select a texture.

For more information about the style selection dialog box, see [Setting Style](#).

### To configure the fill style by setting style properties

1. Select one or more elements.
2. In the Properties Editor, locate the **FillStyle** property.
3. Click the browse button to open the style selection dialog box. For more information about the style selection dialog box, see [Setting Style](#).

### To configure the fill style by setting gradient color style properties

1. Select one or more elements with gradient fill style.
2. In the Properties Editor, locate the **Color1**, **Color2**, and **Color3** properties.
3. Click the browse button for any of these to set the selected gradient color from the style selection dialog box. For more information, see [Setting Style](#).

## Related Topics

[Editing the Fill Properties of an Element](#)

### Setting Unfilled Style

You can configure an element's unfilled style. The unfilled style of an element determines the element's unfilled portion at design time and run time.

## To configure the unfilled style of an element

1. Select one or more elements.
2. In the Properties Editor, click **UnfilledStyle**.
3. Click the browse button in the **UnfilledStyle** line. The style selection dialog box appears.
4. Select a solid color, gradient, pattern, or texture. For more information about the style selection dialog box, see [Setting Style](#).
5. Click **OK**.

## Related Topics

[Editing the Fill Properties of an Element](#)

### Setting Fill Orientation

You can configure an element's fill orientation in the Properties Editor. The fill orientation property determines if the fill style is relative to the screen or element.

- If relative to the screen, the gradient, pattern, or texture does not rotate with the element.
- If relative to the element, the gradient, pattern, or texture rotates with the element.

## To configure an element's fill orientation

1. Select one or more elements you want to configure.
2. In the Properties Editor, click **FillOrientation**.
3. From the list in the same line, click **RelativeToScreen** or **RelativeToGraphic**.

## Related Topics

[Editing the Fill Properties of an Element](#)

### Setting Fill Behavior

You can set the fill behavior of an element. The fill can be:

- Horizontal.
- Vertical.
- Both horizontal and vertical.

## To set an element's fill behavior

1. Select one or more elements you want to configure.
2. In the Properties Editor, set the property **FillBehavior** to one of the following:
  - **Horizontal**

- Vertical
- Both

## Related Topics

[Editing the Fill Properties of an Element](#)

### Setting Horizontal Fill Direction and Percentage

An element can fill:

- From left to right.
- From right to left.

You can also set the amount you want the element to be horizontally filled by as a percentage.

#### To set an element's horizontal fill direction and percentage

1. Select one or more elements you want to configure.
2. In the Properties Editor, set the **HorizontalDirection** property to:
  - **Right** to fill from left to right.
  - **Left** to fill from right to left.
3. For the **HorizontalPercentFill** property, type a percentage (0 - 100) in the value box.

## Related Topics

[Editing the Fill Properties of an Element](#)

### Setting Vertical Fill Direction and Percentage

An element can fill:

- From bottom to top.
- From top to bottom.

You can also set the amount you want the element to be vertically filled by as a percentage.

#### To set an element's vertical fill direction and percentage

1. Select one or more elements you want to configure.
2. In the Properties Editor, set the **VerticalDirection** property to:
  - **Top** to fill from bottom to top.
  - **Bottom** to fill from top to bottom.
3. For the **VerticalPercentFill** property, type a percentage (0 - 100) in the value box.

## Related Topics

[Editing the Fill Properties of an Element](#)

### Editing the Line Properties of an Element

You can set the line properties for any element that contains lines, such as:

- Lines and polylines.
- Rectangles, rounded rectangles, and ellipses.
- Curves, closed curves, and polygons.
- Arcs, pies, and chords.
- Text boxes.

You can set the:

- Start and end points for lines, arcs, and H/V lines.
- Line weight, which is the thickness of a line.
- Line pattern, which is the continuity of a line. For example, a continuous line, a dotted line, a dashed line, or a combination.
- Line style, which is the fill style of a line.
- Shape and size of the end points of a line. For more information, see [Setting Line End Shape and Size](#).

---

**Note:** You can also set the element's line properties in the **Line Format** properties group in the Properties Editor.

---

[Setting the Line Style](#)

### Setting Start or End Points of a Line

After you draw a line or H/V line, you can change its start or end points in the Properties Editor.

#### To set the line or H/V line start or end point

1. Select a line or H/V line.
2. In the Properties Editor, type coordinate values X, Y for the **Start** or **End** properties.

## Related Topics

[Editing the Line Properties of an Element](#)

### Setting the Line Weight

You can set a line weight from 0 pixels to 255 pixels for any element that contains lines. You can set the line weight using the **Format** menu, the toolbar, or the **LineWeight** property in the Properties Editor.

---

**Note:** Large line weight settings can cause unexpected behavior, especially with curves and line end styles.

#### To set the line weight using the Format menu

1. Select one or more elements.
2. On the **Format** menu, click **Line Weight**.
3. To use a predefined line weight, select it from the list.
4. To use another line weight, click **More Line Options**. The **Select Line Options** dialog box appears. In the **Weight** box, type a new line weight from 0 to 255 and then click **OK**.

## Related Topics

[Editing the Line Properties of an Element](#)

### Setting the Line Pattern

You can set the line pattern for any element that contains lines. The line pattern specifies the continuity of a line (continuous, dotted, dashed) and not its fill properties.

#### To set the line pattern

1. Select one or more elements.
2. On the **Format** menu, click **Line Pattern**.
3. To use a predefined line pattern, select it from the list.
4. To use another line pattern, click **More Line Options**. The **Select Line Options** dialog box appears. In the **Pattern** list, select a pattern, and then click **OK**.

---

**Note:** You can also set the line pattern by changing the **LinePattern** property in the Properties Editor.

### Setting the Line Style

You can set the line style for any element that contains lines. Setting the line style is similar to setting the fill style. You can also set the solid color, gradient, pattern, and texture for a line.

## To set the line style

1. Select one or more elements.
2. On the toolbar, click the **Line Color** icon. The line style list appears.
3. Configure the line color. Do any of the following:
  - Click a predefined solid color in the display.
  - Click **More Solid Colors** to open the style selection dialog box and select a solid color.
  - Click **Color Picker** to select a color from the screen.
4. Configure the line gradient, pattern, or texture. Do any of the following:
  - Click a predefined gradient.
  - Click **More Gradients** to open the style selection dialog box and configure a gradient.
  - Click **Patterns** to open the style selection dialog box and select a pattern.
  - Click **Textures** to open the style selection dialog box and select a texture.

For more information about the style selection dialog box, see [Setting Style](#).

---

**Note:** You can also set the element's line style in the Properties Editor. If you do this, you can configure the solid color, gradient, pattern, or texture in the style selection dialog box. For more information, see [Setting Style](#).

---

## Setting the Text Properties of an Element

You can set the following for text, text box, and button elements:

- The text that appears
- The format in which the text appears
- The font of the text
- The alignment of the text
- The text style

You can also substitute strings in text, text box, and button elements.

## Related Topics

## Substituting Strings

### Setting the Displayed Text

You can set the text of a text element, text box, or button in the canvas or by changing the Text property in the Properties Editor.

#### To set the text to display

1. Select the text element, text box or button on the canvas.
2. On the **Edit** menu, click **Edit Text**. The selected element appears in edit mode.
3. Type a text string and press **Enter**.

### Related Topics

[Setting the Text Properties of an Element](#)

### Setting the Text Display Format

You can configure how values are shown for the text in a text box or button. For example, as a rounded float with the format #.###.

You can format the text display for the:

- Text element and the button element in the same way as in the HMI or with the TextFormat property in the Properties Editor.
- Text box element only with the **TextFormat** property.

#### To set the text display format

1. Select a text element, text box, or button.
2. In the **Properties Editor**, type a format for the **TextFormat** property.

### Related Topics

[Setting the Text Properties of an Element](#)

### Setting the Text Font

You can change the font style and font size of a text using:

- The **Format** menu.
- The **Font** property in the **Properties Editor**.
- Lists on the toolbar.

## To set the text font, font style, and size

1. Select a text element, a text box, or a button element on the canvas.
2. On the **Format** menu, click **Fonts**. The **Font** dialog box appears.
3. Set the font, font style, size, and effects.
4. Click **OK**.

## Related Topics

[Setting the Text Properties of an Element](#)

### Setting the Text Color

You can set the text color as a solid color, a gradient, a pattern, or a texture.

**Note:** You can also change the text color in the **Properties Editor** with the **TextColor** property.

#### To set the text color

1. Select a text element, a text box, or a button element on the canvas.
2. Click the **Text Color** icon.
3. Configure the text color. Do any of the following:
  - Click a predefined solid color in the display.
  - Click **More Solid Colors** to open the style selection dialog box and select a solid color.
  - Click **Color Picker** to select a color from the screen.
4. Configure the text gradient, pattern, or texture. Do any of the following:
  - Click a predefined gradient.
  - Click **More Gradients** to open the style selection dialog box and configure a gradient.
  - Click **Patterns** to open the style selection dialog box and select a pattern.
  - Click **Textures** to open the style selection dialog box and select a texture.

For more information about the style selection dialog box, see [Setting Style](#).

## Related Topics

[Setting the Text Properties of an Element](#)

### Setting the Text Alignment

You can change the horizontal and vertical positioning of text within a text box element or button element.

You can also change the positioning for a text element. If the text is modified at design time or run time, the alignment sets how the element boundary changes to fit around the modified text.

**Note:** You can also set the text alignment in the **Properties Editor** by setting the **Alignment** property.

If the element is a text box or a button, then the text is aligned accordingly.

If the element is a text element and you then modify the text at design time or run time, the text is anchored to

the point of alignment.

- Text right alignments move additional text further over to the left.
- Text left alignments move additional text to the right.
- Changes in font size leave the point of alignment unchanged and modify the frame accordingly.

### To set the text alignment

1. Select a text element, text box element or button element on the canvas.
2. On the **Format** menu, point to **Text Alignment**, and then click the appropriate command:

Click this command	To
<b>Top Left</b>	Align the text at the top left frame handle.
<b>Top Center</b>	Align the text at the top middle frame handle.
<b>Top Right</b>	Align the text at the top right frame handle.
<b>Middle Left</b>	Align the text at the middle left frame handle.
<b>Middle Center</b>	Align the text in the middle of the element.
<b>Middle Right</b>	Align the text at the middle right frame handle.
<b>Bottom Left</b>	Align the text at the bottom left frame handle.
<b>Bottom Center</b>	Align the text at the bottom center frame handle.
<b>Bottom Right</b>	Align the text at the bottom right frame handle.

## Related Topics

[Setting the Text Properties of an Element](#)

## Substituting Strings

You can search and replace strings of any element that have the **Text** property on your canvas. You can use the basic mode to replace strings in a list.

You can also use advanced functions, such as find and replace, ignore, case-sensitivity, and wildcards.

You cannot substitute static strings that are used in an Radio Button Group, List Box or Combo Box.

If you substitute strings for a text element in an embedded graphic, that text element is not updated if you change the source graphic's text. For example, an embedded graphic contains a text graphic with the string "SomeTextHere". You substitute "SomeTextHere" with "MyText", and then change the source graphic text from "SomeTextHere" to "NewText". The text in the embedded graphic will still show "MyText".

## To substitute strings in a graphic by using the list

1. Select one or more elements.
2. Do one of the following:
  - Press Ctrl + L.
  - On the **Special** menu, click **Substitute Strings**.  
The **Substitute Strings** dialog box appears.
3. In the **New** column, type the text to be replaced.
4. Click **OK**.

## To substitute strings in a graphic by using advanced functions

1. Select one or more elements.
2. Do one of the following:
  - Press Ctrl + E.
  - On the **Special** menu, click **Substitute Strings**.  
The **Substitute Strings** dialog box appears.
3. Click **Find & Replace**. The dialog box expands and shows advanced options.
4. Configure the search strings. Do any of the following:
  - To find specific strings in the list, type a string in the **Find What** box and click **Find Next** to find the next string.
  - To replace a selected found string with another string, type a string in the **Replace with** box and click **Replace**.
  - To replace multiple strings, type values in the **Find What** and **Replace with** boxes and click **Replace all**.
5. Configure the search options. Do any of the following:
  - If you want the search to be case-sensitive, click **Match Case**.
  - To find only entire words that match your search string, click **Match Whole Word Only**.
  - To use wildcards, click **Use Wildcards**. Use an asterisk (\*) to search for any sequence of characters. Use a question mark (?) to search for strings with one variable character.
6. Click **OK**.

## Setting Style

You can set the fill, line, and text style from various places in the Industrial Graphic Editor using the style selection dialog box. The style selection dialog box is common to any element for which you can set a solid color, gradient, pattern, or texture. You can also set the transparency of the style.

Because you can open the style selection dialog box from different places in the Industrial Graphic Editor, the dialog box header can be different.

Also, not all tabs may be available. For example, for setting one color of a gradient in the Properties Editor, you can only select a solid color from the style selection dialog box.

### Setting a Solid Color

You can set a solid color using the **Solid Color** tab in the style selection dialog box. You can set a solid color from the:

- Standard palette.
- Color disc and bar.
- Value input boxes.
- Color picker.
- Custom palette.

You can also:

- Add the new color to the custom palette.
- Remove a color from the custom palette.
- Save the custom palette.
- Load a custom palette.

# Setting a Solid Color from the Color Disc and Bar

You can set a solid color using the color disc and bar on the **Solid Color** tab in the style selection dialog box. The color disc and bar let you graphically select the color and the luminance (brightness).

## To set a solid color from the color disc and bar

1. In the style selection dialog box, click the **Solid Color** tab.
2. Click on the color disk to select a color. The bar is updated and shows the selected color in varying degrees of luminance (brightness).
3. Click on the bar to select a luminance (brightness). The new color appears in the **New** color box on the right of the dialog box.
4. Click **OK**.

## Related Topics

[Setting a Solid Color](#)

# Setting a Solid Color with the Value Input Boxes

You can set a solid color by typing values that define the color, such as:

- Red component (0-255).
- Green component (0-255).
- Blue component (0-255).
- Hue (0-255).
- Saturation (0-255).
- Luminance (0-255).

## To set a solid color with the value input boxes

1. In the style selection dialog box, click the **Solid Color** tab.
2. In the **Red**, **Green**, **Blue**, **Hue**, **Sat.** and **Lum.** boxes, type respective values. The resulting color appears in the **New** color box on the right of the dialog box and also on the color wheel and bar.
3. Click **OK**.

# Setting a Solid Color with the Color Picker

You can set a solid color by using the color picker on the **Solid Color** tab in the style selection dialog box. The color picker lets you select a color from anywhere on the screen.

## To set a solid color with the color picker

1. In the style selection dialog box, click the **Solid Color** tab.
2. Click the **Color Picker** button. The color picker pointer appears.
3. Select a color from anywhere on the screen by moving the mouse. As you move the mouse, the new color appears in the **New** color box on the right of the dialog box.
4. Click the mouse to complete the color selection.
5. Click **OK**.

## Related Topics

[Setting a Solid Color](#)

# Setting a Solid Color from the Custom Palette

You can set a solid color from the custom palette on the **Solid Color** tab in the style selection dialog box. The custom palette is a set of colors that you want to frequently use. You can save the custom palette to a .pal file or load a custom palette from a .pal file.

To use colors from the custom palette, you first need to add them. For more information, see [Adding and Removing Colors in the Custom Palette](#).

## To set a solid color from the custom palette

1. In the style selection dialog box, click the **Solid Color** tab.
2. In the **Custom Palette** area, select a color. The new color appears in the **New** color box on the right of the dialog box.
3. Click **OK**.

## Related Topics

[Setting a Solid Color](#)

# Adding and Removing Colors in the Custom Palette

You can add up to 36 solid colors to the custom palette. You can also remove any colors from the custom palette. You cannot add a color that is already in the custom palette.

## To add a solid color to the custom palette

1. In the style selection dialog box, click the **Solid Color** tab.
2. Add the color. Do any of the following:
  - Select a solid color from the custom palette.
  - Select a solid color from the color disc and bar.
  - Type values for red, green, blue, hue, saturation, and luminance.
  - Select a solid color with the color picker.The new solid color appears in the **New** color box on the right of the dialog box.
3. Click the add button above **Custom Palette**. The solid color is added to the **Custom Palette** area.

## To remove a solid color from the custom palette

1. In the style selection dialog box, click the **Solid Color** tab.
2. In the **Custom Palette** area, select the solid color you want to remove.
3. Click the delete button above **Custom Palette**. The solid color is removed from the custom palette.

## Related Topics

[Setting a Solid Color](#)

# Saving and Loading the Custom Palette

You can save the current custom palette or load a previously saved custom palette. The custom palette is loaded from or saved to a Windows Palette file (.pal).

After you save or load a custom palette, the .pal file is not connected to the graphic in any way.

### To save a custom palette

1. In the style selection dialog box, click the **Solid Color**.
2. Click the **Save Palette** button. The **Save Palette** dialog box appears.
3. Browse to the location where you want to save the custom palette, type a name, and then click **Save**. The custom palette is saved as a palette file.

### To load a custom palette

1. In the style selection dialog box, click the **Solid Color** tab.
2. Click the **Load Palette** button.
3. If you currently have colors in the custom palette, a message appears. Click **Yes** to continue and overwrite the current colors in the custom palette.
4. In the **Load Palette** dialog box, browse to the location of the palette file, select it, and then click **Open**. The custom palette is loaded from the selected file.

# Setting the Number of Colors for a Gradient

You can set the number of colors you want to use in a gradient.

- If you use one color, the gradient is between this solid color and a specified shade of black to white.
- If you use two colors, the gradient is between these two colors.
- If you use three colors, the gradient is between these three colors in sequence.

### To set a gradient using one color

1. In the style selection dialog box, click the **Gradient** tab.
2. In the **Colors** area, click **One**. A color selection box and a slider for the dark to light selection appears.
3. Click the color selection box to open the **Select Solid Color 1** dialog box. Select a solid color and click **OK**. For more information about this dialog box, see [Setting a Solid Color](#).
4. Move the slider between **Dark** and **Light**. The new gradient appears in the **New** color box on the right of the dialog box.
5. Click **OK**.

### To set a gradient using two colors

1. In the style selection dialog box, click the **Gradient** tab.
2. In the **Colors** area, click **Two**. Two color selection boxes appear.
3. Click the **Color 1** or **Color 2** color field to select a color from the style selection dialog box. For more information about this dialog box, see [Setting a Solid Color](#).  
The new gradient appears in the **New** color box on the right of the dialog box.
4. Click **OK**.

### To set a gradient for three colors

1. In the style selection dialog box, click the **Gradient** tab.
2. In the **Colors** area, select **Three**. Three color selection boxes appear.
3. Click the **Color 1**, **Color 2** or **Color 3** color field to select a color from the style selection dialog box. For more information about this dialog box, see [Setting a Solid Color](#).  
The new gradient appears in the **New** color box on the right of the dialog box.

4. Click **OK**.

## Related Topics

[Setting a Gradient](#)

# Setting the Direction of the Gradient

You can configure the direction of the gradient to be one of the following:

- Horizontal - from side to side
- Vertical - up and down
- Radial - circular from the center outwards
- Custom angle - across the element at a specified angle

### To set a horizontal gradient

1. In the style selection dialog box, click the **Gradient** tab.
2. In the **Direction** area, click **Horizontal**. The new gradient appears in the **New** color box on the right of the dialog box.
3. Click **OK**.

### To set a vertical gradient

1. In the style selection dialog box, click the **Gradient** tab.
2. In the **Direction** area, click **Vertical**. The new gradient appears in the **New** color box on the right of the dialog box.
3. Click **OK**.

### To set a radial gradient

1. In the style selection dialog box, click the **Gradient** tab.
  2. In the **Direction** area, click **Radial**.
  3. Set the center location. Do any of the following:
    - In the **Horizontal** and **Vertical** boxes, type values for the center location.
    - Click and drag the center point in the adjacent box.
- The new gradient appears in the **New** color box on the right of the dialog box.

4. Click **OK**.

### To set the custom angle of a gradient

1. In the style selection dialog box, click the **Gradient** tab.
2. In the **Direction** area, click **Custom**.

3. Set the angle. Do any of the following:
  - In the **Angle** text box, type a value for the angle.
  - Click and drag the angle bar in the adjacent box.

The new gradient appears in the **New** color box on the right of the dialog box.

4. Click **OK**.

## Related Topics

[Setting a Gradient](#)

# Changing the Variant of a Gradient

You can change the variant of a gradient. The variants are alternate gradients with the same colors you can quickly select.

### To change the variant of a gradient

1. In the style selection dialog box, click the **Gradient** tab.
2. In the **Variants** area, click on a variant gradient.  
The new gradient appears in the **New** color box on the right of the dialog box.
3. Click **OK**.

## Related Topics

[Setting a Gradient](#)

# Setting the Color Distribution Shape

You can configure the distribution shape of a triangle gradient with one or two colors.

- In a triangular distribution, the gradient from one color to the next rises and falls at the same rate.

You can also configure the peak and the falloff.

- The peak specifies the offset of the gradient if it has one or two colors.
- The falloff specifies the amplitude of the gradient if it has one or two colors.

Additionally, you can configure the center point of a radial gradient if it is defined by three colors.

### To use a triangular gradient

1. In the style selection dialog box, click the **Gradient** tab.
2. In the **Color Distribution Shape** area, click **Triangular**. The new gradient appears in the **New** color box on the right of the dialog box.

3. Click **OK**.

#### To set the peak of a gradient with one or two colors

1. In the style selection dialog box, click the **Gradient** tab.
2. In the **Color Distribution Shape** area, do one of the following:
  - Use the **Peak** slider to specify the peak.
  - In the **Peak** box, type a value from 0 to 100.

The new gradient appears in the **New** color box on the right of the dialog box.

3. Click **OK**.

#### To set the falloff of a gradient with one or two colors

1. In the style selection dialog box, click the **Gradient** tab.
2. In the **Color Distribution Shape** area, do one of the following:
  - Use the **Falloff** slider to specify the peak.
  - In the **Falloff** box, type a value from 0 to 100.

The new gradient appears in the **New** color box on the right of the dialog box.

3. Click **OK**.

#### To set the center point of a radial gradient with three colors

1. In the style selection dialog box, click the **Gradient** tab.
2. In the **Color Distribution Shape** area, do one of the following:
  - Use the **Center** slider to specify the peak.
  - In the **Center** box, type a value from 0 to 100.

The new gradient appears in the **New** color box on the right of the dialog box.

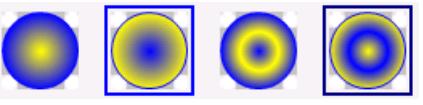

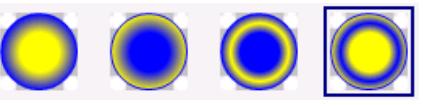

3. Click **OK**.

### Related Topics

[Setting a Gradient](#)

## Setting the Focus Scales of a Gradient

You can set the focus scales of a radial gradient. The focus scales acts as a magnification of the gradient. You can set the height and width of the focus scales.

Height	Width	Appearance
0	0	
50	50	

### To set the height and width of the focus scales for a gradient

1. In the style selection dialog box, click the **Gradient** tab.
2. In the **Focus Scales** area, do one of the following:
  - Move the **Height & Width** slider to specify the height and width.
  - In the text box, type the value for the height and width.
 The new gradient appears in the **New** color box on the right of the dialog box.
3. Click **OK**.

## Setting a Pattern

You can set a pattern for an element. The following table describes the pattern options:

Pattern	Options
Horizontal	Simple, Light, Narrow, Dark, Dashed
Vertical	Simple, Light, Narrow, Dark, Dashed
Percent	05, 10, 20, 25, 30, 40, 50, 60, 70, 75, 80, 90
Grid	Small, Large, Dotted
Checker Board	Small, Large
Diagonals	Forward, Backward, Dashed Upward/Downward, Light/Dark/Wide Upward/Downward
Diamond	Dotted, Outlined, Solid
Cross	Diagonal
Brick	Horizontal, Diagonal
Confetti	Small, Large

Pattern	Options
Others	Zig Zag, Wave, Weave, Plaid, Divot, Shingle, Trellis, and Sphere

Patterns consist of the foreground color and the background color that you can change.

### To set a pattern

1. In the style selection dialog box, click the **Pattern** tab.
2. Select a pattern. The new pattern appears in the **New** color box on the right of the dialog box.
3. If you want to change the foreground color of the pattern, click the **Foreground** color selection box. The style selection dialog box appears. Select a solid color and click **OK**.
4. If you want to change the background color of the pattern, click the **Background** color selection box. The style selection dialog box appears. Select a solid color and click **OK**.  
For more information about setting a solid color, see [Setting a Solid Color](#).
5. Click **OK**.

## Setting a Texture

Textures are images you can use as styles for lines, fills and text. You can stretch the image or tile the image across the entire element to be filled.

### To set a texture

1. In the style selection dialog box, click the **Textures** tab.
2. Click **Select Image**. The **Open** dialog box appears. You can import the following image formats: .BMP, .GIF, .JPG, .JPEG, .TIF, .TIFF, .PNG, .ICO, .EMF. Animated GIF images are not supported.
3. Browse to and select an image file and click **Open**. The new pattern appears in the **New** color box on the right of the dialog box.
4. Configure the size mode. Do one of the following:
  - Click **Tile** to create a pattern that repeats itself.
  - Click **Stretch** to enlarge (or shrink) the pattern across the selected element.
5. Click **OK**.

## Related Topics

[Setting Style](#)

## Setting the Style to No Fill

You can set the style to "No Fill". For example if you set the fill style of a rectangle element to No Fill, the

background of the rectangle appears transparent.

### To set the No Fill style

1. In the style selection dialog box, click the **No Fill** tab.

The No Fill style appears as a red cross-through line in the **New** color box on the right of the dialog box.

2. Click **OK**.

## Related Topics

[Setting Style](#)

### Setting the Transparency of a Style

You can set the transparency of a solid color, gradient, pattern, or texture.

#### To set the transparency of a style

1. Open the style selection dialog box.

2. At the bottom of the dialog box, do one of the following:

- Drag the **Transparency** slider handle left or right to change the transparency percentage.
- In the **Transparency** text box, type a percentage value.

The new style appears in the **New** color box.

3. Click **OK**.

## Related Topics

[Setting Style](#)

### Setting the Transparency Level of an Element

You can set the transparency level of an element. Levels range from 0 percent (opaque) to 100 percent (transparent).

Transparency of a group of elements behaves in a special way.

#### To set the transparency level of an element

1. Select one or more elements.
2. On the **Format** menu, click **Transparency**.
3. To use a predefined level, select it from the list.
4. To use a different level, click **More Transparency Levels**. The **Select Transparency Level** dialog box appears. Type a transparency level in the **Transparency** text box or use the slider to select a transparency level.
5. Click **OK**.

**Note:** You can also set the transparency level by changing the **Transparency** property in the Properties Editor.

## Related Topics

[Editing Common Properties of Elements and Graphics](#)

### Adjusting the Colors and Transparency of a Gradient

You can easily change the colors and transparency of an element with a gradient style.

For example, you can create pipes with a gradient style of different colors. You can change the pipe color, but still keep the 3-D appearance.

You do this in the Properties Editor using the Color1, Color2, Color3, and Transparency sub-properties.

#### To tweak the colors and transparency of a gradient

1. Select the element for which you want to change colors or transparency.
2. In the Properties Editor, locate the appropriate style setting. This can be:
  - FillColor
  - LineColor
  - TextColor
  - UnFillColor
3. Click the + icon to expand the property. The Color1, Color2, Color3, and Transparency sub-properties are shown.
4. Do one of the following:
  - Click the color box of one of the color sub-properties.
  - Type a new value for the transparency and click **Enter**.
5. Click the browse button. The style selection dialog box appears.
6. Select a color from the style selection dialog box and click **OK**. The solid color is applied to the selected element.

### Enabling and Disabling Elements for Run-Time Interaction

You can enable or disable elements so that the run time user cannot use any interaction animations, such as:

- User input.
- Horizontal and vertical sliders.
- Pushbuttons.
- Action scripts.
- Showing and hiding graphics.

Other animations such as horizontal fills and tooltips continue to work as expected.

### To enable an element for run-time interaction

1. Select one or more elements you want to enable.
2. In the Properties Editor **Runtime Behavior** group, set the Enabled property to True.

### To disable an element for run-time interaction

1. Select one or more elements you want to disable.
2. In the Properties Editor **Runtime Behavior** group, set the Enabled property to False.

## Related Topics

[Editing Common Properties of Elements and Graphics](#)

## Changing the Visibility of Elements

You can configure elements to be hidden or shown at run time.

The visibility of an element does not affect its animations. Even when an element is invisible, its animations continue to be evaluated.

### To configure an element to be shown at run time

1. Select one or more elements you want to have shown at run time.
2. In the Properties Editor **Runtime Behavior** group, set the Visible property to True.

### To configure an element to be hidden at run time

1. Select one or more elements you want to have hidden at run time.
2. In the Properties Editor **Runtime Behavior** group, set the Visible property to False.

## Related Topics

## Editing the Tab Order of an Element

You can configure the elements on the canvas so that at run time you can use the Tab key to put each element in focus in a specified sequence. This sequence is called the tab order.

By default, when you place elements on the canvas, they have a tab order number of 0. Elements with the same tab order number are placed into focus by tabbing at run time according to their z-order. This means they are tabbed through at run time according to their position in the Elements List.

You can override the tab order by assigning a unique index number to the TabOrder property of each element.

Lower tab order numbers take precedence over higher tab order numbers. You must change this value to determine the tab order sequence.

Verify that the TabStop property of each element is set to true. When the TabStop property is set to true, you can use the Tab key at run time to switch to the selected element.

#### To edit the element's tab order

1. Select the element for which you want to set the tab order.
2. In the Properties Editor, set the **TabStop** property is set to True.
3. Type a unique value for the **TabOrder** property.

[Editing Common Properties of Elements and Graphics](#)

#### Using the Format Painter to Format Elements

You can apply formatting of one element to other elements quickly by using the format painter. You can apply the format of one element:

- One time to other elements.
- In repetitive mode to other elements.

When you use the format painter, it copies the following formats of the element if applicable to the target elements:

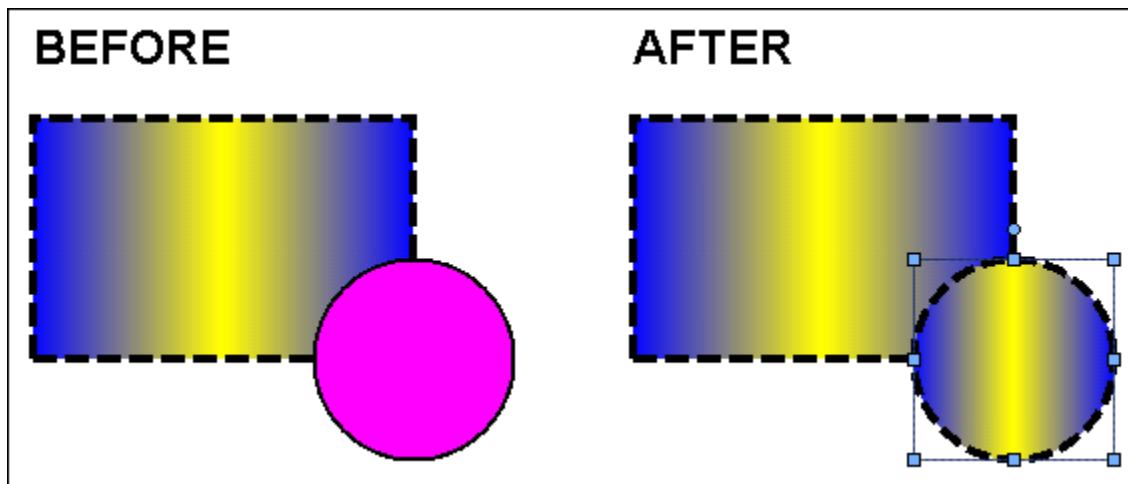

- Font family, size, and style
- Text style, alignment, and word wrap settings
- Line style, weight, pattern, and ends
- Transparency
- Fill style, orientation, behavior, horizontal percent fill, and vertical percent fill
- Unfilled style
- Horizontal and vertical direction properties

You cannot use the format painter for:

- The status element
- An element that is part of a path
- Groups of elements
- Elements in different hierarchy groups

### To copy the format of an element one time

1. Select the element with the format you want to copy.
2. On the **Edit** menu, click **Format Painter**. The pointer appears as the format painter cursor.
3. Select the element you want to apply the format to. The format is applied to the clicked element.

### To copy the format of an element in repetitive mode

1. Select the element with the format you want to copy.
2. On the toolbar, double-click the Format Painter icon. The pointer appears as the format painter cursor.
3. Click each element you want to apply the format to. The format is applied to the clicked element.
4. Repeat Step 3 for any other elements you want to apply the format to.
5. When you are done, press the Esc key.

### Editing the General Properties of a Graphic

You can configure the general properties of a graphic. The general properties determine the overall appearance and behavior of the graphic. You can:

- Add a meaningful description to your graphic.
- Enable anti-aliasing, or smoothing, for your graphic to improve its appearance. The anti-aliasing filter essentially blurs the elements slightly at the edges.
- Allow or prevent the opening of more than one graphic or display from a graphic. One example is a graphic with multiple Show Symbol animations. If this option is enabled, you can open more than one pop-up and each pop-up is modeless.

#### To edit the description of a graphic

1. Click on the canvas so that no elements are selected.
2. In the Properties Editor, type a meaningful description for the **Description** property.

#### To use smoothing (anti-aliasing) for a graphic

1. Click on the canvas so that no elements are selected.
2. In the Properties Editor, select True for the **Smoothing** property.

#### To enable multiple pop-ups for a graphic

1. Click on the canvas so that no elements are selected.
2. In the Properties Editor, select True for the **MultiplePopupsAllowed** property.

[Using Buttons](#)[Editing Control Points](#)[Changing the Tension of Curves and Closed Curves](#)[Changing Angles of Arcs, Pies and Chords](#)[Monitoring and Showing Quality and Status](#)[Using Windows Common Controls](#)

## About Graphic- and Element-Specific Properties

You can configure graphic-specific and element-specific properties. For properties that are common to all or most elements, see [Editing Common Properties of Elements and Graphics](#).

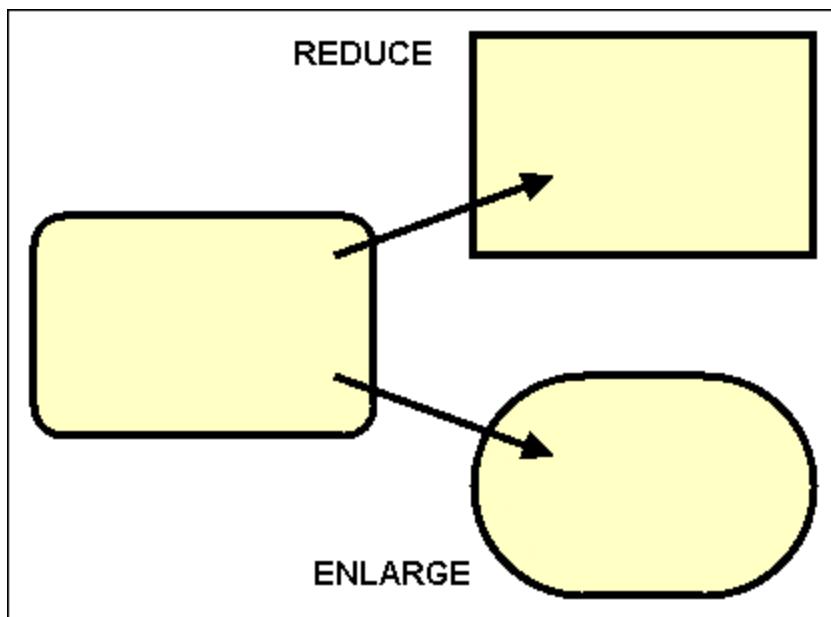

You can configure:

- General properties of a graphic.
- Radius of rounded rectangles.
- Shape and end appearance of lines and H/V lines.
- Auto-sizing and word-wrapping in text boxes.
- Image-specific properties.
- Button-specific properties.
- Control points and tension in curves.
- Angles in pies, chords, and arcs.
- Status elements.
- Windows common controls.

## Setting the Radius of Rounded Rectangles

You can specify the radius, in pixels, of the corners of rounded rectangles. The radius determines their "roundness". You can:

- Enlarge or reduce the radius of the rounded rectangle on the fly. The easiest way to do this is with the keyboard.
- Set the radius of the rounded rectangle to a specific value using the Properties Editor.

Rounded rectangles maintain their radius when their size is changed. If the graphic containing rounded rectangles is embedded into a window and resized, the radius is not affected. This can have adverse affects on the graphic representation of your graphic.

#### To enlarge the radius of a rounded rectangle

1. Select one or more rounded rectangles on the canvas.
2. Press and hold Shift and the + key on the number pad. The radius is enlarged, and the rounded rectangle becomes more round.

#### To reduce the radius of a rounded rectangle

1. Select one or more rounded rectangles on the canvas.
2. Press and hold Shift and the minus (-) key on the number pad. The radius is reduced, and the rounded rectangle becomes more rectangular.

#### To set the radius of a rounded rectangle exactly

1. Select one or more rounded rectangles on the canvas.
2. In the Properties Editor, change the value for Radius property and click **Enter**. The selected rounded rectangles are updated accordingly.

### Setting Line End Shape and Size

You can set the line end shape and size for any element that contains open lines such as lines, H/V lines, polylines, curves, and arcs.

For a line end, you can set the shape to be an arrowhead, diamond, circle, or square. You can set the size if the line end shape is an arrowhead.

### To set the line end shape

1. Select one or more elements.
2. On the **Format** menu, click **Line Ends**.
3. To use a predefined line end shape, select it from the list.
4. To use another line shape, click **More Line Options**. The **Select Line Options** dialog box appears.
5. Do the following:
  - a. In the **Line Start** list, click a shape for the start of the line.
  - b. In the **Line End** list, click a shape for the end of the line.
  - c. Click **OK**.

### To set the size of the line arrowheads

1. Select one or more open line elements.
2. On the **Format** menu, click **More Line Options**. The **Select Line Options** dialog box appears.
3. Select a size on the **Line Start Size** list if the line starts with an arrowhead. Valid sizes are: XX Small, X Small, Small, Medium Small, Medium, Medium Large, Large, X Large, XX Large.
4. Select a size on the **Line End Size** list if the line ends with a shape.
5. Click **OK**.

---

**Note:** You can also set the line end shapes by changing the **StartCap** and **EndCap** properties in the Properties Editor.

---

## Setting Auto Scaling and Word Wrapping for a Text Box

You can configure a text box to auto scale the text or to word wrap the text within the text box.

- For auto scaling, the text is resized to fit the text box.
- For word wrapping, the text in a text box continues on the next line.

### To auto scale the text in a text box

1. Select one or more text boxes.
2. In the Properties Editor, set the **AutoScale** property to true.

### To word wrap the text in a text box

1. Select one or more text boxes.

2. In the Properties Editor, set the WordWrap property to true.

## Using Images

You can place images on the canvas. This is a two step process:

1. Draw a frame which specifies the target size of the image.
2. Import the image from an image file.

After you place an image on the canvas, you can:

- Set the display mode (ImageStyle).
- Set the image alignment (ImageAlignment).
- Set the transparency color (HasTransparentColor, TransparentColor properties).
- Open the image in an image editing application.
- Select a different image for the image element.

## Related Topics

[Selecting a Different Image](#)

## Placing an Image on the Canvas

You can place an image on the canvas. The image data is imported from an image file. You can import the following image formats: .BMP, .GIF, .JPG, .JPEG, .TIF, .TIFF, .PNG, .ICO, .EMF.

You cannot use animated GIF images.

### To place an image on the canvas

1. In the **Tools** panel, select the image icon.
2. Click the canvas where you want to place the image and drag the mouse to draw a rectangle that will contain your image.
3. Release the mouse button. The **Open** dialog box appears.

4. Browse to and select an image file, and then click **Open**. The image is loaded into the image frame.  
If the image frame is smaller than the image, the image is cropped to fit into the frame. If the image frame is larger than the image, the image appears in its original size.

## Related Topics

[Using Images](#)

### Setting the Image Display Mode

You can set the way the image appears on the canvas.

- In normal mode, the image is not stretched or tiled. You can resize the image frame with the resizing handles.
- In stretch mode, the image is stretched so that it fills its frame.
- In tile mode, the image is repeated so that a tiled pattern that fills its frame is created.
- In auto mode, the image frame is enlarged or reduced to the image size. The resizing handles are locked. When the image style of an image element is Auto, you cannot change its size.

#### To stretch an image to the image frame

1. Select the image element you want to stretch.
2. In the Properties Editor, select **ImageStyle**.
3. In the list, click **Stretch**. The image is stretched to the image frame.

#### To tile an image in an image frame

1. Select the image element you want to tile.
2. In the Properties Editor, select **ImageStyle**.
3. In the list, click **Tile**. The image is tiled to fill the image frame.

#### To set an image frame size to its image size

1. Select the image element you want to adjust.
2. In the Properties Editor, select **ImageStyle**.
3. In the list, click **Auto**. The image frame is enlarged or reduced to the image size.

## Related Topics

[Using Images](#)

### Setting the Image Alignment

The image alignment specifies where the image appears in an image frame. By default, images appear in the center of the image frame. You can change this setting to one of the following:

- Top left, top center, or top right
- Middle left, center, or middle right
- Bottom left, bottom center, or bottom right

---

**Note:** You can also set the image alignment in the **ImageAlignment** property in the Properties Editor.

---

### To set the image alignment

1. Select the image element with the image you want to align.
2. In the Properties Editor, select **ImageAlignment**.
3. In the list, click one of the following options: TopLeft, TopCenter, TopRight, MiddleLeft, Centers, MiddleRight, BottomLeft, BottomCenter or BottomRight. The image is aligned accordingly in the image frame.

## Related Topics

[Using Images](#)

### Setting the Image Color Transparency

You can use image color transparency to specify that a color within an image is partially or entirely transparent. When you configure image transparency, you must:

- Enable color transparency for images.
- Specify the color that is to be transparent.

Setting the image color transparency is different than setting the transparency of the image element, as it only applies to one color. Image transparency applies to the entire image.

### To enable image color transparency

1. Select the image element.
2. In the Properties Editor, select **HasTransparentColor**.
3. In the list, click **True**.

### To set the transparency color for an image

1. Select the image element.
2. On the **Edit** menu, click **Select Image Transparent Color**. The pointer becomes a color picker.
3. Click the color you want to use as the transparency color. The image is updated with the new transparency color.

---

**Note:** You can also select a transparency color with the **TransparentColor** property in the Properties Editor. For more information about setting the color, see [Setting a Solid Color](#).

---

## Related Topics

[Using Images](#)

## Editing the Image

You can edit the image in an image element by opening it in an image editing application.

You can specify the image editor by changing the designer preferences. For more information, see [Setting the Image Editing Application](#).

### To edit an image

1. Select the image element with the image you want to edit.
2. On the **Edit** menu, click **Edit Image**. The image is opened with the associated image editing application.
3. Make changes to the image as needed, save the image and close the image editing application. The image is updated on the canvas.

## Related Topics

[Using Images](#)

## Setting the Image Editing Application

You can specify the image editor that opens when you select an image for editing. You can select a currently registered image editing application or add one.

### To set the image editing application

1. On the **Special** menu, click **Preferences**. The **Designer Preferences** dialog box appears.
2. Select an image editor from the Image Editor list.

### To add an image editing application

1. On the **Special** menu, click **Preferences**. The **Designer Preferences** dialog box appears.
2. In the **Image Editor** list, click **Choose Custom Editor**. The **Select Image Editing Application** dialog box appears.
3. Browse to and select the executable file of the image editing application and click **Open**. The image editor is added to the list.

## Related Topics

[Using Images](#)

## Selecting a Different Image

You can change the current image of an image element by selecting a new image.

### To select a different image

1. Select the image element with the image you want to change.
2. On the **Edit** menu, click **Select Image**. The **Open** dialog box appears.

3. Browse to and select an image file, and then click **Open**. The image is loaded into the image frame.

**Note:** You can also select a different image by clicking the browse button in the **Image** property in the Properties Editor .

[Wrapping Text in Buttons](#)

[Configuring Buttons with Images](#)

## Automatically Scaling Text in Buttons

You can automatically scale text so that the font size is adapted to the button size.

### To automatically scale text in buttons

1. Select the button element on the canvas.
2. In the Properties Editor, set the **AutoScale** property to True.

## Related Topics

[Using Buttons](#)

### Wrapping Text in Buttons

You can wrap text in buttons.

#### To wrap text in buttons

1. Select the button element on the canvas.
2. In the Properties Editor, set the **WordWrap** property to True.

## Related Topics

[Using Buttons](#)

### Configuring Buttons with Images

You can use buttons with an image/SVG in Industrial Graphics.

- The "up" image appears after a button is released and returns to the up position during run time
- The "down" image appears after a button is pressed and locks in the down position during run time

You can edit an up image or a down image after you assign it to a button.

#### To use a down image or up image on a button

1. Select the button element on the canvas.
2. In the Properties Editor, select **Image** in the property **ButtonStyle** list.
3. Click the browse button of the **UpImage** property and select an image/SVG in the **Open** dialog box. This is the image that appears on the button by default and also when the button is released.
4. Click the browse button of the **DownImage** property and select an image/SVG in the **Open** dialog box. This image appears after the button is clicked.

#### To edit an up image or a down image of a button

1. Right-click the button element on the canvas. The context menu appears.
2. Click **Edit Button Image**, then click one of the following:
  - Edit Up Image
  - Edit Down ImageThe up image or down image is opened in the default image editor.
3. Edit the image.
4. Save the image and close the image editor. The up image or down image is updated.

[Using Buttons](#)

## Editing Control Points

Control points determine the shapes of polylines, polygons, curves, and closed curves. To change the shape of these elements after they have been placed on the canvas, you can:

- Move individual control points.
- Add or remove control points.

## Related Topics

[Editing Graphic-Specific and Element-Specific Properties](#)

[Moving Control Points](#)

[Adding and Removing Control Points](#)

## Moving Control Points

After you place a polyline, polygon, curve, or closed curve on the canvas, you can change its shape by editing its control points.

### To move the control points of a polyline, polygon, curve, or closed curve

1. Select the polyline, polygon, curve, or closed curve.
2. On the **Edit** menu, click **Edit Control Points**. The control points of the element are shown.
3. Click a control point you want to change and drag it to the new location. The element is updated accordingly.
4. Repeat the previous step for all control points you want to change.

## Related Topics

[Editing Control Points](#)

## Adding and Removing Control Points

You can add or remove control points from polylines, polygons, curves, and closed curves.

### To add control points to a curve or closed curve

1. Select the curve or closed curve.
2. On the **Edit** menu, click **Edit Control Points**. The control points of the element are shown.
3. Press and hold the Shift key.
4. Move the mouse over the curve or closed curve at the point you want to add a control point. The pointer appears as a pen with a plus graphic.

5. Click the curve or closed curve. The control point is added to the curve or closed curve.
6. Repeat the last step for any other control points you want to add.
7. When you are done, release the Shift key.

### To delete control points from a curve or closed curve

1. Select the curve or closed curve.
2. On the **Edit** menu, click **Edit Control Points**. The control points of the element are shown.
3. Press and hold the Ctrl key.
4. Move the mouse over the control point you want to remove. The pointer appears as a pen with a minus graphic.
5. Click the control point. The control point is removed from the curve or closed curve.
6. Repeat the last step for any other control points you want to remove. We recommend you have at least two control points.
7. When you are done, release the Ctrl key.

## Related Topics

[Editing Control Points](#)

### Changing the Tension of Curves and Closed Curves

After you place a curve or a closed curve, you can change its tension. The tension specifies how tightly the curve bends through the control points. Valid range are float values from 0 (tightly) to 2 (loosely).

---

**Note:** You can also change the tension of a curve or closed curve by changing the value for the **Tension** property in the Properties Editor.

### To edit the tension of a curve or closed curve

1. Select the curve or closed curve.
2. In the Properties Editor, type a float value from 0 to 2 for the **Tension** property.

## Related Topics

[Editing Graphic-Specific and Element-Specific Properties](#)

### Changing Angles of Arcs, Pies and Chords

After you place an arc, pie, or chord, you can change the start and sweep angles of elements. You can change the angles to any integer degree from 0 to 359. When you change the angles, you can press the Shift and Ctrl keys to make the angle snap to multiples of 15 or 45 degrees.

You can also move the start angle and sweep angle at the same time. The object appears to be rotated around its arc/pie/chord center point while keeping the same center point angle.

---

**Note:** You can also change the start or sweep angle of an arc, pie or chord in the **StartAngle** or **SweepAngle** properties in the Properties Editor. For more information, see [Utilizing Sweep Angle Run-Time Properties](#).

### To change the start or sweep angle of an arc, pie, or chord

1. Select the arc, pie, or chord.
2. On the **Edit** menu, click **Edit Start and Sweep Angles**. The start and sweep angle handles appear on the selected element.
3. If you want the angle to be multiples of 15 degrees, press and hold the SHIFT key.
4. If you want the angle to be multiples of 45 degrees, press and hold the CTRL key.
5. Grab the start angle or the sweep angle handle and drag it to the new location. The element is updated accordingly.

### To change the start and sweep angles of an arc, pie, or chord together

1. Select the arc, pie, or chord.
2. On the **Edit** menu, click **Edit Start and Sweep Angles**. The start and sweep angle handles appear on the selected element.
3. Select the start angle or the sweep angle handle and keep the mouse button down.
4. Press and hold the Alt key.
5. If you want additionally either angles to be multiples of 15 degrees, press and hold the Shift key.
6. If you want additionally either angles to be multiples of 45 degrees, press and hold the Ctrl key.
7. Drag the mouse. The start angle and sweep angle are changed accordingly.
8. When you are done, release the mouse button and then any keys.

## Related Topics

[Editing Graphic-Specific and Element-Specific Properties](#)

### Utilizing Sweep Angle Run-Time Properties

The 2 and 3 point arc, pie, and chord graphic elements contain **StartAngle** and **SweepAngle Appearance** properties. These properties can be assigned values in a client script that change during run time to show moving sweep angle or start angle lines as part of arc, pie, and chord graphic elements.

Sweep angle run-time properties are well suited for showing a current value within a range of possible values. For example, the movement of a chord sweep angle can show a pie chart with fill that indicates the current time within a repetitive period. Or, the movement of an arc sweep angle can represent a pointer to the current value within a range of possible values like a tachometer.

### To configure sweep angle run-time properties

1. Place an arc, pie, or chord graphic object on the Industrial Graphic Editor canvas.
2. Select the graphic element to show its **Properties** equipment.items.
3. Assign **StartAngle** and **SweepAngle** properties as values of a client script that change based on run-time events.

## Related Topics

## Monitoring and Showing Quality and Status

You can configure your graphic to show non-good status and quality of equipment.items or tags in different ways:

- A status element shows a specific icon depending on the quality and status of configured equipment.items, tags or elements.
- The text, fill, or line appearance of elements is overridden depending on the quality and status of the equipment.items and tags they reference.
- Elements are drawn with an outline depending on the quality and status of the equipment.items they reference.

---

**Note:** Quality and status elements might not be supported by all HMIs. Refer to your HMI help for more information.

---

## Related Topics

[Editing Graphic-Specific and Element-Specific Properties](#)

[Using Status Elements](#)

## Using Status Elements

Status elements show a specified graphic depending on the quality and status of:

- Equipment.items and tags configured for specific animated elements.
- One or more specified equipment.items or tags.

You can assign status elements to an animation in three steps:

1. Draw the status element on the canvas.
2. Associate the status element with animated elements on the canvas and/or equipment.items that provide the quality and status data to be monitored.
3. If needed, configure the appearance of the status element.

## Related Topics

## Using Windows Common Controls

You can add the following Windows common controls to your graphic:

- Radio button group
- Check box
- Edit box
- Combo box
- Calendar control
- DateTime picker
- List box

You can place these Windows common controls as you would any other element by selecting them from the **Tools** panel. You click on the canvas to position a common control and, with exception of the calendar control, drag the rectangle to set of the control.

After placing the control on the canvas, you can then configure:

- Background color and text color (with exception of the DateTime Picker control).
- Other control-specific properties in the Properties Editor.
- Control-specific animations.
- The common Value property in scripting to read from and write to the Windows common control at run time.

## Changing Background Color and Text Color of Windows Common Controls

You can change the background color and text color of all Windows common controls with exception of the DateTime Picker control.

The background color and text color of the Windows common controls can be only solid colors, not gradients, patterns, nor textures.

### To set the background color of a Windows common control

1. Select the Windows common control.
2. In the Properties Editor, click the browse button of the Fill Color property. The **Select Fill Color** dialog box

appears.

3. Select a solid color and click **OK**. For more information, see [Setting a Solid Color](#). The Windows common control background color changes accordingly.

### To set the text color of a Windows common control

1. Select the Windows common control.
2. In the Properties Editor, click the browse button of the TextColor property. The **Select Text Color** dialog box appears.
3. Select a solid color and click **OK**. For more information, see [Setting a Solid Color](#). The Windows common control text color changes accordingly.

## Related Topics

### Reading and Writing the Selected Value at Run Time

You can use the Value property that is common to all Windows common controls. It is not visible in the Properties Editor. You can use the value property in a script or other animation links.

The following table shows you the data type, a description on how the value property is used, and an example for each Windows common control.

Control	Data Type	Description	Example
Radio Button Group	Boolean, Integer, Real or String	Reads the value of the selected item, or selects the item with that value if it exists.	RadioButtonGroup1.Value = "Mixing";
Check Box	Boolean	Sets or reads the checked status.	CheckBox1.Value = 1;
Edit Box	String	Sets or reads the text contents.	EditBox1.Value = "Hello World";
Combo Box	Integer	Reads the value of the selected item, or selects the item with that value if it exists.	ComboBox1.Value = 5;
Calendar	Time	Sets or reads the selected date.	Calendar1.Value = "11/15/2006 11:12:34 AM";
DateTime Picker	Time	Sets or reads the selected date and time.	DateTimePicker1.Value = "11/15/2006 2:55:12 PM";

Control	Data Type	Description	Example
List Box	Integer	Reads the value of the selected item, or selects the item with that value if it exists.	ListBox1.Value = "John Smith";

### Configuring Combo Box Controls

You can use Combo Box controls to select an option from a foldable list.

You can configure:

- Drop-down type of combo box control.
- Width of the drop-down list.
- Integral height flag of the drop-down list to avoid clipping of the items in simple combo box controls.
- Maximum number of items to appear in the drop-down list.

You can also use properties that are specific to the Combo Box control in scripting. At run time, you can access the script to view and modify the items in the Combo Box control.

## Related Topics

[Setting the Maximum Number of Items to Appear in the Combo Box Drop-Down List](#)

[Using Combo Box-Specific Properties at Run Time](#)

# Setting the Type of Combo Box Control

You can use one of the following combo box control types:

- Simple - no drop-down list, values can be entered
- DropDown - has a drop-down list, values can be entered
- DropDownList - has a drop-down list, values cannot be entered

### To set the type of Combo Box control

1. Select the combo box control.
2. In the Properties Editor, select from the list for the DropDownType property:

- Simple
- DropDown
- DropDownList

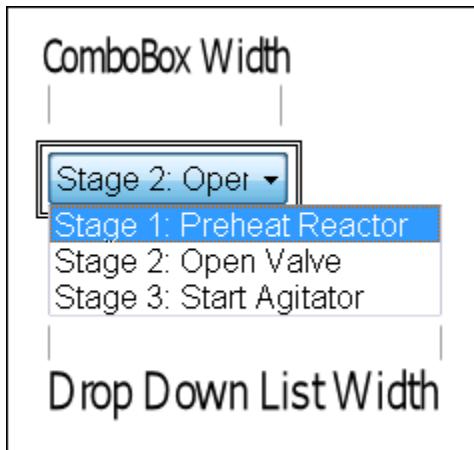

## Related Topics

[Configuring Combo Box Controls](#)

# Setting the Width of the Drop-Down List

You can set the width of the expanded drop-down list when the user clicks on it. This setting can be used to save space of the folded combo box control at run time.

Typically you set the drop-down list width greater than the width of the combo box on the canvas.

If you set the drop-down list width smaller than the combo box control width on the canvas, the drop-down list is the same width as the combo box control.

### To set the width of the combo box drop-down list

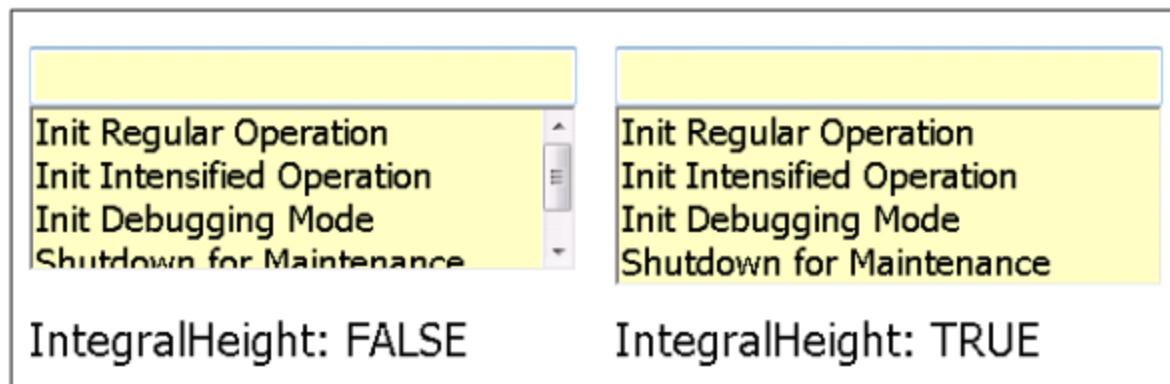

1. Select the combo box control.
2. In the Properties Editor, type a width value in the DropDownWidth property value box.

# Setting the Number of Calendar Month Sheets

You can set the number of calendar month sheets to be shown by specifying the number of month columns and month rows. The number of columns and rows in the calendar control depends on the font size and the width of the calendar control.

For example, you can show six months in a calendar control by specifying two columns and three rows.

### To set the number of calendar month sheets

1. Select the Calendar control.
2. In the **Properties Editor**, configure the calendar properties:
  - For the **CalendarColumns** property, specify the number of columns in the calendar control.
  - For the **CalendarRows** property, specify the number of rows in the calendar control.

## Configuring DateTime Picker Controls

Use the DateTime Picker control to select a date or time.

You can configure the DateTime Picker control to show:

- A long format, such as Friday, August 11, 2008.
- A short format, such as 8/11/2008.
- Just the time, such as 9:16:36 PM.
- A custom time format, such as 8/11/2008 9:16:36 PM.

You can also set the default value of the DateTime Picker control.

### To set the long date format

1. Select the DateTime Picker control.
2. In the Properties Editor, set the Format property to **Long**.

### To set the short date format

1. Select the DateTime Picker control.
2. In the Properties Editor, set the Format property to **Short**.

### To set only time display

1. Select the DateTime Picker control.

2. In the Properties Editor, set the Format property to **Time**.

### To set a custom date/time format

1. Select the DateTime Picker control.
2. In the Properties Editor, set the Format property to Custom.
3. Type the time format in the value box for the CustomFormat property. Use the following letters as placeholders

h	The one or two-digit hour in 12-hour format.
hh	The two-digit hour in 12-hour format. Single digit values are preceded by a zero.
H	The one or two-digit hour in 24-hour format.
HH	The two-digit hour in 24-hour format. Single digit values are preceded by a zero.
t	The one-letter AM/PM abbreviation ("AM" is shown as "A").
tt	The two-letter AM/PM abbreviation ("AM" is shown as "AM").
m	The one or two-digit minute.
mm	The two-digit minute. Single digit values are preceded by a zero.
s	The one or two-digit seconds.
ss	The two-digit seconds. Single digit values are preceded by a zero.
d	The one or two-digit day.
dd	The two-digit day. Single digit day values are preceded by a zero.
ddd	The three-character day-of-week abbreviation.
dddd	The full day-of-week name.
M	The one or two-digit month number.
MM	The two-digit month number. Single digit values are preceded by a zero.
MMM	The three-character month abbreviation.
MMMM	The full month name.

y	The one-digit year (2001 is shown as "1").
yy	The last two digits of the year (2001 is shown as "01").
yyyy	The full year (2001 is shown as "2001").

You can use any other characters, except "g" in the property. These characters then appear at design time and run time in the control.

#### To set the default value in a DateTime Picker control

1. Select the DateTime Picker control.
2. In the Properties Editor, set the DefaultValue property to the date and time value you want to use as default at run time.

## Using Custom Properties

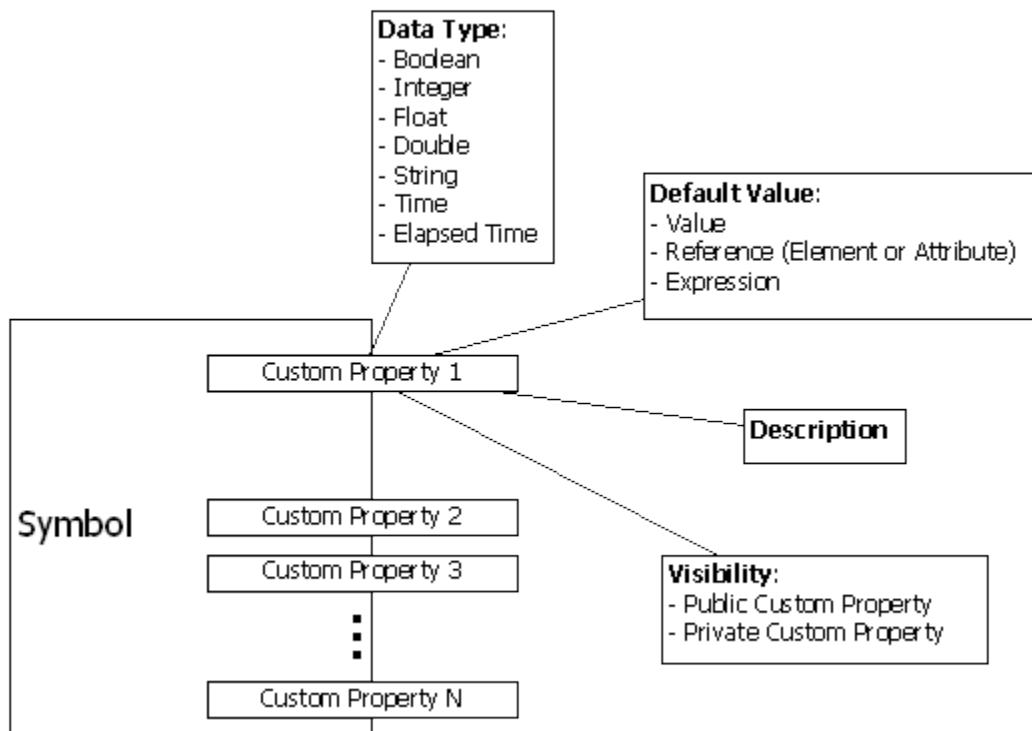

### In This Chapter

[About Custom Properties](#)

[Managing Custom Properties](#)

### About Custom Properties

You can configure and use custom properties to extend the functionality of symbols and use them in combination with the HMI/SCADA software equipment.items or tags. You can use binding with custom properties to dynamically change the reference of a custom property.

You can associate custom properties with functionality you want exposed and that you want to be reusable. You can also use custom properties to connect an embedded graphic to equipment.items and tags in your HMI/SCADA software.

### Related Topics

[Using Custom Properties](#)

### Managing Custom Properties

You manage all custom properties of a graphic using the **Edit Custom Properties** dialog box.

From the **Custom Properties** dialog box, you can:

- Add and delete custom properties.
- Set the types and data types of custom properties.
- Set the default values of custom properties.
- Determine the visibility of each custom property.
- Add a description for each custom property.
- Validate and clear custom properties.

You can also:

- Rename custom properties.
- Link custom properties to external sources.
- Override custom properties with new values.
- Revert custom property values to their default values.

## Related Topics

## Adding and Deleting Custom Properties

You can add and delete custom properties from a graphic.

### To add a custom property

1. Click the canvas to cancel any selected elements.
2. On the **Special** menu, click **Custom Properties**. The **Edit Custom Properties** dialog box appears.
3. Click the **Add** icon. A new line is added in the custom properties list.
4. Type a name for the new custom property and click **Enter**.

You can see the name of the graphic and the custom property in the header of the dialog box.

- If the graphic includes an embedded graphic, the name of the custom property cannot be the same as the name of the embedded graphic or of an element of the embedded graphic.
  - If the graphic includes a script, the name of the custom property and a nested class property in the script cannot be the same.
5. Configure the custom property on the right side of the **Edit Custom Properties** dialog box. For more information, see [Configuring Custom Properties](#).

6. Click **OK**.

### To delete a custom property

1. Click the canvas to cancel any selected elements.
2. On the **Special** menu, click **Custom Properties**. The **Edit Custom Properties** dialog box appears.
3. Select the custom property you want to delete and click the **Remove** icon. When a message appears requesting confirmation to delete the custom property, click **Yes**. The custom property is removed from the custom properties list.
4. Click **OK**.

## Related Topics

[Managing Custom Properties](#)

### Configuring Custom Properties

You can configure custom properties when you create them or at a later point of time.

#### To configure a custom property

1. Click the canvas of the graphic.
2. On the **Special** menu, click **Custom Properties**. The **Edit Custom Properties** dialog box appears.
3. Select the custom property you want to edit. The configuration for the selected custom property appears at the right of the dialog box.

**Note:** The header of the configuration area shows the graphic name on the right, for example "Symbol\_001," and it shows the custom property name on the left, for example "MyCustomProperty." Its reference in a script would be "Symbol\_001.MyCustomProperty."

4. In the **Data Type** list, click the data type of the custom property. You can select one of the following:

Data Type	Graphic
Boolean	
Double	
Elapsed Time	
Float	

5. If you want to:
  - Make the property read-only at design time and prevent further changes to it when the graphic is embedded into another graphic, click the Lock icon.
  - Make the property read-only at run time and prevent its value being changed, click the Lock icon.
6. In the **Default Value** box, type a literal value, reference, or expression or browse for a reference using the **Browse** icon.
7. If the selected data type is String, Time or Elapsed Time, you can click the **T** icon or tag icon.
  - Select the **T** icon to indicate that the default value is a static value.
  - Select the tag icon to indicate that the default value is a reference to a value.
8. In the **Visibility** box, configure how the graphic is visible. Do one of the following:
  - Click **Public** if you want the custom property to be visible and can be used in a source graphic if the graphic is embedded.
  - Click **Private** if you want the custom property to be hidden and no reference be made to it outside of the defining graphic.
9. In the **Description** box, type a meaningful description for the custom property.

## Related Topics

[Managing Custom Properties](#)

## Validating Custom Properties

You can validate custom properties to track down and avoid configuration errors.

### To validate a custom property

1. Click on the canvas to cancel any selected elements.
2. On the **Special** menu, click **Custom Properties**. The **Edit Custom Properties** dialog box appears.
3. Select the custom property you want to validate and click the **Validate** icon. Required boxes are highlighted by a red box, possible errors appear in the status area under the custom properties list.

## Related Topics

[Managing Custom Properties](#)

## Clearing the Configuration of Custom Properties

You can clear the configuration of custom properties. This resets the properties to their default values.

### To clear the configuration of a custom property

1. In the **Edit Custom Properties** dialog box, select the custom property.
2. Click the **Clear** icon. The configured values are reset to their default values.

## Related Topics

[Managing Custom Properties](#)

## Renaming Custom Properties

You can rename custom properties.

### To rename a custom property

1. In the **Edit Custom Properties** dialog box, select the custom property.
2. Click the custom property again. The custom property is in edit mode.
3. Type the new custom property name and click **Enter**. The custom property is renamed.

---

**Note:** If the graphic includes an embedded graphic, the name of the custom property cannot be the same as the name of the embedded graphic or of an element of the embedded graphic. If the graphic includes a script, the name of the custom property and a nested class property in the script cannot be the same.

## Related Topics

[Managing Custom Properties](#)

## Linking Custom Properties to External Sources

You can link custom properties of a graphic directly to external sources by:

- Configuring objects that point to external sources and then point the custom property at the corresponding equipment.item reference.

## Related Topics

[Managing Custom Properties](#)

## Overriding Custom Properties

You can override the custom property default values of embedded graphics within graphics in the Industrial Graphic Editor.

---

**Note:** When you override the custom property, it appears bold in the custom property list.

You can override the following custom property values:

- Default value
- Visibility, but only from public to private, not private to public
- Description
- Locked state
- String mode setting

You cannot override the data type of a custom property.

## Related Topics

[Managing Custom Properties](#)

### Reverting to Original Custom Property Values

After you override a custom property value, you can revert to the original custom property value. This can be done for overridden custom properties of embedded graphics in other graphics.

#### To revert to the original custom property value

- In the **Edit Custom Properties** dialog box, click the Revert icon. The custom property value reverts to its original value.

## Related Topics

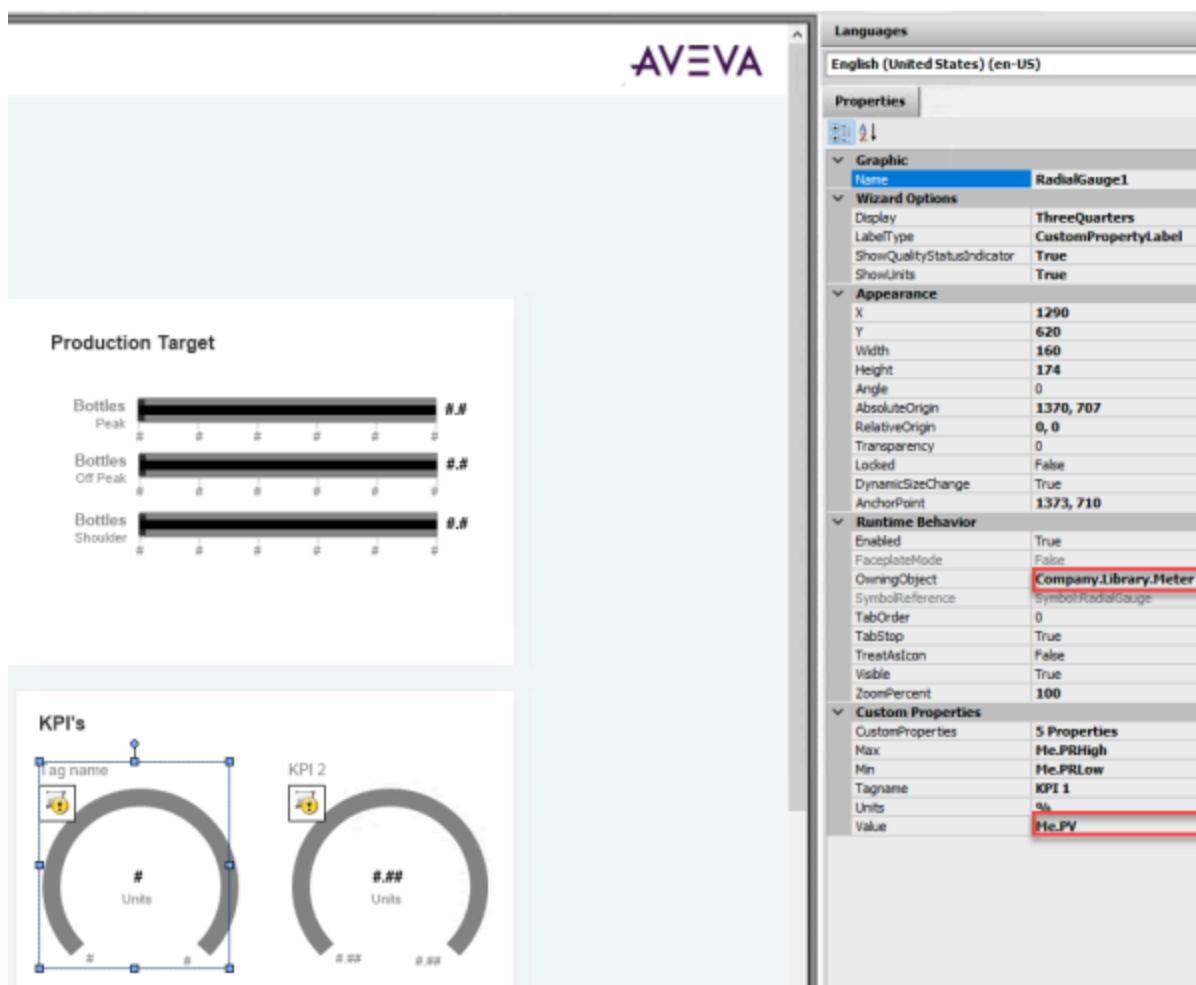

[Managing Custom Properties](#)

## Owning Object and Relative Referencing

For an embedded symbol, you can specify an owning object. This allows you to associate the symbol with a cluster, tag or equipment reference. When you configure a symbol with relative references to an owning object, the embedded symbol will reflect values in the context of the owning object.

## Example

A radial gauge symbol appears on the Industrial Graphics page named **Overview** in the Plant SCADA's **ExampleSA** project. If you open this page from the **Visualization** activity, it will appear in the Industrial Graphics Editor. Select the radio gauge object to view its **Properties** in the pane to the right of the editor.

- **Owning Object:**

The **OwningObject** property in the **Runtime Behaviour** section has the value "Company.Library.Meter". This is the Meter Equipment as defined in the project's equipment model. Any relative references will refer to this equipment.

- **Relative Reference:**

In the example, the Max, Min and Value Custom properties are using relative references to equipment items "PRHigh", "PRLow" and "PV" respectively. This is indicated by the use of the "Me" reserved keyword.

At runtime, "Me" will be substituted with the Owning Object reference. Using the "Value" property, with the value of "Me.PV" as an example, at runtime a subscription will be made not to Me.PV, but to Company.Library.Meter.PV.

## Configure an Owning Object

Follow the steps to define a cluster, tag or equipment reference as the owning object for an embedded symbol.

1. Open a page in AIG Editor from the **Visualization** activity, and embed a symbol on it.
2. Select the embedded symbol to view the **Properties** section in the right-side pane.
3. Enter a cluster, tag or equipment reference in the **OwningObject** property of the **Runtime Behaviour** section.

4. Save and close the page.

## Configure a Relative Reference

Relative referencing is adding references to the embedded symbol, so that in runtime the symbol will reflect the value of the owned object. Configure references using the "Me" keyword followed by the Tag, or Item, or partial Equipment.Item, as per the requirement. For example: Me.Tag1, Me.PV or Me.Equipment.PV.

Following are two methods to configure references to an embedded symbol:

- Hard-coding relative references of custom properties, animation expression, or script within the symbol
- Relative referencing in custom properties of an embedded symbol.

### Hard coding Relative References of custom properties, animation expression, or script within the symbol

To hard code relative references:

1. Open a symbol in AIG Editor from the **Visualization** activity.
2. Open a [Configuring a Value Display Animation](#) for an element in the symbol.
3. Specify a relative reference "Me.<tag name/Item/Equipment.Item>" in **Expression Or Reference**. This should exist for the intended owning object expect to be set when the symbol is embedded. Click **OK**.
4. Save and close the symbol.
5. Open a page in AIG Editor from the **Visualization** activity.
6. Embed the symbol in the page, and specify an owning object for the symbol.
7. Save and close the page.

At runtime, the configured element will reflect the value of the owned object. If the owned object does not have the specified tag (in relative reference), you cannot reconfigure it in the page. Hence, in runtime, it will not reflect the <tag/item/equipment.item> value.

### Relative Referencing in Custom Properties of an Embedded Symbol

To add relative reference for an embedded symbol:

1. Open a symbol in the Industrial Graphics Editor from the **Visualization** activity.
2. [Configuring Custom Properties](#) for the symbol.
3. Open a [Configuring a Value Display Animation](#) for an element in the symbol.
4. Specify the configured custom property in **Expression Or Reference**, and click **OK**.
5. Save and close the symbol.
6. Open a page in AIG Editor from the **Visualization** activity.
7. Embed the symbol in the page, and specify an owing object for the symbol.
8. Under **Custom Properties** specify the configured custom property value as "Me.<tag/item/equipment.item>". This should exist for the specified owning object.
9. Save and close the page.

At runtime, the configured element will reflect the value of the resolved reference belonging to the owning object.

## Working with Element Styles

Styles can be used to manage the appearance of elements, status animations and numeric values in AVEVA™ Industrial Graphics applications.

A style defines a set of visual properties that determine the appearance of elements such text, lines, graphic outlines, and interior fill (see [Visual Properties Defined by Element Styles](#)).

Styles are defined in Plant SCADA Studio's **Standards** activity. The **Styles** view hosts the **Configure Styles** dialog, which allows you to configure an overriding style for a selected visual element.

For more information, see the topic [Styles](#) in the *Standards* section of the Plant SCADA documentation.

Style can then be applied to selected objects in the Industrial Graphics Editor.

## See Also

[Applying Element Styles to Elements](#)

[Applying Element Styles to Groups of Elements](#)

[Configuring an Animation Using Element Styles](#)

## Visual Properties Defined by Element Styles

The following table lists the visual properties of graphic elements defined in an Element Style.

Graphic Element	Element Properties
Text	<ul style="list-style-type: none"><li>• Font family</li><li>• Font size</li><li>• Font style</li><li>• Font color</li><li>• Blink On/Off</li></ul>
Fill	<ul style="list-style-type: none"><li>• Fill color</li><li>• Fill gradient</li><li>• Fill pattern</li><li>• Fill texture</li><li>• Blink On/Off</li></ul>
Line	<ul style="list-style-type: none"><li>• Line pattern</li><li>• Line weight</li></ul>

Graphic Element	Element Properties
	<ul style="list-style-type: none"><li>• Line color</li><li>• Blink On/Off</li></ul>
Outline	<ul style="list-style-type: none"><li>• Outline Show/Hide</li><li>• Outline Pattern</li><li>• Outline Weight</li><li>• Outline Color</li><li>• Blink On/Off</li></ul>

An Element Style may not define every visual property. If a property value is not defined in an applied Element Style, the element's native style is used and can be changed. However, if an element's property value is defined in an applied Element Style, the element's native properties are disabled and cannot be changed.

## Related Topics

[Working with Element Styles](#)

## Applying Element Styles to Elements

You can apply Element Styles to one or more graphic elements. Unlike setting Element Style overrides that change the appearance of an Element Style's properties, applying an Element Style to a graphic element overrides the element's native properties.

Applying Element Styles to graphic elements can help standardize the appearance of those elements and show the current state of an object represented by a symbol or graphic.

For more information, see the topic [Styles](#) in the *Standards* section of the Plant SCADA documentation.

[Understanding Element Style Behavior with a Group of Elements](#)

## Setting a Group's Run-time Behavior to TreatAsIcon

To apply an Element Style to a graphic element group, set the group's **TreatAsIcon** property 'to True. Otherwise, the Element Style lists are disabled when an element group is selected.

### To set a group's TreatAsIcon property to true

1. Select the element group to which the Element Style will be applied.
2. On the **Properties** menu, click **Run-time Behavior** and click **TreatAsIcon**.
3. Select **True** from the drop-down list.

## Related Topics

[Applying Element Styles to Groups of Elements](#)

### Understanding Element Style Behavior with a Group of Elements

- The Element Style applied to a group has higher precedence than the property styles applied to individual graphic elements in the group.
- If the Element Style applied to a group of elements has undefined property styles, then the element continues to use its Element Style or element-level settings for undefined property styles.
- If the Element Style that is applied to a group of elements has defined property styles, then those property styles override the property styles defined at the element level for elements in the group.
- An Element Style cannot be applied to a nested element group.
- If you add an element to a group that has a group-level Element Style applied, the group Element Style is applied to it.

### Configuring an Animation Using Element Styles

You can configure an element or a group of elements with a:

- Boolean animation that applies Element Styles based on a binary True/False condition.
- Truth table animation that applies Element Styles based on a range of possible values.

The truth table animation that applies Element Styles:

- Associates expressions of any supported data type to an Element Style.
- Defines as many conditions as required and applies a separate Element Style for each condition
- Defines the conditions to apply an Element Style by specifying a comparison operator (=, >, >=, <, <=) and a breakpoint, which itself can be a value, an equipment.item reference, or an expression.
- Arranges conditions in the order that Element Styles are processed.

---

**Note:** Bit state animations are not supported by Plant SCADA.

---

## Configuring a Boolean Animation Using Element Styles

You can configure an element or a group of elements with a Boolean animation that uses only two Element Styles.

### To configure an element or a group of elements with an Element Style that uses Boolean animation

1. Open the symbol or graphic in the Industrial Graphic Editor.
2. Select the element or element group.
3. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
4. Click the **Add** icon and select **Element Style**. The Element Style animation is added to the Animation list and the **Element Style** state selection panel appears.
5. Click the **Boolean** button. The **Boolean Element Style** configuration panel appears.
6. In the **Boolean** text box, enter a Boolean numeric value, equipment.item reference, or an expression.
7. Clear **ElementStyle** in the **True, 1, On** area or **False, 0, Off** area if you do not want a different Element Style for the true or false condition than the default Element Style that is shown in the **Element Style** list.
8. In the **True, 1, On** area, select the Element Style in the list to use when the expression is true.
9. In the **False, 0, Off** area, select the Element Style in the list to use when the expression is false.
10. Click **OK**.

## Related Topics

[Configuring an Animation Using Element Styles](#)

## Configuring a Truth Table Animation with Element Styles

You can configure an element or a group of elements with a Truth Table animation that can select multiple Element Styles based on a set of evaluated values or expressions.

### To configure an element or a group of elements with an Element Style that uses Truth Table animation

1. Open the symbol or graphic.
2. Select the element or group.
3. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
4. Click the **Add** icon and select **Element Style**. The Element Style animation is added to the Animation list and the **Element Style** state selection panel appears.
5. Click the **Truth Table** button. The **Truth Table Element Style** configuration panel appears. The Element Style that is applied to the element is shown in the **Element Style** list at the bottom of the panel.
6. In the **Expression Or Reference** area:
  - Select the data type of the expression from the list.
  - Type a value, equipment.item reference or expression in the text box.
7. If the data type of the expression is string or internationalized string, you can specify to ignore the case by selecting **Ignore Case**.

8. In the **Truth Table**, select the **Element Style** check box and select the Element Style for one of the conditions to be defined in the truth table.
9. In the **Operator** column, select a comparison operator.
10. In the **Value or Expression** column, type a value, equipment.item reference, or expression.
11. To add other conditions:
  - a. Click the **Add** icon. An additional condition is added to the truth table.
  - b. Select the **Element Style** check box, select the Element Style for the condition, select an operator, and enter the condition value or expression.
12. After adding all truth table conditions, click **OK**.

Truth Table animation is typically used to set Element Styles to the different states of an object. For example, you can set Truth Table conditions to show different Element Styles that represent the following alarm conditions:

- When the equipment.item TankLevel\_001.PV is 0 then no Element Style is applied.
- When the equipment.item TankLevel\_001.PV is less than 20, then the Element Style is Alarm\_Minor\_Dev.
- When the equipment.item TankLevel\_001.PV is greater than the equipment.item Standards.TankMax then the Element Style is Alarm\_Major\_Dev.

- [Substituting References in Elements](#)

### About Animations

You can use animations to change the appearance of graphic elements at run time. Animations are driven by

data that comes from equipment.item or tag values and expressions as well as element properties.

You can use:

- **Visualization animations** such as visibility, fill style, line style, text style, blinking, percent fill horizontal, percent fill vertical, horizontal location, vertical location, width, height, orientation, value display or tooltip.
- **Interaction animations** such as disable, user input, horizontal slider, vertical slider, pushbutton, action script, show graphic or hide graphic.
- **Element-specific animations** for the Status element and Windows common control elements.

Each element in your Industrial graphic can have one or more animations. You can disable and enable individual animations. You can also cut, copy and paste animations between elements. Only animations supported by the target element are pasted.

You can also substitute references and strings in animations.

---

**Note:** Not all animations are available for all element types. Some animations do not make logical sense, such as line style with a text element. You cannot select or copy these invalid combinations.

---

## Related Topics

[Animating Graphic Elements](#)

### Adding an Animation to an Element

You can add one or more animations to a single element in your Industrial graphic.

#### To add an animation to an element

1. Select the element to which you want to add an animation.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.  
You can also add an animation from the Animation Summary in the lower right corner of the Industrial Graphic Editor.
3. Click the **Add** icon. The list of animations appears.
4. Select an animation from the list. The animation is added to the Animation list. You can configure the selected animation from the Edit Animations dialog box.

---

**Note:** Depending on the animation type, you may get an animation state selection panel instead. For more information, see [Reviewing which Animations are Assigned to an Element](#).

---

## Related Topics

[Animating Graphic Elements](#)

### Reviewing which Animations are Assigned to an Element

You can review which animations are assigned to an element and change the number of animations or their configuration at the same time.

## To review which animations are assigned to an element

1. Select the element. The assigned animations appear in the Animation Summary in the lower right of the Industrial Graphic Editor.  
You can also review which animations are assigned to an element by double-clicking it.
2. Select an animation to view further information on how the element is configured with that animation.

## Related Topics

[Animating Graphic Elements](#)

## Showing and Hiding the Animation List

You can show or hide the Animation list. If you hide the Animation list, the configuration space expands, giving you more space to configure the animations.

### To hide the Animation list

- In the **Edit Animations** dialog box, click the **Hide** icon. The Animation list hides and the configuration space expands.

### To show the Animation list

- In the **Edit Animations** dialog box, click the **Show** icon. The Animation list appears and the configuration space reduces to its default width.

## Related Topics

[Animating Graphic Elements](#)

## Removing Animations from an Element

You can remove an animation from an element by using the **Edit Animations** dialog box. You can remove animations from an element for:

- Individual animations
- All animations at the same time

### To remove an animation from an element

1. Select the element in which you want to remove an animation.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.  
You can also remove an animation from the Animation Summary in the lower right of the Industrial Graphic Editor.
3. Select the animation you want to remove from the Animation list.
4. Click the **Remove** icon. A message appears.

5. Click **Yes**. The animation is removed from the list and no longer associated with the element.

### To remove all animations from an element

1. Select one or more elements from which you want to remove all animations.
2. Do one of the following:
  - Right-click, point to **Animations** and then click **Clear**.
  - On the **Edit** menu, point to **Animations**, and then click **Clear**.

All animations are removed from the selected elements.

## Related Topics

## Enabling and Disabling Animations

You can enable or disable animations for an element. When you disable an animation, its configuration is not lost. This lets you see, for example, each animation independently from each other.

### To disable an animation

1. Select the element with the animation you want to disable.
2. On the **Special** menu, click **Edit Animations**. The Edit Animations dialog box appears.  
You can also disable animations from the Animation Summary in the lower right corner of the Industrial Graphic Editor.
3. Locate the animation you want to disable from the Animation list on the left of the dialog box.
4. Select **Disabled** from the list of that row.
5. Repeat for any other animations you want to disable and click **OK** when you are done.

### To enable an animation

1. Select the element with the animation you want to enable.
2. On the **Special** menu, click **Edit Animations**. The Edit Animations dialog box appears.  
You can also enable animations from the Animation Summary of the Industrial Graphic Editor.
3. Locate the animation you want to enable from the Animation list.
4. Select **Enabled** from the list of that row.
5. Repeat for any other animations you want to enable and click **OK** when you are done.

## Related Topics

## Validating the Configuration of an Animation

You can validate the configuration of an animation. If the configuration contains an error, an exclamation mark appears next to the **Animation** icon.

Examples of animation configuration errors include:

- Animation is disabled
- Syntax errors such as data mismatches
- Required values not specified
- Specified values out of valid range

### To validate the configuration of an animation

1. Select the element that contains the animations you want to validate.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Select the animation you want to validate.
4. Click the **Validate** icon. The currently selected animation is validated. Possible errors are highlighted.

### Organizing the Animation List

You can organize the list of animations alphabetically or by category.

#### To organize the Animation list

- In the **Edit Animations** dialog box, click the:
  - **Alphabetic sort** icon to sort alphabetically.
  - **Category** icon to sort by category.

## Related Topics

- [Managing Animations](#)

### Switching between Animations

If you configure more than one animation for an element, you can easily switch between their configuration panels without having to use the Animation list. This is particularly useful when the Animation list is hidden.

#### To switch between animations

- In the **Edit Animations** dialog box, on the configuration panel click the left or right arrow icon.  
The configuration panel changes to the configuration panel of the previous or next animation.

## Related Topics

- [Managing Animations](#)

### Configuring Common Types of Animations

Every animation type has its own set of configuration parameters. This section shows you how to configure each type of animation and what references it can use.

You can configure:

- Visualization animations such as:
  - Visibility animations
  - Fill style, line style or text style animations
  - Blink animations
  - Alarm Border animations

- Horizontal or vertical percent fill animations
- Horizontal or vertical location animations
- Width or height animations
- Point animations
- Orientation animations
- Value display animations
- Tooltip animations
- Interaction animations such as:
  - Disable animation
  - User input animation
  - Horizontal and vertical slider animations
  - Pushbutton animations
  - Action script animations
  - Show or hide animations

## Configuring a Visibility Animation

You can configure an element with a visibility animation.

---

**Note:** Truth table and bit state animations are not supported for visibility animations.

### To configure an element with a visibility animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **Visibility**. The visibility animation is added to the Animation list and the **Visibility** configuration panel appears.
4. In the **Boolean** box, type a Boolean numeric value, equipment.item reference or expression.
5. Select **True, 1, On** if you want the element to show, when the expression is true, otherwise select **False, 0, Off**.

## Related Topics

- [Configuring Common Types of Animations](#)

## Configuring a Fill Style Animation

You can configure an element with a:

- Boolean fill style animation.
- Truth table fill style animation.

---

**Note:** Bit state animations are currently not supported for fill style animations.

The truth table fill style animation lets you:

- Associate expressions of any data type supported by the HMI with a fill style.
- Define as many fill styles as you require and associate each one with a condition.

You can define the conditions by specifying an comparison operator (=, >, >=, <, <=) and a breakpoint, which itself can be a value, an equipment.item reference, or an expression.

You can add conditions, delete conditions, and also change the order in which the conditions are processed.

[Configuring a Truth Table Fill Style Animation](#)

# Configuring a Boolean Fill Style Animation

You can configure an element with a discrete fill style animation.

## To configure an element with a Boolean fill style animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **Fill Style**. The fill style animation is added to the Animation list and the **Fill Style** state selection panel appears.
4. Click the **Boolean** button. The **Boolean Fill Style** configuration panel appears.
5. In the **Boolean** box, type a Boolean numeric value, equipment.item reference or expression.
6. Clear **Color** in the **True, 1, On** area or **False, 0, Off** area if you do not want a different fill style for the true or false condition than the default fill style.
7. In the **True, 1, On** area, click the color box to configure the fill color when the expression is true. The **Select FillColor** dialog box appears. For more information, see [Setting Style](#).
8. In the **False, 0, Off** area, click the color box to configure the fill color when the expression is false. The **Select FillColor** dialog box appears. For more information, see [Setting Style](#).
9. Click **OK**.

## To set default fill style in a Boolean fill style animation

1. Open the **Edit Animations** dialog box, **Boolean Fill Style** panel.
2. In the **Element Fill Style** area, click the color box to select a style from the **Select FillColor** dialog box.

## To use default fill style in a Boolean fill style animation

1. Open the **Edit Animations** dialog box, **Boolean Fill Style** panel.
2. Clear **Color** to use the corresponding default fill style.

## Related Topics

[Configuring a Fill Style Animation](#)

# Configuring a Truth Table Fill Style Animation

You can configure an element with a fill style animation based on a truth table.

## To configure an element with a truth table fill style animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.

3. Click the **Add** icon and select **Fill Style**. The fill style animation is added to the Animation list and the **Fill Style** state selection panel appears.
4. Click the **Truth Table** button. The **Truth Table Fill Style** configuration panel appears.
5. In the **Expression Or Reference** area:
  - Select the data type of the expression from the list.
  - Type a value, equipment.item reference or expression in the text box.
6. If the data type of the expression is string or internationalized string, you can specify to ignore the case by selecting **Ignore Case**.
7. In the **Truth Table**, click the color box in the **Color** column. The **Select FillColor** dialog box appears. For more information, see [Setting Style](#).
8. In the **Operator** column, select the comparison operator.
9. In the **Value or Expression** column, type a value, equipment.item reference, or expression.
10. To add further conditions, see .
11. Click **OK**.

#### To set the default fill style for a truth table fill style animation

1. Open the **Edit Animations** dialog box, **Truth Table Fill Style** panel.
2. In the **Element Fill Style** area, click the color box. The **Select FillColor** dialog box appears. For more information, see [Setting Style](#).

#### To use the default fill style in a truth table fill style animation

1. Open the **Edit Animations** dialog box, **Truth Table Fill Style** panel.
2. Locate the condition for which you want to set the style to default style.
3. Clear the mark for that condition in the **Color** column of the truth table. The associated style is the same as the style for the **Element Fill Style**.

#### To add a condition to a truth table fill style animation

1. Open the **Edit Animations** dialog box, **Truth Table Fill Style** panel.
2. Click the **Add** icon. An additional condition is added to the truth table.
3. Configure color, operator and breakpoint value according to your requirements.

#### To delete a condition from an analog fill style animation

1. Open the **Edit Animations** dialog box, **Truth Table Fill Style** panel.
2. Select the condition you want to delete.
3. Click the **Remove** icon. The condition is removed.

#### To change the processing order of fill style conditions

1. Open the **Edit Animations** dialog box, **Truth Table Fill Style** panel.
2. Select the condition you want to move up or down the condition list in order for it to be processed sooner or

later.

3. Click the:

- **Arrow up** icon to move the condition up in the truth table.
- **Arrow down** icon to move the condition down in the truth table.

For example, you want to model an analog fill color animation that describes the following conditions:

- When the equipment.item TankLevel\_001.PV is 0 then the fill style is solid black.
- When the equipment.item TankLevel\_001.PV is smaller than 20, then the fill style is solid red.
- When the equipment.item TankLevel\_001.PV is greater than the equipment.item Standards.TankMax then the fill style is red with a diagonal pattern.
- In all other cases, the fill style is solid blue.

# Configuring a Boolean Line Style Animation

You can configure an element with a Boolean line style animation. You can use a new style or use all or parts of the default appearance of a line for:

- Line style.
- Line thickness.
- Line pattern.

### To configure an element with a Boolean line style animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **Line Style**. The line style animation is added to the Animation list and the **Line Style** state selection panel appears.
4. Click the **Boolean** button. The **Boolean Line Style** configuration panel appears.
5. In the **Boolean** box, type a Boolean numeric value, equipment.item reference or expression.
6. In the **True, 1, On** area, click the **Color** box to configure the line style when the expression is true. The **Select FillColor** dialog box appears. For more information, see [Setting Style](#).
7. In the **Weight** box, type a value for the line thickness when the expression is true.
8. From the **Pattern** list, select a line pattern for the line when the expression is true.
9. Repeat the above steps for the false condition in the **False, 0, Off** area.
10. Click **OK**.

### To set default line style, thickness and/or pattern in a Boolean line style animation

1. Open the **Edit Animations** dialog box, **Boolean Line Style** panel.
2. In the **Element Line Style** area, select a style, type a value for the width and select a pattern for the default Boolean line style.

### To use default line style, thickness and/or pattern in a Boolean line style animation

1. Open the **Edit Animations** dialog box, **Boolean Line Style** panel.
2. In the **True, 1, On** or **False, 0, Off** areas, clear **Color**, **Weight** and/or **Pattern** to use the corresponding default style, weight and/or pattern.

1. Open the **Edit Animations** dialog box, **Truth Table Line Style** panel.
2. In the **Element Line Style** area, select a style, type a value for the width and select a pattern for the default truth table line style.

#### To use the default line style, width or pattern in a truth table line style animation

1. Open the **Edit Animations** dialog box, **Truth Table Line Style** panel.
2. Locate the condition for which you want to change the line style, width or pattern.
3. To use the default line style for the condition, clear the mark in the **Color** column of the truth table.
4. To use the default line width for the condition, clear the mark in the **Width** column of the truth table.
5. To use the default line pattern for the condition, clear the mark in the **Pattern** column of the truth table.

#### To add a condition to a truth table line style animation

1. In the **Edit Animations** dialog box, **Truth Table Line Style** panel, click the **Add** icon. An additional condition is added to the truth table.
2. Configure color, weight, pattern, operator and breakpoint value according to your requirements.

#### To delete a condition from an analog line color animation

1. In the **Edit Animations** dialog box, **Truth Table Line Style** panel, select the condition you want to delete.
2. Click the **Remove** button. The condition is removed.

### To change the processing order of line style conditions

1. Open the **Edit Animations** dialog box, **Truth Table Line Style** panel
2. Select the condition you want to move up or down the condition list in order for it to be processed sooner or later.
3. Click the:
  - **Arrow up** icon to move the condition up in the truth table.
  - **Arrow down** icon to move the condition down in the truth table.

## Related Topics

[Configuring a Line Style Animation](#)

### Configuring a Text Style Animation

You can configure an element with a:

- Boolean text style animation.
- Truth table text style animation.

---

**Note:** Bit state animations are currently not supported for text style animations.

---

The truth table text style animation lets you:

- Associate expressions of any data type supported by your HMI/SCADA software with a text style.
- Define as many text styles as you want and associate each one with a condition.

You can define the conditions by specifying an comparison operator (=, >, >=, <, <=) and a breakpoint, which itself can be a value, an equipment.item reference or an expression.

You can add conditions, delete conditions and also change the order in which the conditions are processed.

# Configuring a Boolean Text Style Animation

You can configure an element with a Boolean text style animation.

### To configure an element with a Boolean text style animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.

3. Click the **Add** icon and select **Text Style**. The text style animation is added to the Animation list and the **Text Style** state selection panel appears.
4. Click the **Boolean** button. The **Boolean Text Style** configuration panel appears.
5. In the **Boolean** box, type a Boolean numeric value, equipment.item reference or expression.
6. In the **True, 1, On** area, click the **Color** box to configure the text style when the expression is true. The **Select FillColor** dialog box appears. For more information, see [Setting Style](#).
7. Click the browse button for the **Font** box, to select a font, font style and size for the text when the expression is true.
8. Repeat the above steps for the false condition in the **False, 0, Off** area.
9. Click **OK**.

#### To set default text style and/or font in a Boolean text style animation

1. Open the **Edit Animations** dialog box, **Boolean Text Style** panel.
2. In the **Element Text Style** area, select a style and/or a font for the default Boolean text style.

#### To use default text style and/or font in a Boolean text style animation

1. Open the **Edit Animations** dialog box, **Boolean Text Style** panel.
2. In the **True, 1, On** or **False, 0, Off** areas, clear **Color** and/or **Font** to use the corresponding default style and/or font.

[Configuring a Blink Animation](#)

You can configure an element with a blink animation. You can specify:

- The blinking speed: slow, medium or fast.
- If the element should blink invisibly or if it should blink with specified colors.

**Note:** Truth table and bit state animations are currently not supported for blink animations.

## To configure an element with a blink animation

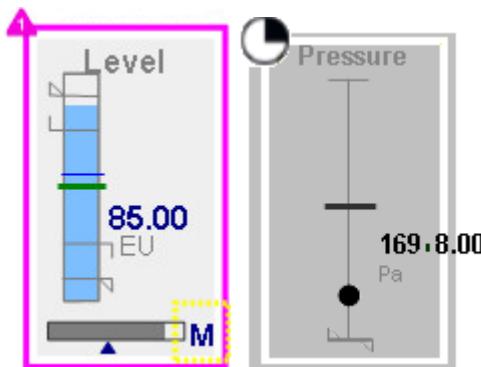

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **Blink**. The blink animation is added to the Animation list and the **Blink** configuration panel appears.
4. In the **Boolean** box, type a Boolean numeric value, equipment.item reference or expression.
5. In the **Blink When Expression Is** area, select:
  - **True, 1, On** to enable blinking when the expression is true.
  - **False, 0, Off** to enable blinking when the expression is false.
6. In the **Blink Speed** area, select **Slow,Medium** or **Fast** for the blinking speed.
7. In the **Blink Attributes** area, select **Blink Visible With These Attributes** or **Blink Invisible**.
8. If you select **Blink Visible With These Attributes**, you can configure the styles used at run time for the text, line and fill component of the element. Click on the corresponding color box, and the **Select FillColor** dialog box appears. For more information, see [Setting Style](#).
9. Click **OK**.

[Configuring Common Types of Animations](#)

## Configuring an Alarm Border Animation

Alarm Border animation shows a highly visible border around a graphic or graphic element when an alarm occurs. The color and fill pattern of the border indicates the severity and current state of the alarm, if supported by your HMI/SCADA software. Plant operators can quickly recognize alarm conditions when Alarm Border animation is used.

Alarm Border animation also shows an indicator icon at the top left corner of the border around a closed graphic element. For open pie or arc graphic elements, the indicator icon is placed at the top-left most location of the start and end points.

Alarm severity (1-4) or the current alarm mode (Shelved, Silenced, Disabled) appear as part of the indicator icon. The indicator icon can be shown or hidden as a configurable option of Alarm Border animation.

Alarm Border animation adheres to the following precedence rules with other functions that can change the appearance of a graphic:

1. Quality status
2. Alarm Border animation
3. Element Style animation
4. Style animations
5. Element Style on canvas

# Understanding Requirements of Alarm Border Animations

Alarm border animation can be applied to all types of graphics except embedded graphics and nested groups. Alarm border animation can also be applied to graphic elements and group elements.

## Related Topics

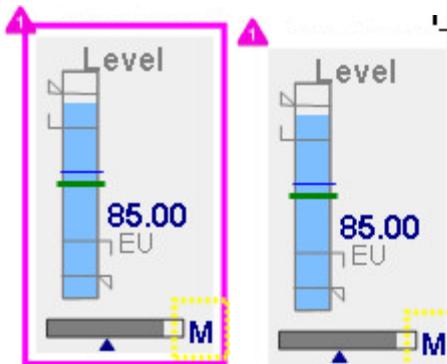

[Configuring an Alarm Border Animation](#)

# Understanding the Behavior of Alarm Border Animations

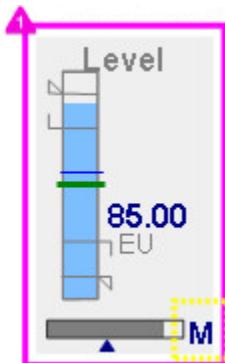

Alarm Border animation appears around a graphic element based on the current state of the object's aggregated alarm equipment.items, or other configured alarm inputs supported by your HMI/SCADA software. The appearance of the alarm border itself reflects the current alarm state and the user's interaction with the alarm.

- A graphic's process value transition into an alarm state.

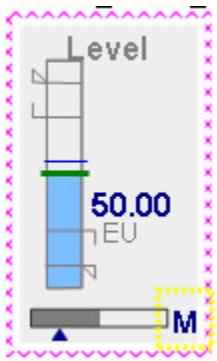

Alarm Border animation appears around the graphic based on alarm severity with blinking.

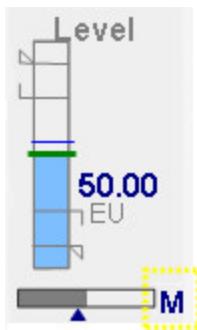

- The user acknowledges an alarm with the process value still in an alarm state.  
Alarm Border animation appears around the graphic without blinking.

- The alarm value returns to normal without the user acknowledging the alarm.  
Alarm Border animation remains around the graphic in a defined Return to Normal visual style without blinking.

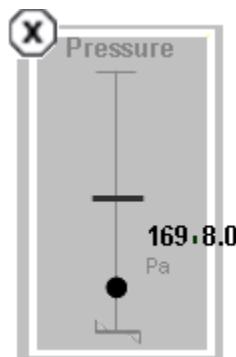

- The alarm value returns to normal and the user acknowledges the alarm.  
Alarm Border animation no longer appears around a graphic.

- The user suppresses an alarm.

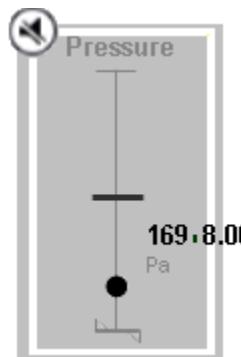

Alarm Border animation remains around the graphic in a defined suppressed/disabled visual style without blinking. The indicator shows the suppressed/disabled alarm mode icon.

- The user silences an alarm

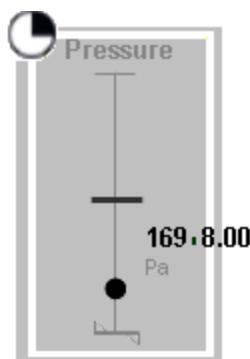

Alarm Border animation remains around the graphic in a defined silenced visual style without blinking. The indicator shows the silenced alarm mode icon.

A silenced alarm mode takes precedence over an alarm in shelved mode.

- The user shelves an alarm

Alarm Border animation remains around the graphic in a defined shelved visual style without blinking. The indicator shows the shelved alarm mode icon.

If a new alarm condition occurs when Alarm Border animation appears around a graphic, the animation updates to show the new alarm state. In the case of aggregation alarms, Alarm Border animation shows the highest current alarm state.

## Related Topics

[Configuring an Alarm Border Animation](#)

# Configuring Alarm Border Animation

Alarm Border animation can be configured by selecting **Alarm Border** from the list of **Visualization** animations. For Situational Awareness Library symbols, Alarm Border animation can be selected as a Wizard Option of the graphic.

The **Alarm Border** animation dialog box contains mutually exclusive fields to set the referenced equipment.items for aggregate or individual alarms.

If your HMI/SCADA software supports aggregating alarms from different plant or functional areas, you can specify Alarm Border animation by entering an equipment.item, object, or tag name in the **Use Standard Alarm-Urgency References** field of the **Alarm Border** dialog box.

The selected object equipment.items or tags typically map to the following aggregation alarm equipment.items:

- AlarmMostUrgentAcked
- AlarmMostUrgentInAlarm
- AlarmMostUrgentMode
- AlarmMostUrgentSeverity
- AlarmMostUrgentShelved

For individual alarms, you can specify Alarm Border animation by entering equipment.item or object names in the **Use Custom Alarm-Urgency References** fields of the **Alarm Border** dialog box.

- **InAlarm Source**

Indicates the InAlarm status (True/False) of the most urgent alarm that is in the InAlarm state or waiting to be Acked. If no alarms are in the InAlarm state or waiting to be Acked, the value is False.

- **Acked Source**

Indicates the acknowledgement status (True/False) of the most urgent alarm that is in the InAlarm state or

waiting to be Acked. If no alarms are in an InAlarm state or waiting to be Acked, the value is True, which means no acknowledgement is needed.

- **Mode Source**

Indicates the alarm mode (Enable/Silence/Disable/Shelved) of the most urgent alarm that is in the InAlarm state or waiting to be Acked. If alarms are configured for an equipment.item, but no alarms are in the InAlarm state or waiting to be Acked, the value is the same as the AlarmMode of the object.

- **Severity Source**

Indicates the severity as an integer (1-4) of the most urgent alarm current in an InAlarm state. If no alarms are in an InAlarm state or waiting to be acknowledged, the value is 0.

- **Shelved Source**

Indicates the current Shelved status (True/False) of the most urgent alarm that is in the InAlarm state or waiting to be Acked. If no alarms are in the InAlarm state or waiting to be Acked, the value is False.

To set Alarm Border animation for individual alarms, specify references to the following alarm equipment.items or tags:

- InAlarm equipment.item
- Acked equipment.item
- Mode equipment.item
- Severity equipment.item
- Shelved equipment.item

Alarm Border animation subscribes to these equipment.items or tags. Based on the alarm state of these equipment.items or tags, Alarm Border animation is applied to the graphic element in run time.

### To configure Alarm Border animation

1. Open a graphic in the Industrial Graphic Editor.
2. Select the graphic to show the graphic elements listed in the **Elements** pane of the Industrial Graphic Editor.
3. Select a graphic element from the **Elements** list to apply Alarm Border animation.
4. Click **Add Animation** to show the list of animation types.
5. Select **Alarm Border** from the list of **Visualization** animations.

The **Alarm Border** dialog box appears with a set of configuration options.

6. Select either **Use Standard Alarm-Urgency References** or **Use Customized Alarm-Urgency References**.

- **To use Standard Alarm-Urgency References**

Click **Browse** and select an equipment.item, tag, or object name, then Click **OK**.

Both direct and relative references to an object or tag are supported. An expression cannot be used to reference the object.

- **To use Customized Alarm-Urgency References**

Click **Browse** and select an equipment.item, a graphic element, or a tag name for all Source fields shown beneath **Use Customized Alarm Urgency References**, then click **OK**.

All fields must contain values and cannot be left blank. Expressions, external references, and custom properties can be entered in all fields.

7. Enter a custom property, a constant (True/False), an external reference, or an expression in the **Show Alarm Indicator** field to set the condition when an alarm indicator icon is shown or hidden.

# Changing Alarm Border Indicator Icons

## Changing Alarm Border Indicator Icons

Alarm border animation shows an indicator icon at the top left corner of the border with alarm severity as a number from 1 to 4 if your HMI/SCADA software supports it. Other indicator images represent alarm suppressed, silenced and shelved modes.

A default Alarm Border indicator image is assigned to each alarm mode and severity level. The default images appear in the **Image** fields of the **Alarm and Event Priority Mapping and Historization** dialog box. The images are saved in an XML file. For details about the location of the file, refer to your HMI/SCADA software documentation.

The default Alarm Border indicator images can be replaced by custom images. Supported image file types include .bmp, .gif, .jpg, .jpeg, .tif, .tiff, .png, .ico and .emf.

### To replace Alarm Border indicator images

1. Create Alarm Border indicator images that will replace the default indicator images.
2. Navigate to the Alarm Priority Mapping configuration dialog. The **Alarm and Event Priority Mapping and Historization** dialog box appears. The navigation path will differ according to your HMI/SCADA software. Typically, the path will be through menu items to configure your project or application components.
3. Click the **Search** button next to the Alarm Border indicator or mode image to be replaced. The **Open** dialog box appears to locate the replacement Alarm Border indicator images.
4. Go to the folder containing the replacement images.
5. Select an image file and click **Open**.
6. Verify the new Alarm Border indicator image replaced the original image in the **Alarm and Event Priority Mapping and Historization** dialog box.

At run time, Alarm Border animation reads the XML file from the location where it is stored. If images are not available from the XML file, an Alarm Indicator does not appear during Alarm Border animation.

# Modify Alarm Border Animation Element Styles

## Modify Alarm Border Animation Element Styles

The color and fill pattern of alarm borders are set by the Outline properties of a set of AlarmBorder Element Styles. The following table shows the Element Styles applied to Alarm Border animations by alarm severity and alarm state.

The assignment of these Element Styles to alarm conditions cannot be changed. Only the assigned Element Style's Outline properties can be changed to modify the line pattern, line weight, and line color of alarm borders.

Alarm Severity	Alarm State	Element Style
1	UnAcknowledged	AlarmBorder_Critical_UNACK
1	Acknowledged	AlarmBorder_Critical_ACK
1	Return To Normal	AlarmBorder_Critical_RTN
2	UnAcknowledged	AlarmBorder_High_UNACK
2	Acknowledged	AlarmBorder_High_ACK
2	Return To Normal	AlarmBorder_High_RTN
3	UnAcknowledged	AlarmBorder_Medium_UNACK
3	Acknowledged	AlarmBorder_Medium_ACK
3	Return To Normal	AlarmBorder_Medium_RTN
4	UnAcknowledged	AlarmBorder_Low_UNACK
4	Acknowledged	AlarmBorder_Low_ACK
4	Return To Normal	AlarmBorder_Low_RTN
All	Suppressed	AlarmBorder_Suppressed
All	Shelved	AlarmBorder_Shelved
All	Silenced	AlarmBorder_Silenced

## Configuring a Percent Fill Horizontal Animation

You can configure an element with a percent fill horizontal animation.

Besides specifying the expressions that determine how much of the element is filled at run time, you can also specify:

- **Fill direction:** from left to right or right to left.
- **Unfill color:** the style of the background when the element has 0 percent filling.
- **Fill orientation:** if the filling is in relation to the element or to the screen. This affects how the fill appears if the orientation of the element changes. If the fill is in relation to the screen and the element or graphic are rotated, the fill remains in relation to the screen.

---

**Note:** The fill orientation is a common setting to the percent fill horizontal and percent fill vertical animations.

---

You can also preview how the percent fill horizontal animation appears at run time.

### To configure an element with a percent fill horizontal animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **% Fill Horizontal**. The percent fill horizontal animation is added to the Animation list and the **% Fill Horizontal** configuration panel appears.
4. Specify the settings. Do one or more of the following:
  - In the **Analog** box, type an analog value, equipment.item reference or expression.

- In the **Value - At Min Fill** box, type an analog value, equipment.item reference or expression that causes the minimum percent of filling at run time.
  - In the **Value - At Max Fill** box, type an analog value, equipment.item reference or expression that causes the maximum percent of filling at run time.
  - In the **Fill - Min%** box, type an analog value, equipment.item reference or expression to specify the minimum percent of filling.
  - In the **Fill - Max%** box, type an analog value, equipment.item reference or expression to specify the maximum percent of filling.
  - In the **Colors** area, click the:
    - Fill Color** box to select a style from the **Select FillColor** dialog box. This is the fill style of the element.
    - Unfilled Color** box to select a style from the **Select FillColor** dialog box. This is the unfilled fill style of the element.
- For more information, see [Setting Style](#).

5. In the **Direction** area, select:
  - **Right** - to fill from left to right.
  - **Left** - to fill from right to left.
6. In the **Orientation** area, select:
  - **Relative to Graphic** - so that the filling is in relation to the element and the filling rotates with the element.
  - **Relative to Screen** - so that the filling is in relation to the screen and the filling does not rotate with the element.
7. You can preview your configuration by using the slider in the **Preview** area. Drag the slider to see how different values affect the appearance at run time.
8. Click **OK**.

## Related Topics

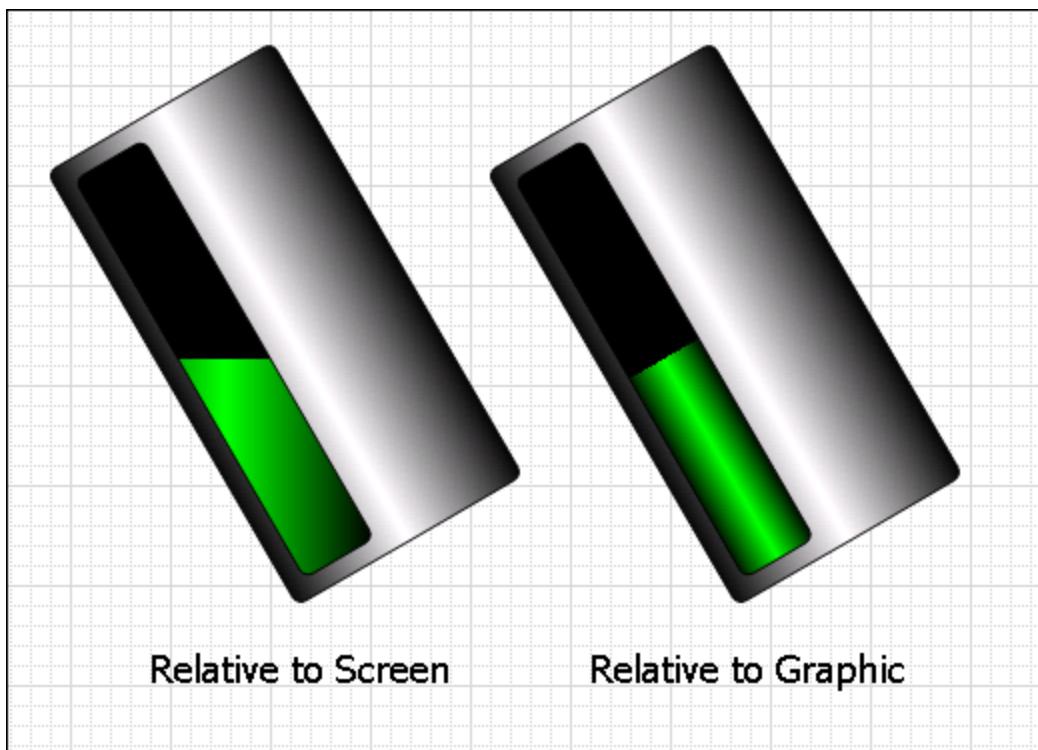

[Configuring Common Types of Animations](#)

### Configuring a Percent Fill Vertical Animation

You can configure an element with a percent fill vertical animation.

Besides specifying the expressions that determine how much of the element is filled at run time, you can also specify:

- **Fill direction:** from lower to top or top to lower.
- **Unfill color:** the style of the background when the element has 0 percent filling.
- **Fill orientation:** if the filling is in relation to the element or to the screen. This affects how the fill appears if the orientation of the element changes. If the fill is in relation to the screen and the element or graphic are rotated, the fill remains in relation to the screen.

**Note:** The fill orientation is a common setting to the percent fill horizontal and percent fill vertical animations.

#### To configure an element with a percent fill vertical animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **% Fill Vertical**. The percent fill vertical animation is added to the Animation list and the **% Fill Vertical** configuration panel appears.
4. In the **Analog** box, type an analog value, equipment.item reference or expression.
5. In the **Value-At Min Fill** box, type an analog value, equipment.item reference or expression that causes the minimum percent of filling at run time.
6. In the **Value-At Max Fill** box, type an analog value, equipment.item reference or expression that causes the maximum percent of filling at run time.
7. In the **Fill-Min%** box, type an analog value, equipment.item reference or expression to specify the minimum percent of filling.
8. In the **Fill-Max%** box, type an analog value, equipment.item reference or expression to specify the maximum percent of filling.
9. In the **Colors** area, click the:
  - **Fill Color** box to select a style from the **Select FillColor** dialog box. This is the fill style of the element.
  - **Unfilled Color** box to select a style from the **Select FillColor** dialog box. This is the unfilled fill style of the element.For more information, see [Setting Style](#).
10. In the **Direction** area, select:
  - **Up** - to fill from lower to top.

- **Down** - to fill from top to lower.
11. In the **Orientation** area, select:
    - **Relative to Graphic** - so that the filling is in relation to the element and the filling rotates with the element.
    - **Relative to Screen** - so that the filling is in relation to the screen and the filling does not rotate with the element.
  12. You can preview your configuration by using the slider in the **Preview** area. Drag the slider to see how different values affect the appearance at run time.
  13. Click **OK**.

[Configuring Common Types of Animations](#)

### Configuring a Point Animation

Point animation changes the X and Y coordinate values of one or more selected points on a graphic or graphic element. During run time, the X and the Y coordinates of a selected point are set to an expression or reference that evaluates to a calculated real floating point value.

Point animation supports negative floating point values, which may cause the animation to go out of scope of the visualization window. In the case when a point's expression evaluates to a null value or causes an exception, animation stops and the point retains its original value.

The X and Y coordinates of a point can be configured as a pair or individually. If only the X coordinate of a point is configured, then the Y coordinate value is kept constant. The animation shows the point of the graphic element traversing the X axis. Likewise, if only the Y coordinate of a point is configured, then the animation shows the point traversing the Y axis with the point's X axis value held constant.

After selecting point animation, a list of configurable points is retrieved from the graphic element based on the following conditions.

- If the graphic element is a multi-point graphic type (Line, HV/Line, Polyline, Curve, Polygon, Closed curve), animation control points appear on the graphic element in preview mode.
- If the graphic element is not a supported multi-point graphic, then the top left X and Y coordinate of the graphic element is selected as the animation point.

In the case of an element group consisting of several graphic elements, the animation point is the top left corner of the rectangle around all grouped elements.

## To configure point animation

1. Open the graphic in Industrial Graphic Editor.
2. Select a graphic element.
3. On the **Special** menu, click **Edit Animations**.  
The **Edit Animations** dialog box appears.
4. Click the **Add Animation** button to show a list of Visualization and Interaction animations.
5. Select **Point** from the Visualization animation list.  
The **Point** dialog box appears with a list of points and a preview of the points on the graphic. The list shows each point as a pair of X and Y fields to enter an expression or a reference that evaluates to a floating point value.
6. Select a point from the list of points.  
The selected point changes to orange in the preview of the graphic.
7. Enter an expression, constant, or reference in the Point field.
8. Repeat steps 6-7 to animate other points in the graphic.
9. Save your changes.

## Configuring an Orientation Animation

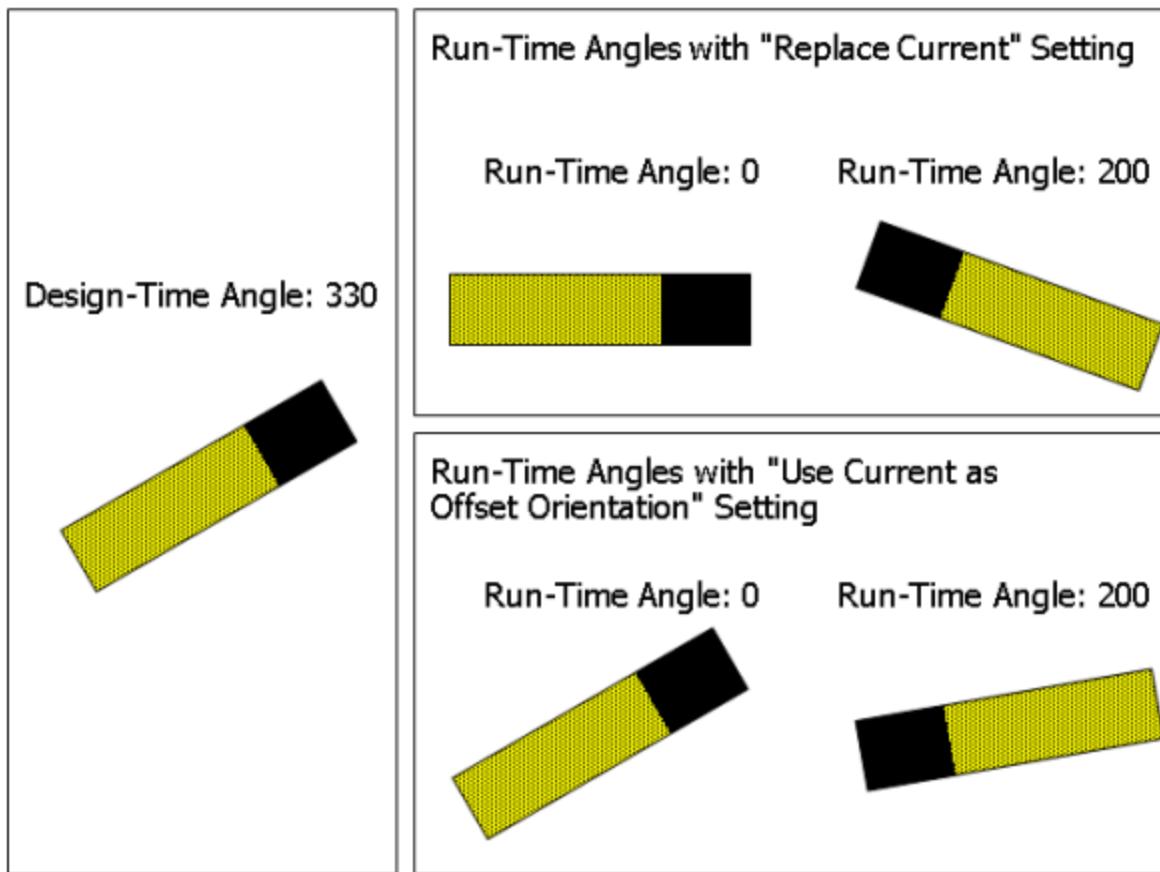

You can configure an element with an orientation animation. You can also:

- Specify a different orientation origin.
- Ignore or accept the design-time orientation of the element on the canvas.

- Preview the orientation at run time with a slider.

### To configure an element with an orientation animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **Orientation**. The orientation animation is added to the Animation list and the **Orientation** configuration panel appears.
4. In the **Analog** box, type an analog value, equipment.item reference or expression.
5. In the **Value-At CCW End** box, type an analog value, equipment.item reference or expression that corresponds to the maximum angle in degrees for the counter-clockwise orientation as specified by the **Orientation-CCW** value.
6. In the **Value-At CW End** box, type an analog value, equipment.item reference or expression that corresponds to the maximum angle in degrees for the counter-clockwise orientation as specified by the **Orientation-CW** value.
7. In the **Orientation-CCW** box, type an analog value, equipment.item reference or expression for the maximum orientation in counter-clockwise direction in degrees.
8. In the **Orientation-CW** box, type an analog value, equipment.item reference or expression for the maximum orientation in clockwise direction in degrees.
9. In the **Orientation Offset** area, select:
  - **Replace Current** to ignore the design-time orientation of the element as it appears on the canvas and to use absolute orientation.
  - **Use Current as Offset Orientation** to orientate the element at run time in relation to its design-time orientation on the canvas.

10. If you use current as offset orientation, you can type an offset value in the text box next to **Use Current as Offset Orientation**. This affects the orientation of the element on the canvas.
11. In the **Current Relative Origin** area, type values in the **dX** and **dY** boxes to specify the rotation origin as offset from the element center point. This affects the point of origin of the element on the canvas.
12. You can preview the orientation and how run-time values affect the appearance of the element, by dragging the slider in the **Preview** area.
13. Click **OK**.

# Configuring an Analog Value Display Animation

You can configure a text element, TextBox, or button to show an analog value. You can also configure an analog value display animation for a grouped element when the TreatAsIcon property is True.

### To configure an element with an analog value display animation

1. Select the text element, TextBox, Button, or grouped element that you want to configure Analog Value Display animation.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **Value Display**. The value display animation is added to the Animation list and the **Value Display** state selection panel appears.
4. Click the **Analog** button. The **Analog Value Display** configuration panel appears.

5. In the **Analog** box, type an analog value, equipment.item reference or expression.
6. Click the **Text Format** drop-down list and select a global number style.
  - **Format String** is the default numeric format, which includes a text field to enter characters that specify a number format.
  - Selecting custom from the **Text Format** list shows another drop-down list to select a number format.
    - **Fixed Width**: Appears on the **Analog Value** Display dialog box for every Custom number format. When selected, the run-time number value will not exceed the text length specified for Value Display animation.
    - **Precision**: Appears on the **Analog Value Display** dialog box for the **Fixed Decimal** and **Exponential Custom** number formats. **Precision** sets the precision of the fractional part of a number to the right of the decimal point.
    - **Bits From** and **To**: Appear on the **Analog Value Display** dialog box for the **Hex** and **Binary** number formats. **Bits From** sets the starting bit position of a hex or binary number shown during run time. **To** sets the ending bit position of a hex or binary number shown during run time.
7. Click **OK**.

Except for the **Format String** and **Custom** text styles, all other text styles are global number styles that do not need further configuration.

[Configuring Value Display Animation with the FormatStyle Property](#)

# Configuring Value Display Animation with the FormatStyle Property

## Configuring Value Display Animation with the FormatStyle Property

When Value Display or User Input animation have a text format configured with a number style from your HMI/SCADA software, numeric data shown during run time is formatted in accordance to the number style selected for the animation.

Changes to a number style are not propagated during run time. Any changes to global number styles become effective only after the HMI/SCADA software is restarted.

A number style can be changed during run time using the FormatStyle property. FormatStyle is a text element run-time property that displays the name of the current applied global number style. The value of the FormatStyle property can be set as the active number style of Value Display and User Input animation during run time .

- If the name applied to the FormatStyle property during run time is the name of a global number style, the

text element is reformatted using the new applied number style for Value Display or User Input animation.

- If the FormatStyle property is assigned a value that does not match any global number style, the value of FormatStyle remains unchanged and a warning message is logged to SMC logger.
- If FormatStyle is set to an empty string, the text format of User Input and Value Display animation reverts to the value specified for **Text Format** during design time.
- If a text element is inside a group in which the **TreatAsIcon** property is set to True, then the group's text format overrides the first text child element for Value Display or User Input animation.
- If a text element's FormatStyle property changes in run time, the new number style is used to format the text element. Because a graphic group does not have TextFormat and FormatStyle properties, using the FormatStyle property is the only way to change the format of text in run time.

# Configuring a Time Value Display Animation

You can configure an element to show a time value.

Use the following letters to set the time format:

h	The one or two-digit hour in 12-hour format.
hh	The two-digit hour in 12-hour format. Single digit values are preceded by a zero.

H	The one or two-digit hour in 24-hour format.
HH	The two-digit hour in 24-hour format. Single digit values are preceded by a zero.
t	The one-letter AM/PM abbreviation ("AM" appears as "A").
tt	The two-letter AM/PM abbreviation ("AM" appears as "AM").
m	The one or two-digit minute.
mm	The two-digit minute. Single digit values are preceded by a zero.
s	The one or two-digit seconds.
ss	The two-digit seconds. Single digit values are preceded by a zero.
d	The one or two-digit day.
dd	The two-digit day. Single digit day values are preceded by a zero.
ddd	The three-character day-of-week abbreviation.
dddd	The full day-of-week name.
M	The one or two-digit month number.
MM	The two-digit month number. Single digit values are preceded by a zero.
MMM	The three-character month abbreviation.
MMMM	The full month name.
y	The one-digit year (2001 appears as "1").
yy	The last two digits of the year (2001 appears as "01").
yyy	The full year (2001 appears as "2001").

The format for elapsed time is:

[–][DDDDD] [HH:MM:]SS[.fffffff]

Use the following letters to set the elapsed time format:

DDDDD	The number of days. Valid values are 0 to 999999.
HH	The two-digit hour in 24-hour format. Single digit

	values are preceded by a zero. Valid values are 00 to 23.
MIM	The two-digit month number. Single digit values are preceded by a zero. Valid values are 00 to 59.
SS	The two-digit seconds. Single digit values are preceded by a zero. Valid values are 00 to 59.
fffffff	Optional fractional seconds to right of decimal, and can be one through seven digits.

**Note:** You can use any other characters, except "g" in the property. These characters then appear at design time and run time in the control.

### To configure an element with a time value display animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **Value Display**. The value display animation is added to the Animation list and the **Value Display** state selection panel appears.
4. Click the **Time** button. The **Time Value Display** configuration panel appears.
5. In the **Time or Elapsed Time** box, type a time or elapsed time value, equipment.item reference or expression.
6. In the **Text Format** box, type a format for the value output. If you change this value, the **TextFormat** property of the element also changes.
7. Click **OK**.

# Configuring a User Input Animation for a Discrete Value

You can configure an element with a user input animation for a Boolean value.

### To configure an element with a user input animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **User Input**. The user input animation is added to the Animation list and the **User Input** state selection panel appears.
4. Click the **Boolean** button. The **Boolean Value User Input** configuration panel appears.
5. Specify the options. Do one or more of the following:
  - In the **Boolean** box, type an equipment.item reference or browse for one by using the browse button.
  - In the **Message to User** box, type a value, equipment.item reference or expression. This is the text that appears as prompt on the Boolean value input dialog box at run time.
  - In the **Prompt - True Message** box, type a value, equipment.item reference or expression. This is the text that appears on the button that causes the equipment.item to be set to true.
  - In the **Prompt - False Message** box, type a value, equipment.item reference or expression. This is the text that appears on the button that causes the equipment.item to be set to false.
  - Specify that the input dialog box appears by pressing a key or key combination. In the **Shortcut** area. Select a shortcut key in the **Key** list. Select **CTRL** and/or **SHIFT** to combine the shortcut key with the **CTRL** key and/or **SHIFT** key.
  - If you don't want the discrete value display element to show the True Message and False Message, select **Input Only**.
  - In the **Display Value - True Message** box, type a value, equipment.item reference or expression. This is the text that appears on the canvas when the associated equipment.item is true.
  - In the **Display Value - False Message** box, type a value, equipment.item reference or expression. This is the text that appears on the canvas when the associated equipment.item is false.
  - Make sure that the input modes of all boxes are set correctly. Click the **Input Mode** icon to set a static value or an equipment.item reference or expression.
6. Click **OK**.

## Related Topics

[Configuring a User Input Animation](#)

# Configuring a User Input Animation for an Analog Value

You can configure an element with a user input animation for an analog value.

### To configure an element with a user input animation for an analog value

1. Select the text element, TextBox, Button, or grouped element that you want to configure for User Input animation.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon from the **Animations** pane and select **User Input**.  
User Input is added to the **Interaction** list and **User Input** state selection panel appears.
4. Click the **Analog** button. The **Analog Value User Input** configuration panel appears.
5. In the **Analog** box, type an equipment.item reference or browse for one by using the browse button.
6. In the **Message to User** box, type a value, equipment.item reference, or expression. This text appears to prompt for the analog value input dialog box at run time.
7. Make sure that the input mode of the **Message to User** box is set correctly. Click the **Input Mode** icon to set a static value or an equipment.item reference or expression.
8. If you want to restrict the range of input values, you can do so in the **Value Limits** area by:
  - First selecting **Restrict Values**.
  - Enter values, equipment.item references, or expressions in the **Minimum** and **Maximum** boxes.
9. In the **Shortcut** area, specify that an **Input** dialog box appears by pressing a key or key combination. Select a shortcut key from the **Key** list. Select **CTRL** and/or **SHIFT** to combine the shortcut key with the Ctrl key and/or Shift key.
10. Select **Input Only** to restrict the text of a graphic from showing the current value of the reference equipment.item.  
If unchecked, the text of a graphic shows the current value of the reference equipment.item.
11. Select **Use Keypad** to show a keypad during run time for the user to type a data value.
12. Click the Text Format drop-down list and select a global number format.  
For more information about the listed global number styles, see [Setting Global Number Styles](#).

**Format String** is the default numeric format, which includes a text entry field to assign a number format using four characters:

Numeric Format Character	Description
Zero, (0)	Represents a digit at each specified position of a real number. Forces leading zeros to the integer part of a number and trailing zeros to the fractional part of a

Pound sign, (#)	Represents a digit at that position within a number.
Comma, (,)	Inserts a comma at the specified position of a real number.
Decimal point, (.)	Inserts a decimal point at the specified position of a real number.

Except for the Format String and Custom text styles, all other text styles are global number styles that do not need further configuration.

13. Click **OK**.

## Related Topics

# Configuring a User Input Animation for a String Value

You can configure an element with a user input animation for a string value.

### To configure an element with a user input animation for a string value

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **User Input**. The user input animation is added to the Animation list and the **User Input** state selection panel appears.
4. Click the **String** button. The **String Value User Input** configuration panel appears.
5. In the **String** box, type an equipment.item reference or browse for one by using the browse button.
6. In the **Message to User** box, type a value, equipment.item reference or expression. This is the text that appears as prompt on the string value input dialog box at run time.
7. Make sure that the input mode of the **Message to User** box is set correctly. Click the **Input Mode** icon to set a static value or an equipment.item reference or expression.
8. You can specify that the **Input** dialog box appears by pressing a key or key combination. In the **Shortcut** area. Select a shortcut key in the **Key** list. Select **CTRL** and/or **SHIFT** to combine the shortcut key with the CTRL key and/or SHIFT key.
9. If you don't want the string value display element to show the string input result on the canvas, select **Input Only**.
10. If you want to use the keypad to type the string value, select **Use Keypad**.
11. If you select **Input Only** and want to see placeholders during the input at run time, select **Echo Characters**.
12. If you are configuring a password input:
  - Select **Password**.

- Type in the replacement character in the adjacent box.
- Select **Encrypt** if you want to encrypt the string that holds the password.

**Important:** Password encryption only works within the context of HMI/SCADA software applications that support password encryption. Do not encrypt the string if you want to pass it to an external security system, such as the operating system or a SQL Server database. The external security system cannot read the encrypted password string and access will fail.

- 
13. Click **OK**.

2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **Pushbutton**. The pushbutton animation is added to the Animation list and the **Pushbutton** state selection panel appears.
4. Click the **Boolean** button. The **Boolean Pushbutton** configuration panel appears.
5. In the **Boolean** box, type a Boolean equipment.item reference or browse for one by using the browse button.
6. In the **Action** list, select:
  - **Direct** so the value becomes true when the element is clicked and the mouse button held. The value returns to false when the mouse button is released.
  - **Reverse** so the value becomes false when the element is clicked and the mouse button held. The value returns to true when the mouse button is released.
  - **Toggle** so the value becomes true if it is false and false if it is true when the element is clicked.
  - **Set** so the value is set to true when the element is clicked.
  - **Reset** so the value is set to false when the element is clicked.
7. If you select **Toggle, Set** or **Reset** as action, you can configure the action to be performed when the mouse button is released instead of pressed down. To do this, select **On button release**.
8. If you select Direct, Reverse, Reset or Set as action, you can configure the value to be written:
  - Continuously by selecting **Continuously while button is pressed**. Also specify the frequency the value is to be sent, by typing a value in the **Delay between value send** box.
  - One time by clearing **Continuously while button is pressed**.
9. Specify that the pushbutton action is executed by pressing a key or key combination. In the **Shortcut** area. Select a shortcut key in the **Key** list. Select **CTRL** and/or **SHIFT** to combine the shortcut key with the Ctrl key and/or Shift key.
10. Preview the pushbutton run-time behavior by clicking **Button** in the **Preview** area.
11. Click **OK**.

# Configuring a PushButton Animation for an Analog Value

You can configure an element with a pushbutton to set an analog value.

## To configure an element with a pushbutton animation to set an analog value

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The Edit Animations dialog box appears.
3. Click the **Add** icon and select **Pushbutton**. The pushbutton animation is added to the Animation list and the Pushbutton state selection panel appears.
4. Click the **Analog** button. The Analog Pushbutton configuration panel appears.
5. In the **Analog** box, type an equipment.item reference or browse for one by using the browse button.
6. From the **Action** list, select:
  - **Direct** so the value becomes Value1 when the element is clicked and the mouse button held. The value returns to Value2 when the mouse button is released.
  - **Toggle** so the value becomes Value1 if it is Value2 and Value2 if it is Value1 when the element is clicked.
  - **Set** so the value is set to Value1 when the element is clicked
  - **Increment** so the value is increased by Value1.
  - **Decrement** so the value is decreased by Value1.
  - **Multiply** so the value is multiplied with Value1.
  - **Divide** so the value is divided by Value1.
7. In the boxes **Value1** and, if applicable, **Value2**, type analog values, equipment.item references or references.
8. You can configure the value to be written when the mouse button is released instead. Select **On button release**. This does not apply if you select Direct as action.
9. You can configure the value to be written:
  - Continuously by selecting the **Continuously while button is pressed**. Also specify the frequency the value is to be sent, by typing a value in the **Delay between value send** box.
  - One time by clearing the **Continuously while button is pressed**.  
This does not apply if you select Toggle as action.
10. Specify that the pushbutton action is executed by pressing a key or key combination. In the **Shortcut** area. Select a shortcut key in the **Key** list. Select **CTRL** and/or **SHIFT** to combine the shortcut key with the **CTRL** key and/or **SHIFT** key.
11. Preview the pushbutton run-time behavior by clicking **Button** in the **Preview** area. Click the button multiple times to preview the value changes over a period of time.
12. Click **OK**.

[Configuring an Action Script Animation](#)

You can configure an element with an action script animation.

You can assign multiple action scripts to one element that are activated in different ways such as:

Use this...	To activate the action script when the...
<b>On Left Click/Key/Touch Down</b>	left mouse button or a specific key is pressed or a tap on a touch display.
<b>While Left Click/Key/Touch Down</b>	left mouse button or a specific key is pressed and held or the touch display is tapped and held.
<b>On Left/Key/Touch Up</b>	left mouse button or a specific key is released or the tap is released from a touch display.
<b>On Left Double Click/Double Tap</b>	left mouse button is double-clicked or the touch display is tapped twice in quick succession.
<b>On Right Click/Long Press</b>	right mouse button is pressed or a long press on the touch display.
<b>While Right Down</b>	right mouse button is pressed and held.
<b>On Right Up</b>	right button is released.
<b>On Right Double Click</b>	right mouse button is double-clicked.
<b>On Center Click</b>	center mouse button is pressed.
<b>While Center Click</b>	center mouse button is pressed and held.
<b>On Center Up</b>	center mouse button is released.
<b>On Center Double Click</b>	center mouse button is double-clicked.
<b>On Mouse Over</b>	pointer is moved over the element.
<b>On Mouse Leave</b>	pointer is moved out of the element.
<b>On Startup</b>	element is first shown in the HMI/SCADA run time display.
<b>While Mouse Over</b>	pointer is over the element.

**Note:** To expand the available space for your script, you can use the **Expansion** buttons to hide the script header and/or the Animation list.

### To configure an element with an action script animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **Action Scripts**. The action scripts animation is added to the Animation list and the **Action Scripts** configuration panel appears.
4. From the **Trigger type** list, select the trigger that activates the action script at run time.

5. If you select a trigger type that starts with "While", type how frequently the action script is executed at run time in the **Every** box.
6. If you select the trigger types **On Mouse Over or On Mouse Leave**, the **Every** box label shows **After** instead. Type a value in the **After** box. This value specifies after what delay the action script is executed at run time.
7. Specify a trigger type that involves pressing a key is run by typing a key or key combination. In the **Shortcut** area. Select a shortcut key in the **Key** list. Select **Ctrl** and/or **Shift** to combine the shortcut key with the Ctrl key and/or Shift key.
8. Create your script in the action script window.
9. Click **OK**.

[Configuring Common Types of Animations](#)

[Configuring an Action Script Animation with a "Mouse-Down" Event Trigger](#)

# Configuring an Action Script Animation with a "Mouse-Down" Event Trigger

Action scripts that are activated with a "mouse-down" event (for example, On Left Click/Key/Touch Down) trigger two separate events:

- A mouse-down event, when the button is pressed.
- A mouse-up event, when the button is released.

As a result, timing issues can occur in if the user holds the button, even momentarily, before releasing it. These timing issues can affect how a pushbutton graphic is displayed. The pushbutton image may continue to show as depressed (active state), even after the user has released the button.

You can avoid this potential timing issue by using a "mouse-up" trigger instead of the "mouse down." A "mouse-up" trigger only sends one event (when the button is released), thus eliminating any timing issues that could result from a delay in the user releasing the button.

[Configuring an Action Script Animation](#)

## Configuring a Show Symbol Animation

You can configure an element with a show symbol animation. A Show symbol animation shows a specified graphic in a new dialog box, when the element is clicked on.

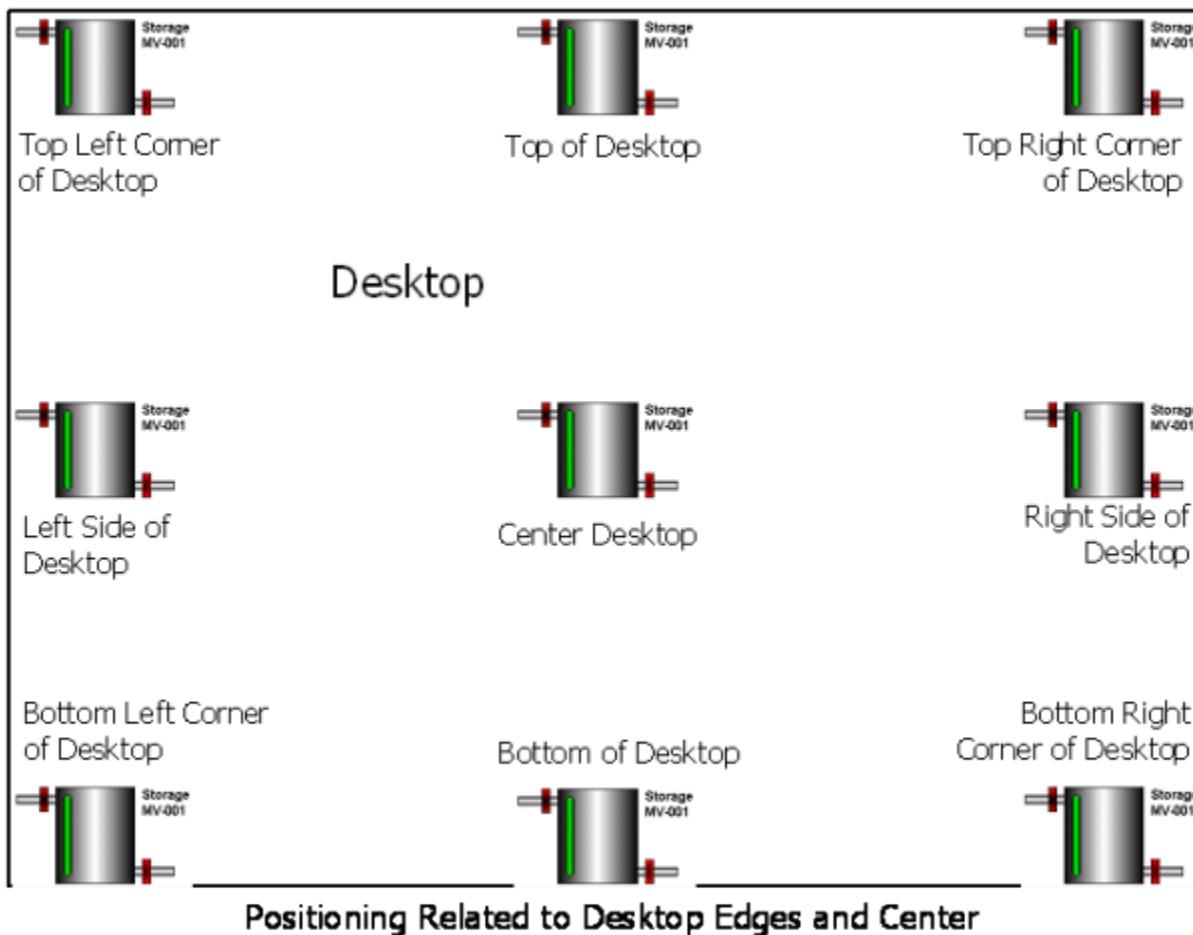

You can configure:

- Which graphic appears in the new window.
- If the window has a title bar, and if so if it has a caption.

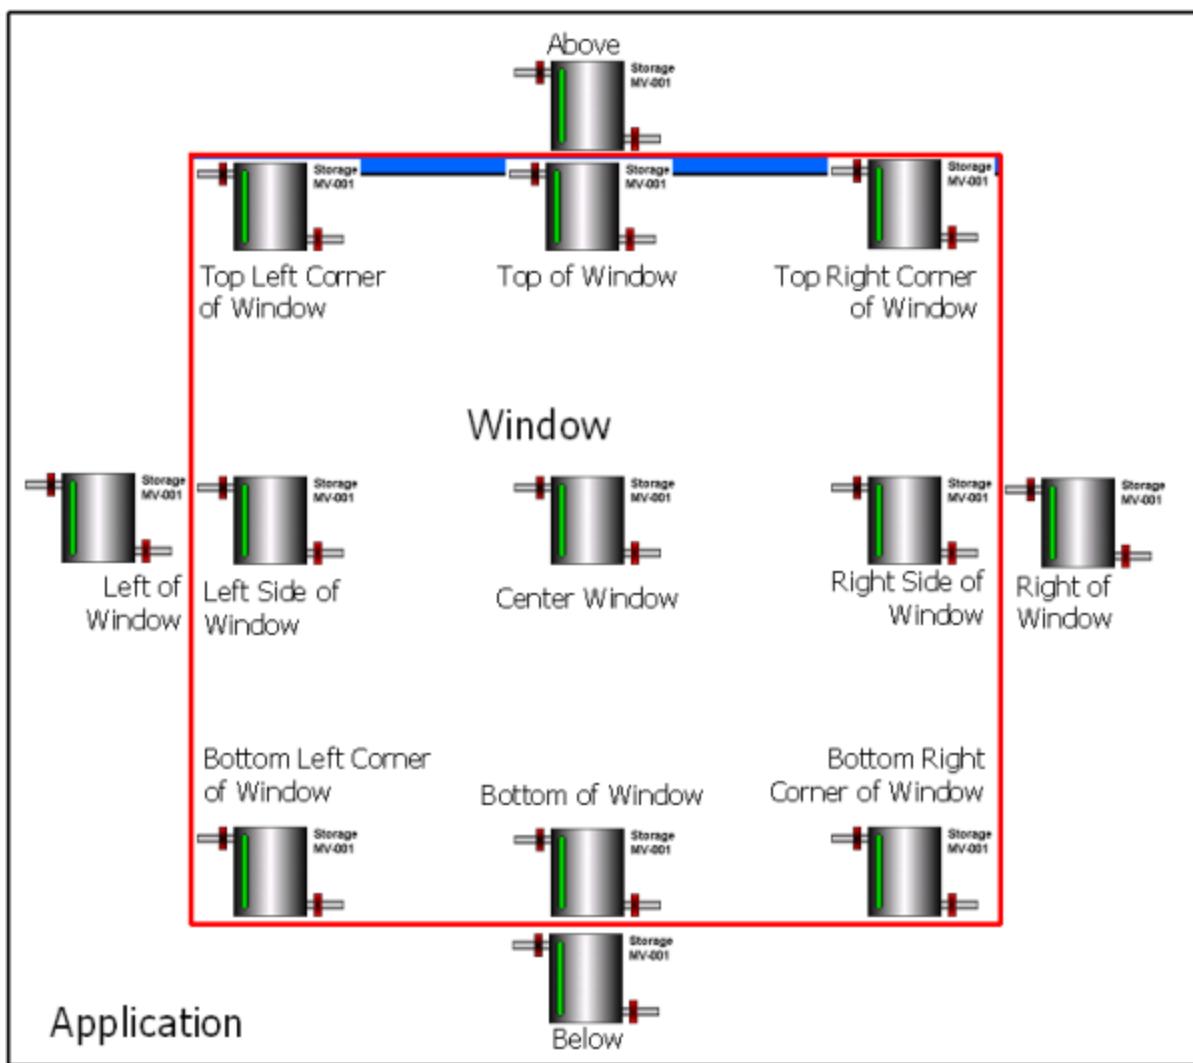

- If the window is modal or modeless.
- If the window has a close button.
- If the window can be resized.
- The initial window position.
- The size of the window.

You can configure the position to be in relation of the:

- Desktop, such as at edges, corners, or at center.

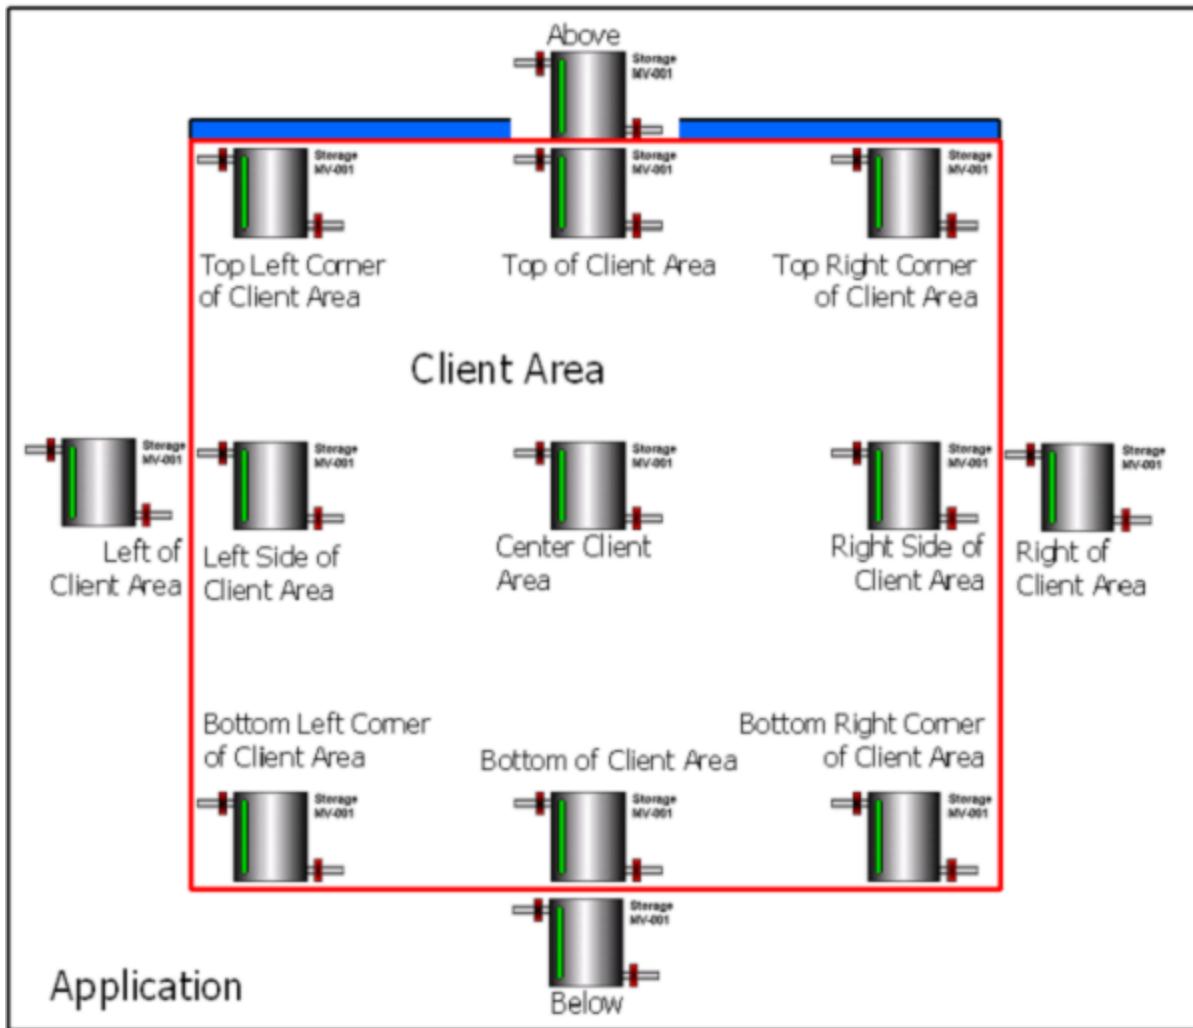

- Window, such as at one of its edges, its corners, its center or above, below, to the left or right. The window area includes the title bar if it appears.

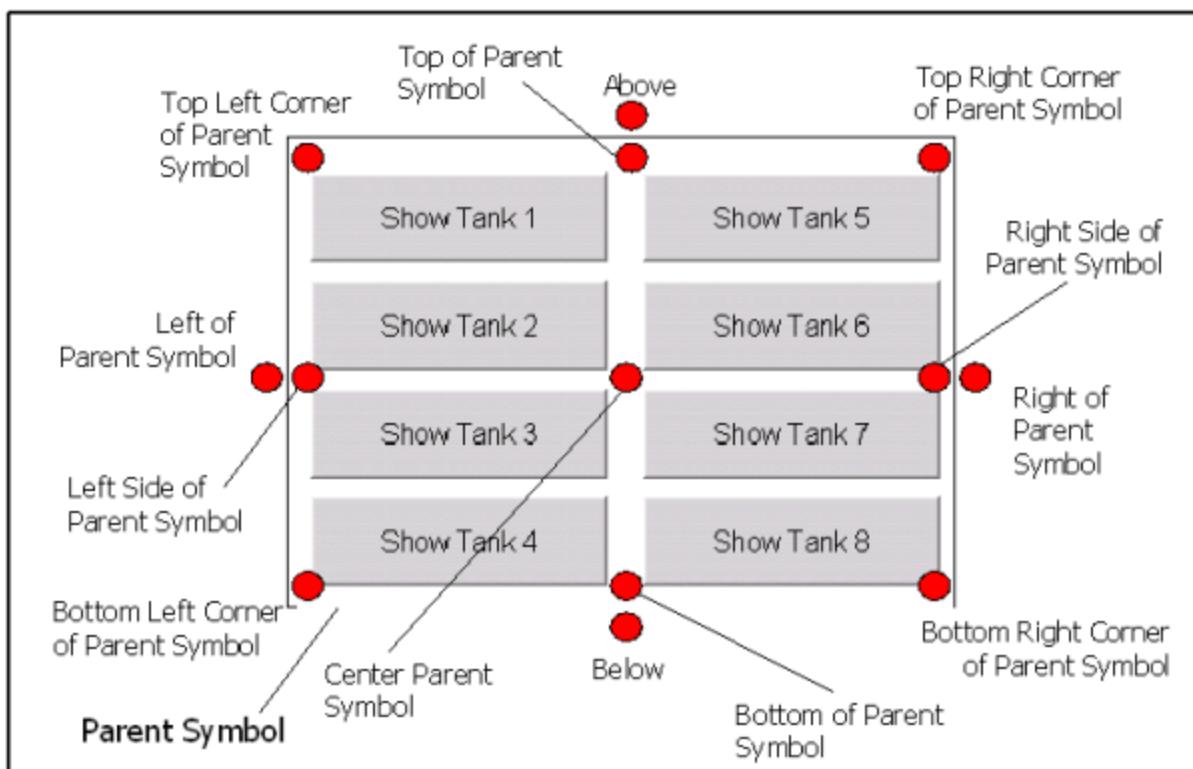

### Positioning Related to Window

- Client Area of your HMI/SCADA software.

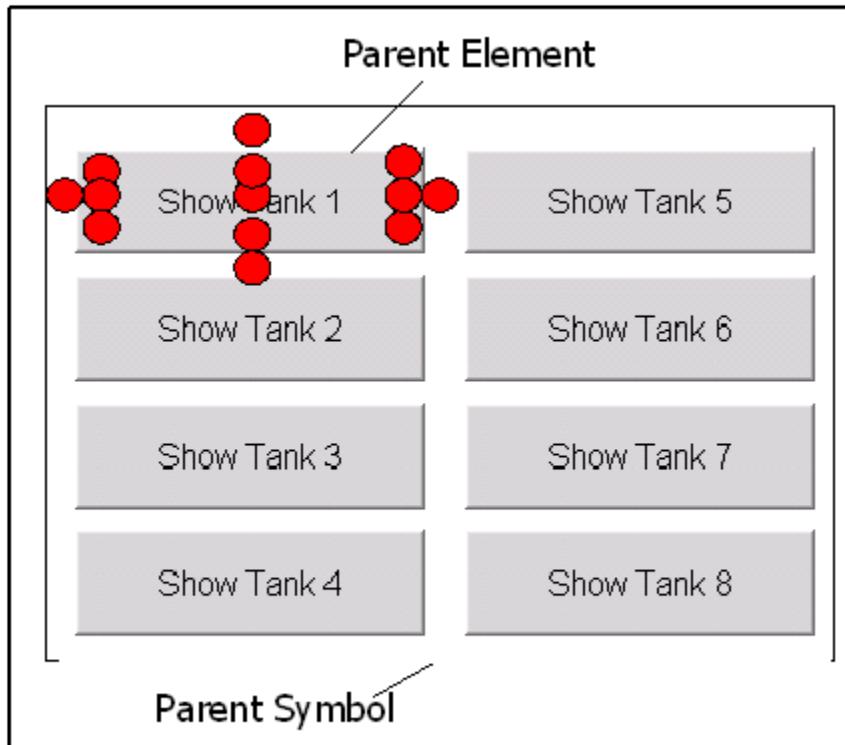

### Positioning Related to Client Area

- Source Symbol, in which case the Show Symbol window is positioned in relation to the entire source symbol that contains the element that called the window.

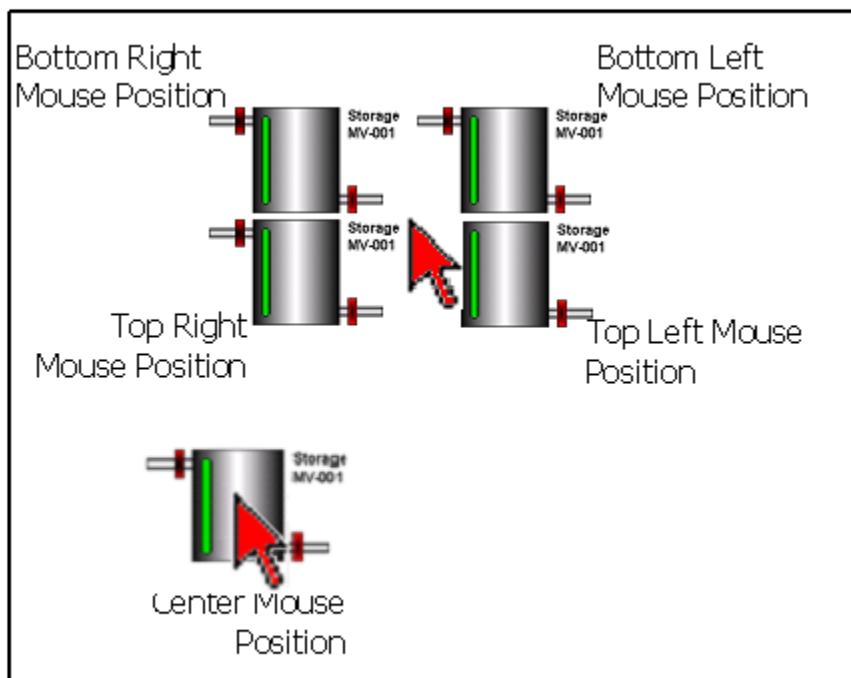

### Positioning Related to Parent Symbol

- Parent Element, in which case the Show Symbol window is positioned in relation just to the element that called the Show Symbol window.

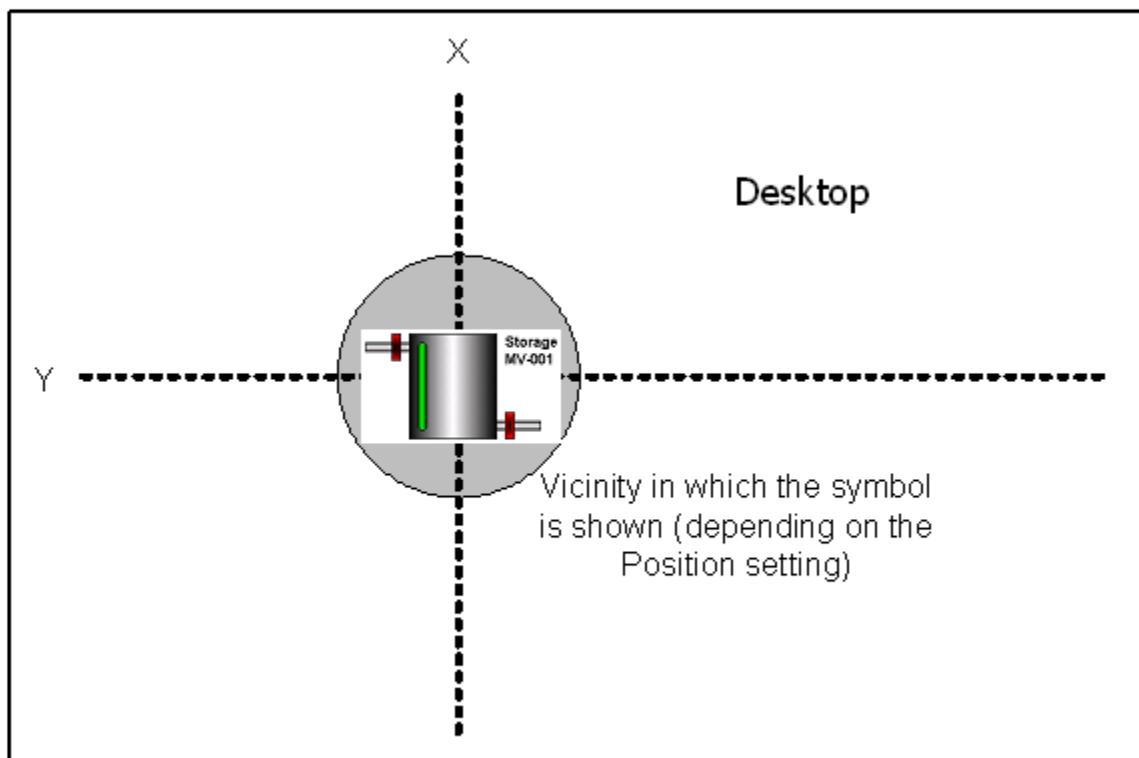

### Positioning Related to Parent Element

- Mouse, in which case the Show Symbol window is positioned in relation to the pointer coordinates.

### Selected Positionings Related to Mouse Pointer

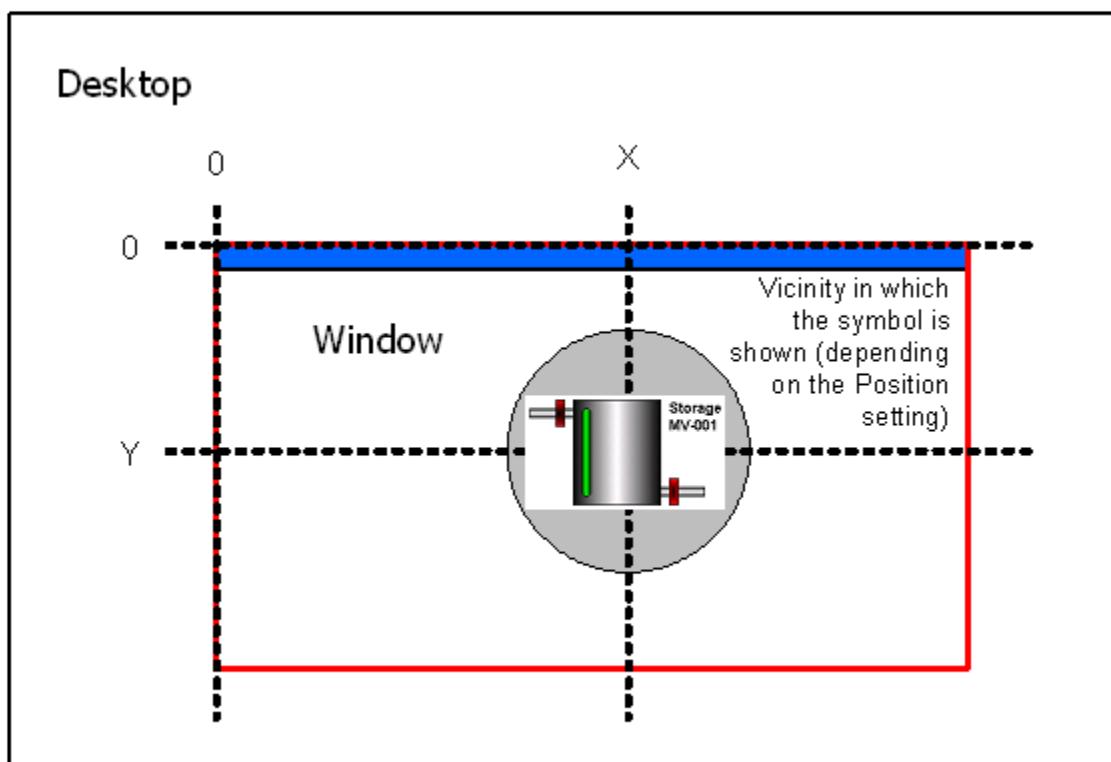

- Desktop coordinates. The graphic is placed in the vicinity of coordinates that relate to the desktop.

### X, Y Positioning Related to Desktop

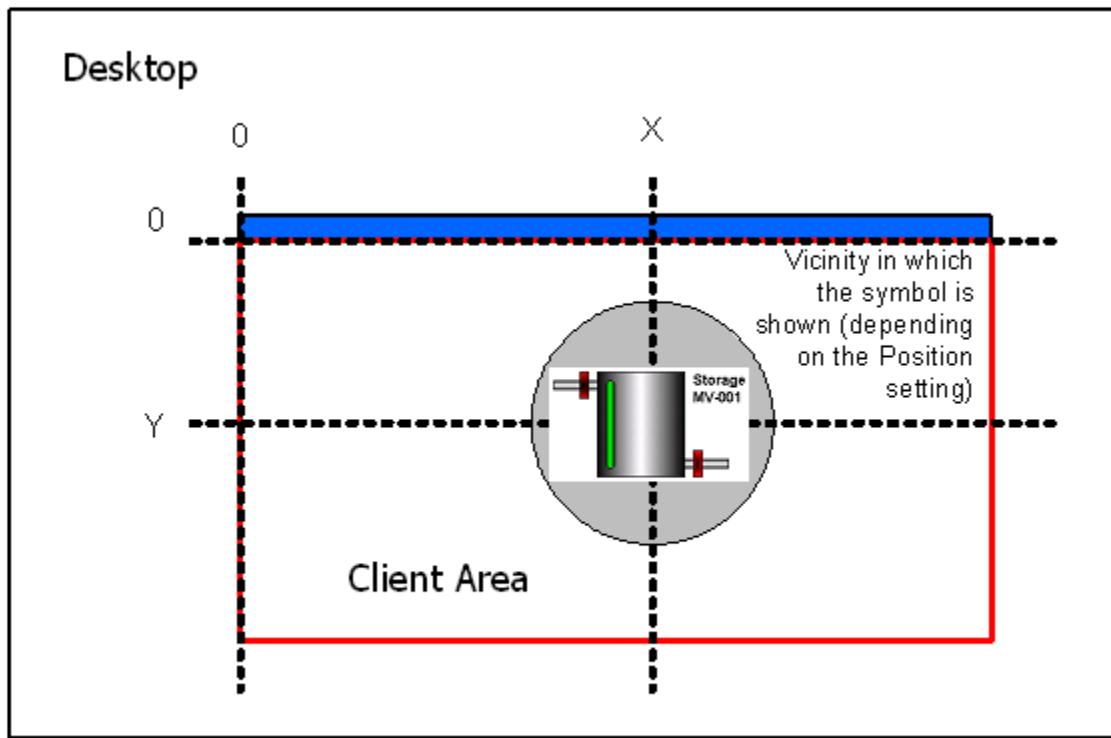

- Window coordinates. The graphic is placed in the vicinity of coordinates that relate to the window, including

the title bar if shown.

### X, Y Positioning Related to Window

- Client Area coordinates. The graphic is placed in the vicinity of coordinates that relate to the client area.

### X, Y Positioning Related to Client Area

## To configure an element with a show symbol animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Add** icon and select **Show Symbol**. The Show Symbol animation is added to the Animation list.
4. Configure the graphic. Do one or more of the following:
  - In the **Reference** box, type a graphic name or browse for one by using the browse button.
  - To add a title bar to the graphic, select **Has Title Bar**.
  - To use the graphic name as window title, select **Use Symbol Name for Window Title**.
  - Select the window type, **Modal** or **Modeless**.
  - To add a Close button, select **Has Close Button**.
  - To add resize controls, select **Resizable**.
5. Select where you want the window to appear by selecting a position in the **Position** lists. The first list contains positions that are in relation to the item of the second list. Select one of the following:
  - **Center**
  - **Top Left Corner**
  - **Top Right Corner**
  - **Left**
  - **Right of**
  - **Lower**
  - **Below**
  - **Above**
  - **Top**
  - **Left of**
  - **Right Side**
  - **Lower Left Corner**
  - **Lower Right Corner**

From the second list, select the item the position is referring to:

  - **Desktop**: relative to the entire desktop
  - **Window**: relative to the window.
  - **Client Area**: relative to the client area.
  - **Parent Symbol**: relative to the entire graphic that calls it.
  - **Parent Element**: relative to the element or element group that calls it.
  - **Mouse**: relative to the pointer.
  - **Desktop X,Y**: relative to a specified coordinate on the desktop.
  - **Window X,Y**: relative to a specified coordinate of the window.
  - **Client Area X,Y**: relative to a specified coordinate of the client area.
6. If you select **Desktop X,Y** or **Window X,Y** or **Client Area X,Y** as position, type the new coordinates in the **X** and **Y** value boxes.

7. Select how large you want the window to be in the **Size** list. You can select:
  - **Relative to Symbol** to make the window size the same as the size of the graphic.
  - **Custom Width and Height** to specify a width and height.  
Depending on your selection of the item the graphic is referring to, you can select:
    - **Relative to Desktop** to adjust the window size relative to the size of the desktop.
    - **Relative to Window** to adjust the window size relative to window that contains the graphic that calls it.
    - **Relative to Client Area** to adjust the window size relative to the client area.
    - **Relative to Parent Symbol** to adjust the window size relative to the size of the graphic that calls it.
    - **Relative to Parent Element** to adjust the window size relative to the size of the element that calls it.
8. Continue specifying position information.
  - If you select **Relative...** as size, enter a scaling percentage in the **Scale Symbol** box.
  - If you select **Custom Width and Height** as size, type the new width and height in the **W** and **H** boxes.
  - If you select **Desktop, Window, Client Area, Parent Symbol or Parent Element** as referred item, you can configure the object to be stretched horizontally or vertically. Do one or both of the following:
    - Select **Stretch symbol to fit ... width** and enter a height in the **H** box.
    - Select **Stretch symbol to fit ... height** and enter a width in the **W** box.
9. You can specify that the graphic window appears by pressing a key or key combination. In the **Shortcut** area:
  - Select a shortcut key in the **Key** list.
  - Select **Ctrl** and/or **Shift** to combine the shortcut key with the CTRL key and/or SHIFT key.
10. Click **OK**.

### Configuring a Hyperlink Animation

You can configure an element with a hyperlink animation, i.e. a link when clicked will launch the default browser with a customizable URL. The animation will allow you to construct a URL animation using static text, reference or a compound expression.

#### To configure an element with a hyperlink animation

1. Select the element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animation** dialog box appears.
3. Click the **Add** icon and select **Hyperlink**. The hyperlink animation is added to the Animation list and the **Hyperlink** configuration panel appears.
4. The hyperlink can be specified as static text, an expression, or a reference.
  - Select the T icon to indicate that it is a static value.
  - Select the tag icon to indicate that it is a reference to a value.
5. For a static value type the complete URL. For example: www.google.com.
6. For a reference or expression value, select a data source.
7. You can also form expression that will use tag values in runtime to generate a URL. For example:  
"www.google.com/search?q=" + CPSearchText
8. Select the **Protocol**; http or https.
9. You can specify a shortcut by pressing a key or key combination. In the **Shortcut** area:
  - Select a shortcut key in the **Key** list.
  - Select **Ctrl** and/or **Shift** to combine the shortcut key with the Ctrl key and/or Shift key.
10. If the value is set as static text, then you can click the **Preview** button and test the link.
11. Click **OK**.

### Configuring Animation for a Status Element

You can configure the Status element with a DataStatus animation to indicate quality and status from:

- equipment.items and tags used in elements with animation.
- equipment.items and tags directly.

The appearance of the Status element depends on the settings in the **Configure Quality and Status Display** dialog box. For more information, see [Configuring Animation for a Status Element](#).

The DataStatus animation is only used by the Status element and cannot be removed from the Status element.

#### To configure a DataStatus animation

1. Select the Status element.
2. On the **Special** menu, click **Edit Animations**. The Edit Animations dialog box appears, showing the **DataStatus** configuration panel.
3. In the **Available Graphic Elements** list, select all elements for which you want to monitor their equipment.item quality and status.
4. Click the **>>** button to add them to the **Selected Graphic Elements** list.
5. Click the **Expression** tab. The Expression panel appears.
6. In the **Value or Expression** list, type a value or expression that can be a literal, or a reference or element

property.

**Tip:** You can also browse for the reference by clicking the browse button.

7. To add more values or expressions, click the **Add** button. An additional row is added for data input.
8. Click **OK**.

## Related Topics

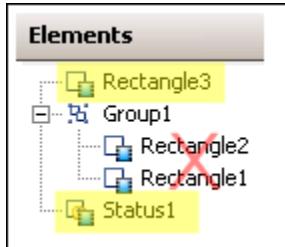

[Configuring Element-Specific Animations](#)

[Restrictions of the Status Element](#)

# Restrictions of the Status Element

Keep the Status element in the same hierarchical level as the animated elements with the equipment.items you want to monitor.

If you move elements out of their hierarchical level after you associate them with a Status element, for example, by grouping them, their equipment.items are no longer monitored.

To avoid this problem, move a new Status element in the hierarchical level you want to monitor, or associate it directly with the equipment.items you want to monitor.

## Configuring a Check Box Animation

The Check Box animation is only used by the Check Box element.

### To configure a Check Box animation

1. Select the Check Box element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears and the **Check Box** configuration panel appears on the right side.
3. In the **Checked value - Boolean** box, type an equipment.item reference. The equipment.item reference is tied to the selected state of the check box control at run time.  
You can select when to submit the value changes. For more information, see [Submitting the Value Changes](#).
4. To set the caption of the check box at run-time, select **Override caption at Runtime with the following expression** and type a string value or equipment.item reference or expression in the **String Expression** box.
5. Click **OK**.

## Related Topics

[Configuring Element-Specific Animations](#)

## Configuring an Edit Box Animation

The Edit Box animation is only used by the Edit Box element. You cannot remove this animation from the Edit Box element, but you can add certain common animations.

You can also use Edit Box-specific methods in scripting to get and set the text at run time. You can browse these methods in your element browser with the Edit Box selected. For more information on these methods, see [Configuring Edit Box Methods](#).

### To configure an Edit Box animation

1. Select the Edit Box element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears and the **Edit Box**

configuration panel appears on the right side.

3. In the **String Reference** box, type a string equipment.item reference. The string equipment.item reference is tied to the text in the edit box at run time.

You can select when to submit the value changes. For more information, see [Submitting the Value Changes](#).

**Tip:** Use the **On Trigger Condition** option to set when the Edit Box element writes the run-time value to the reference. This avoids a conflict between the run-time value of the Edit Box and run-time value of the reference.

4. In the **Configuration** area, select:
  - **Multiline** to wrap the text into multiple lines in the edit box.
  - **Read-Only** to use the edit box to only show text and not allow text input.
  - **Maximum Length** to limit the maximum numbers of characters you can type in the edit box control. You can specify the maximum number in the **Characters** box.
5. Enter a default text in the **Text** box.

## Related Topics

[Configuring an Array Combo Box Animation](#)

[Configuring an Enum Combo Box Animation](#)

# Configuring a Static Combo Box Animation

You can configure a combo box with static values and captions.

### To configure a static combo box animation

1. Select the combo box element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears and the **Static Combo Box** configuration panel appears on the right side.
3. In the **Reference** box, type an equipment.item reference that is to be tied to the selected value at run time. You can select when to submit the value changes. For more information, see [Submitting the Value Changes](#).
4. In the **Static Values and Captions** list, configure the captions of the combo box and also the values that correspond to them:
  - **Add an option** - click the **Add** icon.
  - **Delete an option** - select it in the list and click the **Remove** icon.
  - **Move an option up** the list - select it in the list and click the **Arrow up** icon.
  - **Move an option down** the list - select it in the list and click the **Arrow down** icon.
5. Specify how you want to use captions. Do one of more of the following:
  - To use the values themselves as captions, select **Use Values as Captions**.
  - To alphabetically sort the captions, select **Sorted**.
  - To enable duplicate captions, select **Allow Duplicates**.

**Note:** If you clear **Allow Duplicates** and click **OK**, all duplicate captions are removed from combo box on the canvas. The captions are case-insensitive, so that for example "item1" is considered a duplicate of "Item1". The removal of the duplicate items is reflected when you re-open the **Edit Animations** dialog box.

6. Select the type of combo box from the **Type** list. Select:
  - **Simple** - at run time you can type a value, or select one by using arrow up and arrow down buttons. However, you cannot see the list of values.
  - **DropDown** - at run time you can type a value, or select one from the list.
  - **DropDownList** - at run time you can only select a value from the list, but not type one.
7. Click **OK**.

2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Enum** button. The **Enum Combo Box** configuration panel appears on the right side.
4. In the **Enum Reference** box, type an enum equipment.item reference. The **Enum Values and Captions** list shows the values from the enum reference.

You can select when to submit the value changes. For more information, see [Submitting the Value Changes](#).
5. To define your own captions, clear **Use Values as Captions** and type them in the list.
6. Set **Items Sorting** to:
  - **None** to show the items in the order they are in the enum equipment.item.
  - **Ascending** to show the items sorted in ascending order.
  - **Descending** to show the items sorted in descending order.
7. Click **OK**.

### Configuring a Calendar Control Animation

The Calendar Control animation is only used by the Calendar Control element. The Calendar Control date format depends on the regional settings of the operating system.

## To configure a Calendar control animation

1. Select the Calendar control element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears and the **Calendar** configuration panel appears on the right side.
3. In the **Date Reference** box, type a Time equipment.item reference that is to be tied to the selected value at run time.  
You can select when to submit the value changes. For more information, see [Submitting the Value Changes](#).
4. To restrict the date the user can select at run time, specify limits as follows:
  - In the **MinDate** box, type a lower limit for the date.
  - In the **MaxDate** box, type an upper limit for date.
5. To show some dates as bold, in the **Bolded Dates** box, type a reference that points to an equipment.item array with time data type.
6. To show today's date on the calendar control, select **Show Today**.
7. To change the colors of the calendar control, click in the **Calendar Colors** area the following color boxes:
  - **Month Background**
  - **Month Trailing Forecolor**
  - **Title Background**
  - **Title Foreground**The **Select FillColor** dialog box appears and you can select a solid color.
8. Click **OK**.

## Configuring a DateTime Picker Animation

The DateTime Picker animation is only used by the DateTime Picker element.

### To configure a DateTime Picker animation

1. Select the DateTime Picker control element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears and the **DateTime Picker** configuration panel appears.
3. In the **Time Reference** box, type a Time equipment.item reference that is to be tied to the selected value at run time.  
You can select when to submit the value changes. For more information, see [Submitting the Value Changes](#).
4. To set the datetime format, select one of the following from the **Format** list:
  - **Long** to show the date and time in the long format of the operating system, for example: Thursday, August 03 2006.
  - **Short** to show the date and time in the short format of the operating system, for example: 8/3/2006.
  - **Time** to show just the time in the time format of the operating system, for example: 3:46:09 PM.

- **Custom** to specify your own time format. Use the following letters to set the time format:

h	The one or two-digit hour in 12-hour format.
hh	The two-digit hour in 12-hour format. Single digit values are preceded by a zero.
H	The one or two-digit hour in 24-hour format.
HH	The two-digit hour in 24-hour format. Single digit values are preceded by a zero.
t	The one-letter AM/PM abbreviation ("AM" appears as "A").
tt	The two-letter AM/PM abbreviation ("AM" appears as "AM").
m	The one or two-digit minute.
mm	The two-digit minute. Single digit values are preceded by a zero.
s	The one or two-digit seconds.
ss	The two-digit seconds. Single digit values are preceded by a zero.
d	The one or two-digit day.
dd	The two-digit day. Single digit day values are preceded by a zero.
ddd	The three-character day-of-week abbreviation.
dddd	The full day-of-week name.
M	The one or two-digit month number.
MM	The two-digit month number. Single digit values are preceded by a zero.
MMM	The three-character month abbreviation.
MMMM	The full month name.
y	The one-digit year (2001 appears as "1").
yy	The last two digits of the year (2001 appears as "01").
yyyy	The full year (2001 appears as "2001").

**Note:** You can use any other characters, except "g" in the property. These characters then appear at

---

design time and run time in the control.

5. To restrict the date the user can select at run time, you can specify limits in the:
  - **MinDate** box - type a lower limit for the date.
  - **MaxDate** box - type an upper limit for date.
6. To change the colors of the calendar control that drops down, click in the **Calendar Colors** area the following color boxes:
  - Month Background
  - Month Trailing Forecolor
  - Title Background
  - Title ForegroundThe **Select FillColor** dialog box appears and you can select a solid color.

### Configuring a List Box Animation

The List Box animation is only used by the List Box element.

You can create a:

- **Static** list box - uses static captions and values that you define in the configuration panel.
- **Array** list box - uses captions and values contained in an array if supported by your HMI/SCADA software.
- **Enum** list box - uses captions and values contained in an enum data type if supported by your HMI/SCADA software.

You can also use List Box-specific methods in scripting to perform various functions at run time. You can browse these methods in your element browser with the List Box selected.

For more information on these methods, see [Configuring Combo Box and List Box Methods](#).

[Configuring an Enum List Box Animation](#)

# Configuring a Static List Box Animation

You can configure a list box with static values and captions.

### To configure a static list box animation

1. Select the list box element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears and the **Static List Box** configuration panel appears on the right side.
3. In the **Reference** box, type an equipment.item reference that is to be tied to the selected value at run time. You can select when to submit the value changes. For more information, see [Submitting the Value Changes](#).
4. In the **Static Values and Captions** list, configure the captions of the list box and also the values that correspond to them. To:
  - **Add an option** - click the **Add** icon.
  - **Delete an option** - select it in the list and click the **Remove** icon.
  - **Move an option up** the list - select it in the list and click the **Arrow up** icon.
  - **Move an option down** the list - select it in the list and click the **Arrow down** icon.
5. Specify how you want to use captions. Do one or more of the following:
  - If you want to use the values themselves as captions, select **Use Values as Captions**.
  - If you want to alphabetically sort the captions, select **Sorted**.
  - If you want to allow duplicate captions, select **Allow Duplicates**.
6. Click **OK**.

## Configuring an Array List Box Animation

You can configure a list box with values from an array and captions.

### To configure an array list box animation

1. Select the list box element.
2. On the **Special** menu, click **Edit Animations**. The **Edit Animations** dialog box appears.
3. Click the **Array** button. The **ArrayList Box** configuration panel appears on the right side.
4. In the **Reference** box, type an equipment.item reference that is to be tied to the selected value at run time. You can select when to submit the value changes. For more information, see [Submitting the Value Changes](#).
5. In the **Array Reference** box, type or browse for an array equipment.item. The **Array Values and Captions** list shows the values from the array reference.
6. To define your own captions, clear **Use Values as Captions** and type them in the list.
7. To format the value before it appears as a caption, type a text format string in the **Format** box, for example `#.###`. Preceding zeroes are ignored if the array data type is numeric.
8. Set **Items Sorting** to:
  - **None** to show the items in the order they are in the array equipment.item.

- **Ascending** to show the items sorted in ascending order.
  - **Descending** to show the items sorted in descending order.
9. Click **OK**.

## Configuring a Trend Pen

A Trend Pen shows a succession of process values as a trend line consisting of current and historical data updated at a minimum of one second intervals. A trend line gives operators a quick visual snapshot of a process value over a defined period.

## Related Topics

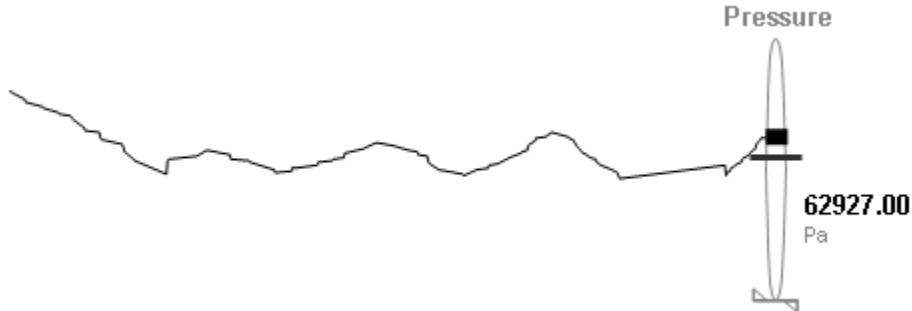

[Configuring Element-Specific Animations](#)

[Understanding the Types of Trend Plots](#)

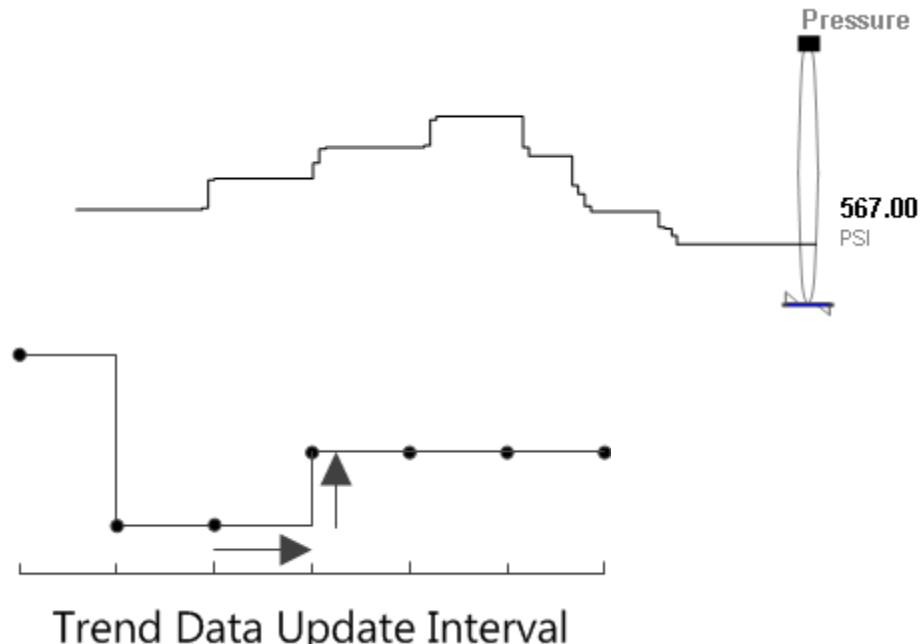

[Understanding the Types of Trend Pen Periods](#)

# Understanding the Types of Trend Plots

You can configure two types of Trend Pen plots. A Line plot draws a line between each successive data point during the trend period.

A Step Line plot draws a horizontal line from a trend data point to the time of the next point on the trend's X-axis, and then draws a vertical line to the data point. A Step Line plot is the default for a Trend Pen.

## Related Topics

[Configuring a Trend Pen](#)

# Understanding the Types of Trend Pen Periods

A trend time period is the interval of process values shown on the X-axis of the trend during run time, which consists of a start time, end time, and a duration.

- The StartTime and duration properties are read/write.

- The EndTime property is a read-only value that the system calculates by adding the duration to the start time.

You can configure two types of Trend Pen periods.

- Moving time period

In a Moving trend period, the start time of a trend period is the current time, and the end time is the duration of the time period from the start time. When the period ends, the next period begins. The start time for the next period is set to the end time of the previous trend period.

- Fixed time period

In a Fixed trend period, the start time is initially the current time. The start time of a trend period does not change automatically, but can be specified by a script using the StartTime property.

The end time of a Fixed trend period is set by the duration of the trend from the specified start time of the period.

$$\text{End Time} = \text{Start Time} + \text{Duration}$$

## Submitting the Value Changes

You can configure a Windows common control to write the data:

- Immediately when it is selected in the control at run time.
- When a specified Boolean expression becomes true.

---

**Note:** The Boolean expression is a trigger that determines when the value is written from the control to the tag or equipment.item. If the value changes in the tag or equipment.item, then the value is written to the control, regardless of the trigger setting or condition.

### To submit value changes immediately

1. Open the Windows common control in the **Edit Animations** dialog box.
2. In the **Submit Value Changes** area, select **Immediately**.

### To submit value changes after a Boolean expression becomes true

1. Open the Windows common control in the Edit Animations dialog box.
2. In the **Submit Value Changes** area, select **On Trigger Condition**.
3. In the **Boolean Expression** box, type a Boolean expression or browse for a Boolean equipment.item.

## Format Strings in Element-Specific Animations

Some element-specific animations support format strings that specify the format of data during run time when a graphic is displayed. Element specific-animations enable you to change the style of the displayed data without changing the graphic in the editor, either interactively through the use of static text or by referencing strings within data items, thereby making the format dynamic. A format string consists of one or more identifiers that define the output.

# Numbers

The following table lists the basic number formatting.

Identifier	Type	Format	Example Output for "1.42"	Example Output for "-12400"
c	Currency	{0:c}	\$1.42	-\$12,400
d	Decimal (whole number)	{0:d}	Error	-12400
e	Scientific	{0:e}	1.420000e+000	-1.240000e+004
f	Fixed point	{0:f}	1.42	-12400.00
g	General	{0:g}	1.42	-12400
n	Number with commas for thousands	{0:n}	1.42	-12,400
r	Round trip	{0:r}	1.42	Error
x	Hexadecimal	{0:x4}	Error	cf90

The following table lists the custom number formatting.

Identifier	Type	Format	Example Output for "1500.42"	Notes
0	Zero placeholder	{0:00.0000}	1500.4200	Pads with zeroes.
#	Digit placeholder	{0:(#).##}	(1500).42	
.	Decimal point	{0:0.0}	1500.4	
,	Thousand separator	{0:0,0}	1,500	Must be between two zeroes.
,.	Number scaling	{0:0,..}	2	Comma adjacent to Period scales by 1000.
%	Percent	{0:0%}	150042%	Multiplies by 100, adds % sign.
e	Exponent placeholder	{0:00e+0}	15e+2	Many exponent formats available.
;	Group separator			Used to separate multiple formats in one string format (for example, including parentheses around a string if the value is negative; see <a href="#">Format String Examples</a> ).

[Format Strings in Element-Specific Animations](#)

## Dates

Date formatting is dependent on the system's regional settings; the example strings here are for the U.S.

The following table lists the basic date formatting.

Identifier	Type	Example
d	Short date	10/12/2002
D	Long date	December 10, 2002

Identifier	Type	Example
t	Short time	10:11 PM
T	Long time	10:11:29 PM
f	Full date and time	December 10, 2002 10:11 PM
F	Full date and time (long)	December 10, 2002 10:11:29 PM
g	Default date and time	10/12/2002 10:11 PM
G	Default date and time (long)	10/12/2002 10:11:29 PM
M	Month day pattern	December 10
r	RFC1123 date string	Tue, 10 Dec 2002 22:11:29 GMT
s	Sortable date string	2002-12-10T22:11:29
u	Universal sortable, local time	2002-12-10 22:13:50Z
U	Universal sortable, GMT	December 11, 2002 3:13:50 AM
Y	Year month pattern	December, 2002

The following table lists the custom date formatting.

Identifier	Type	Format	Example Output
dd	Day	{0:dd}	10
ddd	Day name	{0:ddd}	Tue
dddd	Full day name	{0:dddd}	Tuesday
f, ff, ...	Second fractions	{0:fff}	932
gg, ...	Era	{0:gg}	A.D.
hh	2-digit hour	{0:hh}	10
HH	2-digit hour, 24-hr format	{0:HH}	22
mm	Minute 00-59	{0:mm}	38
MM	Month 01-12	{0:MM}	12
MMM	Month abbreviation	{0:MMM}	Dec
MMMM	Full month name	{0:MMMM}	December
ss	Seconds 00-59	{0:ss}	46

Identifier	Type	Format	Example Output
tt	AM or PM	{0:tt}	PM
yy	Year, 2 digits	{0:yy}	02
yyyy	Year	{0:yyyy}	2002
zz	Time zone offset, 2 digits	{0:zz}	-05
zzz	Full time zone offset	{0:zzz}	-05:00
:	Separator	{0:hh:mm:ss}	10:43:20
/	Separator	{0:dd/MM/yyyy}	10/12/2002

# Format String Examples

The following string is an example of a currency string:

```
String.Format("{0:$#,##0.00;($#,##0.00);Zero}", value);
```

This string example will output values as follows:

- **\$1,240.00** if passed **1243.50**.
- **(\$1,240.00)** if passed **-1243.50**.

- The string **Zero** if passed the number zero.

The following string is an example of a phone number string:

```
String.Format("{0:(###) ###-####}", 8005551212);
```

This string example will output **(800) 555-1212**.

## Related Topics

[Format Strings in Element-Specific Animations](#)

## Cutting, Copying and Pasting Animations

You can cut, copy and paste animations and their configuration between different elements. This is useful when you want to duplicate the animations of one element such as a line, to a different type of element such as a polyline.

If you try to paste an animation to an element that is already configured with that animation, or does not support this animation, a message appears informing you why you cannot paste the animation.

### To copy and paste animations between elements

1. Select the element from which you want to copy the animations.
2. On the **Edit** menu, point to **Animations**, and then click **Copy**.
3. Select one or more elements to which you want to paste the animations.
4. On the **Edit** menu, point to **Animations**, and then click **Paste**. The animation links are copied from the source element to the target elements.

### To cut and paste animations between elements

1. Select the element from which you want to cut the animations.
2. On the **Edit** menu, point to **Animations**, and then click **Cut**.
3. Select one or more elements to which you want to paste the animations.
4. On the **Edit** menu, point to **Animations**, and then click **Paste**. The animation links are removed from the source element and copied to the target elements.

## Related Topics

[Animating Graphic Elements](#)

## Substituting References in Elements

You can search and replace references used by any element on your canvas. You can use:

- basic mode by replacing strings in a list.
- advanced functions such as find and replace, ignore or respect case-sensitivity and wildcards.

### To substitute references in a graphic by using the list

1. Select one or more elements.
2. Do one of the following:
  - Press Ctrl + E.
3. On the **Special** menu, click **Substitute References**.  
The **Substitute References** dialog box appears.
4. In the **New** column, type the reference to be replaced.
5. Click **OK**. All references are substituted accordingly in the elements.

### To substitute references in a graphic by using find and replace functions

1. Select one or more elements.
2. Do one of the following:
  - Press Ctrl + E.
  - On the **Special** menu, click **Substitute References**.  
The **Substitute References** dialog box appears.
3. Click **Find & Replace**. The dialog box expands and shows find and replace parameters.
4. Specify your find and replace options. Do one of more of the following:
  - To find specific references in the list, type a string in the **Find What** box and click **Find Next** to find the next string.
  - To replace a selected found string with another string, type a wstring in the **Replace with** box and click **Replace**.
  - To replace multiple references, type values in the **Find What** and **Replace with** boxes and click **Replace all**.
  - To specify the search is case-sensitive, select **Match Case**.
  - To find only entire words that match your search string, select **Match Whole Word Only**.
  - To use wildcards, select **Use Wildcards**. Valid wildcards are "\*" (asterisk) and "?" (question mark).  
"\*" indicates any number of variable characters. For example. "s\*" to search for all strings starting with "s".  
"?" indicates one single variable character. For example, "M\_7?t" to search for all strings that start with "M\_7" and end with "t" and have exactly 5 characters.
5. Click **OK**. All text strings are substituted accordingly in the elements.

[Animating Graphic Elements](#)

## Adding and Maintaining Graphic Scripts

### In This Chapter

- [About Graphic Scripts](#)
- [Configuring the Predefined Scripts of a Graphic](#)
- [Adding Named Scripts to a Graphic](#)
- [Editing Graphic Scripts](#)
- [Renaming Scripts in a Graphic](#)
- [Removing Scripts from a Graphic](#)
- [Substituting Equipment.item References in Scripts](#)
- [Using Methods in Scripting](#)

### About Graphic Scripts

You can associate scripts to your graphics. Scripts can add animation to a graphic or its elements that can be executed in run time.

---

**Caution:** If you configure scripts that affect more than element and graphic animation, the script processing may affect performance.

---

You can:

- Configure the predefined scripts of a graphic.
- Add named scripts to a graphic.
- Edit existing named or predefined scripts in a graphic.
- Rename named scripts in a graphic.
- Remove named scripts from a graphic.
- Substitute references in named or predefined scripts.
- Use element methods in named or predefined scripts.

The autocomplete feature is available in the Graphic Editor script editor.

### Related Topics

- [Adding and Maintaining Graphic Scripts](#)
- [Predefined and Named Scripts](#)
- [Execution Order of Graphic Scripts](#)
- [Graphic Script Time outs](#)
- [Error Handling](#)

### Predefined and Named Scripts

Predefined graphic scripts run:

- One time when the graphic is shown or opened: **On Show**
- Periodically while the graphic is showing: **While Showing**
- One time when the graphic is hidden or closed: **On Hide**
- Any combination of the above

Named graphic scripts enable any number of scripts to run that are triggered by values or expressions during runtime :

- Being true: **While True**
- Being false: **While False**
- Transitioning from false to true: **On True**
- Transitioning from true to false: **On False**
- Change in value and/or quality: **DataChange**

The name of named scripts can be up to 32 characters in length, contain at least one letter, and contain special characters, such as #, \$, and \_.

## Related Topics

[About Graphic Scripts](#)

### Execution Order of Graphic Scripts

When the graphic is showing, the scripts run in the following order:

1. On Show script.
2. Named scripts, not necessarily in the order that they appear in the list.

Any named script that is triggered by the DataChange trigger type runs the first time when the reference is subscribed to. This behavior is different than the DataChange trigger behavior of Application Server scripts and can take considerable time in intermittent networks.

**Note:** A named script will not run if the script is triggered by the DataChange trigger type and is bound to an HMI tag whose quality is Initializing, or whose quality is Bad and category is not OK.

## Related Topics

[About Graphic Scripts](#)

### Graphic Script Time outs

To avoid infinite loops in a graphic script, a time-out limit can be set in which FOR loops must complete execution. If a script loop does not complete execution within the time-out limit, WindowViewer automatically terminates the loop and writes a message to the Logger.

The time-out limit is checked only at the NEXT statement of the loop. Therefore, the first iteration of the loop is always executed, even if it exceeds the time-out limit.

## To change the time out for a graphic script

1. In WindowMaker, on the **Special** menu, point to **Configure** and click **WindowViewer**. The WindowViewer Properties dialog box appears.
2. Click the **Managed Application** tab.
3. In the **Script timeout (msec)** box, type a time-out value in milliseconds. Valid values are from 1 to 360,000.
4. Click **OK**.

## Related Topics

[About Graphic Scripts](#)

## Error Handling

A graphic script does not run if it contains a syntax error. When the graphic is loaded, a message is written to the Logger.

## Related Topics

[About Graphic Scripts](#)

## Configuring the Predefined Scripts of a Graphic

You can configure the predefined scripts of a graphic. The predefined scripts can consist of:

- A script that runs one time when the graphic opens (**On Show**).
- A script that runs periodically as long as the graphic is open (**While Showing**).
- A script that runs one time when the graphic closes (**On Hide**).

---

**Note:** The **Predefined Scripts** animation cannot be deleted. It can contain scripts for each trigger type **On Show**, **While Showing** and **On Hide**.

---

## To configure the predefined scripts for a graphic

1. Open the graphic in the Industrial Graphic Editor.
2. On the **Special** menu, click **Scripts**. The **Edit Scripts** dialog box appears.
3. In the **Trigger Type** list, click:

- **On Show** to configure a script that runs one time when the graphic opens.

If you create an **OnShow** script that uses a custom property bound to a tag, there is no guarantee that the tag data is valid when the script runs. This could occur because of the asynchronous nature of data subscriptions in HMI/SCADA software. Your script should first test the quality and status of the tag value before it is used in the rest of the script.

When the **On Show** trigger type is selected, the field that appears to the right of the **Type** list becomes a **Data Timeout** field. For more information about using this field, see [Ensuring Proper OnShow Script Execution](#).

---

**Note:** If you create an OnShow script that uses a custom property bound to a tag, there is no guarantee that the tag data is valid when the script runs. This is because of the asynchronous nature of the data subscriptions. Your script should first test the quality and status of the tag value before it is used in the rest of the script.

- **While Showing** to configure a script that runs periodically while the graphic is open.
  - **On Hide** to configure a script that runs one time when the graphic closes.
4. If you configured a **While Showing** script, type a time period in milliseconds in the **Period** box. This specifies after how many milliseconds the action script is executed.
- Note:** If you set the **While Showing** period too low, system performance may decrease.
5. Type your script in the main edit box.
- Note:** If the graphic includes a custom property, the name of the custom property and a nested class property in the script cannot be the same.
6. Select external data using your HMI's browser or explorer.
7. When you are done, click **OK**. The script editor checks the syntax of the script and may inform you of invalid syntax. Click:
  - **Yes** to save changes even if the script contains errors.
  - **No** to cancel the changes and close the script dialog box.

## Related Topics

[Adding and Maintaining Graphic Scripts](#)

[Ensuring Proper OnShow Script Execution](#)

### Ensuring Proper OnShow Script Execution

When an OnShow script includes external references to tags, it is possible that the data from these tags is not yet available when the OnShow script runs. As a result, the script might not work properly.

To avoid this situation, you can enter a value in the **Data Timeout** field. For the duration of the data time-out period, the system checks for the presence of the external reference data. After all external reference data is present, the system executes the OnShow script.

If the data time-out period expires before all external data is present, the OnShow script is executed. However, the script might not work properly.

The default value in the **Data Timeout** field is:

- For new Industrial Graphics, 1,000 ms.
- For some HMI symbols, 0 ms; that is, the presence of external reference data is not checked. Verify the behavior of your HMI/SCADA software.

The maximum data time-out value is 30,000 ms.

Note the following issues regarding OnShow scripts and the Data Timeout function:

- The Data Timeout function is not available for the other trigger script types. It would be rare for external reference data to not be available in time for those scripts.
- The execution of the OnShow script is not delayed if there is an invalid reference (that is, the reference's

quality is Bad).

- Named scripts are blocked until the OnShow script has completed, so some could be missed. For example, the named script OnDataChange might not run for the first few updates.
- Delayed OnShow scripts within nested embedded graphics might run out of order for the different nested levels. If the outer-most level is delayed but the inner levels are not delayed and are executed immediately, the order of execution will be changed.

## Related Topics

[Configuring the Predefined Scripts of a Graphic](#)

### Adding Named Scripts to a Graphic

You can add named scripts to a graphic. A named script runs:

- One time when the specified values, data or expressions change.
- Periodically if the values or expressions meet a certain criterion, such as being true.

Every named script can contain only one trigger type.

To add a named script to a graphic

1. Open the graphic in the Industrial Graphic Editor.
2. On the **Special** menu, click **Scripts**. The **Edit Scripts** dialog box appears.
3. Click the Add icon. A new entry is created in the **Named Scripts** list.
4. Type a name for the named script. The name appears on the right panel as header.
5. In the **Expression** box, do one of the following:
  - Type an expression, value or reference.
  - Browse for a reference.The expression acts as data source for the script trigger.
6. In the **Trigger** list, click:
  - **WhileTrue** to trigger the script periodically when the expression is true.
  - **WhileFalse** to trigger the script periodically when the expression is false.
  - **OnTrue** to trigger the script one time when the expression becomes true from false.
  - **OnFalse** to trigger the script one time when the expression becomes false from true.
  - **DataChange** to trigger the script one time when the expression or its quality changes. Select the **Quality Changes** check box to trigger the script when the quality of the specified expression changes.
7. If you want to specify how often the script is run when the trigger condition is fulfilled, type a time delay in milliseconds in the **Trigger Period** box.
8. If you want to specify by how much the evaluated value is expected to change before the script runs, type a deadband value in the **Deadband** box.
9. Type your script in the main edit box.
10. Use the Script Function Browser and Attribute Browser to select external data.

11. Click **OK**. The script editor validates the syntax of the script and identifies any errors. Click:
  - **Yes** to save changes even if the script contains errors.
  - **No** to cancel the changes and close the script dialog box.

## Editing Graphic Scripts

You can edit predefined and named graphic scripts.

### To edit graphic scripts

1. Open the graphic in the Industrial Graphic Editor.
2. On the **Special** menu, click **Scripts**. The **Edit Scripts** dialog box appears.
3. Select the script from the list. The right pane shows the script configuration.
4. If you are editing a predefined script, select the script trigger from the **TriggerType** list:
  - **On Show** if the action script you want to edit runs one time after the graphic opens.
  - **While Showing** if the action script you want to edit runs periodically while the graphic is open.
  - **On Hide** if the action script you want to edit runs one time when the graphic closes.
5. Edit the action script in the script box.
6. Click **OK**.

## Related Topics

## Renaming Scripts in a Graphic

You can rename named scripts in a graphic. When you rename the named script, the functionality of the script does not change.

### To rename a named script

1. Open the graphic in the Industrial Graphic Editor.
2. On the **Special** menu, click **Scripts**. The **Edit Scripts** dialog box appears.
3. In the **Named Scripts** list, click the script you want to rename.
4. Click the script again. It appears in edit mode.
5. Enter a new name for the script and click **Enter**. The script is renamed.

## Related Topics

[Adding and Maintaining Graphic Scripts](#)

## Removing Scripts from a Graphic

You can remove predefined or named scripts from a graphic.

### To remove predefined scripts from a graphic

1. Open the graphic in the Industrial Graphic Editor.
2. On the **Special** menu, click **Scripts**. The **Edit Scripts** dialog box appears.
3. Select **Predefined Scripts** from the list.
4. In the **Trigger type** list, click:
  - **On Show** if the action script you want to remove runs one time after the graphic opens.
  - **While Showing** if the action script you want to remove runs periodically while the graphic is open.
  - **On Hide** if the action script you want to remove runs one time after the graphic closes.
5. Delete all the script content in the script box.
6. Click **OK**.

### To remove named scripts from a graphic

1. Open the graphic in the Industrial Graphic Editor.
2. On the **Special** menu, click **Scripts**. The **Edit Scripts** dialog box appears.
3. Select the named script from the list.
4. Click the Remove icon. A message appears.
5. Click **Yes**. The script is removed.

## Using Methods in Scripting

Some elements, such as the Edit Box, Combo Box and List Box controls, support methods in scripting. These methods can be used to perform various functions on the elements themselves at run time.

You can see the properties and methods supported by any given element by opening the browser and selecting the element.

You can use the methods of the:

- Edit Box control to save and load the text at run time to and from a file.
- Combo Box and List Box controls to access and change the contents of their lists at run time.

## Related Topics

[Configuring Combo Box and List Box Methods](#)

### Configuring Edit Box Methods

You can use the methods of an Edit Box control to:

- Save the contained text at run time to a file.
- Load text into the control from a file at run time.

#### To save the contained text in an Edit Box control

- In an action script, use the following method:

```
ControlName.SaveText(FileName);
```

where ControlName is the name of the Edit Box control and FileName is the name of the file in which to save the contents of the control.

The text contained in the control at run time is saved to the specified file.

If you only specify a file name, the file is saved by default in the user folder of the operating system. For example: c:\documents and settings\username.

#### To load text into an Edit Box control from a file

- In an action script, use the following method:

```
ControlName.LoadText(FileName);
```

where ControlName is the name of the Edit Box control and FileName is the name of the file you want to load the text from.

The text contained in the file is loaded into the run time contents of the Edit Box control.

If you only specify a file name, by default, the file is expected to be in the user folder of the operating system. For example: c:\documents and settings\username.

[Using Methods in Scripting](#)

### Configuring Combo Box and List Box Methods

The Combo Box and List Box controls have methods that you can use to access and change the items in the list at run time. Typically, you configure an action script to access these methods.

You can:

- Add and insert items into the list.
- Delete individual or all items from the list.
- Find an item in the list.
- Get the item caption based on a specified index.
- Associate the items with values.
- Load items from and save items to a file.

# Adding and Inserting Items into a List

You can add an individual item:

- To the end of the list.
- Above the currently selected item.

### To add an item to a Combo Box or List Box list

- In an action script, use the following method:

```
ControlName.AddItem("ItemCaption");
```

where ControlName is the name of the Combo Box or List Box control and ItemCaption is the new item you want to add.

The item is added to the end of the list.

---

**Note:** You can specify an additional parameter `writeToSelectedItem` in the `.AddItem` function for Combo Box controls. If `writeToSelectedItem` is false, the newly added item is not written to the reference configured in the Combo box's *Selected Item Value*. For example: `Controlname.AddItem("ItemCaption", bool writeToSelectedItem);`

---

### To insert an item in a Combo Box or List Box list

- In an action script, use the following method:

```
Controlname.InsertItem("ItemCaption");
```

where ControlName is the name of the Combo Box or List Box control and ItemCaption is the new item you want to insert.

The item is inserted above the currently selected item in the list.

## Related Topics

[Configuring Combo Box and List Box Methods](#)

# Deleting Items from a List

You can delete:

- An individual item from a list.
- The selected item from a list.
- All items from a list.

If items cannot be deleted from a list at run time, no warning message is shown. Such items include Combo Box and List Box controls configured with enums or arrays.

### To delete an individual item from a Combo Box or List Box list

- In an action script, use the following method:

```
ControlName.DeleteItem(Index);
```

where ControlName is the name of the Combo Box or List Box control and Index is the index of the item you want to delete. The first item of the list has an index of 0.

The item at the specified index is deleted, subsequent items are moved up the list.

### To delete the selected item from a Combo Box or List Box list

- In an action script, use the following method:

```
ControlName.DeleteSelection();
```

where ControlName is the name of the Combo Box or List Box control.

The selected item is deleted, subsequent items are moved up the list.

### To delete all items from a Combo Box or List Box list

- In an action script, use the following method:

```
ControlName.Clear();
```

where ControlName is the name of the Combo Box or List Box control.

All items of the control are deleted.

[Configuring Combo Box and List Box Methods](#)

# Finding an Item in a List

You can find an item in a Combo Box or List Box list. You specify the item caption, and the method returns the index number of the first item found. Otherwise, the method returns -1.

### Finding an item in a Combo Box or List Box list

- In an action script, use the following method:

```
Index = ControlName.FindItem("ItemCaption");
```

where ControlName is the name of the Combo Box or List Box control and ItemCaption is the caption of the item you are looking for.

The index is set to -1 if the item is not found, otherwise it contains the index of the first found item. The first item of the list has an index of 0.

## Related Topics

[Configuring Combo Box and List Box Methods](#)

# Reading the Caption of a Selected Item in a List

You can read the caption of a selected item in a Combo Box or List Box list.

### Reading the caption of a selected item in a Combo Box or List Box list

- In an action script, use the following method:

```
Caption = ControlName.GetItem(Index);
```

where ControlName is the name of the Combo Box or List Box control. Index is the index of the item for which you want to read the caption. The first item of the list has an index of 0.

Caption contains the item caption of the specified index.

## Related Topics

[Configuring Combo Box and List Box Methods](#)

# Associating Items with Values in a List

You can associate items with values in a Combo Box or List Box control. This is the same as using a secondary index system to identify items in the list.

You can:

- Set item data, which associates an item with a value
- Get item data, which returns the value that is associated with an item

### To set item data in a Combo Box or List Box list

- In an action script, use the following method:

```
ControlName.SetItemData(Index,Value);
```

where ControlName is the name of the Combo Box or List Box control, Index is the index of the item that you want to set and Value is the value you want to assign to the item. The first item of the list has an index of 0.

### To get item data in a Combo Box or List Box list

- In an action script, use the following method:

```
Value = ControlName.GetItemData(Index);
```

where ControlName is the name of the Combo Box or List Box control and Index is the index of the item for which you want to get the value. The first item of the list has an index of 0.

Value contains the value that is assigned to the item.

## Related Topics

# Loading and Saving Item Lists

You can load and save all items in a list from and to a file.

### To load the item list for a Combo Box or List Box control from a file

- In an action script, use the following method:

```
ControlName.LoadList(FileName);
```

where ControlName is the name of the Combo Box or List Box control and FileName is the name of a file on the local harddrive or on the network.

If you only specify a file name, the file is expected to be in the users folder. For example: c:\documents and settings\username.

The list contained in the file is loaded and, if valid, the current list is overwritten.

### To save the item list for a Combo Box or List Box control to a file

- In an action script, use the following method:

```
Controlname.SaveList(FileName);
```

where ControlName is the name of the Combo Box or List Box control and FileName is the name of a file on the local harddrive or on the network.

If you only specify a file name, the file is saved to the users folder. For example, c:\documents and settings\username.

The list is saved to the specified file.

[Overriding Custom Properties of the Source Graphic](#)

[Restoring an Embedded Graphic to the Original Size of its Source Graphic](#)

[Converting an Embedded Graphic to a Group](#)

[Detecting the Source Graphic of an Embedded Graphic](#)

[Editing the Source of an Embedded Graphic](#)

[Controlling Size Propagation of Embedded Graphics](#)

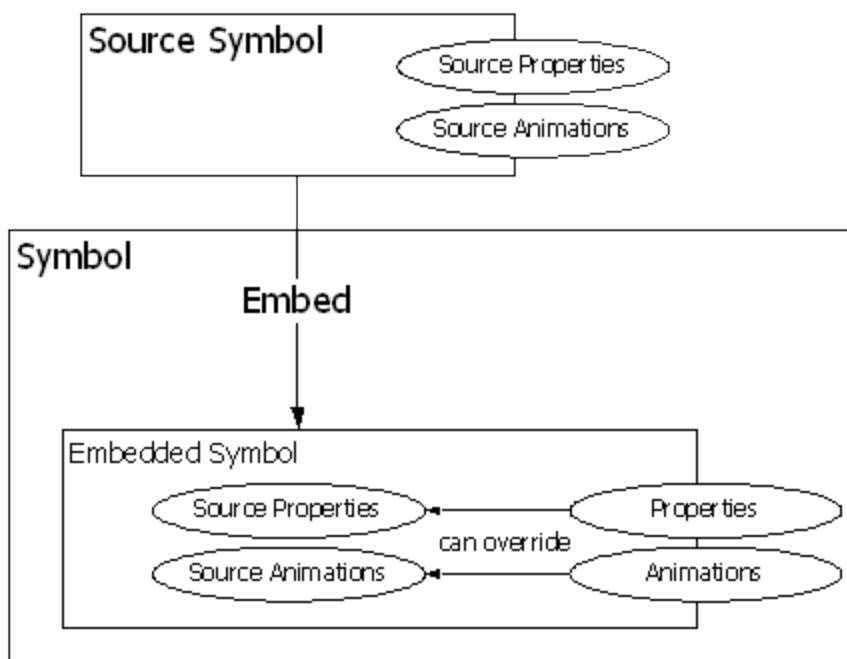

## Embedding Graphics

You can embed graphics into other graphics. This lets you split your visualization into modules and re-use already defined graphics. For example, you can create a valve graphic and embed it multiple times into a tank graphic.

When you embed a graphic into another graphic, you are creating a link to the original graphic. Any changes to the original graphic are propagated to all embedded instances.

You can:

- Embed a graphic within another graphic.
- Edit an embedded graphic.
- Restore an embedded graphic to the original size of its source graphic.
- Convert the embedded graphic to a graphic.
- Detect the source of an embedded graphic.
- Edit the source of an embedded graphic.
- Override the custom properties of the source graphic.
- Control the size propagation of an embedded graphic.
- Select an alternate or same graphic of an alternate object instance as source.
- Edit the object that contains the source graphic.
- Create a new instance of the object that contains the source graphic.

You can embed graphics from the Industrial Graphic Editor into other graphics.

When you embed a graphic, the animation links and scripts are inherited from the source graphic. You can only change the animations and scripts in the source graphic and all changes are propagated to the embedded graphic.

The embedded graphic appears with its original name appended by a number. The number is increased by one if you embed the same graphic again.

---

**Note:** If you embed graphics that have elements outside of the coordinates (0,0) and (2000,2000), the embedded graphic clips these elements. The name of the embedded graphic cannot be the same as a custom property of the graphic in which it is being embedded. The embedded graphic and the graphic in which it is being embedded cannot include elements that have the same name.

---

### To embed source graphics from the Industrial Graphic Editor

1. On the Industrial Graphic Editor **Edit** menu, click **Embed Graphic Symbol**. Your HMI's graphics browser appears.
2. Select a source graphic.
3. Click **OK**. The pointer appears in paste mode.
4. Click on the canvas to place the graphic.

### Related Topics

[Embedding Graphics within Graphics](#)

### Editing the Embedded Graphic

After you embed a source graphic into another graphic, its animations are inherited from the source graphic. The animation of the embedded graphic is controlled by the source graphic.

The embedded graphic itself has certain animations you can configure. The animations override the animations of the source graphic for the embedded graphic. These are:

- Visibility
- Blink
- Location Horizontal
- Location Vertical
- Width
- Height
- Orientation
- Disable

Furthermore you can override the following animations if you change the TreatAsIcon property of the embedded graphic to True:

- Tooltip
- User Input
- Slider Horizontal
- Slider Vertical
- Pushbutton
- Action Scripts
- Show Symbol
- Hide Symbol

### To override the configured animations of an embedded graphic

1. Select the embedded graphic.
2. In the Properties Editor, change the value for the TreatAsIcon property to True.

## Related Topics

[Embedding Graphics within Graphics](#)

## Overriding Custom Properties of the Source Graphic

You can override the value and description of a custom property of the embedded graphic if the custom property's visibility is set to Public in the source graphic.

You cannot add, delete, or rename any custom properties of an embedded graphic or change the data type. However, you can:

- Revert the value and description of the custom property to its default as defined in the source graphic.
- Set the visibility of the custom property. This has an effect if the graphic containing the embedded graphic is embedded into another graphic.

### To override the value and description of a custom property

1. Select the embedded graphic on the canvas.
2. On the **Special** menu, click **Custom Properties**. The **Edit Custom Properties** dialog box appears.
3. Select the custom property you want to override with a new value or description.
4. In the **Default Value** box, type a new value.
5. In the **Description** box, type a new description.

### To revert the value and description of a custom property

1. Select the embedded graphic on the canvas.
2. On the **Special** menu, click **Custom Properties**. The **Edit Custom Properties** dialog box appears.
3. Select the custom property you want to revert.
4. Click the Revert icon. The value and description of the selected custom property are reverted to the value and description of the same custom property in the source graphic.

## Related Topics

[Embedding Graphics within Graphics](#)

### Restoring an Embedded Graphic to the Original Size of its Source Graphic

You can restore an embedded graphic to its original size as it is defined in the object or in the Industrial Graphic Editor.

#### To restore an embedded graphic to its original size

1. Select the embedded graphic that you want to restore to its original size.
2. On the **Edit** menu, point to **Embedded Symbol**, and then click **Symbol - Original Size**. The embedded graphic is restored to the original size of its source graphic.

## Related Topics

[Embedding Graphics within Graphics](#)

### Converting an Embedded Graphic to a Group

You can convert an embedded graphic to a group. A converted graphic is no longer associated with its source graphic. All configuration of the embedded graphic is preserved.

If you convert an embedded graphic to a group:

- Scripts of the embedded graphic are not converted.
- You can optionally move the custom properties to the group.
- Relative references of the embedded graphic are no longer valid.
- Wizard options are no longer supported.

## To convert an embedded graphic to a group

1. Select the embedded graphic that you want to convert to a group.
2. On the **Edit** menu, point to **Embedded Symbol**, and then click **Convert To Group**. The embedded graphic is converted to a group.

## Related Topics

[Embedding Graphics within Graphics](#)

## Detecting the Source Graphic of an Embedded Graphic

You can view the source of an embedded graphic by using the **SymbolReference** property.

### To detect the source of an embedded graphic

1. Select the embedded graphic on the canvas.
2. In the Properties Editor, view the **SymbolReference** property to see what object or environment contains the source and the name of the source graphic itself. This can be:
  - *Symbol:SymbolName*.
  - *Symbol:InstanceName.SymbolName*

## Related Topics

[Embedding Graphics within Graphics](#)

## Editing the Source of an Embedded Graphic

You can edit the source of an embedded graphic by opening it in a new session of the Industrial Graphic Editor.

### To edit the source of an embedded graphic

1. Select the embedded graphic.
2. On the **Edit** menu, point to **Embedded Symbol**, and then click **Edit Symbol**. The source of the embedded graphic is opened in a new session of the Industrial Graphic Editor.
3. Edit the source graphic as needed and click **Save and Close**. The new session of the Industrial Graphic Editor is closed and the **Symbol Changed** icon appears in the status bar.
4. Double-click the **Symbol Changed** icon. The change is reflected in the embedded graphic.  
If you do not accept the change, the embedded graphic is updated the next time you open it in the Industrial Graphic Editor.

## Related Topics

[Embedding Graphics within Graphics](#)

## Controlling Size Propagation of Embedded Graphics

You can control the way that size changes of the source graphic are propagated to its embedded instances, which are embedded graphics. For example, a size change is:

- Resizing one of the elements in the source graphic so that the graphic boundary changes.
- Adding elements to or removing elements from the source graphic so that the graphic's boundary changes.

This feature is called dynamic size change and can be enabled or disabled.

## Related Topics

[Showing or Hiding the Anchor Points of Embedded Graphics](#)

[Enabling or Disabling Dynamic Size Change of Embedded Graphics](#)

## Setting the Anchor Point of a Source Graphic

You can set the position of the anchor point of a source graphic. The anchor point of a source graphic is by default the center point of all elements on the canvas.

You can change the position of the anchor point:

- Numerically by typing the absolute or relative anchor point position values in the Properties Editor.
- Graphically by dragging the anchor point on the canvas.

### To change the position of the anchor point numerically

1. Click on the canvas.
2. In the Properties Editor, type position values X,Y for:
  - **AbsoluteAnchor** property, where the position is relative to the top left corner of the canvas 0,0.
  - **RelativeAnchor** property, where the position is relative to the center point of all elements on the canvas.The anchor point is changed accordingly. The **AbsoluteAnchor** and **RelativeAnchor** property values are updated accordingly.

### To change the position of the anchor point graphically

1. Click on the canvas.
2. In the Properties Editor, click the **AbsoluteAnchor** or **RelativeAnchor** property label. The anchor point of the graphic is shown.
3. Drag the anchor point to the new position. The **AbsoluteAnchor** and **RelativeAnchor** property values are updated accordingly.

## Related Topics

[Controlling Size Propagation of Embedded Graphics](#)

### Showing or Hiding the Anchor Points of Embedded Graphics

You can show or hide the anchor points of embedded graphics. An anchor point shows the current absolute anchor position of the embedded graphic on the canvas.

#### To show or hide the anchor point of an embedded graphic

- On the toolbar, click the **Show/Hide Embedded Symbol Anchor Points** icon. The anchor of the embedded graphic appears or disappears.

## Related Topics

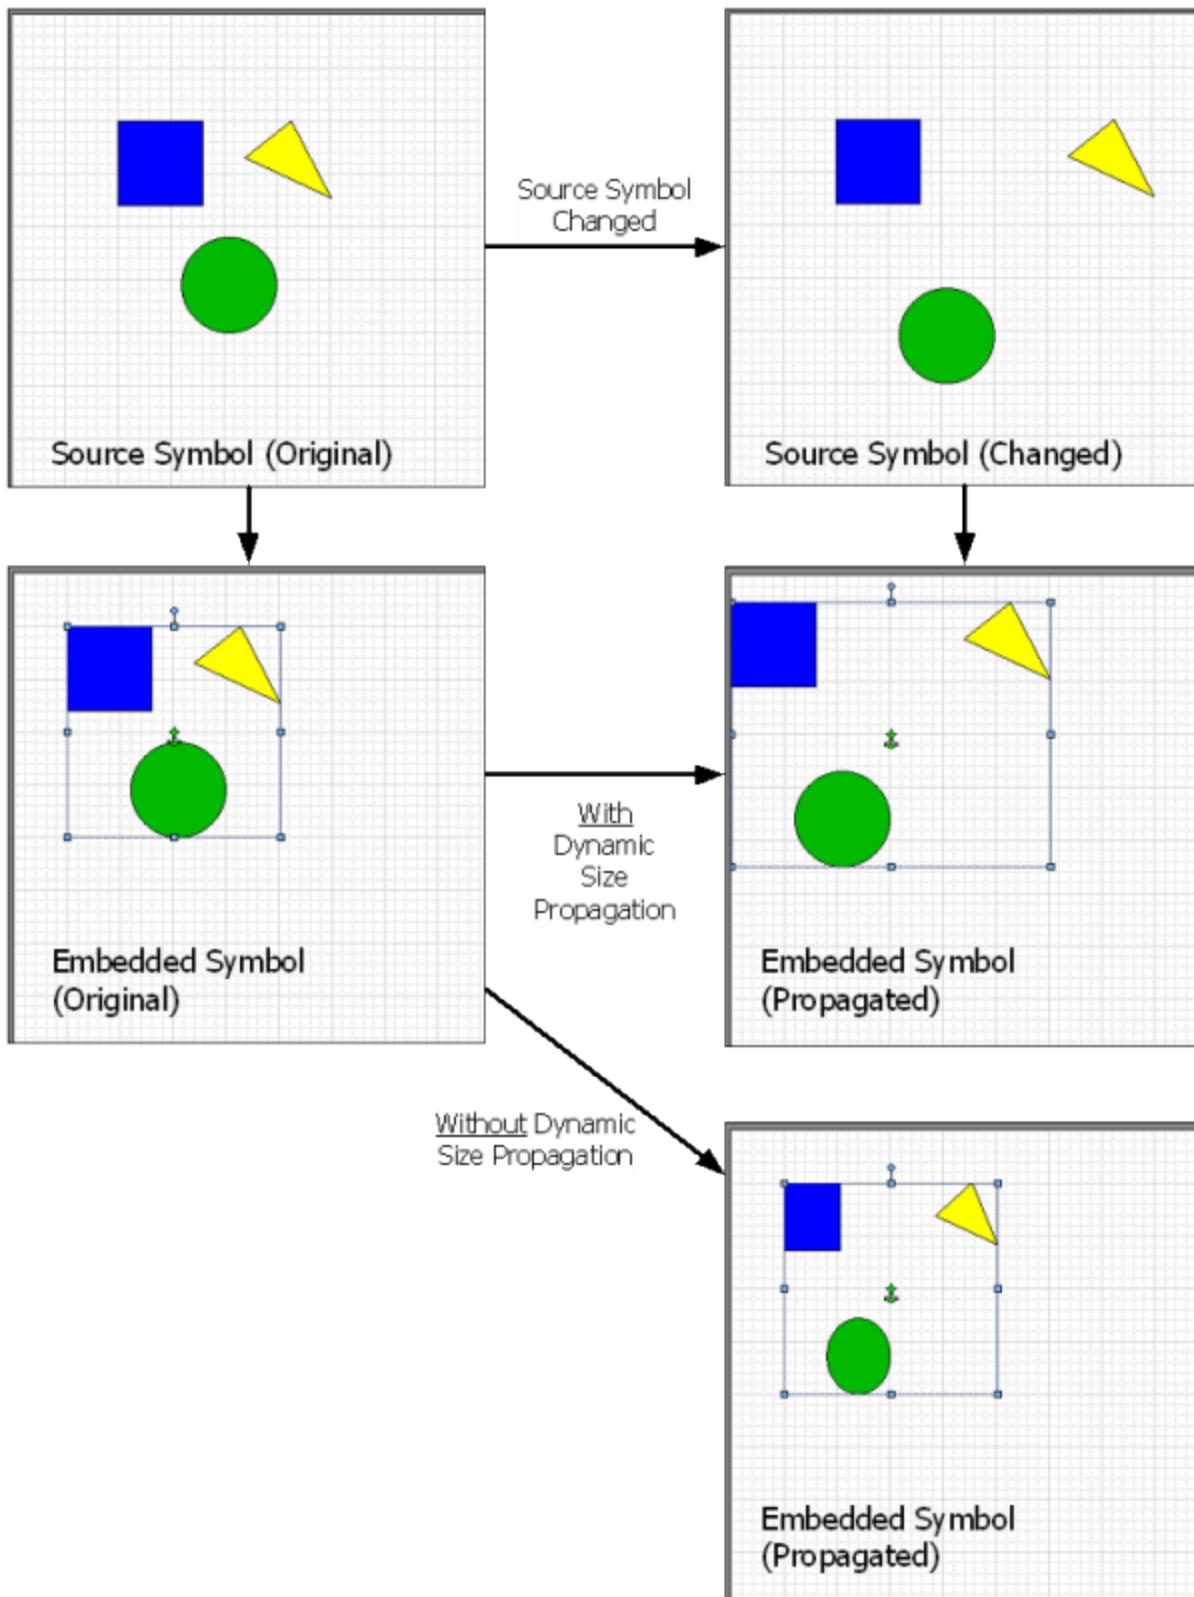

[Controlling Size Propagation of Embedded Graphics](#)

### Enabling or Disabling Dynamic Size Change of Embedded Graphics

You can enable or disable the dynamic size change of embedded graphics. The anchor points of the embedded instances are not changed by any size change to the source graphic.

If the source graphic size changes and the dynamic size change is enabled, the embedded graphic size adapts accordingly. If the dynamic size change is disabled, the embedded graphic size does not change.

In both cases the anchor points of its embedded instances do not move on the canvas.

#### To enable or disable dynamic size change of an embedded graphic

1. Select the embedded graphic on the canvas.
2. On the toolbar, click the **Enable/Disable Dynamic Size Change** icon. The dynamic size change is enabled or

disabled.

## Working with Symbol Wizards

### In This Chapter

[Introduction](#)

[Understanding the Symbol Wizard Editor](#)

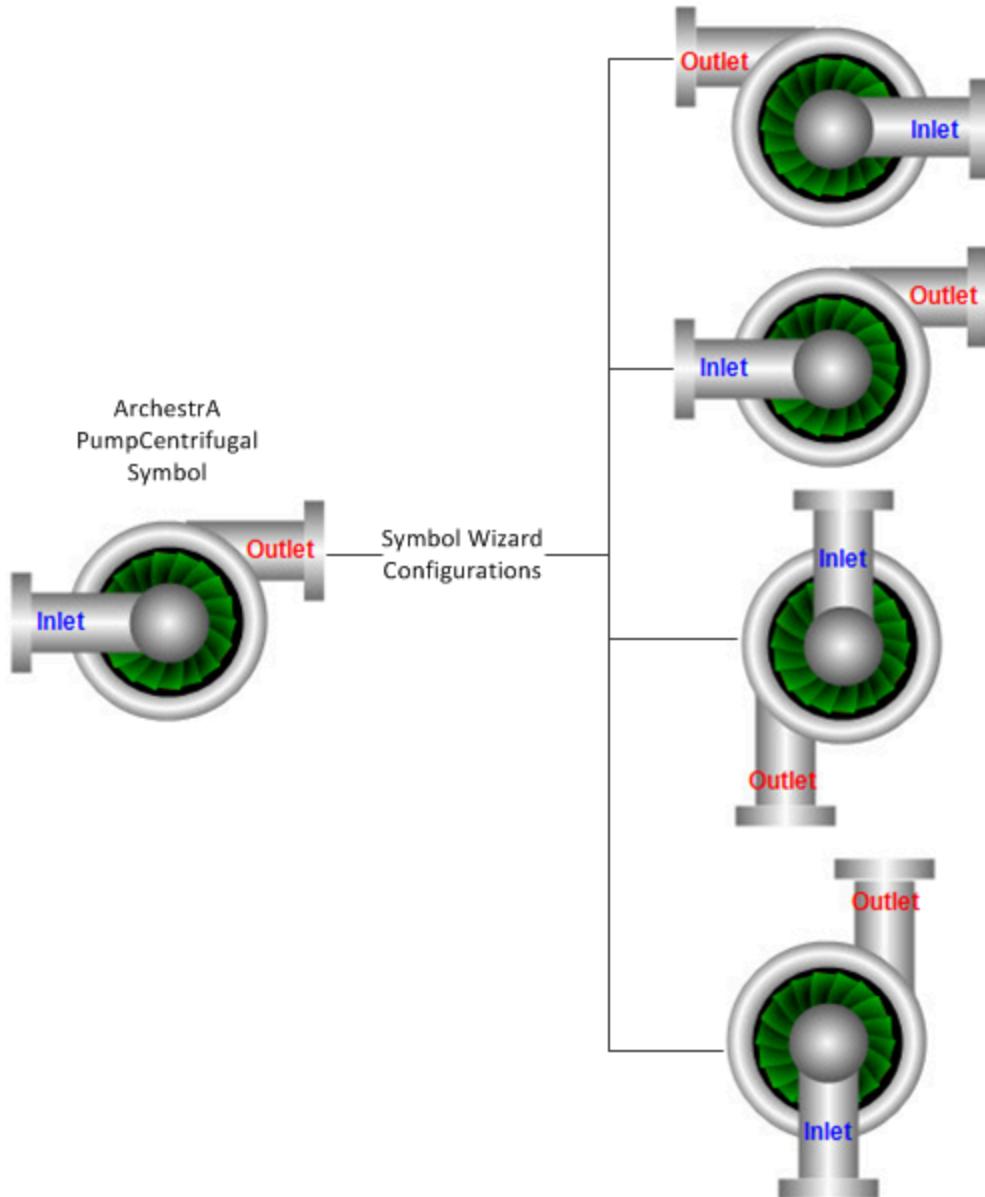

[Designing a Symbol Wizard](#)

[Using Symbol Wizards in an Application](#)

[Symbol Wizard Tips and Examples](#)

### Introduction

The Industrial Graphic Editor includes the Symbol Wizard Editor, which can be used to create reusable configurable graphics called Symbol Wizards. For example, a single pump symbol can be created with the Symbol Wizard Editor that includes different visual pump configurations based on the orientation of inlet and outlet pipes.

Incorporating multiple configurations in a single graphic reduces the number of graphics needed to develop an application.

## Related Topics

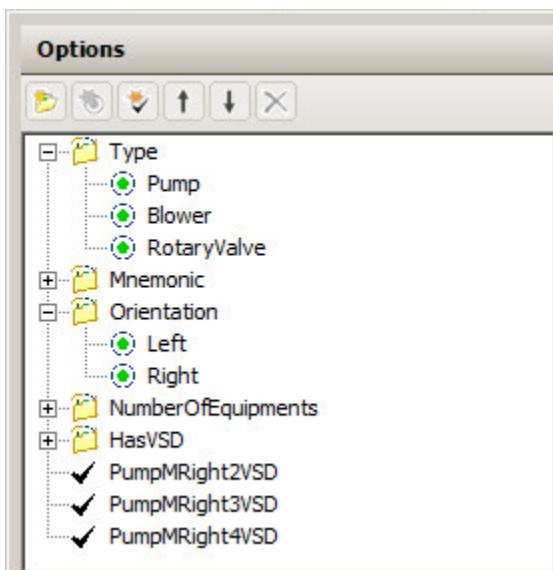

[Working with Symbol Wizards](#)

## Understanding the Symbol Wizard Editor

After enabling the Symbol Wizard Editor, the Industrial Graphic Editor window updates to show Symbol Wizard Editor panes at the left of the window.

- Beneath the **Tools** pane, separate tabbed panes show the graphic elements, custom properties, and named scripts that belong to a graphic.

- The tabbed **Options** pane shows a hierarchical list of Choice Groups, Choices, and Options that define graphic configurations.

The **Options** pane includes buttons to add, delete, and reorder Choice Groups, Choices, and Options.

- The tabbed **Layers** view includes a list of defined graphic layers. Beneath each layer, separate folders contain the graphic's elements, custom properties, and named scripts associated with the layer. A graphic's elements, custom properties, and named scripts are assigned to graphic layers by dragging them to corresponding folders in the **Layers** view.

## Related Topics

[Working with Symbol Wizards](#)

[Understanding Choice Groups and Choices](#)

[Understanding Symbol Wizard Layers](#)

[Defining Graphic Configuration Rules](#)

## Understanding Choice Groups and Choices

The Symbol Wizard Editor **Options** pane includes buttons to create Choice Groups, Choices, and Options.

- A Choice Group represents a unique property of a graphic and appears as the top level property node in the **Options** view.
- A Choice represents a possible value of a Choice Group property. Choices are indented beneath the associated Choice Group node in the **Options** view. Choices are mutually exclusive and only one choice can be selected from a Choice Group for a single configuration of a graphic.

An item shown in the **Options** view list can be moved by selecting it, and then clicking the **Up** or **Down** arrow. If no Choice is specified as the default value for a Choice Group, the first Choice added to the Choice Group is always the default value.

In the example of an centrifugal pump graphic, one possible Choice Group is Orientation for the different configurations of inlet and outlet pipes. The Left, Right, Bottom, and Top choices appear as the associated Choice

attributes of the Orientation Choice Group.

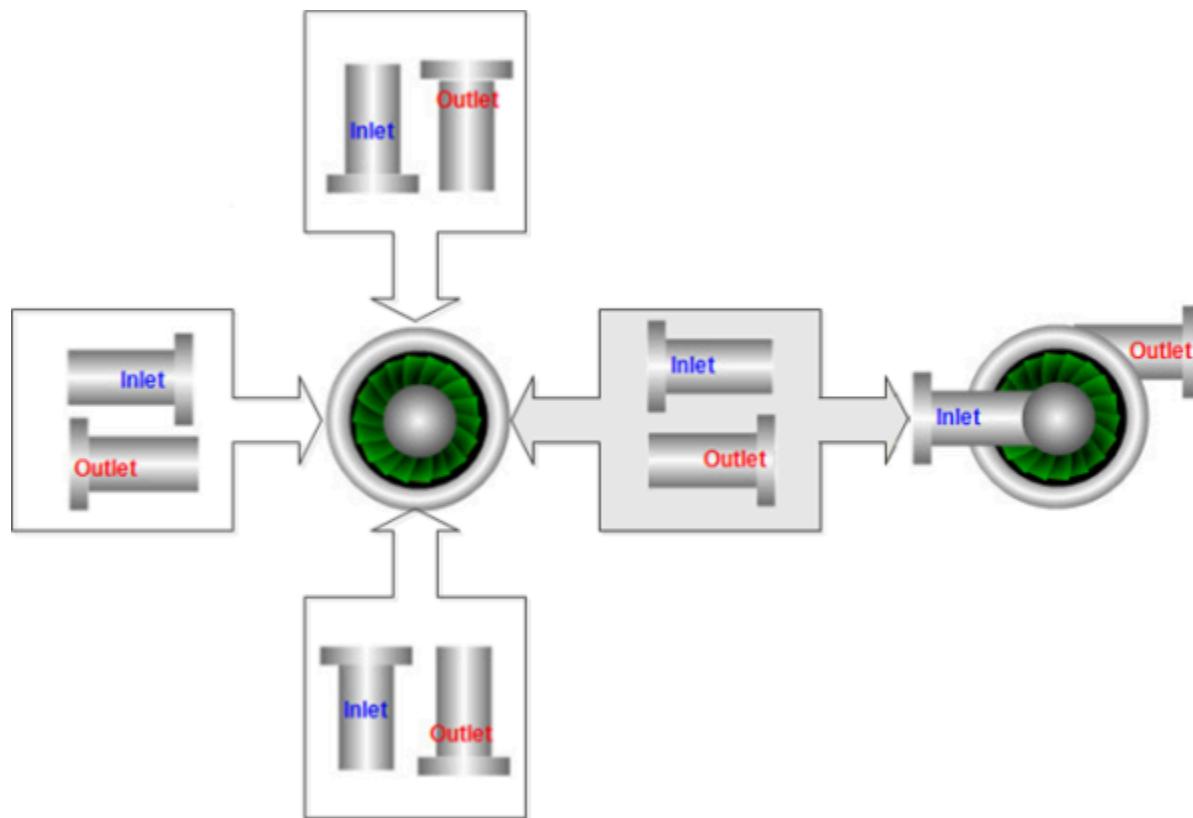

## Related Topics

[Understanding the Symbol Wizard Editor](#)

### Understanding Symbol Wizard Layers

Symbol Wizard layers associate graphic elements, custom properties, and named scripts to a unique graphic configuration defined by a rule. When the rule is True, the layer's graphic elements, custom properties, and named scripts are part of the Symbol Wizard's configuration.

In the example of a centrifugal pump graphic, a rule determines the orientation of the pump's inlet and outlet pipes. When the rule for the Right configuration is True, the Right layer containing the inlet and outlet pipes is part of the graphic's configuration.

The blade housing does not belong to a layer because it is common to all pump graphic configurations. Graphic elements of a graphic that do not belong to a layer appear in all graphic configurations. As a result, the pump's blade housing appears in the Left, Right, Top, and Bottom configurations of the pump by default.

Likewise, adding graphic elements, custom properties, and named scripts to a layer without a rule results in these elements appearing in all graphic configurations. Each layer must have a defined rule that specifies a True condition when the set of graphic elements, custom properties, and named scripts are part of a graphic configuration.

Associating graphic elements, named scripts, and custom properties to graphic layers involves working with the Symbol Wizard Editor **Layers** pane shown to the left of the graphic canvas.

## Related Topics

[Understanding the Symbol Wizard Editor](#)

### Defining Graphic Configuration Rules

A rule defines an expression that determines if a given choice or option and its associated graphic layer is visible or hidden based on the evaluation of the rule to true or false.

Rules can consist of a single expression or compound expressions using Boolean keywords or operator characters:

Boolean Keywords	AND, OR, NOT
Operator Characters	<b>Period (.)</b> A period concatenates a Choice Group to a Choice in a hierarchical expression. <b>Pipe ( )</b> A pipe evaluates to a Boolean OR. <b>Ampersand (&amp;)</b> An ampersand evaluates to a Boolean AND. <b>Exclamation point (!)</b> An exclamation point evaluates to a Boolean NOT. <b>Parentheses ( )</b> A compound expression enclosed within parentheses is evaluated before other expressions in a rule

Any other unlisted keywords or operator characters in a rule are treated as part of the references.

- Compound expressions that include a Boolean keyword need to include blank spaces around the keyword.  
*ConditionA OR ConditionB*
- Compound expressions that include an operator character that evaluates to a Boolean condition do not require blank spaces.  
*ConditionA | ConditionB*
- A property attribute needs to be referenced by its hierarchical Choice Group name.  
*ChoiceGroup.Choice*
- Rules cannot reference a Choice Group alone. Rule expressions need to reference Choices within a Choice Group.  
*ChoiceGroup.Choice*.
- When an Option is renamed, the name change is updated in all referenced rule expressions.
- An Option or a Choice can be deleted only if no graphics are associated with their default layers.

## Related Topics

[Understanding the Symbol Wizard Editor](#)

[Examples of Graphic Configuration Rules](#)

# Examples of Graphic Configuration Rules

The following examples explain how rules specify the layers that belong to a Symbol Wizard configuration.

- Orientation.Left&HasTach.True

When this rule is True, the Symbol Wizard's configuration includes a layer containing a pair of pipes with the inlet pipe oriented to the left and a tachometer.

- Orientation.Left AND HasTach.True

This rule is the same as the preceding rule except that a Boolean keyword is used rather than an operator character. There are blank spaces before and after the Boolean keyword in the rule.

- Orientation.Right&HasTach.False

When this rule is True, the Symbol Wizard's configuration includes a layer containing a pair of pipes with the inlet pipe oriented to the right and a layer that does not include a tachometer.

- (Orientation.Top&HasTach.True)|(Orientation.Bottom&HasTach.True)

When this rule is True, the Symbol Wizard's configuration includes two layers containing pipes with inlet pipe oriented at the top or the bottom. Both pipe layers include a tachometer. The selected option of the Orientation Wizard Option determines which pipe layer appears in the configuration.

For more practical examples of creating rules, see [Symbol Wizard Tips and Examples](#).

## Related Topics

[Defining Graphic Configuration Rules](#)

## Designing a Symbol Wizard

The process of creating and implementing a Symbol Wizard has two workflows:

- The first workflow, referred to as a designer workflow, uses the Symbol Wizard Editor to create Symbol Wizards containing multiple configurations.
- The second workflow, referred to as a consumer workflow, embeds a Symbol Wizard and then configures it for use in an application.

## Related Topics

[Working with Symbol Wizards](#)

[Creating Graphic Choice Groups, Choices, and Options](#)

[Assigning Graphic Configuration Rules](#)

[Updating Graphic Layers](#)

[Associating Configuration Elements to Graphic Layers](#)

[Verifying Graphic Configurations](#)

## Creating Graphic Choice Groups, Choices, and Options

The following list summarizes the tasks that need to be completed in a designer workflow to create a Symbol Wizard containing multiple configurations.

- Define a graphic's Choice Groups, their Choices, and Options
- Assign rules to Choice Groups, Choices, and Options
- Associate graphic elements, custom properties, and named scripts to graphic layers
- Verify each graphic configuration with Symbol Wizard Preview

After planning the possible configurations for a graphic, Designers should know the properties and the possible attributes associated with each configuration. Designers create Choice Groups, Choices, and Options to define a graphic's properties and attributes.

**Important:** Situational Awareness Library symbols have predefined Choice Groups, Choices, and Options.

### To create graphic choice groups, choices, and options

1. In Plant SCADA Studio, create a copy of a graphic in the Industrial Graphic Editor for which you want to create multiple configurations.  
You can also build an entirely unique symbol from scratch and create multiple configurations of it with Symbol Wizard.
2. Check out and open the copied graphic in the Industrial Graphic Editor's canvas drawing area.
3. Click the Symbol Wizard icon shown on the Industrial Graphic Editor menu bar.  
You can also show Symbol Wizard by pressing Alt+W or selecting it as an option from the **View** menu.  
The Industrial Graphic Editor updates to show the Symbol Wizard Editor's tabbed panes at the left of the window.
4. Click the **Options** tab.
5. Click **Add Choice Group** to create a Choice Group.  
A Choice Group folder appears in the **Options** window.
6. Rename the Choice Group to assign an easily identifiable name of a property used in a graphic configuration.  
Creating a Choice Group automatically sets it to rename mode. You can also manually rename a Choice Group by right-clicking on the Choice Group and select **Rename** from the menu.
7. Repeat steps 5-6 to create as many Choice Groups as needed to define all properties of a graphics that determine its configurations.
8. Select a Choice Group folder and click **Add Choice** to add a choice beneath the select Choice Group.
9. Rename the Choice to assign an easily identifiable name of a property attribute used in a graphic configuration.
10. Repeat steps 8-9 to assign all possible Choice attributes to the Choice Groups.
11. Click **Add Option** to add an Option, which appears in the window at the same hierarchical level as Choice Groups.
12. Right-click the Option and select **Rename** to assign a name.
13. Repeat steps 11-12 to create as many Options needed to define a graphic's configurations.

## Related Topics

[Designing a Symbol Wizard](#)

### Assigning Graphic Configuration Rules

In a designer workflow, you can specify rules for a graphic's defined Choices and Options. Choice Groups should not be included in graphic configuration rules.

These rules determine the graphic elements, custom properties, and scripts that belong to a graphic configuration. For more information about rule syntax, see [Defining Graphic Configuration Rules](#).

#### To define graphic configuration rules

1. Show the selected graphic in the Industrial Graphic Editor with the Symbol Wizard enabled.
2. Select a Choice from the **Options** view.

The **Properties** view updates to show **Option Properties** fields. The **Name** field shows the name of the Choice you selected from the **Options** view. The **Rule** field is blank.

3. If necessary, enter a rule for the Choice.

**Important:** Not all Choices require rules. Specify only those rules necessary to create graphic configurations. Choices without rules are always visible.

4. Repeat steps 2-3 to specify rules for the remaining Choices of the graphic.

5. Select an Option from the **Options** view.

The **Name** field of the **Option Properties** view updates to show the name of the Option you selected from the **Options** view.

6. Enter a rule for the Option that defines the conditions to show or hide the Choice Groups and Choices in a configuration.

7. Enter True or False in the **Default Value** field to set the Option as part of the graphic's default configuration or not.

8. In the **Description** field, enter a description of the Option.

The description appears when the Consumer embeds the graphic and clicks on the option to configure it.

9. Repeat steps 5-8 to specify rules and optional default values for the remaining Options of the graphic.

## Related Topics

[Designing a Symbol Wizard](#)

### Updating Graphic Layers

Symbol Wizard automatically creates a set of default layers that match the hierarchical set of Choices and Options defined for a graphic. Each Choice layer has an assigned default rule containing the expression `ChoiceGroup.Choice` that defines an attribute of a graphic's property.

The default rule for an Option layer is simply the name of the Option itself. Renaming an Option automatically renames any layer rules that reference the Option.

In a designer workflow, you can update layers by adding layers to or deleting layers from the set of default layers.

Also, layers can be renamed and the default rule assigned to a layer can be changed.

**Important:** Updating graphic layers may not be necessary if the default set of layers created for Choices and Options can create all graphic configurations.

If a graphic layer is renamed, it loses the link to the Option. When the Option name is updated, the layer name will not get updated with changed Option name.

### To add or delete a graphic layer

1. Show the selected graphic in the Industrial Graphic Editor with the Symbol Wizard selected.
2. Click the **Layers** tab to show the list of layers.
3. To add a layer, do the following:

- a. Click the **Add Layer** icon above the **Layers** list.

You can also add a layer by right-clicking within the layers list to show the action menu and selecting **Add**.

The new layer appears at the bottom of the list with an assigned default name.

- b. Click on the new layer to select it.
- c. Rename the new layer.

Creating a layer automatically sets it to rename mode. You can also manually rename a layer by right-clicking on the layer and select **Rename** from the menu.

4. To delete a layer, do the following:

- a. Click on the layer within the list to be deleted.
- b. Delete the layer by clicking the **Delete Layer** icon above the **Layers** list or right clicking to show the context menu and selecting **Delete**.

### To update a layer rule

1. Show the selected graphic in the Industrial Graphic Editor with the Symbol Wizard selected.
2. Click the **Layers** tab to show the list of layers.
3. Select a layer from the list whose rule needs to be updated.  
The **Layer Properties** view appears and shows the current rule assigned to the selected layer Choice or Option.
4. Click within the **Rule** field to select it.
5. Update the rule.
6. Click **Save** to save the changes to the layer rule.

## Associating Configuration Elements to Graphic Layers

The basic workflow to associate graphic elements, custom properties, or named scripts to a graphic layer consists of these general steps:

1. Select a graphic layer from the **Layers** view.
2. Select items from the tabbed **Elements**, **Named Scripts**, and **Custom Properties** views to associate with the selected layer.  
**Note:** Multiple graphic elements, custom properties, or named scripts can be selected using the Shift key to select a range of listed items or the Ctrl key to select individual items from a list.
3. Drag and drop the selected graphic elements, custom properties, or scripts into the **Layers** view.

Configuration elements can be associated with a graphic layer by two methods:

- **Active layer method:** Select the check box to the left of the layer name. Then, drag and drop the configuration element anywhere within the **Layers** view. The configuration element is automatically associated to the correct folder of the active layer.
- **Direct folder method:** Select a layer and expand it to show the folders for the different types of configuration elements. Then, drag and drop the configuration element directly on the folder that matches the type of configuration element.

# Associating Graphic Elements to Graphic Layers

Graphic elements show the visual properties of a graphic. In a designer workflow, associate graphic elements to the defined layers of a graphic.

## To associate graphic elements to graphic layers

1. Show the symbol with the Symbol Wizard Editor selected.
2. Click the **Elements** tab to show the graphic elements that belong to the graphic.
3. Click the **Layers** tab.
4. Activate a layer from the **Layers** view by selecting the check box next to the layer.  
If you prefer to add graphic elements directly to a layer's **Graphic Elements** folder with the direct folder method, simply click the layer name from the list to select it.
5. Click the box to the left of the check box to expand the layer view and show the **Graphic Elements** folder.
6. Click on the graphic element in the **Elements** view to be associated with the active graphic layer.

You can also select the symbol element group by clicking it on the displayed graphic.

7. Using standard Windows drag and drop technique, drag the graphic element from the **Elements** view and drop it anywhere within the **Layers** view.

If you are using the direct folder method, you must drop the graphic element directly on the selected layer's **Graphic Elements** folder.

The selected element appears beneath the active layer's **Graphic Elements** folder.

8. Repeat steps 6-7 to select all element groups that belong to the graphic layer.

You can also select multiple graphic elements from the **Elements** view and drop them as a set.

9. Repeat steps 4-8 to select all elements for the different layers of a graphic.

The **Show/Hide** icon appears to the left of the **Graphic Elements** folder in the **Layers** view. Clicking the icon shows or hides the graphic elements in a layer's **Graphic Elements** folder on the graphic itself.

10. Click the **Show/Hide** icon to verify the graphic elements associated to a layer are correct for the graphic configuration.

11. Save your changes to the graphic.

## Related Topics

[Associating Configuration Elements to Graphic Layers](#)

# Using Shortcut Menu Commands to Edit Graphic Layer Graphic Elements

The Symbol Wizard Editor provides a set of shortcut menu commands to add graphic elements to graphic layers or remove them from layers. Using shortcut commands makes it easier to add or remove graphic elements when a complex Symbol Wizard contains many graphic elements and layers.

### Adding Graphic Elements to Active Symbol Layers

Adding graphic elements to an active layer involves selecting an active layer, selecting one or more graphic elements, and then using the **Add To Active Layers** shortcut command.

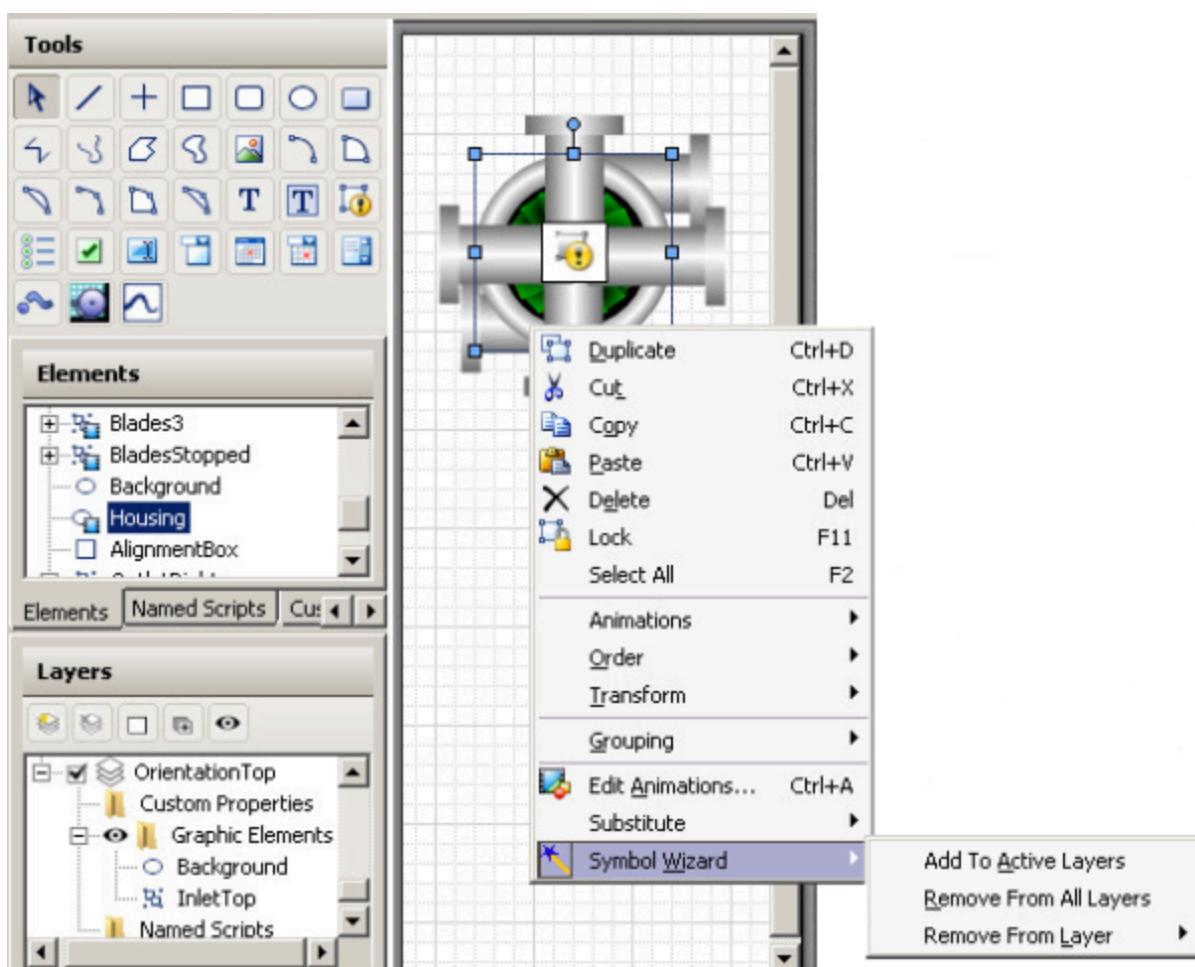

---

**Note:** All graphic elements should be created for all Symbol Wizard configurations before adding them to graphic layers.

---

### To add graphic elements to graphic layers

1. Show the graphic with Symbol Wizard Editor selected.
2. From the **Layers** pane, select the check box next to graphic layer to make it active.  
If you want to add a graphic element to multiple layers, select the check box next to each layer to make them active.
3. Select the graphic element to be added from the displayed Symbol Wizard.  
The graphic element can also be selected from the **Elements** pane.
4. Show the Symbol Wizard shortcut commands by right-clicking on the selected graphic element on the graphic or right-clicking on the graphic element name from the **Elements** pane.

5. Click **Add to Active Layers**.
6. Verify the graphic element has been added to the active layers.

### Removing Graphic Elements from Graphic Layers

Removing graphic elements from graphic layers follows a similar sequence of steps as adding graphic elements to layers. The Symbol Wizard shortcut menu includes separate commands to remove graphic elements from all layers or only from a selected layer.

#### To remove graphic elements from graphic layers

1. Show the graphic with Symbol Wizard Editor selected.
2. From the **Layers** pane, select the check box next to the graphic layer that contains a graphic element to be removed.

Selecting a layer is not necessary if the graphic element will be removed from all layers. Also, if a layer is not selected, the **Remove From Layer** command shows a list of layers that include the selected graphic element to be removed.

3. Select the graphic element to be added from the displayed Symbol Wizard.

The graphic element can also be selected from the **Elements** pane.

4. Show the Symbol Wizard shortcut commands by right-clicking on the selected graphic element on the graphic or right-clicking on the graphic element name from the **Elements** pane.

5. Click **Remove From All Layers** or **Remove From Layer** based on whether the graphic element needs to be removed from all layers or only the selected layer.

If a layer has not been selected, the **Remove From Layer** command shows a list of layers that include the graphic element selected to be removed. Click a layer from the list to remove a graphic element.

6. Verify the graphic element has been removed from the selected layers.

## Related Topics

# Associating Custom Properties to Graphic Layers

Associating custom properties to a graphic layer uses a procedure similar to associating graphic elements. Selected custom properties are dragged and dropped on the **Custom Properties** folder to associate them to a graphic layer. You can associate custom properties to layers with the active layer or directory folder methods.

### To associate custom properties to graphic layers

1. Open the selected graphic in the Industrial Graphic Editor with the Symbol Wizard selected.
2. Click the **Custom Properties** grid to show the locally defined custom properties of the graphic.  
Custom properties of embedded graphics are not listed.
3. Click the **Layers** tab.
4. Select a layer from the **Layers** view to add custom properties by selecting the check box next to the layer.
5. Click the box to the left of the check box to expand the layer view and show the **Custom Properties** folder.
6. Click on a custom property in the **Custom Properties** view that belongs to the selected graphic layer.
7. Using standard Windows drag and drop technique, drag the custom property from the **Custom Properties** view and drop it on the **Custom Properties** folder.  
The selected custom property appears beneath the **Custom Properties** folder.
8. Repeat steps 6-7 to select all custom properties that belong to the graphic layer.
9. Repeat steps 4-7 to select the remaining custom properties for the different layers of a graphic.
10. Save your changes to the graphic.

## Related Topics

[Associating Configuration Elements to Graphic Layers](#)

# Associating Named Scripts to Graphic Layers

Associating named scripts to a graphic layer uses a similar procedure to associate graphic elements or custom properties. You can associate named scripts to layers with the active layer or directory folder methods.

## To associate named scripts to graphic layers

1. Show the selected graphic in the Industrial Graphic Editor with the Symbol Wizard selected.
2. Click the **Named Scripts** tab to show the scripts associated with the graphic.
3. Click the **Layers** tab.
4. Select a layer from the **Layers** view by selecting the check box next to the layer.
5. Click the box to the left of the check box to expand the layer view and show the **Named Scripts** folder.
6. Click on a script in the **Named Scripts** view that belongs to the selected graphic layer.
7. Using standard Windows drag and drop technique, drag the script from the **Named Scripts** view and drop it on the **Named Scripts** folder.  
The selected script appears beneath the **Named Scripts** folder.
8. Repeat steps 6-7 to select all scripts that belong to the graphic layer.
9. Repeat steps 4-7 to select the remaining scripts for the different layers of a graphic.
10. Save your changes to the graphic.

## Related Topics

[Associating Configuration Elements to Graphic Layers](#)

## Verifying Graphic Configurations

After creating the different configurations of a graphic, you can use the Symbol Wizard Preview to verify each configuration works as designed. Also, you can validate the graphic to identify any invalid references to other objects or values.

## To verify graphic configurations

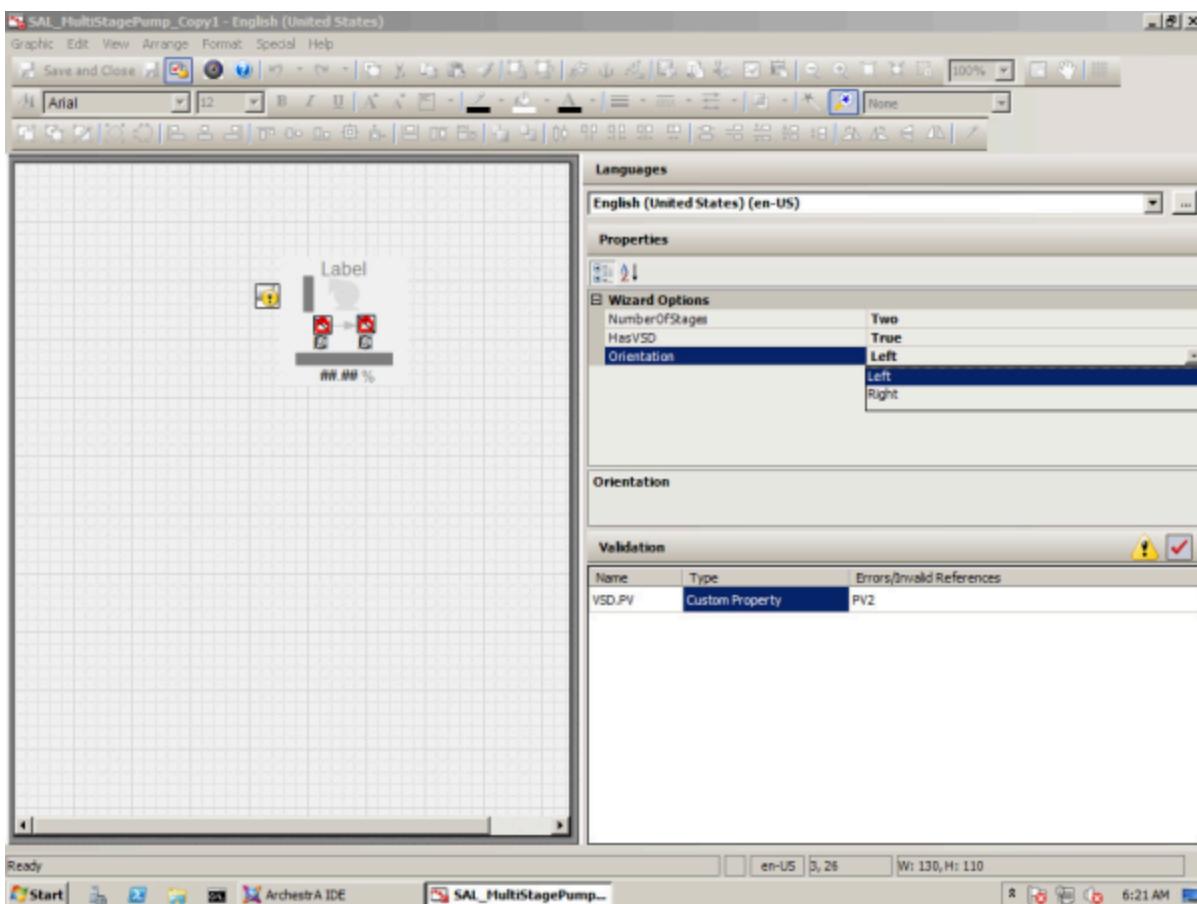

1. Open the graphic created with Symbol Wizard in the Industrial Graphic Editor.

2. Click **Symbol Wizard Preview** shown on the menu bar of the Industrial Graphic Editor.

You can also open the Symbol Wizard Preview as a **View** menu option or by pressing Alt+P.

The Industrial Graphic Editor updates to show the **Wizard Options** view with a set of drop-down lists to select different graphic property attributes and options. Select the default graphic configuration.

3. Select the different combinations of property values and view options from **Wizard Options** fields.
4. Verify the graphic that appears is correct for the specified configuration Choices and Option rule.

5. Click the **Validation** icon to see if the graphic contains any invalid references.

The **Validation** view lists any invalid references within the graphic that need to be corrected.

Invalid references also include references to properties or elements in hidden graphic layers.

## Using Symbol Wizards in an Application

Symbol Wizards are stored in a library just like standard Industrial Graphics. When you select a graphic and embed it into an HMI/SCADA application, the graphic's default configuration is selected.

In a consumer workflow, you can change a Symbol Wizard's configuration by changing the values assigned to the graphic's properties from the Symbol Wizard's **Wizard Options** section of the **Properties** view. After selecting a graphic configuration and changing any properties, save the graphic.

The Symbol Wizard appears as the configuration you have selected. A Symbol Wizard's configuration cannot be changed during application run time.

## Related Topics

[Working with Symbol Wizards](#)

[Embedding Symbol Wizards](#)

### Embedding Symbol Wizards

In a consumer workflow, you embed Symbol Wizards from the Industrial Graphic Editor. Embedding a Symbol Wizard is similar to embedding a standard Industrial Graphic.

A Symbol Wizard appears with its default configuration when it is embedded. The Consumer can select another configuration by changing the configuration values shown in the **Wizard Options** section of the **Properties** view.

#### To embed a graphic

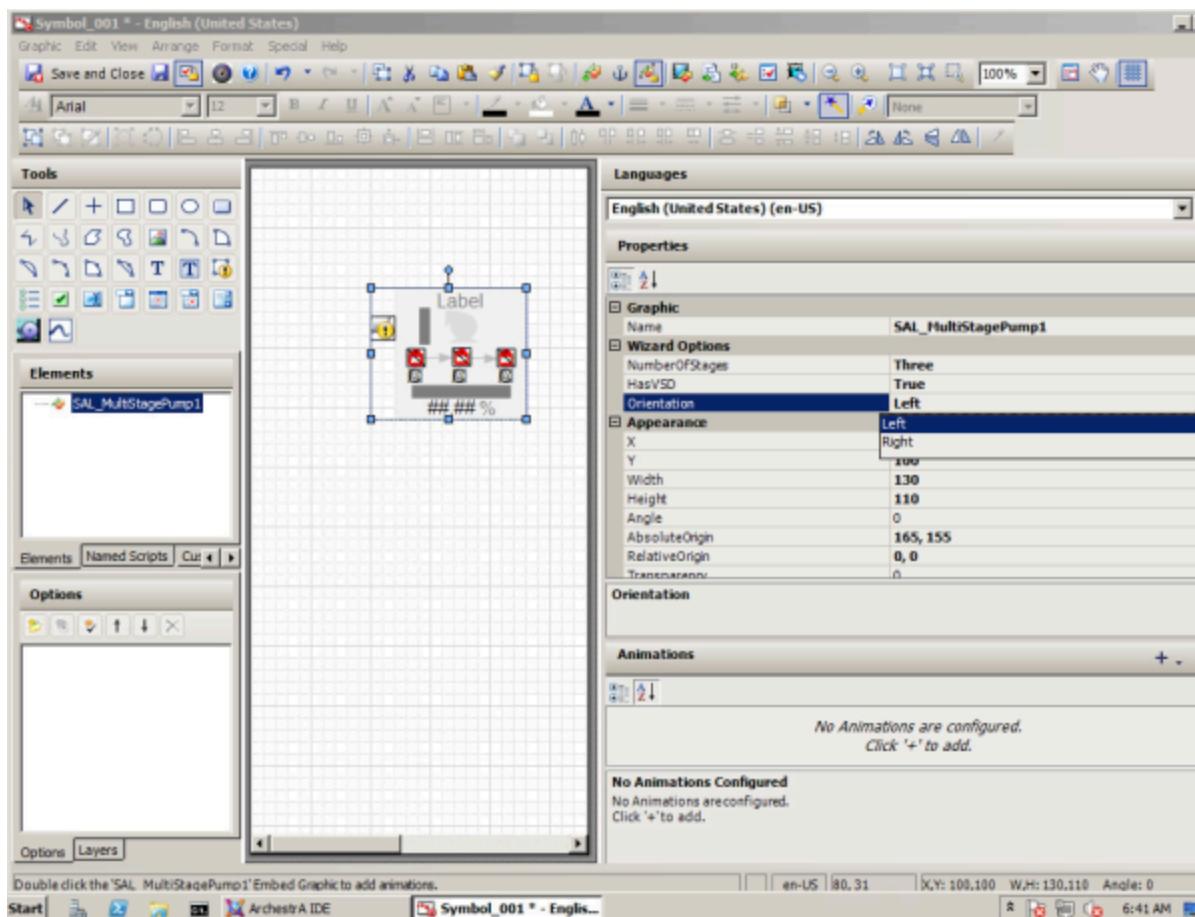

1. Create a new graphic or add a graphic to your HMI application.
2. Open the symbol to show the Industrial Graphic Editor.
3. On the **Edit** menu, click **Embed Graphic**.

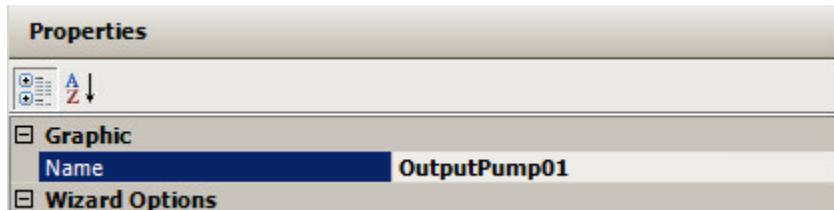

You can also click the **Embed Graphic** icon from the menu bar.

Your HMI's graphics browser appears.

4. Locate the folder containing the Symbol Wizard.
  5. Click the graphic to select it and click **OK**.
  6. Position the pointer at the location where the Symbol Wizard should be placed.
  7. Click once to embed the Symbol Wizard.
- An embedded Symbol Wizard appears with handles on the Industrial Graphic Editor canvas to show that it is selected.
8. Select the graphic's configuration by selecting values for the various options shown in the **Wizard Options** view.

- Rename the graphic.

- Right-click on the graphic and select **Custom Properties** from the menu.  
The **Edit Custom Properties** dialog box appears with the set of custom properties defined for the Symbol Wizard.
- Configure the custom properties with the required references for the application.
- Press [F10] to show the **Edit Scripts** dialog box.
- Verify if any changes need to be made to the graphic's named scripts to run within the application.
- Save the changes made to the graphic.

[Planning Symbol Wizard Configurations](#)

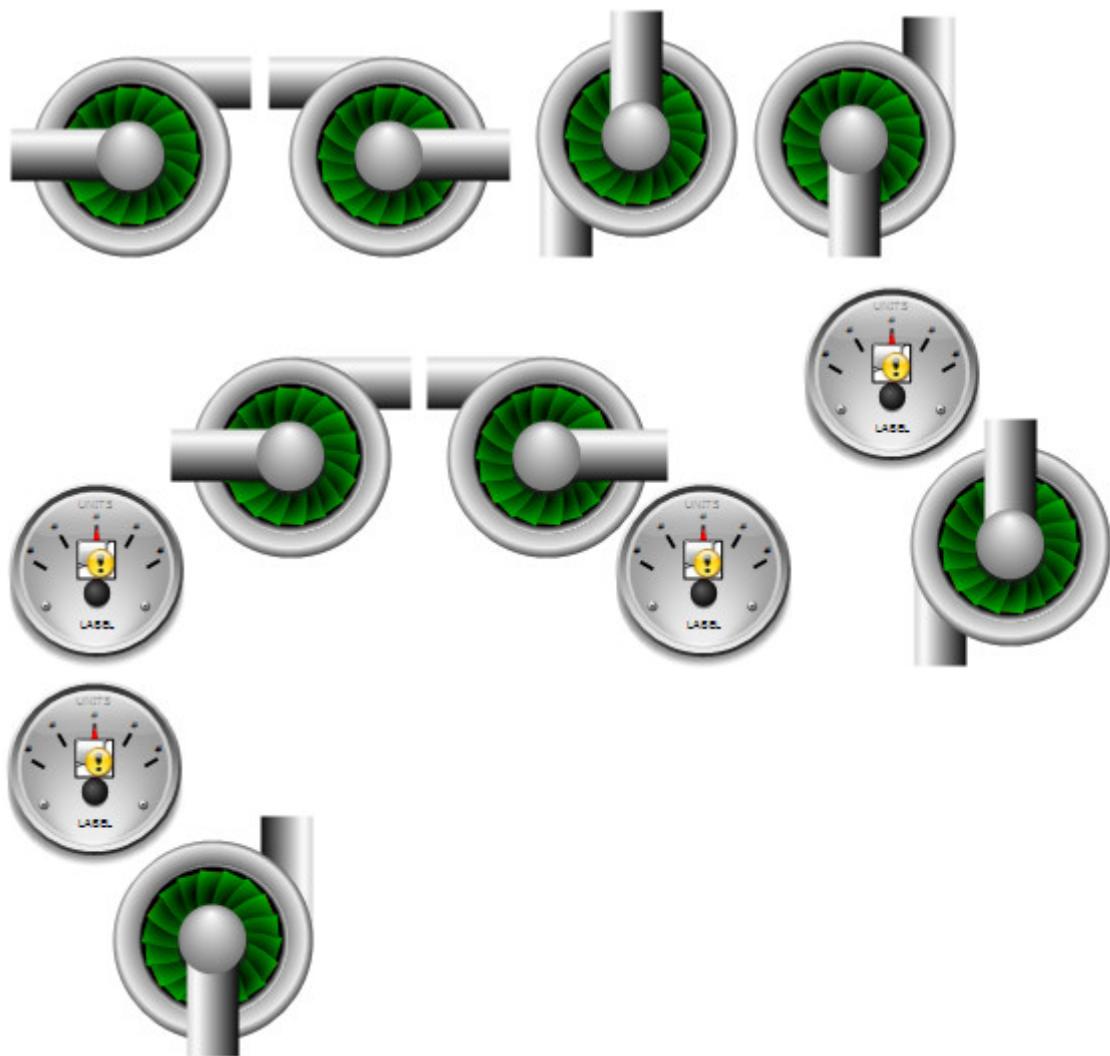

[Identify Graphic Elements](#)

[Build a Visual Representation of a Symbol Wizard](#)

[Specify Rules to select Graphic Layers](#)

# Planning Symbol Wizard Configurations

The first step in creating a Symbol Wizard is to identify the different configurations that should be included in a symbol. In the example of a centrifugal pump, a Symbol Wizard should represent a pump that has the inlet pipe at the left, right, top, and bottom of the pump's central housing. Also, the Symbol Wizard should be able to show or hide a tachometer for each orientation of the centrifugal pump.

After identifying all of the different configurations of a Symbol Wizard, identify the unique properties of each configuration. The example of a centrifugal pump includes two properties: inlet pipe orientation and whether a tachometer is shown with a pump or not.

The next step is to identify the properties and associated equipment.items for each configuration of the symbol.

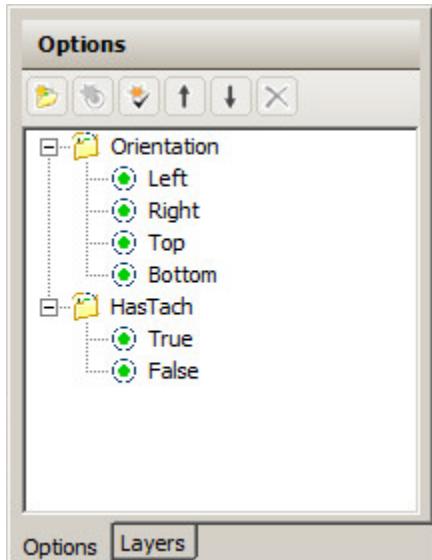

Symbol Configuration	Configuration Properties
	Orientation=Left HasTach=False

	Orientation=Left HasTach=True
	Orientation=Right HasTach=False
	Orientation=Right HasTach=True
	Orientation=Top HasTach=False
	Orientation=Top HasTach=True

	Orientation=Bottom HasTach=False
	Orientation=Bottom HasTach=True

Using the Symbol Wizard Editor, create the Choice Groups and Choices needed to represent all properties and equipment.items of a Symbol Wizard.

In the example of a centrifugal pump, the Choice Groups are Orientation and HasTach. The Orientation Choice Group includes Left, Right, Top, and Bottom Choices, which are the possible equipment.items of a pump's inlet pipe. The HasTach Choice Group includes Boolean True or False Choices that indicate whether a configuration includes a tachometer or not.

Initially, the top listed Choice is the default for a Choice Group. To assign another listed Choice as the default value for the Choice Group, assign the Choice in **Default Value** field of the **Option Properties** pane.

Option Properties	
Name	Orientation
Description	
Rule	
DefaultValue	Right

If the desired base configuration of a centrifugal pump has pipes oriented to the right and includes a tachometer, then Right should be assigned as the default Orientation Choice and True assigned as the default HasTach Choice.

#### Planning Tips

- Always decide the different configurations that should be incorporated into a Symbol Wizard as the first step.
- Identify those properties that define a symbol's configurations. These properties will be specified as the Choice Groups when building configurations with the Symbol Wizard Editor.

Identify all equipment.items of each property that define a symbol's configurations. These equipment.items will be the child Choices of the parent Choice Groups.

Select a default Symbol Wizard configuration at the planning stage to identify the symbol elements, named scripts, and custom properties that you want to include in the base configuration.

#### Related Topics

[Creating Visual Configurations of an Industrial Graphic](#)

## Identify Graphic Elements

Graphic elements are the graphics, named scripts, custom properties, and animations included with each configuration of a Symbol Wizard. The first step is to identify the graphic elements that need to be created for each Symbol Wizard configuration.

The following table shows the graphic elements needed to create a Symbol Wizard of a centrifugal pump.

Graphic Configuration	Configuration Properties	Required Graphic Elements
	Orientation=Left HasTach=False	Graphic elements: <ul style="list-style-type: none"><li>InletLeft</li><li>OutletRight</li></ul>
	Orientation=Left HasTach=True	Graphic elements: <ul style="list-style-type: none"><li>InletLeft</li><li>OutletRight</li><li>MeterLeft</li></ul>
	Orientation=Right HasTach=False	Graphic elements: <ul style="list-style-type: none"><li>InletRight</li><li>OutleftLeft</li></ul>
	Orientation=Right HasTach=True	Graphic elements: <ul style="list-style-type: none"><li>InletRight</li><li>OutleftLeft</li><li>MeterRight</li></ul>
	Orientation=Top HasTach=False	Graphic elements: <ul style="list-style-type: none"><li>InletTop</li><li>OutletBottom</li></ul>

Graphic Configuration	Configuration Properties	Required Graphic Elements
	Orientation=Top HasTach=True	Graphic elements: <ul style="list-style-type: none"> <li>• InletTop</li> <li>• OutletBottom</li> <li>• MeterTop</li> </ul>
	Orientation=Bottom HasTach=False	Graphic elements: <ul style="list-style-type: none"> <li>• InletBottom</li> <li>• OutletTop</li> </ul>
	Orientation=Bottom HasTach=True	Graphic elements: <ul style="list-style-type: none"> <li>• InletBottom</li> <li>• OutletTop</li> <li>• MeterTop</li> </ul>

### Identification Tips

- Assign short descriptive names to graphic elements. Default names are created for layers by concatenating Choice Group and Choice names. Shorter names reduce the number of Option and Layer rules that will extend beyond the borders of **Rule** field of the Symbol Wizard Editor.
- Use a standard naming convention for the graphic elements of a Symbol Wizard. Using a standard naming convention groups similar functional graphic elements together in the list shown in the **Elements** pane. This makes it easier to find graphic elements when a Symbol Wizard contains many graphic elements. Also, the names of layers appear in alphabetic order.

### Related Topics

[Creating Visual Configurations of an Industrial Graphic](#)

# Build a Visual Representation of a Symbol Wizard

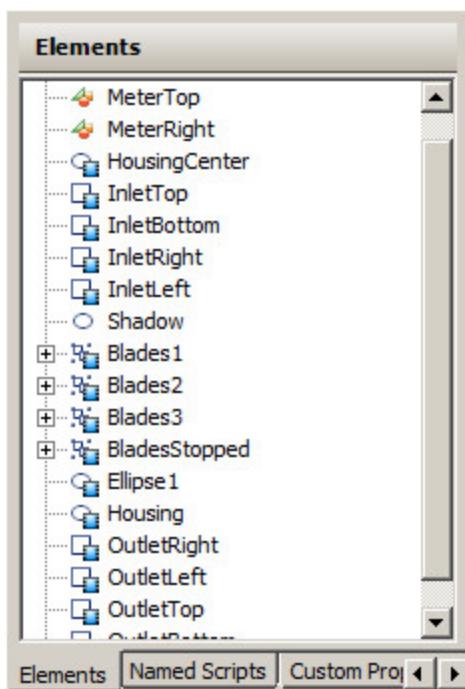

The major steps to add the necessary graphic elements to a Symbol Wizard consist of the following:

1. Check out and open an instance of a graphic from the Industrial Graphic Editor in the Industrial Graphic Editor, or create a new graphic.
2. Create the graphic elements required for each Symbol Wizard configuration by doing one of the following:
  - Embed other graphics from the Industrial Graphic Editor into the symbol.
  - Duplicate graphic elements from the symbol and edit them as necessary for each Symbol Wizard configuration.

In the example of the centrifugal pump Symbol Wizard, a meter has been embedded into centrifugal pump graphic, and then duplicated for the different configuration positions. The inlet and outlet pipes are created by duplicating the graphic pipe elements from the centrifugal pump graphic.

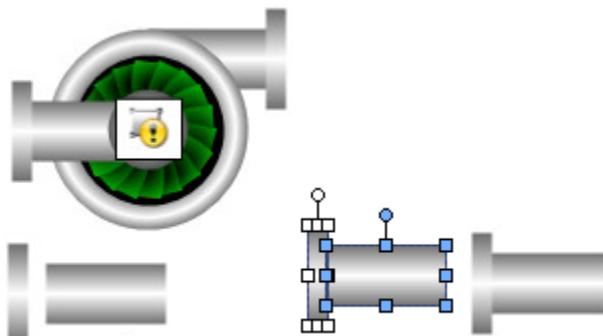

3. Rename each graphic element to easily associate it with a Symbol Wizard configuration.

4. Position the graphic elements to accurately represent the different visual representations of each configuration of a Symbol Wizard.

#### Visualization Tips

- If the same graphic element will be placed at different positions within a Symbol Wizard based on different configurations, create a copy of the graphic element for each position. Each graphic element can be placed into a separate layer, making it easier to specify rules to show the element at the desired position.
- If a graphic element included in a specific Symbol Wizard configuration consists of two or more elements, group the elements together. Grouping related elements makes it easier to assign graphics to Symbol Wizard layers.

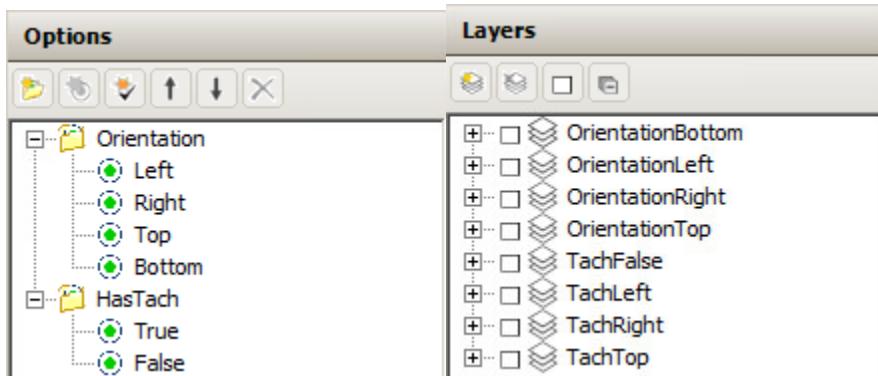

#### Related Topics

[Creating Visual Configurations of an Industrial Graphic](#)

# Assign Graphic Elements, Named Scripts, and Custom Properties to Graphic Layers

By default, the **Layers** pane shows a layer for each Choice Group/Choice combination listed in the **Options** pane. In the example of a centrifugal pump Symbol Wizard, there are unique layers for each orientation of the inlet pipe of the pump graphic. Inlet and outlet graphic element pairs are added to each Orientation layer.

Layers need to be added for the left, right, and top positions of the tachometer when the HasTach Choice Group is True. Copies of the embedded tachometer graphic are added to the TachLeft, TachRight, and TachTop layers, which map to the different positions of the tachometer shown in the pump Symbol Wizard. The TachFalse layer does not contain any graphic elements because it selects the Symbol Wizard configurations without a tachometer.

## Layer Tips

- Use the Active Layer method to quickly drag and drop elements, scripts, and custom properties to a layer folder. Selected elements can be dropped anywhere within the **Layers** view and automatically placed in the correct folder of the active layer.
- If not created by default, create an empty layer without graphic elements for a Choice Group with Boolean True/False Choices. This makes it easier to write layer rules to hide graphic elements when a Choice Group is False.
- After adding graphic elements to a layer, toggle the **Show/Hide** icon on and off to verify the correct graphic elements have been added to the layer.
- Toggle the **Expand All/Collapse All** button above the **Layers** pane to show or hide all of the folders beneath each layer.

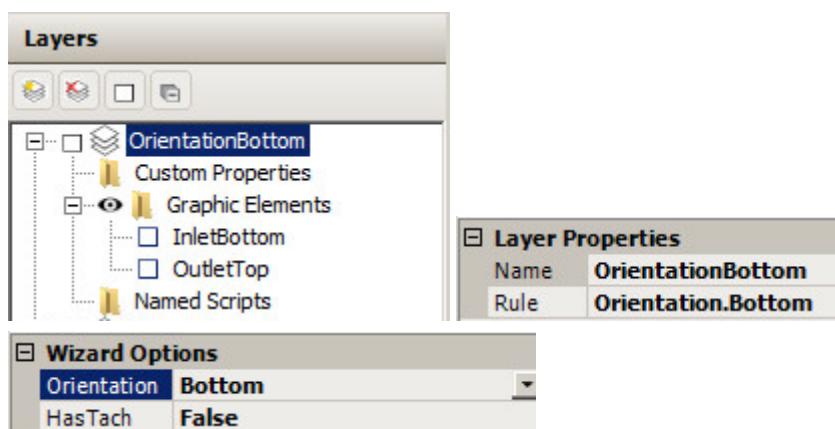

## Related Topics

[Creating Visual Configurations of an Industrial Graphic](#)

# Specify Rules to select Graphic Layers

A default rule is assigned to each layer based on the Choice Group Choice pair. In the example of the centrifugal pump Symbol Wizard, the Orientation Choice Group layer rules map directly to **Wizard Options** choices.

Selecting an Orientation option displays the graphic elements of the selected layer in the pump's configuration.

Modify the default layer rules to show or hide the tachometer. In the case of the Left or Right pump orientation, we recommend that the layer rules select the appropriate Orientation layer and tachometer layers. The TachLeft and TachRight layer rules include an AND statement that selects the tachometer and the Symbol Wizard's pipe orientation:

TachLeft: Orientation.Left&HasTach.True

TachRight: Orientation.Right&HasTach.True

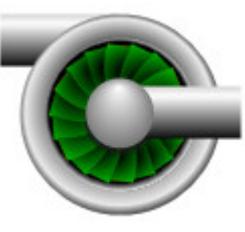

The layer rule to select the Top and Bottom Orientation configurations with a tachometer is more complex because the position of the tachometer is the same in both orientations. The TachTop layer rule includes separate Top and Bottom compound expressions joined with an OR statement.

(Orientation.Top&HasTach.True)|(Orientation.Bottom&HasTach.True)

Using Symbol Wizard Preview, verify each set of layer rules defines only a single unique Symbol Wizard configuration. Rule errors become apparent when a Symbol Wizard includes elements from other configurations, or elements are missing.

Symbol Wizard Configuration	Wizard Options and Corresponding Active Configuration Layer Rules			
	<table border="1"> <tr> <td data-bbox="869 1311 1400 1347"><b>Wizard Options</b></td> </tr> <tr> <td data-bbox="869 1347 1400 1383">Orientation: <b>Left</b></td> </tr> <tr> <td data-bbox="869 1383 1400 1419">HasTach: <b>False</b></td> </tr> </table>	<b>Wizard Options</b>	Orientation: <b>Left</b>	HasTach: <b>False</b>

<b>Wizard Options</b>							
Orientation	<b>Bottom</b>						
HasTach	<b>True</b>						
(Orientation.Top&HasTach.True) (Orientation.Bottom&HasTach.True)							

### Rule Tips

- Symbol Wizard rules are evaluated simultaneously. Place parentheses around compound expressions, which are evaluated before other operators outside of parentheses in a rule.
- Rules cannot reference a Choice Group alone. Always write rule expressions that reference Choices within a Choice Group in a hierarchical manner: ChoiceGroup.Choice.
- Use operator characters (&, |, !) rather than Boolean keywords (AND, OR, and NOT) to save space when writing rules. Using operator characters reduces the likelihood that a long rule will extend beyond the borders of the **Rule** field.

### Alphabetical List of Properties

This section shows you the properties of elements, the canvas, element groups, and embedded graphics.

Each property has a purpose, a category it belongs to, where it is used if it can be used in scripting at run time, and where to find more information on how to use it.

The first part of this section contains an alphabetical list of all properties, the second part shows a table for each category of properties.

The following table contains a list of properties used by the:

- Elements.
- Canvas.
- Element groups.
- Embedded graphics.

Asterisk (\*) marks properties that are specific to only one type of element or the canvas, a group or an embedded graphic.

Property	Purpose, category, usage and further information
<b>AbsoluteAnchor*</b>	Purpose: Defines the absolute anchor point of the source graphic. By default, this is the center point of all elements on the canvas but can be changed.
	Category: Appearance
	Used by: Canvas
	Can be read by script at run time: No
	Info: <a href="#">Size Propagation and Anchor Points</a>
<b>AbsoluteOrigin</b>	Purpose: Defines an X, Y location relative to the top, left (0, 0) origin of the graphic or window.
	Category: Appearance

	<p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Embedded Symbol, Group, Path, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box.</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Changing Points of Origin in the Properties Editor</a></p>
<b>Alignment</b>	<p>Purpose: Controls the location of the text relative to the bounding rectangle of the element.</p> <p>Category: Text Style</p> <p>Used by: Button, Text, Text Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Text Alignment</a></p>
<b>AnchorFixedTo</b>	<p>Purpose: Determines if the anchor point is fixed to the canvas when you resize, delete, or add elements (Absolute), or if the anchor point is recalculated relative to the element sizes and positions (Relative).</p> <p>Category: Appearance</p> <p>Used by: Embedded Symbol, Canvas</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Size Propagation and Anchor Points</a></p>
<b>AnchorPoint*</b>	<p>Purpose: Defines the anchor X, Y location of the embedded graphic.</p> <p>Category: Appearance</p> <p>Used by: Embedded Symbol</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Size Propagation and Anchor Points</a></p>
<b>Angle</b>	<p>Purpose: Defines the current angle of rotation of the element. 0 is always the top of the element relative</p>

	<p>to the canvas. Angle is always determined relative to the top of the element and rotates in a clockwise direction.</p>
	<p>Category: Appearance</p>
	<p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Group, Embedded Symbol</p>
	<p>Can be read by script at run time: Yes</p>
	<p>Info: <a href="#">Rotating Elements by Changing the Angle Property</a></p>
<b>AutoScale</b>	<p>Purpose: If this property is set to True then the text is stretched horizontally and vertically (larger or smaller) to fit the bounding rectangle.</p>
	<p>Category: Appearance</p>
	<p>Used by: Button, Text Box</p>
	<p>Can be read by script at run time: Yes</p>
	<p>Info: <a href="#">Setting Auto Scaling and Word Wrapping for a Text Box</a></p>
<b>ButtonStyle*</b>	<p>Purpose: Determines if the button appears as a standard button or as an image.</p>
	<p>Category: Appearance</p>
	<p>Used by: Button</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Configuring Buttons with Images</a></p>
<b>CalendarColumns*</b>	<p>Purpose: Defines the number of columns the calendar object has.</p>
	<p>Category: Appearance</p>
	<p>Used by: Calendar</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Setting the Number of Calendar Month Sheets</a></p>

<b>CalendarRows*</b>	<p>Purpose: Defines the number of rows the calendar object has.</p> <p>Category: Appearance</p> <p>Used by: Calendar</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Number of Calendar Month Sheets</a></p>
<b>Caption*</b>	<p>Purpose: Defines the text shown on the Check Box at design time and at run time when the caption property is not bound to a reference in the checkbox animation panel.</p> <p>Category: Text Style</p> <p>Used by: Check Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Caption Text of a Check Box Control</a></p>
<b>Checked*</b>	<p>Purpose: Sets or gets the value of check box. This is the initial value of the check box when the control is not connected to a reference and is overridden at run time with value of reference.</p> <p>Category: Appearance</p> <p>Used by: Check Box</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting the Default State of a Check Box Control</a></p>
<b>.Color1</b>	<p>Purpose: Color1 is a sub-property of a FillColor, UnfilledColor, LineColor or TextColor property. It is used to change the first color of the fill, unfill, line or text style if applicable.</p> <p>Category: Depends on its source property</p> <p>Used by: Depends on its source property</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Enabling and Disabling Elements for Run-Time Interaction</a></p>
<b>.Color2</b>	<p>Purpose: Color2 is a sub-property of a FillColor,</p>

	<p>UnfilledColor, LineColor or TextColor property. It is used to change the second color of the fill, unfill, line or text style if applicable.</p>
	<p>Category: Depends on its source property</p>
	<p>Used by: Depends on its source property</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Enabling and Disabling Elements for Run-Time Interaction</a></p>
<b>.Color3</b>	<p>Purpose: Color3 is a sub-property of a FillColor, UnfilledColor, LineColor or TextColor property. It is used to change the third color of the fill, unfill, line or text style if applicable.</p>
	<p>Category: Depends on its source property</p>
	<p>Used by: Depends on its source property</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Enabling and Disabling Elements for Run-Time Interaction</a></p>
<b>ControlStyle</b>	<p>Purpose: Defines the control style as Flat or 3D.</p>
	<p>Category: Appearance</p>
	<p>Used by: Radio Button Group, Check Box</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Setting the Layout of the Radio Button Group Options</a> and <a href="#">Setting the 3D appearance of a Check Box Control</a></p>
<b>Count</b>	<p>Purpose: Indicates how many items there are in a list.</p>
	<p>Category: not available at design time</p>
	<p>Used by: Radio Button Group, Combo Box, List Box</p>
	<p>Can be read by script at run time: Yes</p>
	<p>Info: <a href="#">Using Radio Button Group-Specific Properties at Run Time</a>, <a href="#">Using Combo Box-Specific Properties at Run Time</a> and <a href="#">Using List Box-Specific Properties at Run Time</a></p>

<b>CustomFormat*</b>	Purpose: Defines the format to be used in the DateTime Picker control for input of a date or time. ***inappropriateUI***  Category: Appearance  Used by: DateTime Picker  Can be read by script at run time: No  Info: <a href="#">Configuring DateTime Picker Controls</a>
<b>CustomProperties</b>	Purpose: The collection of CustomProperties defined by the graphic.  Category: Custom Properties  Used by: Canvas, Embedded Symbol  Can be read by script at run time: No  Info: <a href="#">Using Custom Properties</a>
<b>Description*</b>	Purpose: Contains a meaningful description of the graphic.  Category: Graphic  Used by: Canvas  Can be read by script at run time: No  Info: <a href="#">Setting the Radius of Rounded Rectangles</a>
<b>DefaultValue</b>	Purpose: The default time value to use for the control.  Category: Appearance  Used by: Calendar, DateTime Picker  Can be read by script at run time: No  Info: <a href="#">Setting the Default Value of the Calendar Control</a> and <a href="#">Configuring DateTime Picker Controls</a>
<b>DownImage*</b>	Purpose: Defines the image that is rendered in the button element when it is clicked or held down.  Category: Appearance  Used by: Button

	<p>Can be read by script at run time: No</p> <p>Info: <a href="#">Configuring Buttons with Images</a></p>
<b>DropDownType*</b>	<p>Purpose: Defines the type of combo box: simple, drop-down or drop-down list.</p> <p>Category: Appearance</p> <p>Used by: Combo Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Type of Combo Box Control</a></p>
<b>DropDownWidth*</b>	<p>Purpose: Defines the width of the drop-down list.</p> <p>Category: Appearance</p> <p>Used by: Combo Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Width of the Drop-Down List</a></p>
<b>DynamicSizeChange*</b>	<p>Purpose: Determines if the embedded graphic propagates the size changes from the source graphic.</p> <p>Category: Appearance</p> <p>Used by: Embedded Symbol</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Enabling or Disabling Dynamic Size Change of Embedded Graphics</a></p>
<b>Enabled</b>	<p>Purpose: When set to True enables the element at run time and allows the user to interact with it. If the property is set to False the user cannot use the mouse or keyboard to interact with the element. Data changes as a result of an animation or script still execute.</p> <p>Category: Runtime Behavior</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Radio Button Group, Check Box, Edit</p>

	<p>Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p>
	<p>Can be read by script at run time: Yes</p>
	<p>Info: <a href="#">Enabling and Disabling Elements for Run-Time Interaction</a></p>
<b>End</b>	<p>Purpose: Defines the end of a line or H/V line as X, Y location.</p>
	<p>Category: Appearance</p>
	<p>Used by: Line, H/V Line</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Setting Start or End Points of a Line</a></p>
<b>EndCap</b>	<p>Purpose: Defines the cap used at the end of the line of an open element.</p>
	<p>Category: Line Style</p>
	<p>Used by: Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Setting Line End Shape and Size</a></p>
<b>FillBehavior</b>	<p>Purpose: Determines how the Fill (Horizontal, Vertical or Both) should be applied to the element.</p>
	<p>Category: Fill Style</p>
	<p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Setting Fill Behavior</a></p>
<b>FillColor</b>	<p>Purpose: Defines the fill style used for the filled portion of the element.</p>
	<p>Category: Fill Style</p>
	<p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Radio</p>

	<p>Button Group, Check Box, Edit Box, Combo Box, Calendar, List Box, Path</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Fill Style and Changing Background Color and Text Color of Windows Common Controls</a></p>
<b>FillOrientation</b>	<p>Purpose: Determines the orientation of the fill when the element orientation is any value other than 0.</p> <p>Category: Fill Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Fill Orientation</a></p>
<b>FirstDayOfWeek*</b>	<p>Purpose: Defines the first day of the week used for the display of the columns in the calendar.</p> <p>Category: Appearance</p> <p>Used by: Calendar</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the First Day of the Week</a></p>
<b>Font</b>	<p>Purpose: Defines the basic text font as defined by the operating system.</p> <p>Category: Text Style</p> <p>Used by: Button, Text, Text Box, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Text Font</a></p>
<b>Format*</b>	<p>Purpose: Defines the format of the reference values. This is only available for array mode.</p> <p>Category: Appearance</p> <p>Used by: DateTime Picker</p>

	<p>Can be read by script at run time: No</p> <p>Info: <a href="#">Configuring DateTime Picker Controls</a></p>
<b>HasTransparentColor*</b>	<p>Purpose: Indicates whether or not the image applies a transparent color. If True the image is rendered transparent wherever a color in the image matches the TransparentColor property.</p> <p>Category: Appearance</p> <p>Used by: Image</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting the Image Color Transparency</a></p>
<b>Height</b>	<p>Purpose: Defines the height of the element.</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Resizing Elements by Changing Size Properties</a></p>
<b>HorizontalDirection</b>	<p>Purpose: Determines the horizontal direction of the fill for the element. Can be "Right" or "Left".</p> <p>Category: Fill Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Horizontal Fill Direction and Percentage</a></p>
<b>HorizontalPercentFill</b>	<p>Purpose: Determines the percentage of horizontal fill for the element.</p> <p>Category: Fill Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse,</p>

	Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path
	Can be read by script at run time: Yes
	Info: <a href="#">Setting Horizontal Fill Direction and Percentage</a>
<b>HorizontalScrollbar</b>	Purpose: Determines if a horizontal scroll bar appears on a list box control to allow the user to scroll the list box items horizontally.  Category: Appearance  Used by: List Box  Can be read by script at run time: No  Info: <a href="#">Using a Horizontal Scroll Bar in a List Box Control</a>
<b>Image*</b>	Purpose: Defines the image that is rendered in the element. Any image format supported by the application can be used.  Category: Appearance  Used by: Image  Can be read by script at run time: No  Info: <a href="#">Selecting a Different Image</a>
<b>ImageAlignment*</b>	Purpose: Controls the location of the image relative to the bounding rectangle of the graphic. This property is only applicable when the ImageStyle is set to Normal.  Category: Appearance  Used by: Image  Can be read by script at run time: No  Info: <a href="#">Setting the Image Alignment</a>
<b>ImageStyle</b>	Purpose: Defines how the image is rendered relative to its bounding rectangle.  Category: Appearance  Used by: Button, Image

	<p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Image Display Mode</a></p>
<b>IntegralHeight</b>	<p>Purpose: Determines if the List Box size is an integral multiple of the Font Size so that a finite number of items fit in it without being clipped.</p> <p>Category: Appearance</p> <p>Used by: Combo Box, List Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Avoiding Clipping of Items in the Simple Combo Box Control</a></p>
<b>Language</b>	<p>Purpose: Defines the current language of the graphic.</p> <p>Category: Runtime Behavior</p> <p>Used by: Embedded Symbol</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Selecting a Language for a Graphic.</a></p>
<b>LanguageID</b>	<p>Purpose: Defines the current language ID of the graphic.</p> <p>Category: Runtime Behavior</p> <p>Used by: Embedded Symbol</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Selecting a Language for a Graphic.</a></p>
<b>Layout*</b>	<p>Purpose: Defines the way the radio buttons are arranged in the group (Horizontal or Vertical).</p> <p>Category: Appearance</p> <p>Used by: Radio Button Group</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Layout of the Radio Button Group Options</a></p>
<b>LineColor</b>	<p>Purpose: Defines the color and affects of the line or</p>

	<p>border.</p>
	<p>Category: Line Style</p>
	<p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Text Box, Path</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Setting the Line Style</a></p>
<b>LinePattern</b>	<p>Purpose: Defines the pattern of the line or border.</p>
	<p>Category: Line Style</p>
	<p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Text Box, Path</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Setting the Line Pattern</a></p>
<b>LineWeight</b>	<p>Purpose: Determines the weight of the element's line or border. A value of 0 means that there is no line or border.</p>
	<p>Category: Line Style</p>
	<p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Text Box, Path</p>
	<p>Can be read by script at run time: Yes</p>
	<p>Info: <a href="#">Setting the Line Weight</a></p>
<b>Locked</b>	<p>Purpose: Locks or unlocks the element's size, position, orientation and origin. Other properties that can have an affect on element size, position, orientation and origin are also locked. These are element-specific.</p>
	<p>Category: Appearance</p>
	<p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2</p>

	<p>Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Locking and Unlocking Elements</a></p>
<b>MaxDropDownItems*</b>	<p>Purpose: Defines the maximum number of items the drop-down list shows.</p> <p>Category: Appearance</p> <p>Used by: Combo Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Maximum Number of Items to Appear in the Combo Box Drop-Down List</a></p>
<b>Multiline*</b>	<p>Purpose: Determines if the control shows several lines of text that automatically wrap up when reaching the right border of the control.</p> <p>Category: Appearance</p> <p>Used by: Edit Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Configuring the Text to Wrap in an Edit Box Control</a></p>
<b>MultiplePopupsAllowed*</b>	<p>Purpose: If False, ShowSymbol animations only show within a single dialog window no matter how many animations are invoked and regardless of how the animations are configured. If True, ShowSymbol animations show in separate dialog windows.</p> <p>Category: Runtime Behavior</p> <p>Used by: Canvas</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Radius of Rounded Rectangles</a></p>
<b>Name</b>	<p>Purpose: Gives the element a meaningful unique name.</p>

	<p>Category: Graphic</p>
	<p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Embedded Symbol, Path</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Setting the Radius of Rounded Rectangles</a></p>
<b>NewIndex</b>	<p>Purpose: Returns the index of the last value added to the list. This is provided for migration of HMI application windows common controls.</p> <p>Category: not available at design time</p> <p>Used by: Combo Box, List Box</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Using Combo Box-Specific Properties at Run Time</a> and <a href="#">Using List Box-Specific Properties at Run Time</a></p>
<b>OwningObject*</b>	<p>Purpose: Used as the object reference to replace all "Me." references in expressions and scripts. Everywhere there is a "Me." reference this object reference is used instead. The object name can be set either using a tag or equipment reference.</p> <p>Category: Runtime Behavior</p> <p>Used by: Embedded Symbol</p> <p>Can be read by script at run time: Yes</p>
<b>Radius*</b>	<p>Purpose: Defines the radius of the corners of the Rounded Rectangle.</p> <p>Category: Appearance</p> <p>Used by: Rounded Rectangle</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting the Radius of Rounded Rectangles</a></p>

<b>ReadOnly*</b>	<p>Purpose: Determines if the user can type data into the edit box.</p> <p>Category: Appearance</p> <p>Used by: Edit Box</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Configuring the Text to be Read-Only in an Edit Box Control</a></p>
<b>RelativeAnchor*</b>	<p>Purpose: Relative anchor point of the source graphic. By default, this is 0,0.</p> <p>Category: Appearance</p> <p>Used by: Canvas</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Size Propagation and Anchor Points</a></p>
<b>RelativeOrigin</b>	<p>Purpose: Defines the relative origin as X, Y location. The location is relative to the center point of the element (0, 0).</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Changing Points of Origin in the Properties Editor</a></p>
<b>Scripts*</b>	<p>Purpose: Defines a collection of scripts configured for the graphic.</p> <p>Category: Runtime Behavior</p> <p>Used by: Canvas</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Adding and Maintaining Graphic Scripts</a></p>
<b>SelectedValue</b>	<p>Purpose: Reads the value of the selected item, or</p>

	<p>selects the item with that value if it exists.</p> <p>Category: not available at design time</p> <p>Used by: Radio Button Group, List Box</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Using Radio Button Group-Specific Properties at Run Time</a> and <a href="#">Using List Box-Specific Properties at Run Time</a></p>
<b>ShowToday*</b>	<p>Purpose: Determines if today's date is shown on the calendar control.</p> <p>Category: Appearance</p> <p>Used by: Calendar</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Showing or Hiding Today's Date on a Calendar Control</a></p>
<b>Smoothing*</b>	<p>Purpose: When False the graphics are rendered normally, when True graphics are rendered with anti-aliasing which produces a smoother appearing graphic.</p> <p>Category: Appearance</p> <p>Used by: Canvas</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Radius of Rounded Rectangles</a></p>
<b>Start</b>	<p>Purpose: Defines the start of a line or H/V line as X, Y location.</p> <p>Category: Appearance</p> <p>Used by: Line, H/V Line</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Start or End Points of a Line</a></p>
<b>StartAngle</b>	<p>Purpose: Defines the starting angle of an Arc, Pie or Chord. 0 is always the top of the graphic relative to its orientation. A positive number is clockwise from 0 and a negative number is counter clockwise from</p>

	<p>0. If a negative number is used to set the property it is automatically converted to a positive value.</p>
	<p>Category: Appearance</p>
	<p>Used by: 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, 2 Point Arc, 3 Point Arc</p>
	<p>Can be read by script at run time: Yes</p>
	<p>Info: <a href="#">Changing Angles of Arcs, Pies and Chords</a></p>
<b>StartCap</b>	<p>Purpose: Defines the cap used at the start of the line of an open graphic.</p>
	<p>Category: Line Style</p>
	<p>Used by: Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Setting Line End Shape and Size</a></p>
<b>SweepAngle</b>	<p>Purpose: Defines the ending angle of the Arc, Pie or Chord. This angle is always measured from the start angle.</p>
	<p>Category: Appearance</p>
	<p>Used by: 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, 2 Point Arc, 3 Point Arc</p>
	<p>Can be read by script at run time: Yes</p>
	<p>Info: <a href="#">Changing Angles of Arcs, Pies and Chords</a></p>
<b>SymbolReference*</b>	<p>Purpose: Contains the exact location that the embedded graphic is linked to. This can help the user in locating the original definition for editing purposes.</p>
	<p>This property is always disabled.</p>
	<p>Category: Runtime Behavior</p>
	<p>Used by: Embedded Symbol</p>
	<p>Can be read by script at run time: No</p>
	<p>Info: <a href="#">Detecting the Source Graphic of an Embedded Graphic</a></p>

<b>TabOrder</b>	<p>Purpose: Defines the tab order for the element. The tab order is only used when navigating by the keyboard. This property is valid only when the TabStop property is set to true.</p> <p>Category: Runtime Behavior</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Editing the Tab Order of an Element</a></p>
<b>TabStop</b>	<p>Purpose: Determines if the element can be navigated to and can receive focus at run time.</p> <p>Category: Runtime Behavior</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Editing the Tab Order of an Element</a></p>
<b>Tension</b>	<p>Purpose: Specifies how tightly the curve bends through the control points of the curve.</p> <p>Category: Appearance</p> <p>Used by: Closed Curve, Curve</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Changing the Tension of Curves and Closed Curves</a></p>
<b>Text</b>	<p>Purpose: Defines the unicode text that is shown by the element.</p>

	<p>Category: Appearance</p> <p>Used by: Button, Text, Text Box, Edit Box</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting the Displayed Text</a></p>
<b>TextColor</b>	<p>Purpose: Defines the color and affects applied to the text.</p> <p>Category: Text Style</p> <p>Used by: Button, Text, Text Box, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Text Color</a> and <a href="#">Changing Background Color and Text Color of Windows Common Controls</a></p>
<b>TextFormat</b>	<p>Purpose: Defines the formatting string that is applied to the text when it is shown.</p> <p>Category: Appearance</p> <p>Used by: Button, Text, Text Box</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting the Text Display Format</a></p>
<b>TitleFillColor*</b>	<p>Purpose: Determines the background solid color in the title bar of the calendar control.</p> <p>Category: Fill Style</p> <p>Used by: Calendar</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Title Fill Color and Text Color on a Calendar Control</a></p>
<b>TitleTextColor*</b>	<p>Purpose: Determines the text solid color in the title bar of the calendar control.</p> <p>Category: Text Style</p> <p>Used by: Calendar</p>

	<p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Title Fill Color and Text Color on a Calendar Control</a></p>
<b>TopIndex*</b>	<p>Purpose: Returns the index of the top most item in the list. This is provided for migration of HMI application windows common controls.</p> <p>Category: not available at design time</p> <p>Used by: List Box</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Using List Box-Specific Properties at Run Time</a></p>
<b>TrailingTextColor*</b>	<p>Purpose: Determines the text solid color of the text for the trailing days. The trailing days are days outside the current month.</p> <p>Category: Text Style</p> <p>Used by: Calendar</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Text Color for Trailing Dates in a Calendar Control</a></p>
<b>Transparency</b>	<p>Purpose: Defines the transparency of the element. A value of 0 means fully opaque and a value of 100 means fully transparent.</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Group, Path, Embedded Symbol</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting the Transparency Level of an Element</a></p>
<b>.Transparency</b>	<p>Purpose: Transparency is a sub-property of a FillColor, UnfilledColor, LineColor or TextColor property. It is used to change the transparency of the fill, unfill, line or text style if applicable. The transparency acts in addition to the transparency of</p>

	<p>the element.</p> <p>Category: Depends on its source property</p> <p>Used by: Depends on its source property</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Enabling and Disabling Elements for Run-Time Interaction</a></p>
<b>TransparentColor*</b>	<p>Purpose: Defines the RGB color value that is used as the transparent color.</p> <p>Category: Appearance</p> <p>Used by: Image</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting the Image Color Transparency</a></p>
<b>TreatAsIcon</b>	<p>Purpose: If this property is set to False, the animations defined on the graphics within the group or embedded graphic take precedence over an animation defined on the group or embedded graphic. If there are no animations or the user clicked on an area of the group or embedded graphic that does not have an animation, then the group or embedded graphic animation executes.</p> <p>If the property is set to True, only the animation on the group or embedded graphic is executed. The interactive animations within the group or embedded graphic never execute.</p> <p>Category: Runtime Behavior</p> <p>Used by: Group, Embedded Symbol</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Editing the Embedded Graphic</a></p>
<b>UnFilledColor</b>	<p>Purpose: Determines the element's unfilled area appearance.</p> <p>Category: Fill Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2</p>

	<p>Point Chord, 3 Point Chord, Button, Text Box, Path</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Unfilled Style</a></p>
<b>UpImage*</b>	<p>Purpose: Defines the image that is used in the button element when it is un-clicked or released.</p> <p>Category: Appearance</p> <p>Used by: Button</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Configuring Buttons with Images</a></p>
<b>Value</b>	<p>Purpose: Reads the value of the selected item, or selects the item with that value if it exists. Its data type depends on the control.</p> <p>Category: not available at design time</p> <p>Used by: Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box</p> <p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Reading and Writing the Selected Value at Run Time</a></p>
<b>VerticalDirection</b>	<p>Purpose: Defines the vertical direction of the fill. Can be "Top" or "Bottom".</p> <p>Category: Fill Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path</p> <p>Can be read by script at run time: No</p> <p>Info: <a href="#">Setting Vertical Fill Direction and Percentage</a></p>
<b>VerticalPercentFill</b>	<p>Purpose: Determines the percentage of vertical fill for the element.</p> <p>Category: Fill Style</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Button, Text Box, Path</p>

	<p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Setting Vertical Fill Direction and Percentage</a></p>
<b>Visible</b>	<p>Purpose: Determines the visibility of the element. This property is configured at design time and used only at runtime. At design time all elements are visible irrespective of this setting.</p> <p>Category: Runtime Behavior</p>
	<p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p>
	<p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Changing the Visibility of Elements</a></p>
<b>Width</b>	<p>Purpose: Defines the width of the element.</p> <p>Category: Appearance</p>
	<p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p>
	<p>Can be read by script at run time: Yes</p> <p>Info: <a href="#">Resizing Elements by Changing Size Properties</a></p>
<b>WordWrap</b>	<p>Purpose: When set to True, the text in the button or text box is formatted to fit as much text on a single line within the horizontal bounding area of the element and then continued to the next line. This continues as long as there is vertical space.</p> <p>Category: Appearance</p>
	<p>Used by: Button, Text Box</p>
	<p>Can be read by script at run time: Yes</p>

	Info: <a href="#">Wrapping Text in Buttons</a>
X	<p>Purpose: Defines the left position of the element.</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p>
	Can be read by script at run time: Yes
	Info: <a href="#">Moving Elements</a>
Y	<p>Purpose: Defines the top position of the element.</p> <p>Category: Appearance</p> <p>Used by: Rectangle, Rounded Rectangle, Ellipse, Polygon, Closed Curve, 2 Point Pie, 3 Point Pie, 2 Point Chord, 3 Point Chord, Line, H/V Line, Polyline, Curve, 2 Point Arc, 3 Point Arc, Button, Text, Text Box, Image, Status, Radio Button Group, Check Box, Edit Box, Combo Box, Calendar, DateTime Picker, List Box, Group, Path, Embedded Symbol</p>
	Can be read by script at run time: Yes
	Info: <a href="#">Moving Elements</a>

### Graphic Category Properties

The following table contains a list of properties in the Graphic property category used by the:

- Elements.
- Canvas.
- Element groups.
- Embedded graphics.

It shows their purpose, where they are used and where to find more information on how to use them.

An asterisk (\*) identifies properties that are specific to only one type of element or the canvas, a group or an embedded graphic.

Property	Purpose, category, usage and further information
<b>Description*</b>	Purpose: Contains a meaningful description of the graphic. Category: Graphic Used by: Canvas Can be read by script at run time: No Info: <a href="#">Setting the Radius of Rounded Rectangles</a>
